BHATTI, a Rajput tribe of Yadubansi descent. They are the rulers of Jeyrumer, which they founded A.D. 1156, and gave their name to the country between Hisar and the Garah, called Bhattiana. The tract from Loni to Kasna was called Bhatner after them. Some of them became converts to Mahomedanism after Timur's invasion. Shortly after that event, a colony migrated from near Bhawalpur under a leader Bersi, and captured Bhatner from a Mahomedan chief. — Elliot. The Jit and the Bhatti seem to have been so intermingled that distinction is now impossible. The Jit who resisted the advance of Mahmud of Ghazni, in a naval warfare on the Indus, are supposed by Colonel Tod to have, long prior thereto, established themselves in the Rajputana desert as well as in the Panjab, and to have had great political power, as they were reckoned one of the
BHATTI.

thirty-six royal races. In A.D. 1205, which was twelve years after the conquest of India by Shahab-ud-Din, the Jit of the northern desert attempted to wrest Hansi from the Mahomedan empire, and Kutub-ud-Din, his successor, conducted in person the war against the invading Jit. When the dethroned queen Razia sought their protection, they joined all their forces with their Sythic brethren the Gikhar, and marched with the queen at their head to meet her foes, but she fell in battle in the attempt to regain her kingdom.

Again, it is mentioned that in A.D. 1397, when Timur invaded India, Bhatar was attacked for ‘having distressed him exceedingly on his invasion of Multan,” when he ‘in person secured the country, and cut off a tribe of banditti called Jit.” The Phi of Jeysulmer retain their Hindu notions, though with some degree of laxity, from their intercourse with the Mahomedans on the northern and western frontiers; while those who long occupied the north-east tracts towards Phoolra and the Gikhar, on becoming proselytes to Islam, cease to wear the ceinture, or girdle, and lose either interest in or connection with the parent stock. The Bhattis did not acquire the same martial reputation as the Raktor, Chauhan, or Sisodio, but he was deemed to equal if not surpass the Kachwaha, or any of its kindred branches, Nirooka or Shekhavat. He is not perhaps so athletic as the Raktor, or so tall as the Kachwaha, but is generally fairer than either, and possesses the Jewish features of the Bikanir Rajputs. The Bhattis intermarries with all the families of Rajwara, though seldom with the rajas of Mewar. The late Juggut Singh of Jeypore had five wives of this stock. The dress of the Bhattis consists of a jama, or tunic of white cloth or chintz, reaching to the knee; the kambrak, or ceinture, tied so high as to present no appearance of waist; trousers very loose, and in many folds, drawn tight at the ankle; and a turban, generally of a scarlet colour, rising conically full a foot from the head. A dagger, shield, and sword complete the dress. The Bhattiani wear a fine woolen brilliant red gogra or petticoat, and scarf thirty feet in width. They also wear the churor or rings of ivory or bone, which cover their arms from the shoulder to the wrist, of value from sixteen to thirty-five rupees a set; and silver kurri (massive rings or anklets) are worn by all classes, who deny themselves the necessaries of life until they attain this ornament. The poorer Rajputni assist in the husbandry. The Bhattis are addicted to the immediate use of opium, or umpani ‘infusion,’ and the pipe. The Bhattis annals may be divided into four distinct epochs: 1st, that of Heri, the ancestor of the Yadu race. 2d, Their expulsion, or the voluntary abandonment of India by his children, with their relations of the Herica and Pandu races, for the countries west of the Indus; their settlements in Marustali; the founding of Guzni, and combats with the kings of Room and Khorasan. 3d, Their expulsion from Zubulushan, colonisation of the Panjab, and creation of the new capital of Bahmanpur. 4th, Their expulsion from the Panjab, and settlement in Mer, the rocky basin of Maroo, to the erection of Tumante in the Indian desert, in A.D. 731. The Bhattis are a branch of the Yadu or Jadoor race, whose power was paramount in India three thousand years ago; and the prince now governing this distant corner of India, claims descent from those Yadu kings who ruled from the Yamuna to the Yumud and at that remote period. Colonel Tod is of opinion that the Yadubhatti is the original Yuti colony from central Asia, and that the Jit prince of Saluhur was the predecessor of the Yadubhatti races. Tod’s Rajputana, vol. ii. pp. 212, 285. See Saharun.

BHATTIAH, a mercantile race, supposed by Colonel Tod to have been one of the equestrian order converted into the commercial. The habits of the Bhattias are like those of the Arorah, next whom he ranks as to activity and wealth. The Arorah and Bhattias have commercial houses at Shikarpur, Hyderabad, Bombay, Surat, and Jeyapore.

BHATTIANA, a tract of country in the Panjab, forming part, since 1835, of the Hissar and Sirsa districts. It takes its name from the Bhatti Rajputs. In 1795, George Thomas, who had got possession of Harrianah, obtained an influence over the Bhatti, but after the victories of Lord Lake in 1808 it passed under British rule.

BHATTYA, a Brahmanical dynasty of five kings of Magadh in ancient India, who reigned from B.C. 978 to B.C. 447, all paricides. See Bhara.

BHATU, a wandering tribe of gymnasts in the south of India. They are not numerous; they are known as Dumar in the Canarese districts, as Kollati in the Dekhan, Dunbram in Tamil, and Dumberwar in Telugu, and as jugglers and tumblers. Their young women are prostituted, or are devoted at Chinchor as Murli girls, and they reverence the idols at Tripatty and Gudadoor (Cuddalore). They keep no idols, do not respect Brahmans, and they bury the dead.

BHATUL, HIND. A hard bread from the grains of ‘arhar,’ ‘chenan,’ and ‘munf,’ used only by the very poor.—Elliot.

BHATWA. PANJ. Chenopodium vulgare and Ch. album.

BHIAU. MAHR. A brother, a cousin; a title of respect, as Hari-bhau, A daughter-in-law, also a bride; bridal fees given to a zamarra by a ryt on the marriage of the ryt’s daughter.

BHIAU BIJA. A Hindu festival about the end of October, on the second day of Kartik, in commemoration of Yama having dined with his sister. On this festival, Hindus visit their sisters’ houses, and make presents to them. Among the Brahmans, their wives and sisters worship their husbands and brothers.

BHIAUCHYA, one of the 14 Hindu patriarchs who are supposed to preside successively over the 14 Manwantara of the Culp.

BHIAU DAJI, a learned orientalist, a native of Western India, of the middle of the nineteenth century. He was born near Sawantwarre in the Konkan, and educated for the profession at the Elphinston and Grant Medical Colleges. He has written on female infanticide. He founded the Bombay Reform Association, and the Boards of Education of many and learned societies owe much to his exertions.

BHIAU-GARDI. MAHR. Any terrible defeat.

BHAIMA, one of the names of the planet Mars; in Hindoos, the analogue of Mars.

BHIAU MALLANG, lat. 10° 6’ N., long. 73° 12’ E. A hill 10 miles N.E. of Panwel, in the Konkan. Top of the hill is 2250 feet above the sea.

BHIAUNAGAR, a seaport town, capital of a
native state in Gujerat, with an area of 2784 sq.
miles, and a population, in 1875, of 408,754, con-
sisting chiefly of Vaishava and Sumat Hindus,
Jains, and Mahomedans. The ruler, styled Thakur,
is a Gohil Rajput. In the eighteenth century the
family aided in the suppression of piracy in the
Gulf of Cambay. The Thakur has powers of life
and death over his own subjects. The capital has
a good and safe harbour.—Imp. Gaz.
BHAW. See Theatre.
BHUTTOOI. Beng. Chryzeopogon aculearius.
BHAVA or Babu, a.d. 1560, author of the
Babo Prakasa, a Hindu physician who lived in
the middle of the 16th century. He compiled a
book much of the structure of which he gave
a summary of the practice of all the best writers
on medicine, and named the book after himself;
it is written in a clear style, and is still greatly
valued by the physicians of Northern India as a
practical work on Hindu medical science.
BHABHUTA, a celebrated Sanskrit scholar
and dramatist, with the literary title of Sri-
kanta, he in whose throat eloquence resides. He
was a Brahman, born in Beder or in Berar in the
8th century, but resided at or near Ujjjayani.
He was of the Kasyapa tribe or gotra. He de-
scribes nature in her magnificence. Some of his
dramas were translated into English by Professor
Wilson. He wrote the Uttara Rana Charita, a
Sanskrit drama, history of Rama to the death of
Ravana, and Maha-Vira Charita to the end of
his life. In his drama of Malati and Madhava, he
has made powerful use of the Aghori in a scene
in the temple of Chamunda, where the heroine of
the play is decoyed in order to be sacrificed to
the dread goddess Chamunda or Kali.—word,
v.; Garrett; Dowson. See Kala Priyamata.
BHAVANJII CHETTU. Tel. Psoralea cory-
folia.
BHAYA, an itinerant actor, musician,
dancer.
BHAWA. Hind. Cathartocarpus fistula.
BHAWAN. Hind. A house, a palace.
BHAWANI, written Bowany, a tributary of the
Cauvery river. It rises among the hills on the
western side of the Koonda, runs eastwards along
the foot of the Nilgherry mountains, and is joined
by the Moyar, which, together with the Pykara,
rises in the Nedawattam range, and, joining the
Bhawani at Danikan Cottah, the Bhawani enters
the Cauvery.
BHAWANI, also written Bhavani, wife of Siva,
a Hindu goddess, to whom also the names Apara-
jita, Chandi, Durga, Kali, Maheswari, Parvati,
Prakriti are given, according to her worshippers'
opinions of her character. Durga and Bhavani
are two names of Prakriti, the symbol of created
nature, and as Parvati, Kali, Durga, and Bhavani,
the wife of Siva bears a strong resemblance to the
Isis of Egypt, to the Juno of Homer, to Hecate,
to the armed Pallas, and to the Lucretian Venus.
As Kali, she is the agent for her husband’s deci-
sions. She is often depicted with the pāsa or string
in her hands, for binding and strangling incorrigible
offenders. As Durga, or active virtue, she de-
stroyed the Asura. Bhavani, in the form of Parvati,
is nature personified, in which character she is
fabled in one of the hypotheses of the Hindus,
to have been the mother of Brahma, Vishnu, and Siva,
and to have divided herself and become their sakti.
The Saiva Hindus are wor-
shippers of Siva and his wife Bhavani conjointly,
and adore the lingam and yoni in the compound
type of god and goddess. Bhavani and her
consort Siva are extensively worshipped in the
south of India, have a multitude of small temples,
but there is little or no reverence. It would seem
as if a Scythic and an Egyptian goddess, with
their respective attributes and mixtures of war,
love, philosophy, physiology, cosmogony, and final
judgment had been amalgamated. As a war
goddess, Bhavani is often invoked. Tod tells us
that, in the belief of Rajputts, the double-edged
sword presented by Gorakhnath in the forest of the
Tiger mount, could, with the proper incantation,
ever rocks. It is surmised to be the identical
blade which is yet annually worshipped by the
sovereign and chiefs on one of the nine days
sacred to the god of war,—a rite completely
Scythic. The genealogists of the family repeated
him the incantation. It is: ‘By the preceptor
Gorakhnath, and the great god Euklinga, by
Takyc the serpent, and the sage Harita, by
Bhavani, strike!’ This goddess is supposed to
have inspired Sivaji to murder Afzal Khan, the
general of the king of Bijapur. At a conference,
Sivaji struck Afzal Khan with a wagnak, and
finally despatched him with the beautiful Geneco-
blade called Bhawani, which he always wore.
That sword, down to the time of the British
supremacy, had a little temple for itself in the
palace of Sivaji’s descendants, and it was annually
worshipped by them and their household, not
as a mere act of veneration for their ancestor’s
trustysword, but merely as a sacred instrument of sacrifice, and the attendant who watched it used to say that no doubt some of the
spirit of Bhavani must still remain in it. Many
towns and rivers are named after her.—Tod’s
Rajasthan, i. 226; Cole, Myth. p. 96; Moor, Hindu
Pantheon; Sir William Jones; Paulino’s Voyage.
BHAWAR or Bhavar. Hind. Lowlands in
the Terai, at the foot of the Himalaya. In the
N.W. Himalaya, a forest tract below the Siwalik
range. This term is not used in the Panjab. Qu.
Bhabar.
BHAYEL RAJPUTS of Mewar (Bhayel, rocky
hills), are descendants of Susjun, a Puar Rajput.
B Hedan or Basatkela, a very old Gond chief-
ship, now attached to the Sambulpore district.
During the 1857 mutiny the chief joined the rebels,
and was killed in action.
BHEDIL, Beng. A dyke, an embankment.
BHIEKKAR. Hind. Adhatoda vasica.
BHEKRA. Mahr. Tetraceros quadricornis.
BHEL. Hind. Andromeda ovalifolia.
BHEL. Hind. Semecarpus anacardium.
BHEL. Hind. Semecarpus esculentum. The
capsules, when green, are boiled whole and eaten,
or sliced and put into soup or curries; the inside is filled with albumen, and,
when dressed, not unpleasant. The seed is
sometimes laid upon toast with butter, pepper,
and salt. Another species, A. moschatus, has a
smaller capsule; the seeds when rubbed between
the fingers have a strong scent of musk. The
Arabs flavour their coffee with them.
BHEING. Hind. Nelumbium speciosum.
BHERA GHAT, on the Nerbadda, near Jubbulpur
(10 miles), on the line of the railway to Bomb-
ay. Marble is plentiful, and easily accessible, and
has been used in a limited degree at Jubbulpur, sometimes to make line, and other times for metalling roads. It is made up into images by natives, but does not take a good polish. A block was sent to the late Paris Exhibition, and pronounced to be equal to Italian marble for statuary purposes. At this place the river winds between perpendicular rocks of the magnesian limestone, the Marble Rocks, which in one part approach so close as to get the name of the Monkey's Leap.

BHERANDA. Beng. Castor-oil plant.

BHERANDA. Hind. Argemone mexicana.

BHERI. Tel. Leonotis nepetfolia, R. Br.

BHERJA or Bheriga. Hind. Canis lupus, the wolf; also pronounced in the various dialects, bhera, bhara, bharya.

BHERI. MAHR. Caryota urens.

BHERA, Hind., also Bhrara. Wheat and other grain sown together.

BHET, Hind., also Bhent. Land alongside a river, subject to periodical inundation.

BHENDI, a district in the vicinity of Bombay, in which reside many christianized Koli.

BHI. Hind. Cyclonia vulgaris, quince.

BHFA, the marnot of the Bhot.

BHILDAIRA, the root of a small bush found in Ajmir, and brought from Dehli; has little taste; used in medicine. Women take it during pregnancy, believing it can cause the womb to rise out of the pelvis when tardy in so doing.—Gen. Med. Top. p. 129.

BHILAR, a tribe which, according to local tradition, appears to have been one of the aboriginal races of Rohilkhand and the Upper Doab. They were expelled from Nerowlee Bhujjee and the neighbouring districts by the Bir-Gujar Rajputs. In the Doab they are commonly called Beimhar, and in Rohilkhand, Bihlar.—Elliot, p. 68; Wilson’s Glossary.

BHKK. Hind. Alms, Bhikshu or Bhikkari, a beggar. Three religious garments, a begging pot, razor, sewing needle, waistband, and bathing cloth, are peculiar to the Bhikshu or Hindu mendicant ascetic. The Bhikshuaka in Sanskrit, in Pali, Bhikkhuno, is a mendicant who goes three objects of human existence,—pleasure, wealth, and virtue,—and remains constantly occupied with devotion; to abstain from all wrongdoing, call nothing his own, and to suppress desire, anger, pride, and covetousness. For the support of existence, and to apply for alms at Brahman, Kshatriya, and Vaisya houses, after their cooking fires have been extinguished and the people have eaten; to reside but one night in a village, and not more than four nights in a city. Bhikshuni is a woman who follows the life of a Buddhist devotee; a nun. Bhikshu-graha is a cell in which Buddhist ascetics dwell.—Garrett.

BHIL, one of the races who early occupied India. According to Malcolm, in a Sanskrit vocabulary at least 700 years old, the term Bhil occurs to denote a particular race of barbarians, subsisting chiefly on plunder, and found more particularly in the mountainous woody tract of the Nerbadda. But there is still earlier mention of them in the Mahabharata, in which the Bhil are minutely described, and a long fabulous account given of their origin. The Caba race, now almost extinct, was famed, even in the days of Krishna, as the savage inhabitants of Saurashtra. It was a forester Bhil who mortally wounded Krishna, having mistaken him for a deer. When the Bhil was expressing his contrition for the unintentional act, he was forgiven, with the remark that it was only retributive justice, as 'in a former birth,' as the godlike Rama, Krishna had slain him. Thus Rama appears as the subjugator and civiliser of these indigenous tribes, of whom the Caba are described as plundering Krishna's family after his decease. The Bhil have been called the Later immigrants into the forest tracts, like many other tribes in Central India, as the Kol, Gond, Mina, and Mahanadi, the mountains of Sarigua, and Chutia Nagpur; many of them still only little removed from savage life, and with dialects as various as their manners.

The Bhil occupy parts of the Vindhya and Satpura ranges which form the western boundaries of Malwa and Kondesh. Their favourite abodes are the woody and rugged banks of the Tapti, the Mahi, and Nerbadda; but from lat. 20° to 25° N., and long. 75° to 76° E., is partly occupied by them, as also the neighbouring hills, where they extend in one line along the mountains to the utmost limits of Dongargar. As a distinct tribe, they are found in the block of hills surrounding the fortress of Asirgarh, and on one side they are bordered by the Koli, and on another by the Godavari and Chandwana. They occupy the petty states of Dundiika, Rompur, and Gogo, between the Mahi and the Nerbadda, and Nerbadda and Tapti, and Rajipura N.E. of Surat.

The northern part of the chain of ghats, and the country at its base, is inhabited by the Bhil; that part to the south of Baugean and the country at its base, as far south as Bassein, is inhabited by the Koli. The Bhil possess the eastern part of the range, and all the branches that run out from it towards the east, as far south as Poona; they ever spread over the plains to the east, especially north of the Godavery, and the neighbourhood of the Varda. On the north, they extend beyond the Tapti and Nerbadda. Both the Bhil and the Koli are numerous in Gujerat. South of Poona the Bhil are succeeded by the Ramusi, a more civilised and subordinated tribe, with thievish habits. To the north of Poona, in Kandes, Malwa, and Mewar, are the chief Bhil localities. The Ramusi do not extend farther south than Kola, or farther east than Hyderabad city. The Bhil who find their way to the western coast, are known as the Dubla, or the Kala Puraj, or black men. They are to be seen in outlying portions of the Indore and Gwalior territories, in Dhar, Bakhtigarh, Jharna, Ali Rajpur, Jothat, Kattivara, Ratamanaul, Mathwar, Dahi, Nimikhera, Bara Barkhera, Chota Barkhera, Kali Baori, Barwari, Jamelia, Rajigar, Kothi, Garhi, and Bharadipura. Mr. Forbes, a recent writer, described the Bhil as wearing few clothes, of diminutive stature, with swift and active habits, independent in spirit; eyes which bear an expression of liveliness and cunning; bold in assault, but rapid in flying to the jungles; formidable in anarchy, but incapable of uniting amongst themselves; and as by far the most numerous of the predatory races who in former days resided in the hills between Gujerat and Rajputana, and disturbed the country. Their arms are bows and arrows; they are averse to
industry, addicted to drunkenness, and quarrel-
some when intoxicated. Until the middle of
the 19th century, the national weapon was the
Kumpta or bamboo bow, the string being a thin
slip of its elastic bark. The Bhil, from ancient
times, use the fore and middle fingers of their
right hand to the string of their bow, holding the
arrow between the two fingers. Their readiness
to become predatory has marked them as bold,
daring marauders, occasionally mercenaries, but
invariably plunderers. They were cruelly dealt
with by the Maharattas and Mahomedan govern-
ments, and were several times severely punished
by the British; but by the middle of the 19th
century they became more peaceable, and many of
them came to the plains to live as cultivators and
agricultural labourers. They came prominently
and unfavourably before their British rulers in
the early part of the 19th century. During the
campaigns for supremacy in Kandesh between the
Maharattas and the Moghuls, to which, in A.D. 1808,
a fearful famine resulted in the country north of
Ahmadnagar, the whole of the Bhil race formed
into gangs of plundering assassins, and resettling
them occupied the British Government from 1825
to 1833. The Bhil clans are now in a state of
great moral transition.

It was part of the ceremony of installation of
Rajput princes, for a drop of blood to be taken
from the toe or thumb of a Bhil or Mina to mark
the tika on the chieftain's forehead. Amongst
the Mina, the right of giving the blood is claimed
by particular families; but this rite has been largely
discontinued. The Bhil have now no separate
languages.

The Bhil child is named as soon after birth as
possible, and the name given has generally some
connection with the hour and date of its birth.
If no Brahman is available, the ceremony is per-
formed by the paternal aunt of the child, in which
case it is named after the day of the week on which
it was born. The parents give a feast, and distri-
bute presents of clothes to female relations at the
Holi next after the birth. The head of a male
child is shaved when two or three months old.
Betrothal, as a rule, takes place before the girl
arrives at a marriageable age. The father of the
boy seeks out a bride for his son, and arranges
the dapa, or price of the girl, with her parents.
This being agreed to, the girl is placed on a stool,
under which six pie are thrown. One rupee, one
piece, and a little rice are then put in her hand,
which she throws over her shoulder, and the cere-
mony is completed. Marriage generally takes place
in the presence of a girl's relative or protectress;
this is not at all unusual for virgins of a mature
age to be espoused, in which case marriage follows
as soon as practicable. A Brahman usually officiates,
but sometimes an elderly member of the bride's
family. When the guests have assembled, the
clothes of the young couple are tied together, and
they walk hand in hand round the party, an offer-
ing being made to the patron saint, Gotamji,
whose image is to be seen in a niche of the wall
of most Bhil houses. The bride is then placed on
the shoulders of either of her relations in turn, and
danced about till exhausted. Polygamy is allowed,
but a Bhil generally contents himself with two
wives. On the death of an elder brother, the
next takes his widow or widows, without the usual
marriage ceremonies. An elder brother cannot
take a younger's widow, who, if there is none
younger still to espouse her, and she has no pro-
erty of her own, must return to her parents, or
be supported by her husband's next of kin until
she can find another husband in another got or
clan. If, however, a widow has a grown-up son,
she stays with him. A woman is very particular
in her relations with the opposite sex after mar-
rriage, but not so usually before. The fine imposed
upon an adulterer is 240 rupees, and this is given
as compensation to the husband, who may discard
his wife or not as he likes. For the seduction of
a virgin the fine is 60 rupees, which is given to
her parents, and the man compelled to marry the
girl. These cases are always adjudicated by a pen-
cil and laws.

The Bhils invariably burn their dead; but in the
case of the first victim to an attack of smallpox
in the pal, the body is buried for a space of time
to propitiate Mata, and if within a certain time no
one else dies of the disease, it is disinterred and
burnt. The corpse is generally burnt if possible
near a river, and the ashes, with the exception of
a bone or two, thrown into it; two or three days
afterwards, an earthen pot containing rice is placed
on the spot; but if the cremation took place some
distance from a river, the ashes are simply heaped
up and the pot of rice placed on the top. The
bones recovered from the ashes are subsequently
thrown into either the Samkaji river in Mahakants,
the Gotamji in Bauswar, or the Mahi, where it
flows by the temple of Banshwar in Dungarpur,
all of which are considered sacred; for until a
bone or two of the deceased find their resting-place
in one of these sacred streams, the spirit is sup-
posed to remain on earth and haunt the surviving
relations. A few days after the death, one of
the deceased's relations often announces that he has
been told in a dream that the spirit rests on a cer-
ing hill, when the relatives erect a platform there,
and deposit on it a quantity of liquor and
rice. Ten or twenty days after the cremation, the
friends of the deceased assemble at the house of
the next of kin, who spends some 40 rupees' worth
of liquor on the occasion. On their arrival a
quantity of Indian corn is set to cook; and in the
meantime the company shave another and
drink the liquor provided. When the corn is
ready, the host gives each a dhak (Butea frondosa)
leaf full of it, and dismisses them.

The symbols of worship are Cairns, usually on
the hill-tops; the worship of Siva and his consort,
as symbols of terror and darkness; the construc-
tion of stone platforms, on which stand blocks of
stones smeared with red paint; the sacrifice of
victims and birds; and effigies. The burnt piles
of loose stones, on which are arranged a number
of stone or burnt-clay effigies of the horse; oil-
lamps are burnt on them in fulfillment of vows, and
pieces of cloth are generally hung over them. The
first of all goddesses in the tracts is Samundra Mata,
whose athen is near the village of Dhemla,
about eight miles north of Khairwaras. Mahadeo
and Hanuman are worshipped everywhere. Local
deities are also numerous. The effigies of the
horse are small, hollow clay images, with a hole
behind, through which the spirits of the deceased
are supposed to enter and travel up to paradise.
On arrival there, the horse is made over to pro-
pitiate the local deity, and swell his train of war-
horses. These effigies are mostly found on hill-

346
Bhil.

At certain shrines, where they are made. There is a tradition among the Bhils that the gods themselves offer small sacrifices at the present day. Goats now form the sole sacrifices, and are eaten by the worshippers after Mata is supposed to be satisfied. The priests, called waiti and jogi, are Bhils. They eat and drink with the rest. They believe in ghosts and departed spirits. They wear charms and amulets on the right forearm to keep spirits at a distance. Witchcraft is firmly believed in; there are bhop or witchfinders in every large pal. Before a woman is swung as a witch, she is compelled to undergo the ordeal of plunging her hand into boiling oil, or of keeping her head under water until an arrow shot from a bow is brought back by one of the spectators. If she pass through this unharmed, she is released, otherwise she is swung. The process of swinging is conducted by first tying a bandage of red paper over the victim's eyes, and then swinging her head downwards from the bough of a tree until she confesses or dies. If she confesses, she is taken down, and either killed with arrows, or turned out of the pal. The Bhil believes to a limited extent in transmigration of souls, particularly of bad spirits, and that the spirits of the dead haunt places they lived in during lifetime. Eclipses and other celestial phenomena he believes to be the gods diverting themselves, and he adopts, without well knowing why, the Hindu rite of making hideous noises during an eclipse. A cat crossing a Bhil's path when starting on any particular business, will send him home again at once. The Hol Dasera and Dewali festivals are strictly kept; the first especially is the occasion of much drunkenness and excesses. It is kept up for ten days or more; dances take place, rude jests are made, and the women attack and stop travellers till they release themselves by paying a fine. At all festivals and before a fight, the men dance the ganna ring dance. The drummers stand in the centre, and the dancers revolve in a circle with sticks in their hands, which they strike alternately against those in front and behind. Time is kept with the drum all through, and as the performers get more excited it becomes louder, and they jump about wildly; the women's hair falls down, and every now and then one of them disengages himself and dances a pas inside the circle.

Bhil houses are comfortably and fairly built of interwoven bamboos or loose stones, and are often capacious and tiled. They are invariably constructed on a small rising ground or slope of a hill; and each homestead generally consists of several houses for cattle and grain, all within a single enclosure. The furniture comprises a charpoi, large pots for the storage of grain, and a bamboo cradle. The men wear nothing but a dirty rag round the head (the hair being plaited and fastened with a wooden comb), and a waistcloth of limited length. They are usually barefooted; are very fond of earrings; the whole lobule of the ear is often bored along the edge, and loaded with little rings; but the favourite ornament is a large ring which passes behind the ear from top to bottom. The women wear a fond of jewellery, and silver waistbelts, etc., are by no means rare. Those who can afford it possess guns and swords, but the national weapons are bows and arrows. The bow is made entirely of bamboo, except two links of gut which fasten on the string, likewise made out of split bamboo. The arrow is a real tipped with an iron spike; the quiver a piece of strong bamboo matting. The women often wear on their arms and legs the lac and glass chassis of the poorer Hindus, but their peculiar bracelets and bangles are made of brass. Four rings of this metal are generally worn on each arm and leg, and there is also a W-shaped ornament worn by married women on the ankle.

The young women wear only necklets of beads, and children are kept without dress almost to the age of puberty. All cases and quarrels amongst Bhils are settled by a panchayat, and a fine is the invariable punishment. The fine for murder is 240 rupees; and until this is paid a blood-feud is carried on between the relatives of the murderer and his victim. A man suspected of treachery is indiscriminately plundered and ejected from the pal, but he can re-establish himself by paying the fine awarded by a panchayat on his case.

Fights between one clan or village against another are generally indulged in to avenge a murder or affronts, or to assert some right. Before active measures are taken, the patriarch of the village or the pal is consulted, and if he decide for war, the Kilki is sent. The Bhils are excited during a peculiar whirring noise made by placing the hand in front of the mouth—is sounded, or the drum beaten, which gathers all the inhabitants of the pal together, male and female, in an incredibly short space of time. Drinking is then deeply indulged in, and, when worked up to a sufficient state of excitement, they sally forth with their women in front, and on arrival at their opponents' pal an encounter is soon brought about by means of a shower of stones and abusive language, in which the women take a prominent part. When opposed, the women of both parties draw on one side, and the fight commences with bows and arrows. The women on the other side give any wounded man drink or any assistance he may require, and it is a point of honour not to injure the wounded in any way while the fight is going on. After the fight, a panchayat assembles, and the feud is generally closed by the payment of a fine, in which case the offending party make friends by drinking opium out of each other's hands. The Bhils principally subsist on the produce of their cultivation and of their cattle, of which large numbers are kept. They also cut and sell grass, and manufacture baskets, screens, and winnowing-fans out of bamboo. They are still to a certain extent predatory, but a great improvement in this respect has taken place of late years. The jogi of some pals are said to occupy themselves in making a coarse description of blanket. The staple commodity is Indian corn. The ground is merely scratched below or near the hut of the labourer, and the seed thrown in broad-cast. The fields are surrounded by temporary hedges of thorn bushes to keep off animals. Irrigation from wells is not undertaken by Bhils; but for the cultivation of rice, walls of loose stones, earthed up with soil, are built across the narrow valleys in the hills, and a series of terraces thus formed. The following gods were worshiped by the Bhils of Jebrah:—

Kali, on many occasions.

Hati-pows, at the Dewali and Dasara feasts.
Waghacha-Kunwar, to protect them against wild beasts.
Halk Mata, for success in predatory journeys.
Khoriatal Mata, for protection of cattle from plundering and sickness.
Devi Kanail, for a good harvest.
Behyu Baiji, for rain.
Ghora Raja, against plunderers.
Mahadal, the Malwa Bhils, at the annual pilgrimage to the large hill of Retna Wal in Barlya.
Chameonda Mata, goddess of harvest, and the first of every grain is offered to her.
Havin Wana Mata, against murrain and lameness among cattle.
Sita Mata, and Ghona and Bhadrí Bae, goddess of smallpox.

BHILALAH.

—Sir J. Malcolm, Tr. R. As. Soc. i. p. 70; Elphinstone's India, pp. 366-7; Malcolm's Central India, i. p. 518; Coleman; Elliot; Wilson's Glossary; Tod's Travels, pp. 34-39; Tod's Rajasthan, i. p. 724, ii. p. 217; Treaties, iv. 454; Latham; Wheeler's India, p. 85; Friend of India; Forbes' Rasamala; Captain C. E. Yate in Rajputana Gazetter.

BHILALAH, a tribe of Central India, claim a descent, by their father, from the Rajputs, their mother being of the Bhil tribe.—Malcolm, i. 550.

BHILSA, a town in India, in lat. 77° 50' E., and long. 23° 39' N. It is famous for Buddhist topes. There are five or six groups of topes, containing sixty distinct and separate examples. The Sanchi group has several topes. The largest of them is a stupa, raised to mark a sacred spot, and is not a dagoba or shrine containing a relic. At Sonari, 6 miles distant, is a group of eight topes; at Sotibhar, 3 miles further on, is a tope 101 feet in diameter, and a smaller one from which relics of Sariputra and Mogglana have been obtained. A numerous group is at Bhojpur, 7 miles from Sanchi, and 5 miles west of Bhojpur. At Andher, a little village 104 miles S. of Bihula, and 5 miles W. of Bhojpur, is another. Their age is supposed to be between 250 B.C. and A.D. 100. The principal of the remains is known as the great tope at Sanchi. The smaller ones are known from General Cunningham's descriptions in his Bihula Topes.—Cunningham; Ferguson.

BHILU. BURN. Amongst the Burmese Buddhists, a spirit, a ghost.

BHILWAN, also Bihila, a district in Central India, taking its name from the Bhil race.

BHIM or Bheem, a prince of Mewar who was celebrated for activity, and could, while his steed was urged to its speed, disengage and suspend himself by the arms from the bough of a tree. To one of these experiments, however, he owed his death, as he dislocated his spine in a feat of strength.—Tod's Rajasthan, i. p. 392.

BHIMA, the second of the five Pandava brothers. He was of great bodily strength, ferocious courage, wrathful and abusive, and a gross feeder. He fought in the Mahabharata war against the Kurus, and killed several of his opponents. On the eighteenth and last day of the fighting, he struck down Durvodhana by a foul blow, for which his incensed brother Yudhistira struck him, and angered Arjuna and Bala Rama.—Taylor; Garrett; Dowson.

BHIMAIH, a river of the Mahratta country, which joins the Kistna. It is often confined to a narrow bed, as at Korygun. Bhima Teral is the valley of the Bhima river, famed for its breed of hardy ponies or small horses. The breed is known in Northern India as the Bhimratthali. Mawa, the horse which bore Holkar in many a desperate strife, was of this breed. The head is a model, exhibiting the highest quality of blood,—ears small and pointed, eyes full and protruding, and a mouth that could drink out of a teacup. This is the type of the Bhima Teral breed.

BHIMAL. HIND. Species of Grewia.

BHIMA-RATRI, the 7th night of the 7th month of the 77th year of a man's age, lunar reckoning, after which a Hindu is exempted from all institutional observances, it being considered the end of his natural life. He would then be in his 75th solar year.

BHIMB, HIND. Coecinea Indica.

BHIM, GORA, in the Saharanpur district of the N.W. Provinces, lat. 29° 56' N., long. 78° 14' E., has a kund or sacred pool, a place of Hindu pilgrimage, on a perpendicular rock 350 feet high.

BHIM-RAJ, HIND, Edelius paradisensis, is the mocking-bird of Europeans.

BHIM-SENI'S GADA, an ancient stone pillar at Allahabad, which has four inscriptions engraved on its surface. See Lat.

BHIM TAL. See Lake.

BHIN AUNLAH. Duk. Phyllanthus miruri.

BHINDA PURUB, a sacrificial ceremony, till recently practised in Dholbhum.

BHIRA, a town on the left bank of the Jehulum; Old Bbir, on the opposite bank, is a mound of ruins, also called Johnath Nagar, which General Cunningham supposes to be the ancient capital of Sophites or Sopoths, the contemporaries of Alexander, who are said to have been formed of Craters and Heplestion, holding both banks to await the arrival of the fleet of boats. It is three days' boating distance from Mong, the ancient Nikesa, where Alexander defeated Porus. Bhira, also, until it was supplanted by Pand Dadan Khan, had always been the principal city in this part of the country. At Bhira, the Chinese pilgrim Fa Hian crossed the Jehulum in A.D. 400; and against Bhira, eleven centuries later, Baer conducted his first Indian expedition.—Cunningham, India, 155.

BHIRBUTI. HIND. A beautiful scarlet-coloured insect resembling a piece of scarlet velvet. They are collected during the rains. They yield an oil, and have a use similar to the Cantharis as a blister and irritant.—Powell. See Insects.

BHIRM-SUGAN, leaves of a small plant brought to Ajmir from Dehli, employed in making scents. Bhirmi-Visaya, leaves of a climber from Mount Abu, very stimulating, and in Ayurvedic use in the 'sect,' a disease stimulating catalepsy.—Gen. Med. Top. p. 129.

BHIS, HIND., also Basend, Bhisend. The edible root of the lotus, or the fibres of the stem.—W.

BHISHIMA, whose early name was Santanavu, was son of Santanu, raja of Hastinapuri. When old, raja Santanu wished to marry a young and beautiful girl, but her parents objecting, on the ground that even if there were children, Santanavu would succeed to the kingdom, Santanavu made a vow to them, saying, 'If you will give your daughter in marriage to my father, I will never accept the kingdom, or marry a wife, or become the father of children by any woman; so that if your daughter bear a son to the raja, that son shall succeed him in the kingdom.' This stern vow procured him the designation of Bhishma, or 'the dreadful.' He educated Dhritarashta,
BHISTEE.

Pandu, and Vidura, and afterwards made Draup the preceptor of the Pandava and Kaurava; and at a meeting of council he proposed that the kingdom should be divided between the two parties. In the battle that ensued, he led the Kaurava race, and on the tenth day he was mortally wounded by Arjuna. The Bhisham-ashrami festival, on the 8th day of the moon, is in honour of the childless Bhishma. Two kinds of water are made to his spirit, also offerings of sesame seeds and boiled rice, saying, 'I present this water to the childless hero Bhishma, of the race of Vyaghrapada, the chief of the house of Sankriti. May Bhishma, the son of Santanu, the speaker of truth and subjugator of his passions, obtain by this water the oblations due by sons and grandsons.'—Garrett; Dowson.

BHISTEE, ANGLO-HIND, properly Bahishi, a water-carrier who conveys water in a skin slung from his shoulders, resting over his loins. The water-skin is called a Mashak. The Pakhali, another water-carrier, carries water in skins, pakhal, slung across a bullock.

BHISTU DHARI, a sect of the Daddu Panthi who follow the avocations of ordinary life. They burn their dead at dawn.

BHITAR, HIND. The ground on which a house stands; the Kampong of the Malay, or compound of the British. In Urdu it is theangan.

BHOG, HIND, also Bhoga, Bhogam, and Bogam. Enjoyment, fruition, use; anything that may be used, Savodha or Nirvolsa, i.e. with or without obstruction. Bhogi Pandikai, the Festival of enjoyment, the Tamil New Year, when good wishes and new year's compliments and gifts are interchanged, and Indra worshipped. Bhogam, Tel., also Bhogam Vudu, a common woman.

BHOGA, food offered to an idol. Bhogamudnap, that part of the temple of Jagannath where the food to be offered to the idol is cooked. Bhoga-murtti, an idol carried about in processions in lieu of the principal idol, which is never taken from the shrine.

BHOGRA. HIND. Cleome pentaphylla. MAHR., the Cascaria elliptica.

BHOI or Bhooee, in Telingana and in the southern parts of India, a race who are palanquin-bearers, also fishermen. See Bhu.

BHOI-WANLU, also called Ur-Bhoi-wanlu, mercenary soldiers in Southern India, who serve native chiefs. They are never found in the ranks of the British army. There are a few of them in every large town in the south.

BHOJ, the last of the great Pramara race of Hindustan who ruled over Ujjain and Dhar. He was a great patron of learning. His name is famous in the literature of India. Bentley fixed his era between A.D. 982 and 1082; but Wilford supposes him to have died between A.D. 977 and 982. The name of Bhoj, the Pramara, is very celebrated in the annals of India, but there appear to have been more than one of this name or title. The Dhar ruler has been supposed to be the same as Vikrama, or to have been a contemporary. The nine learned men, the nine gems, are said to have flourished during his reign, or that of Vikrama, which was the golden age of Hindu literature; but all connected with Bhoj is uncertain, even his position as a patron to literature.

BHOJA, a Yadava prince who reigned at Mrittikavatti, on the Parnasa river, in Malwa. —Garrett; Dowson.

BHUPATRA. HIND. Bhetula bhojpatra.

BHOPUR, a ruined town where remains of Buddhist stupas stand, on the southern end of a low range of hills, 6 miles S.S.E. of Hilsa, and 7 miles E.S.E. of Sanchi. —Cunningham. See Hilsa.

BHOKUR, HIND. Cordia latifolia, Roxb.

BHOLA NATH, or the 'Simple God,' is one of the epithets of Siva, whose want of reflection is said to be so great, that he would give away his own divinity if asked; from himla, to forget.

BHOLERI, DUKH. Mimnsopa elench.

BHONSLA, the family surname of the Mahratta rulers of Poona, Sattara.

BHONSLA, the family surname of the Mahratta rulers of Sivaji, was also that of the ruling dynasty of Berar.

Parsoji, the founder of the Bhonsla dynasty of Berar, was a private horseman from the neighbourhood of Sattara. Though bearing the same surname as the family of Sivaji, there is no proof that he was of the same race. He attained distinction, and was one of the first to join raja Saho; when he returned from Dehli, he was further advanced by that prince, and was invested with the right of collecting all the Mahratta dues in Berar and the forest country farther to the east. His cousin Raghoji, who was a favourite of raja Saho, and married to his sister-in-law, was raised to his station on his death, in preference to Parsoji's son, who ought to have succeeded him. In 1734 Raghoji Bhonsla was nominated Sena Sahib Suba, or General of the Mahratta Confederacy. In 1745 the head of the family became the undisputed ruler of Gondwana. Raghoji II., who succeeded his father in 1788, had previously shot his own brother Sabaji. Raghoji II., after a reign of 30 or 40 years, died on the 23rd March 1816, leaving but one son, Parsoji, who was imbecile in mind and body. At some opposition, Mahbub, known as Apa Sahib, son of Venkaji, was declared regent, and sedulously courted the British alliance. In January 1817 he proceeded to Chanda, and during his absence from Nagpur, Parsoji died, murdered, as it was subsequently learnt, by Apa Sahib's secret orders. The latter, as nearest heir, now became raja of Nagpur. Avowedly a warm friend of the British, he privately intrigued against them in all directions, until November following, when he threw off the mask and declared hostilities. The battles of Sitabadi and Nagpur followed, in which he was signaliy defeated, and was forced personally to surrender, and to agree to terms which rendered him wholly dependent on the British. In January 1818 he was permitted to resume the government, but immediately recommenced his intrigues.
BHOOA.

Apa Sahib’s repeated treachery having proved him unworthy of trust, the British Government decreed his deposition, and placed Bhagjai, a grandson of Raghoji II., on the head of Nagpur state. On the 12th May 1818, Apa Sahib fled from the place allotted to him, to the Sikh territories, and he ultimately died, in 1840, almost forgotten, at Jodhpur. The family became extinct during the administration of Lord Dalhousie, on the demise of Goozur, grandson of Raghoji, who in 1818 had been seated on the throne when Mudhaji (Apa Sahib) was deposed. After the defection of Apa Sahib in 1817, the administration was, at first, conducted by British officers; but in 1826, on the raja coming of age, the territories were handed over to him, the British Government retaining in their own hands certain districts for the payment of the military force of Berar. In 1829 these also were given up, a treaty having been made with the Governor-General, whereby, in lieu of the native contingent, a sum of 3,000 laks of rupees was to be paid to the British Government;—Elphinstone, p. 642. See Maharatta Governments; Sivaji.

BHOOA. Hind. See Insects.

BHOOI-DAGDHA. Hind. A place of cremation.

BHOOA. A hereditary guardian of the Mahadeo temple. The chief of Alomg, in the Hoshangabad district, is one of the Bhoopa. Bhopi, also Bhoppa, the priest of a village temple, generally a Sudra.

BHPAL, a feudatory state in Malwa, in Central India, in alliance with the British Government. It is bounded on the N. by Gwalior, N.E. and S.E. by the Saugar and Nerbadda territories, S.W. by the possessions of Holkar and Sindia, and N.W. by those of Sindia. It lies between lat. 22° 32' and 23° 46' N., and long. 75° 25' and 78° 20' E.; is 157 miles long from E. to W., and 76 broad from N. to S., with an area of about 8200 square miles, and a population of 769,200 in 1875. Its army is 694 horse, 2200 foot, and 57 guns. The family of the chief descends, belonging to the house of Abdul Azaiz Khan, of the Dynasty of the Orakzi; Dr. Hunter says the Mirazai Khel. It was formed into a principality by Dost Muhammad, in the service of Aurungzeb, on whose demise, Dost Muhammad established his independent authority, and died in 1723, aged 66. Several changes in the succession occurred; and during the Mahratta rule the country was harrassed by that race, and overrun by Pindari. When Colonel Goddard, in 1778, marched through the territory, en route to Bombay, its ruler treated Goddard with great kindness, and this has never been forgotten by the British. And again, in 1809, the Nawab urged Colonel Close to grant British protection. Since 1817 the alliance has been intimate. About 1818 the Nawab was accidentally shot, and his widow, Kudisia Begum, retained the control until 1897, when her son-in-law, Jahangir Mahomed, husband of her daughter, Sikander Begum, was appointed. On her death in 1849, Sikander Begum reigned till her death in 1860. Her daughter, Jahan Sahib, ruled till her death. Sultan Jahan Begum married in 1874. These ladies abandoned the Goha customs of their religion, transacted ably all business in public; and during the revolt in 1857 Secunder Begum adhered firmly to the British, for which she was rewarded by the grant of the pargana of Bairaseh, and created a knight of the Star of India. She died in 1868, and was succeeded by her daughter, Shah Jahan Begum. Her consort was Nawab, Wala Jah, Amir-ul-Mulk, Syed Muhammad Sidiq Khan Khan, Sahib Bahadur.——Aitchison’s Treaties, iv. p. 309.

BHOPAL AGENCY is a British political department in relation with Kilchipur, Bhopal, Rajgurh, Nursingur, Kurwai, Mukundurg, Mahomedurg, Basoda, Pathari, Larawut, Gwalior districts; Soronje. The three petty chiefships, Kurwai, Mahomedurg, and Basowda, are immediately dependent on the British Government itself. The relatives of other chiefs, with their immediate suzerain, have been mediated and guaranteed by the British Government.—Treaties.

BHOPAWAR, a British political agency which superintends four petty feudatory states, viz. that of Jobut, whose chief is a Malik Rajput, with a population of about 7000, chiefly Bilis; Mutwaras, also with a Bilil population; Khatuwarr and Ruttonmul; Mota Barhakera; Kali Bouri. The guaranteed states are Allisajpur of Dar, Plaobe, Ninkhera, or Tirlo Chupra, Soreypur, Masta Barhakera, and Kali Bowri.——Aitchison, iv. 405.

BHORA. Bene. Mangrove; Rhizophora mangii; R. mucronata.

BHOR GHA'T, in lat. 18° 44' N., long. 73° 22' E., in the Dohkan, the principal pass on the route from Bombay to Poona. It has been formed into part of the Great Peninsular Railway line. The top of the ghat is 1798 feet above the sea. See Railway.

BHOSE. ANGOLO-BENG. An honorific suffix to several Kayasth families in Bengal; properly Basu.

BHT. This word, according to Latham, under the appellations of Balt in Bultistan, But in Butan, Bet in Tibet, or in such words as the Bhuteya or Bhotiya, in etymology, comprises the Little Tibetans, the natives of Bhot-pa or Ladakh, the Tibetans of Tibet proper, and the closely allied tribes of Butan. Balti or Baityl is called Palolo or Balor by the Dards, and Nang Kod by the Tibetans. It is preserved, he says, in the Tibetan in Bylto, and in the Russian by Vatko, and Skrato by Iskardro, from the name of its fort and capital. Balti proper is a small table-land, and, with that of Deotsin, is about 60 miles long and 36 broad; the mean height of its villages above the sea is about 7000 feet. The Balti, the people of Little Tibet, the Bylto of Ptolemy, though Tibetan in language and appearance, are all Mahomedans, and differ from the more eastern Tibetans of Le (who call themselves Bhotia, or inhabitants of Bhot), by being taller and less stoutly made. Their language differs considerably from that of Le, but only as one dialect differs from another. The Bhot of Ladakh is strong, hardy, short, and square, with a decidedly Mongol physiognomy, by which is meant a flat face, broad cheek, depressed nose, very large ears, oblique and narrow eye, curtained at the corners, black hair and low stature, their average height being 5 feet 6-1 inches. The skulls are less Mongolian, having a capacity of 73 cubic inches, &c. The Tibetans retain a face similar to a European. The grand Lama is a Bhot. As a general rule, the Himalaya mountains divide Hindustan from Bhotland, but there are Bhot in several parts south of the crest of those mountains in Garhwal and Kamaon. The people of Le, the eastern Tibetans, call themselves Bhotias, or inhabitants of Bhot. They are not so tall, and are stouter made than the Tibetans of Balti or Little Tibet. Bhotiya dialects vary in Man, Niti,
BHOUYLA.

Milam, Darma, and Byans; but they are all closely allied to the Tibetan now spoken in Hunede.—Thomson's Tr. 247; Latham's Ethnol.; A. Cunning.

BHOUYLA is a light Bajra boat, varying in dimensions between the Dhungi or passenger boat and a medium-sized Bajra. It is in general use on the Ganges, alike for a suburban trip or for a long up-country journey. See Boat.

BHOVANNAGAR, in long. 72° 21' E., and lat. 21° 47' N., a seaport in Kattyawar, 9 miles N.W. of Gogo. Its principal taluqads are the Nawab of Junagurh, the Jam of Navannagar, the Rawal of Bhownaggar, the Rana of Porebandar, the Raj of Dronagada, and the Thakur of Murvi. Junagurh, the most important, is held by a descendant of Sher Khan Babi, a soldier of fortune, who seized it in the general anarchy which preceded the subversion of the Moghuls. 20 miles to the west are the ruins of Balahpura, a submerged town covered with 18 feet of alluvium. Half the towns and villages around are built from the bricks and carved stones of this ancient city. — Dr. Nicholson in Bombay Times, February 1852.

BHARAMARA MARI. Tel. Clerodendron serratum. The Telugu word signifies bee-killer.

BHARAMUK. Beng. Helianthus annuus.

BHARATAR. Sansk. Brother; he who carries or assists.

BHATHI-DWITYA. Sansk. A Hindu festival on the second of the month Kartik, on which Hindu sisters entertain brothers, in memory of Yamuna entertaining her brother Yama. It is the 'brother' festival of the Hindus, and is held on the second day of the new moon following the Kali Pooja or Diwali. A brother goes to his sister's house, and receives from her unhussed rice, doora grass, and sandal, with good wishes, which the brother reciprocates. — Wilson.

BHIGU, a Hindu sage, mentioned in the several Puranas. He is said to have lived on Mount Mandara, and is described as wearing a shrot of cloth only around his loins, with a pilgrim's staff and beggar's dish in his hand. Bhrigu, Vasishta, and Atri are three of the great saints or sages called Prajapati or Brahmadika, that is, mind-born sons of Brahma, variously described as 7, 9, 10, and even 21 in number. — Williams' Story of Nata, p. 214; Ward, iv. p. 23. See Brahmadika.

BHIGU, a name of the planet Venus.

BHIGU-BANSI, a tribe of Rajputs claiming descent from Parasu Rama, the stem of the Barhoulia clan.

BHINGAR. Beng. Verbesina prostrata.

BHINGOJI, the skeleton attendant on Siva.

BHUL, in Hindu astronomy, seems to imply the middle place. Bhul-chakra when applied to the celestial sphere, means the equinoctial line. Bhul-chakra is the radius of the equator. Bhul-paridhi, the same as Bhun-chakra.

BHUL. Beng. Contraction of Bhoom, the earth.

Bhu, also Bhumi, also Bhum. Earth, land, soil, ground, hereditary landed property. Bhudanam, a gift of land. Bhul-pati, a landholder, a prince. Bhumia, a proprietor.

Bhu, Bhuvra, Swar, earth and sky and heaven.

Bhu-ad, scarlet garland flowers, Hedychium angustifolium; also Abelmachus esculentus.

Bhu-Devi, also Bhuma Devi, also Prithivi, in Hindu mythology, names of the earth, and famed to have been married to Prithu, the first king who taught the mode of cultivating the ground; hence the earth is called Prithivi. Bhu-Devi is the terrestrial name of Parvati, as goddess of the earth. As the names of Diana were varied to suit her various forms, so being Luna in heaven, Proserpine or Hecate in hell, so her archetype, the Hindu Parvati, is the heavenly Bhavani, on earth Bhu Devi, and Patala-Devi as consort of the regent of the infernal regions. Bhu-Devi, as spouse of the earth goddess, is a name of Siva.

Bhui Mung, Arachis hypogaea, ground nut.

Bhum-Champa, Kampaedia ponnula.

Bhun-Dagulla, its earth burning. Gifts of Indus at marriages and funerals, from the ceremony of burning earth prior to their presentation.

Bhun-Dalima, Carca harricacea.

Bhun-Dumur, Ficus repens.

Bhun-Jamba, Premna herbaec.

Bhun-Kami, Ipomoea Gaugentica.

Bhun-Kunnra, Batatas paniculata, also Triaches anthes cordata.

Bhun-Koit, Feronia elephantum.

Bhun-Koli, a tribe of the Koli race of the west of India. They and other non-Aryans devote their women to the gods, and style them Murli, Jogni, and Basavi; the deities to whom those near the Bhima are devoted are Yellamah and Mata.

Bhul-Mung, ground nut, earth nut.

Bhun-Oka, creeping vervain, Zapania monilifora.

Bhun-Patl, creepng Dentella, Delautella repens.

Bhun-Phul, also Bhumphor, Phelliura cataltropidea.

Bhun-Sing, Arachis hypogaea, ground nut.

Bhun-Souri, Crotalaria prostrata.

Bhun-Kumbum, batatas.

Bhun-Kupin, Feronia elephantum.

Bhun-Loka, earth. See Loka.

Bhunhekara Gadda, also Nela gumandu. Batatas paniculata, Ch.

BHUDUCK, or Badhak, a predatory race of the Nepa Terai.

BHUGRI. Hind. An inferior kind of date boiled in oil and water and dried; used in Multan as the Demaj; also the Ber fruit dried.

BHUL, Bhuiya, or Bhuya, a very numerous tribe dwelling all along the borders of Bengal, Oriissa, and part of Behar. Colonel Dalton thinks they were once the dominant race in Assam; they seem, he says, to have been the prior occupants of Bengal, and to have no connection with the Bhumi or Boyar. They appear to be the original occupants of much of the lower country to the south of the Chutta Nagpur plateau, great part of Singhbhum, and Bowani, and the borders of Oriissa. They have been partly driven from a portion of their country, and partly, or entirely, or dominated over by Kol, themselves probably impelled south and east by pressure from the north and west. But they are still very numerous in all the districts and petty states thereabouts, and are found more or less all the way across the lower hill country to the borders of Behar, close up to Gya, where they are succeeded by the Kahar as palaequin-bearers. The Bhuya are the palaequin-bearers of Chutta Nagpur. Major Tickell describes them as originally rich in cattle; and Mr. Campbell deems it possible that the Hindu race have changed them to Goahl, who are the most numerous Hindu race in Bengal and Oriissa. They are a dark-complexioned race, with rather high cheek-bones, but not otherwise peculiar, and approximate in appearance to the Urya. Those in the hills towards the Behar border have
BHUMA.

BHUMIA.

a darker complexion. They have no language of their own, but speak Urya on the Urya borders, Bengali on the borders of Bengal, and Hindi further north.—Campbell; Dalton.

BHUMIER, a very primitive small tribe of a few hundred families met with in Palaman and Jaspur, but who must not be confounded either with the Bhuia or the Boyar. They are very dark, heads altogether round as bullets, projecting jaws and lips, scarcely any prominence of nose, pigs' eyes, large bodies, and small limbs; no muscular development, short of stature, not one of them more than five feet, very filthy in their persons, with diseased skins and sore eyes.—Dalton, 133.

BHUMIN-HAR, also Bhoom-har, a Hindu agricultural tribe, numerous in the districts of Gorakhpur, Azimgarh, and Benares. The rajas of Benares is of this race. They claim Brahmanical descent, and style themselves Thakur, with names of subdivisions common to them and Sarwaria Brahmanas, as Sandal, Gautam, Dikshit, Upadhyaya, and Deyody; and several other families distinguished are intended to be signified by religious titles connecting them with the same stock, as the Sankarwar, who take the title of Misr, the Donwar, that of Tewari, etc. No Brahmanic honours are, however, paid by any caste to the Babban or Bhun-har. They have some curious rules, within which they and Rajputs may take food from one another, and in Chutia Nagpur they claim to be Rajputs. The names of their clans are almost without exception exempted from the Rajputs. Their customs present a striking similarity to those of the Kshatriya class, and in fact, except their own assertion, there seems to be not one single reason for believing the curious statement made by Mr. Campbell in his Ethnology of India, that there is 'no doubt that this class' is formed by an intermixture of Brahmanas with some inferior caste.—Campbell; Wilson; Sherrington.

BHUI YANSA, a zamindari race, called Khudra rajput, which has its headquarters at Bhuiya, Mau, and has its origin from the Bhuiya of Gobra, who was a deposee of the Rajputana princes, from 1580 to 1804, when Mukund Deo was deposed.

BHUIYA, a race in Keonjirur and Bonai, divided into four clans,—(1) the Mall or Desh Bhuiya, who call themselves, and are called, the Desh-lok, or the people of the country, (2) the Dandesna, (3) the Khatti, and (4) the Raj-Kuli Bhuiya. They are anxious to oblige, and have customs of primitive simplicity. There are 60 chiefs in the Pawri Desh or Bhuiya highlands, and a knotted string passed from village to village will rope the whole of them.—Dalton's Ethnology.

BHUIJ, in lat. 23° 15' N., long. 89° 45' E., capital of the province of Cutch. The Dak bungalow is 281 feet above the sea, and the hill fort is 678 feet by trigonometeric measurement. Bhuj is on a plain at the foot of the hill, on which there is a snake temple. It was taken by Sir W. Keir's army on the 23d March 1819. Its three principal temples are the Olang Math, Kshayan Eswar, Swamandap. A large number of articles in gold and silver are annually made. The silver and gold used are very nearly pure. The charge is at the rate of 8 annas per tola weight. A stone procured from the Hubba hills is polished at Bhuj, and is used as a substitute for marble in the decoration of temples.

BHUKAPATRI. Tel. Betula bhupatari.

BHUKHA MATA. In a temple at Udaipur is a picture so called, personifying Famine. Her necklace, like that of her lord Siva or Mahadeo, is of skulls. Two persons are represented lying near who have died of famine, and a beast of prey is approaching to devour them. The words mean hungry mother, gaunt famine.—Tod.

BHUKRI. Hind. Tribulus anatus, T. lanuginosus.

BHUKSA, a forest tribe under the hills from Purunpur Subna on the Sagda to Chandpur on the Ganges. They claim to be Puar Rajputs expelled from Dhar, and had taken refuge, first in Oudh, and finally in the hills bordering on Kamaon. They are divided into 15 clans,—12 superior, 3 inferior.—Wilson's Glossary.

BHULAM. Tel. Aloe littorallis.

BHULEA and Sansu are silk cloths much used by the women of Nepal.

BHULL. Like all large rivers which flow for a very lengthened course through an alluvial soil, the Indus throws up patches of alluvial deposit at its mouth. In Sind these are called Bhull, and they are of great value in the cultivation of the red rice of the country. They are swampy, and often on both sides of the principal mouths of the Indus, in the Gora bares and Shabhunder parganas, but produce a considerable portion of the rice consumed in Sind.—Simonds, p. 293.

BHULLEH, a clan of Agniclea Rajputs.

BHUM. SANSK., HIND. The land, earth; Bom, PERS. Bhumia, a landlord. Bhumiawat, a general plundering. Bhum-bhai, a landowner in a village.

Bhum Bakeswar, a group of hot sulphur springs on the banks of the Bakeswar streamlet, in the Birhbum district of Bengal, lat. 23° 53' 30" N., long. 87° 24' 35" E.; Fahr. 128° to 162°. About 120 cubic feet per minute are ejected from the hottest well. Bhunma, the tutelary divinity of a village, or its boundaries.

Bhumhari, freehold land tenures in Chutia Nagpur.

Bhumia, a man of the soil.

Bhumi, in Hindu astronomy, the terrestrial globe, supposed to be in the centre of the universe.

Bhumi savana, proper, natural to the earth.

Bhumi savana dina, a natural day.

Bhumi-Daha, being reduced to earth, being burned as a Hindu.

Bhumi Jombuka, Gunda barings.

Bhumi-Nim, Bonnaya serrata.

Bhumi Kumara, Trichosanthes cordata.

Bhumi Tylum, naphtha, petroleum, earth oil.

Bhumowra, Cornus capitate.

Bhum-Phor, earth-splitter; Philippea calotropis, Tulipa stellata.

Bhumidevi, the goddess of the earth, and Vishnu's secondary wife.

Bhumiyaa, in Muttra district, an altar or shrine of the village deity; it is an oblong low structure of masonry.

BHUMIA. HIND. From Bhum, land. A landed proprietor in Rajputana; the aaldal proprietor of Mewar, offshoots of the eldest princes. The term Bapota implies the inheritance or patrimony; its holder, if a military vassal, is called Bhumia, meaning one actually identified with the soil (Bhun). The Bhumia of Rajasthan is the Mog- medan wuttam-dar, or meers-dar, and the Canti-atchi of the Tamils. The Bhumia is vested with the rights of the crown, in its share of the bhog or rent. But when their own land is in the pre-destination called gulthas, or reversions from lapes to the commune, he is seised in all the rights of
the former proprietor; or by internal arrangements, they can convey such right by cession of the commune. The Bhum is exempt from the jureeb or measuring rod; it is never assessed; and his only sign of allegiance is a quit-rent, in most cases triennial, and the tax of khur-lakur, a war imposition, since commuted for money. These alodial tenants are the yeomen of Rajasthan, and, as in the districts of Komutler and Mandelgur, constitute the landwehr, or local militia. The Rajput vaunts his aristocratic distinction derived from the land, and opposes the title of Bhumia Raj, or government of the soil, to the Banya Raj, or commercial government, which he affiliates as an epithet of contempt to Jeypor, where 'wealth accumulates and men decay.' Bhum rakhwali, or land [in return for] 'preservation,' is one kind of Bhum; the crown itself holds Bhum rakhiwali on its own fiscal demesnes, consisting of small portions in each village. In S. 1782, the turbulent Bhumia on the western frontiers were checked by the Rajput chiefs on their borders, and the Sinc Chur Nos, the Bals, the Bora, the Balehna, and the Champa, were compelled to serve. The ancient clans, prior to Sanga Rana, had ceased, on the rising greatness of the subsequent new division of clans, to hold the higher grades of rank, and had, in fact, merged into the general military landed proprietors of the country under the term Bhumia. These Bhumia, the scions of the earliest princes, are to be met with in various parts of Mewar; those of high antiquity were defended from oppression by the rocks and wilds in which they obtained a footing, as in Komutler, the wilds of Chappun, or plains of Mandelgur, long under the kings, and where their agricultural pursuits maintained them. Their clannish appellations, Kombawut, Loonawut, and Ramawut, distinctly show from what stem and when they branched off; and as they ceased to be of sufficient importance to visit the court on the new and continually extending ramifications, they took to the plough. But while they disclaimed not to derive a subsistence from labouring as husbandmen, they never abandoned their arms; and the Bhumia, amid the crags of the alpine Aravalli, where they cultivate his cattle or cultivates his fields, preserves the erect mien and proud spirit of his ancestors, with more tractability, and less arrogance and folly, than his more courtly but now widely separated brethren. They form a considerable body in many districts, armed with matchlock, sword, and shield. In Mandelgur, where their own interests and the prince's unite, four thousand Bhumia could be collected. They held and maintained without support the important fortress of that district, for their prince, during half a century of turmoil.—Tod's Rajasthan, i. 169, 498.

BHUMIJ, literally earth-born, prior inhabitants of Orissa, with whom the Uraon or Ho or Kol mixed when driven eastward. Bhumij are the majority of the population in all the estates of the Manbhum district to the south of the Khasi river. As they approach the confines of Chutia Nagpur, they appear to be called indifferently Mundah or Bhumij, and these intermarry. More to the east, the Bhumij has greatly assimilated to the Bengali; many have acquired estates and influence as Sirdar Ghatwali, the hereditary guardians of the passes. They tenaciously cling to their national songs and dances. Bhumij are to be found in Mahbun and Keonjir, and it is this branch of the Mundah race which has spread farthest in an eastern direction. The Bhumij of the lower part of Singhbhum and Manbhum are tolerably civilised. All the wild tribes of Central India, and the primitive races of the east, have been either subdued or attracted to settle in some tributary town, which is brought back into the house soon after the funeral, apparently that the soul may thereforwards be worshipped as a household spirit. Traces of this superstition may be found all over the world. It is practised by Hindus, Herodotes and Homer show its antiquity. Captain Burton mentions it in Africa. The Bhumij, dwelling between the Kassai and Subarnarekha rivers, are the original inhabitants of Dhalbhum, Barahum, Patum, Ramguti, and still form the bulk of the inhabitants. Many are Sirdar Ghatwali, and well off, and those dwelling amongst the Bengali still retain their dancing customs.—Cent. Ind. Proc. Com. Rep. 1749, 1750, p. 5. 9; Dalton, pp. 147, 156; Campbell, p. 35.

BHUMIAT. H. H. the Maharajah of. BHUNDARA, a district in the Nagpur division of the Central Provinces, situated on the Wain-ganga, east of Nagpur. It has an area of 1748 square miles, and a population of 626,000. Some noble specimens of the Kuttung bamboo are to be found in the Lanjee jungles north of Bhundara, on the Deo and Son rivers, also in Serneha, and (though smaller) in the cantonment of Jubbulpur.

BHUNGHE. Beng. Corchorus olitorius. BHUNHYA or Bhuniya, a tribe in varied stages of civilisation, and of varied religious development. Buchanan Hamilton found them in Bhagulpur, Bihar, and Dinajpur, and he considered them to be the remains of the armies of Jarsandha. Some of the tribe live strictly as Hindus; while others eat beef, pork, camels, horses, ass, rats, cats, fowls, lizards, and worship the Vina or spirits of their dead. Mr. (Sir George) Campbell considered them to be part of the Basi tribe of the northern province. The Basi, according to Mr. Dalton, regards them as part of the Brahmi tribe who at one time ruled in the valley of Assam. In northern and eastern Bengal, and in Chutia Nagpur, they are so humble as not even to cultivate their own fields. Yet the landowners surrounding Parnasat hill, though claiming to be Kshatriya, are undoubtedly Bhuniya, being almost black, with coarse negro-like features. The Bhuniya are numerous in Singhbhum. Tradition says they were once dominant in the western and southern parts of that country, but were subjugated by the 'Ho' (Kol). Colonel Dalton says they are the monkey-like tribes who aided Rama Hanuman, the general of the ape army, was 'Pawan-Kn-pat, the son of the wind;' and the Bhuniya to the south of Singhbhum call themselves Pawanbans, the children of the wind. They are a dark-brown, well-proportioned race, with black, straight hair, plentiful on the head, but scant on the face; of middle height, light-framed like the Hindu, but with figures well knit, and capable of enduring great fatigue. The nose is but slightly elevated, still neither so depressed nor so broad at the root as the generality of Turanian noses. They sometimes call themselves Khandaits, and
BHUNJA.

BHURDUNDI. Tel. Tiardium indicum.

BHUSA. HInd. Bran of wheat, chaff, or cut straw, or leaves, etc., for feeding cattle.

BHUSANDI, in Hindu mythology, a famous crow.

BHUSKI. HInd. A carbonate of soda.

BHUT. HInd. Soy bean? Soja hispida?

BHUT, a spirit, generally an evil spirit, and usually represented by a stone in a forest; commonly coupled with the Preta. In the south of the Peninsula of India, the people recognise the amiable Kaminmar, or virgin spirits; the various amans, with Bhagavati, Chakkmal, and Dwara, Pali, are village gods; and Samaladevi is the cholera goddess. Necromancers employ Karupp, Maden Patchee, and Irulappen, and Kollevai Pali is the will-o'-the-wisp. The Khatari Buddh, Pessasan, Mohini, Jadamuni, and Etchipai are other good and evil spirits. See Bhut-Bali.

BHUT, also Bhuta. HInd. Zea mayis, Indian corn.

BHUTALABAHI. Tel. Bhutakamianus. Sansk. Croton oblongifolium, Roxb. iii. 638. The Telung name signifies demon-driver or devil-goad, and it is used medicinally for making a cooling drink.

BHUTAN, on the N.E. of British India, is situated between lat. 26° 30' and 28° N., and long. 85° 45' to 92° 25' E., and occupies from the southern declivities of the great central ridge of the Himalaya mountains, to the level ground in front of that portion of their inferior chain which constitutes the natural northern boundary of the Assam valley eastwards from Sikkim to where the Brahmputra passes through the mountains. Bhutan is bounded on the north by Tibet, on the west by Sikkim, on the south by the British territory, and on the east by several independent mountain tribes. It consists of a number of rough transverse chains of hills at right angles to the parent range, which forms the backbone of Asia. Between the ridges are precipitous valleys, at the bottom of each of which a mountain stream runs down. The first intercourse of the British with Bhutan was missioned without the expedition of 1772 for the relief of the raja of Koch-Bahar. The Buteah being driven out of Koch-Bahar, and pursued into the hills, threw themselves on the protection of Tibet. The Tesoa Lama, then regent of Tibet, and guardian of the Grand Lama of Lassa, addressed the Government of India on their behalf. The application was favourably received, and a treaty of peace was concluded on 25th April 1774. From that year, with the exception of two unsuccessful commercial missions in 1774 and 1783, there was little intercourse with Bhutan, until the British occupation of Assam, which connected the British and Bhutan frontiers. From that time there had been a continued series of aggressions by the Buteah on British territory, followed by reprisals on the part of the British Government, and the occupation of the Doars or passes which lie at the foot of the Buteah hills. During the 19th and 19th centuries, missions were sent to Bhutan under the Bogle, Captains Turner and Pemberton, and Mr. (Sir) Astley Eden; but the ruling race and the...
people are faithful and immolatory, and the intercourse ended by the British annexing the marches or Doars on the 11th November 1865.

The upper classes, and particularly the highest officers, are described as shameless beggars, bullies and scoundrels, while the lower classes are characterized as tolerably honest and truthful. They wear a coarse cloth, make piles from the bark of the Diah tree, distill a spirit from wheat, rice, and millet, and indulge freely. Chastity is little regarded, and very little practised. The custom of a community of wives between brothers, five or six cohabiting with one woman, obtains here as well as among other countries in the hills. The women are indolent and immodest, but polyandry prevails far more extensively in the northern and central portions of Bhutan than in the southern. Mr. Eden says the intercourse between the sexes is, in reality, promiscuous. On the death of any head of a family, however numerous his children, and whether male or female, the whole of the property becomes escheated to the Deb or Dharma. The spiritual ruler, or Dharma raja, is supposed to be an incarnation of Buddha. The Deb raja is chosen from amongst the chief officers of the country, and is supposed to vacate the government after three years; in practice, however, he holds office as long as he has power to do so. Below the Deb and Dharma rajas are the spiritual council, composed of twelve Buddhist monks, and the secular council, consisting of six Zimp. Subordinate to the Deb are the Para Pilo or Penlo, who have the management of the country west of the Tchinchoo river, and the Tongu Pilo of the country to the east towards Assam. Each of those Pilo has under him six Souhals, or Commissioners of Division.

The Ghylong or Lama priests are estimated at 1500 to 2000, and there are many nuns.

The Lhopa race are quarrelsome and cruel, but not brave. They have invariably black hair, which is cut close to the head. The eye is small, black, with long pointed corners. Their eyelashes are so thin as to be scarcely perceptible, and the eyebrow is but slightly shaded. Below the eyes is the broadest part of the face, which is rather flat, and narrows from the cheekbones to the chin,—a character of countenance far more strongly marked in the Chinese. Their skins are remarkably smooth, and most of them arrive at a very advanced age before they can boast even the earliest rudiments of a beard; they cultivate whiskers, but the best they produce are of a scanty and straggling growth. Many of these mountaineers reach the 6 foot high.

The Changlo are a branch of the Lhopa of Bhutan. The Changlo dialect has a considerable amount of glossarial peculiarity with Tibetan, but in other respects it is entirely Tibetan, softened and slightly changed in phonology. The Changlo dialect is spoken among that portion of the northern frontier of the valley which extends from the Binji Doar to the confines of the Kuriapera Doar, or about 90° to 92° east of long. Neither its northern limit nor the languages speaking it have been ascertained. The inhabitants of this region occupy the lower elevation of the southern Himalayas range, and are, generally speaking, agricultural. Their physical appearance exhibits a few shades of distinction noticeable between them and the tribes of the Sub-Himalayas.

**BHYNSOR.**

They are smaller, less muscular, and the hue of their skin possesses a deep isabelline tint. From the latter circumstance, probably, they derive their appellation, the term Changlo meaning black.—Bogle, Turner, and Pemberton's Embassies; Atkinson's Treatises, i. pp. 105, 142, vii. p. 360; Proskip's Tibet, p. 17; Fraser's Himal. Miss. p. 335; Gerard's Kumaure; Hook. Him. Miss.; Jour. Ind. Arch., 1853.

**BHYUT-ANJAY.** also Bhowra. HIND. A large black bee, failed to be enumerated of the lotus.

**BHYUT-SHUDHI.** SANSK. Bhuta signifies the four elements, and Shuddhi, purification. A Hindu purificatory rite.

**BHYUT-BALL.** offerings to malignant spirits, ghosts, or goblins. Offerings to demons or spirits at funerals. Offerings to all creatures. On the 1st of the dark half of Aswin, Hindus make offerings to malignant spirits. Bhuta-devata is an evil being worshipped as a divinity. Bhut-khet is a field or land granted to the Pahan for the cost of sacrifices offered to propitiate the evil spirits. Bhut Baman, literally, idol-Bhutam; a name of Baman.

Bhun Jajj, literally, devil's soda.

**BHYUT-RHORUBI.** Beng. Preana barbata.

**BHYUTRAJ.** Beng. Adder's tongue, Lygodium flexuosa.

**BHYUTTA or Bhoota.** HIND. An ear of Indian corn. Zea mays.—V.

**BHYUTTER or Buther, and Iyen are two titles of Tamil Brahmins in Travancore.**

**BHYUT-THA.** a large tree of Akyah, plentiful in Ramree and Sowandy districts.—Col. Cat. Ex.

**BHYUTTHIAH, a Rajput race, formerly martial, now traders, and like the Arorah, and both these have commercial agencies all over India.** See Batta; Bhattiah.

**BHYUTTOTE, Thug designation of the strangler.**

**BHYUT-TULASI, Ocimum basilicum; O. pilosum.**

**BHYUT-TULSI.** Beng. Salvia plectra.

B'UVAA-LOKA. SANSK. The higher regions, from Bhuvra, the sky, and Loka, a world. The atmosphere or firmament. Mahar-loka, the region above the pole-star, tenanted by saints. Bhuvana Cosa and Bhuvana Sagara, Hindu books on geography. See Loka.

**BHYUANESWARA, the ancient Eskamara of Orissa, a great seat of the Saiva sect, and largely visited by pilgrims. For six centuries it was the capital of the Kesari or Lion dynasty of Orissa kings, from about A.D. 500 to 1104. 7000 shrines once clustered round the sacred lake, and 500 or 600 still remain, some of them of exquisite design and ungrudging artistic toil.—Downson: Imp. Gaz.**

**BHYACHARA.** HIND. The land tenure by village communities. Bhyad brotherhood is the term employed to designate the minute subdivision of fiefs which obtains in all Rajput states.

**BHYKING-TSENG.** BURM. In Amherst, a close-grained, compact, grey wood, fit for general purposes.—Captain Dance.

**BHYNEE.** CAN. Caryota urens; its sap is abundant, and is converted into toddy and arrack.

**BHYNSOR.** is the tract named Puehali, or the flat, between the river Chambal and the pass, and contains about twenty-four villages, in the lordship of Bhyensor. According to the local tradition of some of the wild tribes, its more ancient name was Bhadravati, the seat of the Hun race; and the
traces of the old city, in extensive mounds and ruins, are still beheld around the more modern Bhyrnasor. Tradition adds that the Chirmitti, the modern Chambal, had not then ploughed itself a channel.—Tod's Rajasthan, ii. p. 713.

BIA. HIND. Pterocarpus marsupium.
BIADHIA. HIND. Green turban.
BIANA, a chieftain of Biana, Dahima, was one of the most powerful vassals of the Chauhan emperor, Pithal rajah. The brothers of this house held the highest offices under the emperor, and the period during which the elder Kaimas was minister, was the brightest in the Chauhan dynasty.—Tod.

BIAH. PUNJ. M Mebra, near Abbottabad Hazara; it is Persian longifolia, and P. excelsa.
BLAY. HIND. Interest of money.
BIBA BIBA. CAN. Holigarna longifolia.
BIBACHA. HIND. Brassica Grifithii.
BIBASIS, a name of the Beas.

BIBI. HIND. Lady. Bibi Sahib, Ang.-Hind., properly Bibi-sabibah, an Englishwoman, the mistress of a house. Bibi, Begum, Dorsani, Thakurani, are courtesy titles of Indian ladies.

BIBLA, of the Brahmi race, the Bibia bag of Northern India, is the smaller leopard. F. pardus.

BIBLA-HUNI. MAHI. Pterocarpus marsupium.

BIBLE, from the Greek Biblos and Latin Biblum, a book. Christians divide their sacred book into two portions, the Old and New Testaments. The former contains the writings of Moses and other prophets, and is the canonical book of the Semitic religion of the Jews or Hebrews; the latter contains the doctrines of Jesus Christ, and but few books are admitted in the religion of Christians. The two books of the Old and New Testament are revered but not read by the Mahomedans of the S. and S.E. of Asia; and the possessors of the Taurait, Anjil, Zahur, and the Koran, viz., the books of Moses, the Evangelists, the Psalms, and the Koran, are all styled Ahl-i-Kitab, or People of the Book, i.e. people possessing a revealed religion. The Old Testament is supposed to have been mostly written in Hebrew, from which it was translated into Greek. The New Testament of the Bible was written, it is supposed, originally in Greek, but the book has now been translated into all the European, and most of the Semitic, Aryan, Mongol, and Polynesian tongues, and largely distributed. The Old Testament, too, has been, in parts, turned into the vernacular tongues of the East Indies, and the whole of the two books have appeared in Arabic. It is related that Philadelphia sent Aristocles, a man whose wisdom had gained him friendship, and Andreae, captain of the guard, both of them Greek Jews, with costly gifts, to Eleazer the high priest of Jerusalem, and asked him to employ learned and fit men to make a Greek translation of the Bible for the library at Alexandria. Eleazer named seventy elders to undertake the task, and they held their first sitting at the king’s dinner-table; and Menedemus, the Socratic philosopher, the pupil of Plato, who had been sent to Philadelphia as ambassador from Eubea, was also present. The translators then divided the work among themselves; and when each had finished his task, it was laid before a meeting of the seventy, and then published by authority. Thus was said to have been made the Greek translation of the Old Testament, which, from the number of the translators, is called the Septuagint; but a doubt is thrown upon the whole story by the fables which have been mingled with it to give authority to the translation. During 1870 to 1881 a committee in England revised the New Testament. In the 2d century there is said to have been an Indian translation of the New Testament St. Chrysostom (Evant. Joan. Homil. I. cap. 1) says the Syrians too, and Egyptians, and Indians, and Persians, and Ethiopians, and innumerable other nations, translating into their own tongues the doctrines derived from this man, barbarians though they were, learned to philosophize.

Nur-ud-Din, in 1740, ordered Mirza Mehdi to translate the four Gospels, but it was done in a very faulty manner. A Georgian translation was printed at Moscow in 1743. The Armenians have it in their tongue; the Nestorians and Jacobite Christians use the Syriac Bible, and it is in the vernacular of all the nations of Europe.

The first versions printed in India of any of the Christian Gospels in the Persian and Hindustani languages, were in 1805 at the College of Fort-William. The Persian was superintended by Lieut.-Colonel Coblooke, and that in Hindustani by William Hunter. Thomas Jarrett translated the Gospels into Western Malay; Púrtham, into the Úriya; Vydyn Náth, into Mahtrádi, under the superintendence of Dr. William Carey. The Old and New Testaments, in whole or in part, have now been translated into 72 of the languages of the East Indies.

In Malay it was published in the Arabic character, in 5 vols. 8vo, in 1758, under the direction of Jacob Mossel, Governor-General of the Dutch possessions in the East Indies.

The immense numbers of Malayan Bibles and other religious books that have been circulated throughout the East Indies, have produced a uniformity of idiom which greatly facilitates communication not only between Europeans and natives, but between the natives of the different islands themselves. Indeed, the Malay language here assumes a degree of importance which is unknown to the other European establishments in the Archipelago. It becomes in a great degree the language of general society, as Dutch is rarely spoken except by individuals born in Europe, who are few in number. A constant correspondence is also kept up in Malay between the Government and Orang Kaya of the interior. Under these favourable circumstances, the Malayan dialect of the Moluccas affords a facility in expressing ideas which is unknown to the westward, where the language is only spoken generally by uneducated people, a circumstance which may eventually lead to the
Ambonaya dialect becoming the general medium of communication throughout the Archipelago. A similar result followed on the translation of the Koran. It gave the purest Arabic a hold.

Since 1811, Bible Societies for the distribution of this sacred book have been formed in most of the Protestant countries of Europe.—Indian Antiq., 1873; Cust, Modern Languages, p. 196; Sharpes History of Egypt, i. pp. 308, 309.

**BIBLIOTHECA SANSKRITAE.** A catalogue by Professor Gildemeister, published in 1847, of authors, Indian and European, who have edited or translated Sanskrit works, or treated of Sanskrit literature.—Cal. Rev.

**BIBOS CAVIFRONs,** the Gyal; Gaviaea gaurus, BIBWA, MAHR. Semeacranus arcaeumidum.

**BICHE DA MAR.** Holothuria, sp.

Hoy-shan, CHIN. Holothuriun, LAT. Swallow of traders, ENG. Sula, MALAY. Sea-slug, Sea-cucumber, Tripang, Beche de mer, POUR, FL. Balate.

Species of Holothuria are found in most of the shallow waters of the Malay and Philippine Archipelago near Ceylon, Mauritius, Zanzibar, Polynesia, in the upper part of the Gulf of Siam, and are so abundant on the northern coast of Australia, that the people of Celebes, receiving advances from the resident Chinese, have been long in the habit of making annual voyages thither in quest of it. Its only market is that of China, to which many hundred tons are yearly sent, for the consumption of the curious epicures of that country. The fishery of the trepang is to China what that of the sardine, tunny, and anchovy is to Europe. It is for the most part caught by hand, for it has little power of locomotion, but in deep water, sometimes by diving. The great sources of wealth of the Aru Islands are the pearl and trepang banks, on the eastern side of the group. These extend the entire length of the islands, and are often several miles in width, being intersected by deep channels, some of which will admit vessels of burden. The greater portion is caught in shallow water, where it can be picked up off the bank without diving. It is produced in the greatest abundance on small coral islands, especially those to the south-west of the island. Trepang on that coast is of several varieties. It is sometimes two feet long; but its common length is from four to ten inches, and its diameter two or three. Its tentaculars are short, and when the animal is captured, are folded up under its body. The trepang is first thrown into a kettle filled with boiling sea-water, after a few minutes it is removed and gutted. It is then thrown into a second kettle, where a small quantity of water and the parching rind of a mimosa produce dense vapours. This is done to smoke the trepang for better preservation. Finally, it is dried in the sun, or in case of bad weather under a shed. For a long time the Chinese were the sole carriers of the article, but foreigners now engage in the trade. A great deal of this article is imported into Macao, in junks and Portuguese vessels. In the market it appears hard and rigid, and has a dirty brown colour; when brought to the table, it resembles pork rind in colour and consistency. The Chinese use it by itself, or as an ingredient in other dishes, and consume large quantities, under the belief that it is an aphrodisiac. The varieties into which they divide it are above thirty, varying in price from $80 down to $1 per pikeil, but unless one is well acquainted with the article, it is impossible to distinguish them. In the Chinese tariffs, all the sorts are arranged under the two heads of black and white.—Jour. Ind. Arch. iv. p. 480; Hor, Mr. Morrison's Compendious History; Crawford's Dictionary; Faulkn. See Holothuria; Trepang.

**BICHHATI,** also Bich-taruka, BENG. Silver weed, Argyreia speciosa. Bich'hu'ti, Tragia involucrata, Linn.

**BICHU.** HIND. Martynia diandra.

**BICHUAA, BICHHATA.** HIND. The Himalayan nettle. Urtica heterophylla. Urticainterrupta. The name is from Bichu, a scorpion.

**BICHUA.** HIND. A dagger with a waved blade.

**BIDABAD,** all of it was formerly a place of refuge. See Basat.

**BIDAL.** BENG. Baulinia variegata.

**BIDARA, KARN.** also Bidi Kaivarou, a troop of grain-carriers.

**BIDARIKAND.** HIND. Root of Pepera tuberosa, in Aujur, considered of a warm nature, and used among a great number of ingredients of many prescriptions.—Gen. Med. Top. p. 126.

**BIDASPES, Bedaspes, or Hydaspes of the Greeks, the modern Ichut; the ancient Vitaste.**

**BIDDARD.** SANSK. Gnelina Asiatica.

**BIDDAT.** ARAB. In Mohamedan law, points of religion neither directly enjoined nor yet forbidden by Mahomed.

**BIDDHUKURNU.** BENG. Clypea herannahplia.

**BIDEN, CHRISTOPHER,** author of Naval Discipline, or a View of the Necessity for a Law establishing an efficient Naval Discipline in the Merchant Service. He was for many years master attendant at Madras.

**BIDENS.** Smith. The Kwei-chon-ts'au of the Chinese. A composite plant, one of the Shan-yoh or mountain drugs of the Chinese. It has algogogue properties.—Smith.

**BIDGIRAMMI.** MAL. Linseed.

**BIDHATA PURUSH,** the Hindu god of fate.

**BIDHAY.** BENG. The signal for taking leave, often accompanied by a gift.

**BIDPAl or Pilpai is the name given to the author of the oldest known collection of tales, but no edition of them is in existence. Tradition says that they were written in Sanskrit by a Brahman of this name, for the benefit of Dasishim, his king, and to them almost all the fabulous relations of other countries have been clearly traced by Mr. Colebrooke, the Baron de Sacy, and Professor H. H. Wilson. The Bidpai collection is traditionally said to have been since reproduced in the Pancha-tutra, or five chapters, also known in India as the Panchopakhyanam, or *Five Collections* of 80 stories, which are supposed to have been in prose, written by Vishnu Sarma for the education of a king's sons. Pancha-tutra means literally Pentateuch, or the Pentameron, or Quinque Partitum. Its five chapters relate to the disensions, and the acquisition, of friends; inveterate enmity; loss of advantage and inconsiderateness. The book has many aphorisms to guide a person in life. Another collection, called the Hitopadesa, i.e. Sutary Advice, was originally written in the Sanskrit language in prose and verse. It is a collection or selection of tales drawn from the fables of Bidpai.**
the source also of the Panchatantra, and has been translated into most of the languages of British India, also into English by Dr. Charles Wilkins, Sir William Jones, and Francis Johnston. It is full of maxims and worldly advice; it is as interesting as the Proverbs or Ecclesiastes, and is probably as old as those two works. It opens with a reference to Ganesha, the Hindu god of wisdom, and the story relates to king Sudarsana of Pataliputra and his intractable sons. Both these books have been published in Britain and Germany, and there are English, German, French, and other translations of them. They were translated into English in the time of Nushirwan, in the 6th century; from that into Arabic, by Abdullah-Ibn-al-Makaffa, about the middle of the 8th century, and his book is known as the Kalin-wa-Damna.

This was in the reign of the Khalif Al-Mansur in the 8th century. The Kalin-wa-Damna had 18 chapters, and must have been from another or from a larger collection. Then, about the close of the 9th century, into Persian, by Rudaki, who received 80,000 dirhems for his labours. About the middle of the 12th century (A.D. 1150), in the time of Bahram Shah, a Persian prose translation was made, and a subsequent second translation was made, by Kashi-fi, and named the Anvar-i-Sohelli. A Greek version was made by Simeon Seth, at the command of Alexis Commenes, and they appeared since in Hebrew and Aramaic, Italian, Spanish, and German. The first English edition was in the 16th century; then in French in 1644 and 1709; and they are the foundation of Esop's fables. In these tales and fables the Hindus appear to have been the instructors of all the rest of mankind. The complicated scheme of story-telling, tale within tale, like the Arabian Nights, seems also to be of Hindu invention, as are the, subjects of many well-known romances, both oriental and European.—*Elph.* pp. 156, 157; *Chips,* iii. 145, also iv.

BIDUANDA KAILANG, a race who, with the Orang Sectar, dwelt in Singapore till removed from it by the British, when they occupied the island in 1818. They speak Malay with a guttural accent. They are now dwelling in the Malay Peninsula.

BIDURU NANA BIIYAM, Tel., *Euphorbia thymifolia.* _L._ has the signification of 'green or raw rice of Biduru.' The term pachchi arisi, *Tam._ 'raw rice,' is applied to several of the smaller species of *Euphorbia.*

BIGANDEL, Roman Catholic Bishop of Ramath, who resided for many years in Burma and the Malay Peninsula. He published in 1858 a legendary history of Gauda, and subsequently a revised edition of it, which Lieutenant Gauvin translated into French.

BIGHA, Bhiga, or Beega, a land measure varying in extent in different parts of India. The standard bigha of the Revenue Surveys of the North-West Provinces is equal to 3026 square yards, or 5-6ths of an acre. In Bengal, the bigha contained only 1600 square yards, or little less than one-third of an acre. In Benares, it was, at the time of the settlement, determined at 3136 square yards. In other parganas it was 2025 to 3600, or to 3926 square yards. A kacha (immature, crude, small) bigha is in some places a third, in others only a fourth, of a full or standard bigha. Akbar's bigha of 5900 square gun=2600 square yards=0-558, or somewhat more than half an acre on the above estimation.

In the N.W. Provinces of India it is nearly five-eighths of an acre. In the Lower Provinces it is 120 feet square, or 4800 superficial feet, nearly one-third of an English acre. Tod says that in Rajputana 120 are = 40 acres. Sir H. Elliot specifies the following as some of the variations found in the Upper Provinces for 100 acres, viz.:—

<table>
<thead>
<tr>
<th>Bigha</th>
<th>Bha.</th>
<th>Kitta.</th>

</table>

In Cuttack, the bigha is now considered to be an English acre. The Mahrantha bigha is called twenty pund, or 400 square kathi or rods, each five cubits and five hand-breaths; as the rod varies so does the bigha; under the Adal Shahi dynasty it was equal to 4683 square yards, or only 457 yards square, less than an English acre. The Gujarath bigha contains only 2841 square yards.—*Wilson's Glossary,* p. 85; *Elliot, Supplement,* Tod's *Rajasthan,* i. p. 555; *Carney.*

BIGN. _Hind._ Celta Caucaica.

BIGNONIA. This genus of plants is one of the Bignonaceae, and 18 species occur in Chana, the Moluccas, Assam, Morung, Peninsula of India, and Malaca. Amongst them are B. adenophylla of Burma, B. undulata of Hindustan and Gujerat, B. multijuga of Sylhet and Ponom. The leaves of B. chia yield a rod colouring matter. Several species in Burma and Tenezannah are not yet specifically identified. They are called by the Burmese, Lain-bha, Kyoun-douk, Than-day, Thug-gai-ii, and Thau-thet-ngai. Bignonia coronaria, a large tree with white flowers; very plentiful in the Tharwadda and Pegu districts; affords from the inner bark material for rope.

Bignonia chelonioides, *Linn.*

*Stereospermum chelonioides,* _D. C._

Padal, Sammi, _Hind._ Pathiri maram, _Tam._ Keersul, Tututaka, MAHI Tagada, Kaligour, _Tel._ Padri maram, _Malak._ Kahikutru, Kaligouru, _Tam._ Pu-padiri maram, _Tel._ Pumulpdri, _Mal._ URLA.

This is found in various parts of the Madras Presidency, both above and below the ghats in Canara and Sandu, though not common there; abundant in the Dekhan, on the right bank of the Godavary, and in Ganjam and Gumaur; also in the Bombay ghats, at Khandalla and Parr; also in the Punjab, the Siwilak tract, Sylhet, and Assam. In the mountainous parts of the coast of Coromandel it grows to be a large tree; flowers during the hot and rainy seasons, and the seed ripens in December and January. The wood is high-coloured, hard, and durable, and much used amongst the inhabitants of the hills, where it is plentiful. It attains an extreme height of 20 feet, with a circumference of 1 foot, and the height from the ground to the intersection of the first branch is 8 feet. The tree is held sacred by the Hindus, in consequence of which it is difficult to obtain the timber; but it is a good fancy wood, and suitable for buildings. The bark and fruit are used medicinally, and the pleasant-tasted fragrant flowers are used to make a cooling drink in fevers.

Bignonia indica, _Linn._

*Spathodea indica._ *Calosanthus indica,* _Blume._ *Bignonia pentandra,* _Lour._
BIGNONIA.

Mulin, Sori, ... HIND. Tat Morang, ... HIND. Tat Palang, ... Teto, ... MAH. L. 

This is common near water streams on the Bombay side, chiefly below the ghats. On the Coromandel coast it grows tall, chiefly up among the mountains; flowering-time, the beginning of the wet season; seed ripens in January and February. The wood is soft and spongy as to be unfit for use. It grows in Behar and in the Siwalik hills, and immense pods 18 in. long and 4 in. thick hang from its branches in its leafless state. In the Tenasserim Province it is often seen near the dwellings of the natives; it grows luxuriantly in the cold regions of the Himalaya. The bark and capsules are astringent, and used in tanning and dyeing. The leaves, called Sionak in the Panjab, are used in medicine.

Bignonia quadrilocularis, Roxb.

Spathodea Roxburghii, Spr. | Wurr, ... MAH.

This large tree is found in the higher hilly places of the Konkan, the higher valleys of the ghat, Ceylon mountains, Malabar hill, Bombay, Elephant; and it is very common in Padahapore jungles, in the Southern Mahatra country. It flowers during the beginning of the hot season, and its flower is very beautiful. The wood is strong, tough, durable, and is much used for beaux, as planking for carts, and for many purposes, by the natives.

Bignonia stipulata, Roxb.

Spathodea stipulata, Wall.

Pha bhan, ... AYAB. Ma shoy, of Moulem. Ka-mhong, ...

The stipuled trumpet-flower tree has a long twisted pod. It is common throughout Tenasserim and at Moulem. The flowers are often seen in bazars, where they are sold for food. In Akhyab the natives make a spurious liquor from the bark. Dr. McLeodlan describes it as affording a strong, very dense, and most valuable wood for purposes requiring strength, elasticity, and density.

Bignonia suaveolens, Roxb.

Sterculia suaveolens, W. | Tecoma suaveolens, G. Don.

Pam, Parool, ... BENG. Bhita padari? ... SANSK. Padul, Padali, ...

Sami, Sammu, ... HIND. Dvtali, Kahorgu, Parul, ... MAH. Kuberekash, Padari, Tel.

This middle-sized tree grows in the Dandole forest above the ghats, in Canara and Sundar. It occurs, though not very common, in Ganjam and Gumsur, where it attains an extreme height of 20 feet, with a circumference of 1½ feet, and the height from the ground to the nearest branch is 12 feet. It is a native of the southern parts of the Coromandel coast, and also occurs in the Dekhan, Sukarnagur, Gorakhpur, the Khar jungle, Dehra Doon, and Kangra. It has large, dark, dull crimson flowers. Its wood is very similar to that of B. chelonoides, but of a redder hue, elastic, and long-grained, and is used for buggy shafts, plough yokes, etc. The bark is employed medicinally.—Roxb.; Vaigt; Gibson; Beddome.

Bignonia suberosa, R. Indiam cork tree.

Millingtonia hortensis, Linn. fl.

Neemi Chambeli, HIND. Aka Nin, ... HIND.

This is a very handsome tree, common in the gardens of S. India, in Tanjore, Madras, Sengaon, and between Ava and Taong Dong. In January the tree is covered with beautiful and fragrant pure white blossoms. It grows with great rapidity, sending out numerous suckers, from which it may be easily raised. It is a good avenue tree. The rough bark peels off in small pieces about once a year, and is deeply cracked and spongy, like an inferior sort of cork. The wood is hard, close-grained, and of a pale yellow colour, not easily worked, flexible, but not fibrous.

A cubic foot unseasoned weighs 50 to 52 lbs., and 42 lbs. when seasoned, and its specific gravity is 672. It is well adapted for furniture and ornamental work.—Roxb.; Riddell; Beddome; Cliqthen.

Bignonia undulata, Roxb.

Tecoma undulata, G. Don.

Bomla Reora, ... HIND. Khaw, ... SIND. Rakt Reora, ... MAH.

A tree with drooping branches like the weeping willow, leaves covered with micaceous scales; flowers in lateral racemes, very large, orange-coloured, and scentless. It is found in the N. parts of Baglan and in Kandesh; is more common in Sind, in some of the valleys of the Gabar hills, and at Shah Bihali; it occurs in Gujarat, is very common in Marwar and other parts of Rajpore; and in the month of March, when covered with its blossoms, it is splendid. The wood is fine-grained and valuable, having a scent like the walnut leaf. It is reckoned very strong and durable, but from its size is applicable only to small purposes.—Dr. Roxb., Irvine, Gibson.

Bignonia xyloarpa, Roxb.

Tecoma xyloarpa, G. Don.

Ghau seng, ... CAN. Vadenkurni maram, TAM. Khurseng, ... MAH.

This large tree grows in all the Madras forests. It is easily distinguished by its peculiar rough pods, two feet or more in length. The wood is never large, is of a brownish yellow colour; very hard, and good if ripe; rather close-grained; takes a good polish, and is used in turnery and in cabinet-making. It also affords an oil, obtained by a simple process of reverse distillation, and said to be of great efficacy in cutaneous affections.—Dr. Roxb., Wight, M'Clelland, Hooker, Mason, Stewart, Cloy, Riddell, Gibson; Capt's. Beddome, Macdonald.

BIGOTI. GUJ. In Barooch, village lands, undivided.

BIH, HIND. Seeds of Cydonia vulgaris; quince seed, from Bibi, the quince. There is a 'tural' or bitter, and 'shirin' or sweet, quince; also a sweetmeat made with quince seeds.

BIHISHTI, HIND., or Saka, ARAB., a water-carrier who conveys it in a skin over his back. The word seems to be derived from Bibisht, the paradise or heaven of the Mahomedans.

BIH RECHNI, HIND. Euphorbia dracunculoides.

BIHU, a somewhat sensual dance by the Mri girls. It resembles the Naga movement. Once a year, the unmarried people in the village live together in a large building, and at the close the couples who suit each other pair off and marry.

BIHULL, the inner bark of Grewia oppositifolia, employed in the Himalaya for making ropes. BID, also Binn, HIND. Seed, any seed, hence Bijwark, seed-corn. Bij hand is the Sida cordifolia and Rumex acutus; Kamul bii, Nymphaeas a/b; Sukka-ki-bii, Cannabis sivata; BiJ-ga, Loicera quinquelandiculens. Bij-ga, a weed.

BIJA GANITA and the Lilawate are the best Hindu books on algebra and arithmetic, by Bhaskara Acharya.
BIJAI. HIND. A bull liberate by the Hindus as part of a religious ceremonial. See Brikhotasr.

BIJALa, surnamed Silpargi, king of Kalyan in the early part of the 11th century. He was a Jaina, and was assassinated by three of the Vri Saiva sect, at the instigation of his minister Basava.

BIJAPUR, formerly the capital of the Adal Shahi dynasty, which ruled there from A.D. 1501 to A.D. 1660. Yusuf Khan, a son of Murad II. of Anatolia, was purchased, in 1499, at Ahmadabad, for the Bijapur Body Guard. But in 1501 he assumed independence, under the title of Adal Shah. The territories over which this dynasty ruled varied considerably in extent, as the Nizam Shahi of Ahmadnagar, the Bohmni kings of Beder, the Maharrattas, and Dehi family pressed on them. The successive sovereigns were—

Yusuf Khan, styled Yusuf Adal Shah, A.D. 1501
Ismail Adal Shah I., 1502-1527
Mallo Adal Shah I., 1527-1534
Ibrahim Adal Shah I., 1534-1557
Ali Adal Shah I., 1557-1579
Ibrahim Adal Shah II. (in his reign Chand Sultan was regent.), 1579-1626
Muhammad Adal Shah, 1626-1660
Ali Adal Shah II., 1660-1672
Sikandar Adal Shah,

The tombs of this family at Gogi and Bijapur are domes on basement. Bijapur was taken by Aurangzeb A.D. 1686, and is now in ruins, only occupied by 12,938 inhabitants. Its splendid mosques, mausoleums, and palaces, although falling into decay, are amongst the grandest architectural works in India. The more conspicuous structures are the tomb of Ibrahim, the Mehtar Mahal, the Jama Masjid, the tomb of Muhammad Adal Shah. A great brass gun is still on the ramparts of this city, said to have been cast on the 19th December 1585 at Ahmadnagar, by a European, whom tradition styles Russi Khan. It weighs 41 tons. Bijapur fell to Aurangzeb after a siege. Although they had an inner fort much stronger than the outer works, the garrison were so much in want of provisions, that they were compelled to surrender at the 15th October 1686. Shirzi Khan concluded the terms through Ghazi-ud-Din, to whom the emperor, agreeably to custom, when he received such proposals through any of his officers, was pleased to assign the nominal honour of the conquest. Bijapur thenceforth ceased to be a capital, and was soon after deserted. The ruins occupy a space of about thirty miles in circumference, and are exceedingly grand. The great Mahomedan historian Ferishta is supposed to have died here, during a pestilence that swept away a multitude of the people, but this is uncertain. A Buddhist or Jaina temple, under ground, the several beautiful mosques and mausoleums, and the huge gun on the ramparts, into which a full-grown man can creep, all merit attention. —B. N. ’N. Raj.

BIJAR. Harra. Stiff clay soil, lying low, chiefly sown with rice only; occasionally with grain also. Bija Sal, also Bija Sar, HIND., Pterocarpus marsupium.

BIJARA SALA. SANSK. Marking nut.

BIJAYANAGAR, also written Vijayanagar, said to be properly Vidia-nagar, or the town of learning, was founded, according to one account, by two fugitives from Telingana; according to Prinsen, in 1338, by Bilal Deo of Karnata, who resisted Mahomed Toghalak, and founded Vijayanagar. In 1347, Krishna Rai ruled there; in 1425, Deva Rai; in 1478, Siva Rai. The sovereigns claimed to be of the Yadu race. Towards the 16th century it was the capital of a great Hindu power, which ruled over the Hindu chiefs to the south and south-east of the territories of the Adal Shahi, Nizam Shahi, and Kutub Shahi, kings of their Dekhan; and what is now called the Ceded Districts of British India formed the chief part of their dominion. Their capital was successively at Bijanagar on the Tumbdra, at Pennamonda, and Chandrajrig. The rajas long maintained their place among the powers of the Dekhan, but in A.D. 1565 four Mahomedan rulers formed a league against Ram Raj, and a great battle took place (A.D. 26th January 1565, A.H. 20 Jamad us Sani 972) near Talli-cotta, on the Kista, at which the venerable raja, then 70 years of age, was taken prisoner, and put to death in cold blood. His army numbered 70,000 horse, 90,000 foot, 2000 elephants, and 1000 heavy cannon. Writing towards the middle of the 19th century, Elphinston says his head was kept till lately at Bijapur as a trophy. This battle destroyed the supremacy of Vijayanagar, but added little to the territories of the victors, their mutual jealousies preventing them extending their frontiers, and the country fell into the hands of petty chiefs or insurgent officers of the old government, since known to the British as zamindars or poligars. The brother of the raja removed his residence further east, and finally settled at Chandrajrig, 70 miles N.W. of Madras, at which place his descendant first granted a settlement to the English in A.D. 1640. The ruins of Bijanagar are now known as those of Humpi, and those at Chandrajrig are extensive and remarkable. —Elphinston, p. 416.

BIJION. BHM. In Ahmednagar, a timber used for house posts, rafters. It is a heavy, compact, grey, close-grained wood. —Captain Dance.

BIJNOUR or Bijnour, a town which gives its name to a district in the N.W. Provinces of India. The town is in lat. 29° 22' 36" N., and long. 78° 10' 32" E., with a population of 12,865 souls. The district has an area of 1902 square miles, and a population of 737,153 souls. Of these, 243,455 were Mahomedans.

BIJOLI. The rao of Bijoli is one of the sixteen superior nobles of the rana of Mewar's court. He is a Pramara of the ancient stock of Dhar. There is an ancient inscription at Bijoli. See Lat.

BIJUCO, a fibre exhibited from Manila in the Exhibition of 1851. Its source was not known.

BIJUK. BENG. Citrus medica, citron.

BIKANIR. long. 73° 22' E., lat. 27° 56' N., is the chief town of a sovereignty, chiefly in the great Indian desert, which has an area of 17,676 square miles. The population was estimated by Lordelo in the begining of the 19th century at about 339,000, and the revenue at about six lakhs of rupees. In 1874, Major Powell estimated the population at 800,000. The ruling family are of the Rajbari tribe of Rajputs, who have held sway there since 1439. Bikanir maintains a force of 2100 cavalry, and about 1000 infantry and 50 guns. Bikanir was originally inhabited by various small tribes of Jats and others, the squatters among whom led to the conquest of the country in 1458 by Bika Singh, a son of raja Jodh Singh of Jodhpur. After consolidating his power, he conquered Bagore from the Bhatee of Jeyswinh, and founded the city
of Bikanir; he died in A.D. 1505. Rai Singh, the fourth in descent from Bika Singh, succeeded to power in 1573, and in his time the connection of Bikanir with the Dehli emperors began. Rai Singh became a leader of horse in Akbar's service, and received a grant of 52 parganas, including Hansi and Hisar. The earliest treaty with the British Government was in 1801. Sirdar Singh succeeded to power in 1852. He did good service during the mutinies, both by sheltering European fugitives, and by co-operating against the rebels in the districts of Hansi and Hisar. He received a salute of 17 guns and the right of adoption. The Oswal and the Mahesi Rajputs form the chief part of the population; the Sewak are ser- vants of the temples. On the side of the tank where the dead are burned are the cenotaphs of twelve chiefs. The wells at the city are 300 feet deep. The territory was once populous and wealthy; but the plundering Beedawat bands, with the Sahrai, the Khasa, and Rajur robbers in the more western desert, so destroyed the kingdom, that while formerly there were 2700 towns and villages in Colonel Tod's time, not one-half of these remained. Three-fourths of the population are the aboriginal Jit, the rest are their conquerors. —the descendants of Bika, including Sazare (Saraswati) Brahmins, Charsans, Bards, and a few of the servile classes. A list is given of 37 fiefs, the chieftains, retainers of Bikanir, holding 43,572 foot and 5402 horse. —Tod's Rajasthan, I. p. 240, ii. p. 98; Princep's Antiquities, p. 259; Atcheson's Treatises, iv. p. 147; Elphinston's Caudul, p. 10.

BIKAS. HIND. A grass of N. India, growing in low ground, with stem and leaves larger than the Dub grass.

BIKH, Bikhma, Bikya, Bish, Visha, Visha, and Ati visha, HIND., are names of a powerful vegetable poison. Dr. Wallich refers the plant to the Aconitum ferox; it seems, however, to be the root of several aconites, for Dr. Hooker, in one part of his journal, mentions that he met with A. palma- tum, which yields one of the celebrated Bzik poisons. All the Sikkim kinds are called gning by the Lepcha and Bhota, who do not distinguish them. The A. napellus, says, is abundant in the north-west Himalaya, and is perhaps as virulent a Bzik as any species. At another place he mentions that magnificent genus grows in the Lachogon valley, also Sencsce, Corydalis, and the Aconitum luridum, a new species, whose root is said to be as virulent as A. ferox and A. napellus. The result, however, of Drs. Thomson and Hooker's examination of the Himalayan aconites (of which there are seven species), is that the one generally known as A. ferox, and which supplies a great deal of the celebrated poison, is the common A. napellus of Europe. Bikhamaura is also a name for A. ferox.—Wall.; Hooker's Jour. i. p. 168, and ii. p. 108; Engl. Cyc. p. 455. See Aconitum.

BIKK. Tel. Gardenia latifolia.

BIKRAMPUR, an ancient town in the Dacca district of Bengal, equal to Nadya as a seat of learning; for several hundred years, from the time of Vikramaditya until taken near by the Maho- medans, it was a seat of government under the Hindu rulers of Bengal. There is a mound near; and near the site of the palace is a deep excavation called Agnikunda, in which it is said the last native prince with all his family burned themselves on the approach of the Mahomedans.—Imp. Gaz.

BIKJAN and Bhungaria are branches of the Gaur taga.

BILLA, a Negro race occupying the southern part of the Malay Peninsula, along with the Sinang, in the provinces of Quelah, Perak, Pahang, and Trangani.

BILADURI, or Al Biladuri, author of the books Tatab ul Baladin, or the Conquest of Sind, Syria, Mesopotamia, Egypt, Persia, Spain; and the Kitab-ul-Baldan, a cosmographic work. His name was Ahmad bin Yahya bin Jahir, surmised also Abu Jafar and Abu Hassan. He lived at Bagulad, and died A.D. 892-3, A.H. 279. He was called Biladuri, from being addicted to the use of an intoxicating electuary made with the Malacc bean of the Anacardium occidentale.

BILLA KAND. HIND. Pueraria tuberosa.

BILLASPUR of the Central Provinces forms the northern section of that tract of country which is usually known as the Chhattisgarh plateau. It is situated between lat. 21° 45' and 23° 10' N., and long. 81° 30' and 81° 15' E. It was long held by the Hai-hya Bansi Rajput, but was overrun by the Maharrtas early in the eighteenth century. The district contained a population of 715,998 in 1872, amongst whom the chief divisions are:

Chamar, 164,383 Other Hindus, 133,833.
Panks, 72,972 Mahomedans, 9,641.
Ahir or Raut, 66,574 PRIOR RACES, 173,194.
Kurmi, 39,849 Kauwar, 30,306.
Mal, 27,125 Dhuama, 2,514.
Brahman, 17,167 Binjwar, 7,009.
Bairagi, 11,062 Dhanwar, 3,988.
Rajput, 10,762 Other non-Hindus, 9,338.

BILLATEE or Bilati. BENG. An alteration of the Persian word Bahayat, meaning foreign, exotic.

Bilati Ananas, Fournerry cantaIa.

Arun, Spondias dulcis.

Aloo, potato, Solanum tuberosum.

Amlee, Garciinia pictoria.

Pita-silli, common parsley.

Bagoon, tomato or love-apple.

Mehndee, myrite, Myrtus communis.

BILLAURY. HIND. Polygornum bistorta.

BILBA, a nomade tribe in Labijan in Persian Azarbijan, who roam about the frontiers of Persia and Turkey. They are the most predatory, turbulent, and treacherous of all the border tribes of Kurdistan, and have been ruthlessly hunted down by other tribes. They number about 5000 families, in three divisions,—Piran, Mengur, and Marnish.

BILDI. HIND. Pharbitis nil.

BILIGHI RANGAN, a range of hills in the east of the Yeladur Jaghir in Mysore. The only inhabitants are the wild Soligar.

BILIMBI. MALAY. Averrhoa bilimbi, and A. carambola.

BILIN. HIND. Feronia elephantum.

BILITHSI. HIND. Ribes nubicola, R. glaci- als, and R. glossularia; currant and gooseberry.

BILLA GANNERU. Tel. Vinea rosea.

BILLA ILEI. CAN. Gerbillus Indicus.

BILLAIN-LENA. HIND. A depractory custom in India amongst Mahomedan women. A woman
sweps her open hands along the outline of the body of another person from the head downwards, then presses the backs of her fingers against her own temples. The ceremony is intended to represent that the performer takes on herself all the evils that may befall the other.

BILLA JUVVI, Erra Juvvi, and Nandircka. Tel. Ficus nitida, Thoub. Dr. Wight considers this to be the same as F. Benjamina, L.

BILLAPA. Tel. Trichostylis globulousa. Nees.

BILLA SOORGUM, a town in the Ceded Districts of India, where there are caves containing osseous breccia and deposits, described by Liotet. Newbold.

BILLAWAR. CAN. A wood of Mysore. It has great toughness or elasticity, makes handsome furniture resembling walnut, and is much used for the framework of carriages, for feloes and spokes of wheels.

BILLAWAR, a race in Canara engaged in collecting palm toddy.

BILLICUL, a small natural lake near Segoor on the Neelghiries, 5700 feet above the sea.

BILLI. LOTAN. SANS. Valeria speciosa, also a species of Melissa or Biophetta ruderalis. The words mean cat-rolling, from the circumstance that cats roll amongst these plants.

BILLU KARRA, also Billuuda chettu. Tel. Satin wood, Chloroxylon Swietenia, D.C. Karrar in Telugu means wood, Chettu, a tree.

BILL-LUTA. BEN. Pogostemon pleuranthoides. Bil-nalita, Corchorus fasciculatus.

BILODAR or Bidojoa. HIND. Falcóneria insignis.

BILT-PAT. BEN. Lochnichia corchorifolia.

BIL-RAI. BEN. Simpsia patens.

BILU, Burmese Buddhist myths, the equivalents of the Hindu Raksha. They are generally, however, described as engaged in some humorous mischief.—Yule’s Embassy, p. 27.

BILL. MAHE. Waste land, or uncultivated land, viz. the Gaotian or village site; Gaorm, free grazing ground; Turmndu, the cattle standing-place; Hulabum, grass land.

BILLA, SANS. Eagle marmole. It is sacred to Mahadeva; he alone wears a chaplet of its flowers, and they are not offered in sacrifice to any other deity. If a pious swain, Hindu should see any of its flowers fallen on the ground, he would remove them reverently to a temple.

BILLVA-TITHA. CAN. Feronia elephantum.

BIMA, one of three races speaking distinct languages current in the island of Sumulawa. Their alphabet, once distinct, has been displaced by that of the Celebes. See India.

BIMAK KABULL. HIND. Myrsine Africana.

BIMB or Vimba. SANS. Bryonia grandidis.

BIMB of Abyssinia. Bruce thought that this might be the insect which is alluded to in Scripture as the plague of flies. See Tsal-tsai; Tse-Tse.

BIMBA, a race who occupy the rugged mountains of, and along with, the Kukha. They were under Sirkh rule, but are at present Mahomedans.

BIMBASARA, king of Magadha, B.C. 578, reigned 52 years. He was first of the house of Bhattaya, and was murdered by his successor,—this dynasty, from B.C. 578 to B.C. 447, in succession being paricides. See Bhattaya; Vindusara.

BIMLIPATAM, a seaport town, in long. 83°

29'E., and lat. 17°38' N. It has an open roadstead with a small river. It is 15 miles N. of Vizagapatam, on the eastern side of the Peninsula of India. The Dutch had a factory there, which was plundered by the Mahattivas in 1754.

BIMRA of Chenah, Vivex negundo.

BIN. BURM. A tree; Cannabis sativa.

BINA or Vira. HIND. A lyre; also Andropogon muricatrum. In Bengal, Aviceania tomentosa; in Borneo, Antiaris toxicaria.

BINAWLA. Seed of the cotton plant. Bindaar, HIND., cotton-gatherer.

BINWARIA. HIND. A plant of N. India, given as fodder to horned cattle.

BIN BHANTA, SANS. Solanum melongena.

BIN-BHINSA. HIND. The jungle sheep or four-horned antelope, Tetracerus quadricornis.

BINDA. Tel. Abelmoschus esculentus.

BINDA, Chasing or Chain, fisheremen, boatmen, and general labourers.

BINDAHARA, at a native Maloy court, the treasurer.

BINDAK, also Findak. HIND. Corylus avellana, hazel.

BINDAL. HIND. Monomorica esculenta.

BINDI MATHU, a great temple at Benares, described by Tavernier 1680, but destroyed by the emperor Aurangzeb. It was in the form of a St. Andrew’s cross.

BINDIYACHAL hills, in Bundelkhand, commencing near Sonndah, long. 26° 14’ E., lat. 78°50’ N.; proceeds S.W. to Narwar, 25° 39’ 37° 52’; S.E. to 24° 12; N.E. to Ajeghar, 24° 53’, 80° 20’, and Kullinagar in the same vicinity; and E. to Bargarh, 25° 10’, 81° 36’. None are more than 2000 feet; the average between the Tura and Kuttra passes, about 520 feet. The Tons falls over the brow by a cascade of 200 feet; Bilohi, 398 feet, and Bonti, 400 feet.

BINDLIGAR. HIND. Maker of tinsel ornaments.

BINDRABAN or Vrindawana, signifying a grove of Tulai trees, is a holy Hindu town situated on the right bank of the river Jumna. The circumstance which imparts most to its sacred character, is its having been the site of the early revels of Krishna, the Apollo of the Hindus, Muttra having been his birthplace. Many a Hindu Anacreon courts the muses with lays dedicated to this youth, prominent in Hindu mythology, and minstrels and maidens join in soft strains to his praise. Bindruban is now noted for the manufacture of pretty toys, made of a composition that may be mistaken for mineral. Indeed, the vendors pass them off as such, and, to enhance their value, declare that they are brought from Jeypore, where articles of this description, and marble toys especially, receive a fine finish. The Valabhabharya sect of the vaisnavha Hindu have many hundreds of their temples at Mathura and Bindruban. At Benares and Bindruban, the annual dances, constituting the Ras Yatra, in commemoration of Krishna and the sixteen Gopi, are performed with much display.—Tour of India by Frech, 214. See Ras Yatra; Radha Sampradaya.

BINDU, a perfect jogi, and teacher of yoga practices.

BINDUNI, a small tribe amongst the Bakhtiari, who are believed by the latter to be prior settlers.

BINDU-SAROVARA, a lake from which the
Ganges issues, also called Lake Mansaravara. It is fabled to be formed by drops of water falling from Mahadeva's hair.

BINFATTA, in Coorg, a race of Malabar who personate lions at festivals.

RINGHAR BII. Hind. Asphodelus fistulosus.

RINGU. Panj. Celcis Canceae.

BINJAL. Malay. Mangifera cassia, Jack.

BINJY DOAI, a tract of country in the N.E. frontier of India, towards Buntan, in long. 91° E. The language spoken thence to the Kuriapera Dar, in long. 92° E., is a dialect of the Buteali or Tibet. It is occupied by the Changio race, a word which means black. See Buntan.

BIN-JOGI, a pipe used by snake-charmers.

BINJWAR, a tribe who speak a dialect of Hindi, and generally observe Hindu customs, but the names of their forefathers appear to be their chief worship; they live in a very wild state, subsisting principally by hunting. The Byga of the Mundla district are nearly connected with them.—Dalton, Ethnol. 148.

BIN-KUK. Arab. Armeniaca vulgaris, Lam.

BINLANG is the name given by the Singhalese to a species of Ipecacuanha. There are two kinds, one called Elle Binnuge; the other, which is red, is called Rat Binnuge. The red is reported to be the better. Both are species of Periploca, both creep or twine round the bushes which grow on the sandy downs.—Thunberg's Trs. iv. p. 186.

BINN. Hind. Myrsina Africana.

BIN. Bint. A daughter, a girl. In Egypt, every woman expects to be addressed as 'O lady,' 'O female pilgrim,' 'O bride,' or 'Ya bint' (O daughter). In Arabia you may say, 'Ya mara' (O woman); but if you attempt it near the Nile, the answer of the offended one will be, 'May Allah cut out thy heart!' or, 'The woman, please Allah, in thine eye!' And if you want a violent quarrel, 'Ya aeguz!' (O old man), pronounced drawlingly,—'Ya ago-o-ooz,'—is sure to satisfy you. In India, 'Ho-ma' (O mother) is a usual and acceptable exclamation of a father, or the Ma-Saha or lady mother, are terms which the highest in the land would accept. On the plains of the Torrent, it was always customary, when speaking to a peasant girl, to call her 'Bella fe' (Beautiful woman), whilst the worst of insults was 'Vecchiarella.' So the Spanish calello, under the most trying circumstances, calls his mule 'Vieja, ravieja' (Old woman, very old woman).—Butt's Mecc. i. p. 121.

BINTANG, a wood of the Malay Peninsula, in great abundance around Singapore. It is used in ship-building, serving for planks, masts, spars, etc., and is exported in large quantities to the Mauritius, California, etc. For masts and yards, the wood preferred is the red Bintangor of Sumatra. It is a species of Uvaria or Calophyllum, which, in all the maritime ports of India, has obtained the name of poona or puhn, from the Malay word signifying tree in general; as puhn upas, the poison tree, puhn kayu, a timber tree, etc., the source of the commercial term for the poona or peon spars.—Ezk. of 1851.

BINTENNE, a town in Ceylon where hot springs occur. See Hot Springs.

BINTUUL, a river of Borneo, on the banks of which the Kyans dwell. See Kyans.

BINTUNGAN wood of Java is employed in the same manner as Wadang, but grows to a larger size; the colour of the wood and bark is red.

BINUA. The Jakun, Orang Bukit, Ilayet Utan, Sakai, Bintangor, or Orang, people of the country. Malaya term them Orang Utan, men of the forest; Orang Darat, wild men of the interior; and Orang-ulu, people of the upper part of the river, etc.—epithets which they consider offensive. The Binua people occupy the rivers Johore (the Lingiu and the Sayong), BintPontian, Batu, Pahator, Kio, Formosa (the Simbang, Kiri, Pan, and Simorang, with their numerous auxiliaries), and Indus, the whole race, by the watered by them, and by means of these rivers a constant communication is maintained between the families of the Binua on the two sides of the Peninsula. The boundary between Pahang and Johore intersects the country of the Binua, the whole of the Anak Indus, and the lower part of the Simorang being in Pahang, and all the other rivers, including the Made, on which they are found, appertaining to Johore. The authority of the Bindahara and the Tamunggong is little more than nominal. The Binua are divided into tribes, each under an elder, termed the Batin. The Jakun are extremely proud, and will not submit, for any length of time, to servile offices or to much control. The Binua or Sakai language of Perä appears to resemble, in its phonetic character, the rude dialects of the Burman group. This character is intermediate between that of the Simang on the one side, and that of the rumatam, Javan, and Bornean, on the other. The Johor Binua is more guttural, aspirate, and harsh, remarkably broad and slow.

In the Binua, the cheek-bones are broad in all directions, and prominent, giving to the face, below the base of the forehead, a marked lateral development beyond it, or to the forehead, an appearance of being compressed. The lower jaw is massive, spreads out and does not rise rapidly, thus producing an obtuse chin, and the anterior maxillary projection considerable.

The lofty Gunong Bernun, nearly 100 miles to the north of the Lumut group, with the mountains which adjoin it, may be considered the central highlands of many tribes. In the ravines and valleys of Gunong Bernun, two of the largest rivers of the Peninsula, the Pahang, and the Muar, with their numerous upper tributaries, have their source. The Simunjung, which unites with the Lingi, also rises there.

The upper part of these rivers, and many of their feeders, are occupied by five tribes, differing somewhat in civilisation and language. The Udaie (who appear to be the same people who are known to the Binua of Johore under the name of Orang Pago) are found on some of the tributaries of the Muar, as the Segamat, Pahang, and Kapit in the vicinity of Gunong Ledang. This tribe has less approximated to Malayian habits than the
BIOPHYTUM SENSITIVUM.  
BIRD FEATHERS.

others. The Jakun partially frequent the same territory, the lower part of Palungun, Gappam, etc., and extend northwards and north-westwards within the British boundaries.

Many of the Mintim around Gunong Bermen wear the bark of the tirap, the men using the chawat, and the women a piece of rude cloth, formed by simply beating the bark, which they wrap round their persons, and which, like the same plant of the Jhoro women, reaches only from the waist to the knees. The Udal women wear the chawat like the men. The Bermen tribes believe in Pirman as a being who made the world. He dwells above the sky. Each tree has a jin, and the Jin Bhumni haunts the rivers and mountains, causes sickness and death. There is no religious worship, but recourse is had in sickness to a Poyang, who combines the functions of priest, physician, and sorcerer. The Poyang and Pawang of the Bermen tribes, the Poyang of the Binua, the Bat, the Dyak, and Dato, and the Si Basso of the Bat, are all the shaman, priest, wazir, physician, in different shapes.—Journal Indian Archipelago, 1847; Newbold, British Settlements, ii. p. 392.

BIOPHYTUM SENSITIVUM. D. C. Syn. Oxalis sensitiva. A plant of the Moluccas and of both the Peninsulas of India.—Rosb. ; Voigt.

BIR or Vir, a man, the Latin vir. Birbani is the term amongst the Jet for a man's own wife; a femme couverte. Birbhum, said to mean the land of heroes.

BIR, a town on the left bank of the Euphrates, in the pashalik of Orfa, with 1700 houses. Caravans and travellers from Aleppo to Orfa, Darkorr, Baghdad, and Persia, cross the river here.

BIR or Ber. Arah. A cistern to hold rain-water. Jacob's well, Bir Yakub, or Bir-us-Samar-Rah, is 9 feet broad, and more than 70 feet deep. In 1855 it still had a stone over its mouth, as in John iv.

BIR, a village in the Kangra district of the Panjab, with valuable magnetic iron ore, from which iron is manufactured.

BIRA or Beri. 2. Hind. Small pieces of areca nut, spice, catechu, and sometimes a little quick-lime, rolled up in a leaf of the piper betel. It is used as a masticatory, an aromatic, astrigent, and alkaline condiment. It is presented to visitors on their leaving.—W.

BIRA. M. Elaeocarpus Roxburghii, W. and A. BIRA. HIND. Ziya-phus nummularia.

BIRA KAYA. TEI. Luffa feotida, IV.

BIRAMANDI. HIND. Micronchonchus divaricata.

BIRBA. HIND. Terminalia bellerrica.

BIRBAL. Raja Birbal, a general of the emperor Akbar, who placed confidence in him. He failed in an expedition against the Yuzzafan Afghan, and was killed in the destruction of the army in January 1586. His companionable qualities endeared him to the emperor, but he was a man of solid merit, and of very lively conversation, and many of his witty sayings are still current in India. A small but richly-ornamented house is pointed out to have been the residence of Birbal in Futtelpur Sierai.—Tv. Hind. ii. p. 9; Elphinstone, p. 455.

BIRBAT. SANSK. Coral.

BIRBAT. SANSK. Areca nut, with spices.

BIRBHAN, the founder of the Sadh or Sadhu, a Hindu unitarian sect, who are chiefly in the upper part of the doab from Farrukhabad to beyond Dehli. In 1868 there were 9923 in Oudh. According to Mr. Trant, the sect originated about A.D. 1658, with a person named Birbhan, an inhabitant of Brijhasir, near Narmal, in the province of Dehli. He is said to have been taught by Udaya Das, or Uda-Ka-Das (the servant of the one God), who was also known as the Malik-ka-Hukum, the commander of the Creator, meaning the personified word of God. Birbhan has also been said to be a disciple of Jogia.

The essence of the Sadh doctrines is embodied in the Adi-Upani-sad, a tract with twelve commandments,—(1) to acknowledge one God; (2) to be modest and humble; (3) not to lie; (4) nor malign; (5) nor steal; (6) nor kill; (7) nor beg; (8) nor covet; (9) to avoid narcotics; (10) be monogamic; (11) wear white clothes; and (12) make no marks on their bodies. Their doctrines are evidently derived from the unitarianism of Kabir, Nanak, and similar writers, with a slight graft from the principles of the Hebrew code. They have no temples. Birbhan preached a really pure and excellent ethical code, making truth, temperance, and mercy the cardinal virtues, but retaining many of the doctrines of Hinduism, such as that of Muki, which is the tenet concerning the ultimate object of all devotion to be liberation from life on earth.—H. Wilson, p. 353; Oudh Centenary, p. 455.

BIRBHUM, a district in the Bengal Presidency, between lat. 23° 33' and 24° 9' N., and long. 87° 71' and 88° 4' 15" E., with an area of 1344 square miles, and in 1872 a population of 696,915. Its name is said to mean the land of heroes, but the Santal Parganas are on the north, and in their tongue Vir means jungle. The aboriginal races, Bagdi, Chamar, Muchi, Dom, Bauri, number 197,423. Its former chief town is Nagar or Rajnagar, now in decay. Near Deoghar or Bijnath is a small town in the zillah of Birbhum, famous for its temples, visited every year by thousands of pilgrims from the North-West Provinces of India. It is situated in the great table-land which extends from near Bardwan to Dunwa Ghat in Behar. Granite, syenite, and gneiss, traversed by greenstone veins, are the prevailing rocks; copper, lead, and iron ores. The vein of copper at the surface runs east and west; is partly in the form of green carbonates. Veins of lead ore, in the state of galena or sulphuret, traverse the principal vein at right angles. The nearest coal is forty miles off.

BIRCH TREE. Betula, sp. Tag-pa, . . . . Bhot. Jhurija, . . GR., SANSK. Birch trees are found in the N.W. Himalaya, and in Japan. The birch, tagpa, of the Chenab river is usually a crooked and stunted tree, but sometimes exceeds one foot in diameter. The annual bridges over the mountain torrents are made of birch twigs. The thin white bark of the Betula bhojputra occurs in sheets or pieces, which can be peeled off. It is used to make umbrellas, and for writing on in lieu of paper. A species of Birch from China, the Hwa-muh (bark, Hwa-muh-pi), is used in the saddler, shoemaker, cutler, and candle-maker's trades. See Betula.

BIRD CHERRY. Cerasus, species.

BIRD-EYE PEPPER. Capsicum baccatum.

BIRD FEATHERS, from the cranes and king-
fishers, form a considerable article of trade in South-ern Asia. The feathers of a large grey kingfisher are exported from Malaya to Singapore, to be used by the Malays, Javanese, and Chinese. They sell at 200 per cent. profit.

BIRD FISH, Hemiramphus argentuces.

BIRD ISLAND, called by the Malays Pulo Manok, lies midway between Ceram and the Ser-watty group, in the Eastern Archipelago. It is a high solitary mountain with a truncated cone, inhabited by myriads of birds, and natives resort to the island to collect the eggs. Sulphur also occurs on the island.—Horsburgh. See Kelling.

BIRD, JAMES, of the Bombay Medical Service, in which he rose to be a Member of the Medical Board. He wrote an Analysis of the Murat-i-Ahmad, a history of Gujerat, in Lond. As. Trans. 1853, i. p. 117; Biographical Sketch of Capt. M'Murdo, ibid. 123; Memoir on the Country from Poona to Kitoor, ibid. ii. p. 65; Account of the Rined City of Bilijapur, Bom. As. Trans. i. p. 367; Translation of Cufic Inscriptions from Southern Arabia, ibid. 239; Translation of Inscriptions at Burra and Bajah, ibid. 458; Introductory Notice to the History of Sind, ibid. 462; Biographical Notice of Arabic and Persian Library at Cutch Bhoj, ibid. 470; On Bactrian, Hindu, and Roman Coins in the Bombay Collection, ibid. 293; Account of Temple of Sonnath, from the Persian, ibid. ii. p. 13; On the Christian Faith in Arabia, and Hindyantic Inscriptions from Aden and Saba, ibid. 30; Hindi Gold Coins, and Zodiac Coins of Jahangir, ibid. 55; On the Ethiopic Family of Languages in Eastern Africa, ibid. 294; Memoir of General Kennedy, ibid. 417; Historical Geography of Hindustan, and on the Origin of the Social State among the Hindus, Bl. As. Trans. 1840, ix. p. 818; Account of the City of Balkh and its Neighbourhood, extracted from Persian Authorities, Bom. Geo. Trans. ii. p. 60; Illustrations of the Arab and Persian Geographers, or the Geography of the Middle Ages, ibid. 58; Historical Researches on the Origin and Principles of the Buddha and Jain Religions, with Accounts of the Caves of Western India, Bombay 1847, folio.—Dr. Brist's Catalogue.

BIRD-LIME.

Kilut; gasap, MALAY, Pissini, TAM. Pits-chi-Kiel, TEL.

The substances known in Europe under this name are the viscid juices of several trees. One is prepared in Europe from the middle bark of the holly, by boiling it seven or eight hours in water, then laid in heaps on the moist ground to ferment, with stones over it, to press it down till it passes into a mucilaginous state, then pounded, washed and kneaded till free from extraneous matter, and kept for four days in pots to ferment and purify itself, when it is fit for use. In Southern India it is obtained from the Palay, the Isonanda acuminata. The best is prepared from the outer covering of the fruit and tender twigs and bark of the jack tree, but several of the Aracapulc yield it.

—Rhode; Tom.

BIRD NESTS.

Abahil-ka-ghos-ha, BURM. Jala, CHIN. Bajah. HIND. Nibidi-Tunclino, IND. Susah, JAV. Sarang-buring, MAL. Nidos de la China, SP.

The edible birds' nests of Southern and Eastern Asia are perhaps obtained from more than one species of swallow, but one of them seems to be the Collocalia nigida, C. rievisirostris, M'Clendon, of Java, and other islands of the Eastern Archipelago, the Assam hills, the Sikkim Himalaya, Neighberries, Melilla, Ceylon, the Western coast of India, at Pigeon Island S. of Honore, the Vin-goria rocks, and at Sacrifice Rock, 20 miles S. of Tellicherry. Dr. Jordan says that the best nests are from the Collocalia lioch (C. rievisirostris), which builds in the Nicobar Islands, and along the east coast of the Bay of Bengal from Arakan southwards to Java; but several other species of Collocalia occur in the islands of the Eastern Archipelago, as far as New Guinea, one in the Mauritius, and one in the islands of the Pacific. The nests are collected all over the Malay and Philippine Archipelagos, on the Malabar coast and the Tenasserim provinces, wherever there are caves to afford the birds shelter and protection. The caves are most frequent in the limestone formation, but Java and Borneo seem to be the birds' chief resort. The celebrated caves of Karang-bolong (hollow-rocks) are situated in the province of Bagien in Java, and on the south of the southern end at the sea level, and at the foot of limestone rocks several hundred feet in height. One place has 200 feet of perpendicular descent before coming to the first ledge. The mouths of the caves are about 18 feet broad and 30 high, while, within, they expand to breadth of from 60 to 114 feet, and to heights of from 420 to 480, the sea penetrating them to the extent of one-fourth of their length, and in rough weather rendering them inaccessible. The descent of the collectors to the caves is effected by narrow ratten ladders, usually about 74 feet in length, attached at top to a stout tree. Within the caves are bamboo scaffoldings erected in order to reach the nests, which are detached from the sides by the hand, and from the roof by hooks attached to long poles. There are three periods for making the collection, April, August, and December. The nest-gatherers are bred to their dangerous calling, and before the commencement of the first gathering, plants are set up in neat nests, and there is feasting on the flesh of buffaloes and goats, to invoke the aid of the 'lady queen of the south' (Nai ratu kidul), an imaginary being, without whose tutelary aid the work of robbing the nests would not, as they think, prosper. After the crop has been taken, the caves are closed against human ingress. The whole annual gathering, which is effected at little cost, amounts to from 50 to 60 pikuls yearly, or, on an average, to 7370 lbs., worth at Batavia about £18,000. On the N.W. side of Borneo, and not far from the banks of the river Barun, birds' nests caves are found 140 miles from the sea, by the course of the river. They consist of three chambers, one of which is reckoned to be no less than 200 fathoms in length. These are the property of the powerful Kayan tribe, and, like those of Karang-bolong, are carefully guarded.

The nests used by the Chinese are brought principally from Java and Sumatra. Nests are composed of a mucilaginous substance, and it has been supposed by some that the Gelandium corneum enters into their composition, but it is more probable that they are formed by mucus.
eliminated from the stomach of the swallow. Externally they resemble ill-concocted fibrous isinglass, and are of a white colour, inclining to red; their thickness is little more than that of a silver spoon, and their weight from a quarter to half an ounce. When dry, they are brittle and wrinkled, little larger than a goose egg. Those that are dry, white and clean, are the most valuable. They are packed in bundles, with split rattans run through them to preserve their shape. If procured before the eggs are laid, the nests are of the best kind; if they contain eggs only, they are still valuable; but if the young are in the nests or have left them, they are nearly worthless, being dark-coloured, streaked with blood, and intermixed with feathers and quills. The best are found in deep, damp caves, which, if not injured, will continue to produce indefinitely. Some of the most profitable caves are 50 miles in the interior. Everywhere the method of procuring these nests somewhat resembles that of catching birds in the Orkney Isles. After they are obtained, they are separated from feathers and dirt, are carefully dried and packed, and are then ready for the consumer. The Chinese are the only purchasers, and carry them in junk to the Chinese market, where they command extravagant prices; the best, or white kind, often being worth 1800 dols. per pikul of 133½ lbs. avoird., which is nearly twice their weight in silver. The middling kind is worth from 1200 to 1800 dollars, and the worst, or those procured after fledging, 150 or 200 dollars per pikul; according to these three qualities, the duty is levied. 84 millions of nests are annually imported into Canton. Latterly nests of first quality fetched £3 to £4 the pound; those of the second quality, 9s. 4d.; and the third sort, only 3s. 1d. The most part of the best kind is sent to Pekin for the use of the court. The Japanese do not use them. The Chinese consider the birds' nests as a great stimulant and tonic, but other geltinous food would be equally serviceable. To render it fit for the table, every feather, stick, or impurity of any kind is carefully removed; and then, after undergoing many washings and preparations, it is stewed into a soft, mucilaginous jelly. The sale of birds' nests is a monopoly with all the governments in whose dominions they are found. Crawfurd estimated that about 243,000 pounds, at value of 1,263,570 dols. are annually sent away from the Archipelago, mostly to China. Java alone sent about 27,000 pounds, mostly of the first quality, estimated at 60,000 dollars.

New birds' nests of the esculent swallow are to be got from a rocky island about 20 miles south of Tellicherry, named Sacrifice Rock. The only preparation the birds' nests undergo is that of simple drying, without direct exposure to the sun, after which they are packed in small boxes. The edible-nest swallows are numerous in the limestone caves on the inlets and islands on the Tavoy coast; and the government revenue from the bird nest farm in 1847 was nearly Rs. 11,000; but in 1849 it fell to less than Rs. 700. At Mergui they are not so numerous. The Japanese powder the agar-agar seaweed, boil it to a jelly, and make artificial nests, called Dschin-schan, which they export to China.—Crawfurd's Dis. pp. 54, 55; Morrison; Jordon.

Birds of PARADISE. Ceratopis parvula, the Lesser Paradise Bird, in New Guinea, Mysool, and Jobs. P. rubra, the Red Paradise Bird, in Waigiu. Cinnamonus regius, the King Paradise Bird, in New Guinea, Aru Islands, Mysool, Salwatti.
Diphyllodes speciosus, the Magnificent, in New Guinea,  
Myol, and Salwatti.

Serious aureus, the Paradise Oriole, in New Guinea  
and Salwatti.

Epimachus magnus (Uppa magna, Cin., U. superba, Lab.). Body generally black or brownish-black; tail graduated, three as long as the body (Lesson says three feet in length, French); feathers of the sides elongated, raised, curled, glittering on their edges with steel-blue, azure, and emerald green, like precious stones; the head and the belly lustrous, also with steel-blue, etc. In truth, language fails to convey just any idea of the magnificence of the species. It inhabits the coasts of New Guinea.—Indian Field;  
J. Russel Wallace; Bikmore; J. I. Arch. iv. 182;  
Crawf; Forrest, Voyage, 142; Valentyn, Ind. Arch.  
iii. 366.

BIRD PEPPER. Capsicum frutescen.

BIRD, ROBERT MERTENS, a Bengal civil  
servant; during the years 1834—1844, along with  
others, he completed the rent settlement for twenty  
to thirty years of the lands of the N.W. Provinces  
of India. It comprehended a survey of 72,000  
square miles in extent, containing a population of  
25,000,000, and cost $500,000.

BIRDS, Aves.

The birds of Eastern and Southern Asia have  
been described by many naturalists. In 1831  
a catalogue of 156 species, collected by Major  
Franklin on the banks of the Ganges and the  
Vindhan range of mountains, was published in the  
Proceedings of the Zoological Society of  
London.

In 1832 a catalogue of 226 species, collected  
by Colonel Sykes in the Bombay Presidency, was  
also published in the Proceedings of that society.  
This was undoubtedly the most valuable enumera-  
tion of the birds of India published, and con-  
tained descriptions, with many highly interesting  
observations, on the habits, food, and structure  
of many of the species.

In 1859 Dr. Jerdon published a catalogue of  
390 birds of the Peninsula of India, with brief  
notes on their habits and geographical distribu-  
tion. Subsequent to this, he issued a series of  
supplements, followed by a paper from the pen of  
Lord Arthur Hay, Marquess of Tweeddale, who,  
till his death in 1878, continued to enrich the  
literature of this branch of science. In 1881, his  
nephew, Captain Ramsay, edited a complete  
reprint of all the Marquess of Tweeddale’s ornitho-  
logical works. Mr. B. Hodgson of Nepal  
furnished a large amount of valuable information  
on the ornithology of the Himalaya; General  
Hardwicke’s labours were of great value, his  
collection being described in 1852 by J. E. Gray.  
Captain Tickell, Bengal army, also contributed  
largely to the stock of knowledge regarding the  
ornithology of Central India; and the other  
names which may be added to this list of naturalists  
are Captain J. D. Herbert, who collected in  
the Himalaya; Dr. N. Wallich, who collected in  
Nepal; Dr. M'Clelland, who added birds from  
Assam and Burma; Dr. W. Griffith, whose  
collections of birds were made in Afghanistan; Dr.  
Hugh Falconer, in N. India; and Captain (now  
General) Richard Strachey, in Kamaon and  
Ladakh. Dr. Stoliczka collected in Tibet and the  
Himalayas at elevations from 2000 to 16,000 feet,  
and notices of the birds appeared in the Ibis,  
1866- 7-8. The birds of the Tenasserim Provinces  
have been largely described by the Rev. Dr.  
Mason, and those of Ceylon by Dr. E. Kelaart,  
Edgar L. Layard, and Captain Legge. These  
were accompanied by a continued series of valuable  
articles from Mr. E. Blyth, who was constant in  
his pursuit of science. Dr. Horsfield and Mr.  
Moore’s catalogue of birds in the India House  
Museum, appeared in 1856 and 1858; and Jer-  
non’s Birds of India, printed in 1862 and 1864,  
and the reprint of 1877, have done much to  
complete our knowledge of this class of the animal  
kingdom. The comprehensive work of Allan  
Hume, C.B. and Major C. H. T. Marshall, on  
148 of the Game Birds of India, and Allan Hume’s  
list of above a thousand of the birds of India,  
have added many forms to those which previous  
writers had described. Eastwards from the Malay  
Peninsula into the Eastern Archipelago, the  
labours of Dr. T. Horsfield in Sumatra, Sir T.  
Stamford Raffles in Java, Mr. G. Finlayson, Dr.  
Helfers, Dr. Theodore Cantor, Professor Bikmore,  
and Mr. Alfred Russel Wallace, have given to  
Europe a very full knowledge of the birds of that  
extensive region.

The birds of the East Indies are scarcely less  
beautiful than numerous. Perhaps the choicest  
of them are the Himalayan pheasants, distin-  
guished for their very graceful and rich plumage,  
and the beautiful paradise birds of the Eastern  
Archipelago. The Himalayan bustard is remark-  
able for its size and rich variegated colour. The  
cardinal of the Zion at their pairing season have saca-  
cali or dancing parties amongst the larger forest trees  
with immense heads, spreading branches, and large  
but scattered leaves, giving a clear space for the  
birds to play and exhibit their plumage. One of  
the birds is nearly as large as a crow, and is of rich  
coffee-brown colour. The head and neck is of  
a pure straw yellow above, and rich metallic green  
beneath; and long plumy tufts of golden orange  
feathers spring from the sides beneath each wing,  
and when the bird is in repose, are partly  
concealed by them. At the time of its excitement,  
however, the wings are bent over its back, the  
head is bent down and stretched out, and the  
long plumages are raised up and expanded till they  
form two magnificent gold fans, striped with deep  
red at the base. When seen in this attitude, it  
really deserves its name. A dozen or twenty  
full-plumaged male birds assemble together, raise  
up their wings in a vertical position, and elevate  
their exquisite plumes, keeping them in a con-  
tinual vibration. Between whiles they fly across  
from branch to branch in great excitement, so  
367
that the whole tree is filled with waving plumes in every variety of attitude and motion.

The colouring of birds is often initiative, in the tropics. Among forests which never lose their foliage, are groups whose chief colour is green, and the parrots are a most striking example. The stork-chats, the larks, the quails, the goat-suckers, and the grouse which abound in the North African and Asiatic deserts, are all tinted and mottled so as to resemble with wonderful accuracy the average colour and aspect of the soil in the district they inhabit. Birds of this family, during the breeding season, the Juvus Turnix have generally large and bright-coloured pugnacious females; and Jerdon, in his Birds of India, mentions the native report that during the breeding season the females desert their eggs and associate in flocks, while the males are employed in hatching the eggs.

Most birds moult or change their plumage once a year only, after the season of pairing or incubation; but certain families or tribes of birds have two molts, one of them immediately before pairing, and the plumage then becomes showy and gay, with tufts or plumes. Some birds in spring actually change their colour, or portions of their feathers are changed, as in the ear-tufts of the lesser florikin, the Sympocetes auritus. The male of birds is the more highly coloured, except in birds of prey, the painted snake (Klyynchea), and some species of Ortygis, the little b Zust drafts. A few of the gallinaceous birds are polygonal, and their males are very pugnacious. Nests greatly vary. Those of the weaver-bird, tailor-bird, honeysucker, and oriole are made with much art. The edible nest of the colosacia swallow is formed in caverns, of inspissated saliva; swallows, swifts, bee-eaters, and weaver-birds build in companies; certain ducks breed on cliffs or trees, and they must carry their young to the water, though this has not been observed. The Megapodiidae, gallinaceous birds (says Mr. Wallace, i. 156) found in Australia, its surrounding islands, and as far west as the Philippines and the N.W. of Borneo, have large feet and long curved claws, and most of them rake together rubbish, dead leaves, sticks, and stones, earth and rotten wood, until they form a mound often 6 feet high and 12 feet across, in the middle of which they bury their eggs, and leave them to be hatched by the sun or by fermentation. The eggs are as large as those of a swan, and of a bright red colour, and are considered a great delicacy. The natives are able to say whether eggs be in the mound, and they rob them eagerly. It is said that a number of these birds unite to make a mound and lay their eggs in it, and 40 or 50 eggs are found in one heap. The mounds are found in dense thickets. The species of the Megapodidae in Lombok is as large as a hen, and entirely of a dark hue, with brown tints. It eats fallen fruits, earth-worms, snails, and centipedes, but the flesh is white and well flavoured when properly cooked.

In Bengal, the newly-arrived European will particularly be struck with the number of birds of large size which he sees everywhere, even in the most densely-populated neighbourhoods: Flocks of vultures, huge adjutants in their season, swarms of kites in their season too, for they disappear during the rains, all three are seen soaring and circling high in air as commonly as at rest; Brahmany kites, various other birds of prey, among which four kinds of fishing eagle, including the British osprey, are not uncommon; waterfowl in profusion in all suitable localities; herons especially, of various kinds, very abundant; several sorts of kingfisher, mostly of bright hues; the common Indian roller, also a bird of great beauty, and the little bright green bee-eater (Merops viridis) conspicuous everywhere; the common crow of India, of unwonted familiarity, impudence, and matchless audacity; the different species, remarkable for their tameness; the drongo or king crow, a species of satyr-like birds, with their discordant chattering; two sorts of melodiously chirruping bulbuls; the bright yellow mango bird or black-headed oriole; the pretty pied dchyali, the only tolerably common sylvan songster worthy of notice; the brilliant, tiny honeysuckers, also with musical voices; the lively and loud golden-backed woodpecker, and two monotonously-toned species of barbet; the pleasingly-coloured rufous tree-magpie (Dendrocitta rufa); the noisy kool, remarkable for the dissimilarity of the sexes, and for parasitically laying in the nest of the crow; the crested cuckoo (Oxypholus) during the rainy season (parasitical upon the satbhl), with other eucine birds, especially the cocul or crow-phantom, another noisy and conspicuous bird wherever there is a little jungle; and last, but not least, characteristic in many regions, the harmonious cooing of several kinds of dove, soothing to the ear, pleasant to the eye; and the loud screaming of flocks of swift-flying green parrakeets, with sundry other types all strange to the new-comer; as the bright little jona, the tiny tailor-bird, and the baya or weaver-birds, with their curious penile nests, and the diminutive thick-billed munia. Of the swallows, occasionally and somewhat locally, a few of the Hirundo rustica may be seen, chiefly over water; and along the river banks the small Indian bank martin (H. Sinensis) will be seen abundantly. But the swallows are replaced by two non-migratory swifts, the common house swift (Cypelus aulnus) and the little palm swift (C. Batassiasis). The roller and the king crow habitually perch on the telegraph wire to watch for their insect prey, the former displaying his gaily-painted wings to advantage as he whisks and flutters about, regardless of the fiercest sun. The small white vulture, bird, Neophron percnopterus, the mahanah or Pharoh's chicken, is abundant, and a single pair has been known to stray to Britain. Of the smaller British land birds, the wryneck is not uncommon; and the European cuckoo will now and then turn up, more frequently in the barred plumage of immaturity; the hoopoe, too, is common, but rare. Among the hawks, the kestdel will occasionally be observed in extraordinary abundance; and harriers (Circus) are often seen beating over the open ground. But the small waders are particularly common in all suitable places, including most of those found in Britain in greater or less abundance; wonderful is the number of fishers, and vast indeed must be the consumption of their finny prey. Sundry fishing eagles, and a great bare-legged fishing owl, with various kingfishers in abundance, numerous kinds of heron in surprising numbers, pelicans, darters (plotos), pigmy cormorants, and grebes or dabchicks, besides gulls, terns.
and rarely skimmers (rynchophs), gulls, three species, the common British Xema ridibunda, and a nearly allied species, with the fine kroko-ceplalus lejthysaeus, are seen chiefly towards the mouths of the Gangetic rivers. Over the salt water lake near Calcutta has been seen the great white egret, so prized in Europe. The gull-billed tern is there one of the common birds; and the whiskered tern (Hydrochelidon Indica), and the peregrine falcon, may not infrequently be seen, well meriting the name of duck-hawk bestowed on it in North America; also great flocks of longshanks (Himantopus), wading and seeking their subsistence in the expanse of shallow water along the reed-fringed nullahs or watercourses; various rallids are swarming around.

In winter, many Indian birds assemble in large flocks. Amongst these are crows, starlings, finches, larks, parrots, a few thrushes, pigeons, rock pigeons, cranes, ducks, flamingoes, and pelicans.

The migratory birds of India are mostly residents of the colder northern countries; they come to India in September and October, and leave it again in March, April, and May. Among the grallatrices or waders, some cranes and storks, four-fifths of the ducks, and the great majority of the scolopacidae, breed in the north, and come to India in the cold season. The peregrine falcon, the true hobby, the kestrel, the British sparrow-hawk, all the Indian harriers, and the short-eared owl, are true migratory birds. Amongst the passerines, the wagtails, some of the pipits, and larks, stone-chats, several warblers and thrushes, buntings, and the shrike, hoopoe, and two starlings, are the chief groups amongst which migratory birds occur.

In Lower Bengal, kites quit Calcutta and neighbourhood during the rains, and return in the cold weather; it is supposed that they go to the north-east. The kestrel, baza, and Indian hobby are most frequent in Bengal during the rains; and in the rains the adjutant visits Calcutta, and leaves in the cold weather. The European quail is the only real migratory bird of the gallinacea; but some other quails, buntings, and rock partridges (Pteroclidiae), wander about to different localities; and the Syrphidae auritus. Buphos caronarius, some rails, terns, and gulls, also wander. These birds travel with wonderful instinct direct to their homes, returning year after year to the same spot, often to the same nest.

The great migration of birds to and from Southern India, Asia, says Mr. Hodgson, 'seems to take place across the mountains of Nepal. The wading and natatorial birds generally make a mere stage of the valley on their way to and from the vast plains of India and Tibet, the valley being too small, dry, open, and populous for their habits, especially that of the larger ones. Some, however, stay for a longer or shorter time in their vernal and autumnal migrations; and some, again, remain throughout that large portion of the year in which the climate is congenial to their habits. Of all of them, the seasons of arrival, both from the north and from the south, are marked with precision.

The grallatrices and natatorial birds begin to arrive in Nepal from the north towards the close of August, and continue arriving till the middle of September. The first to appear are the common snipe and jack snipe and rynchophs; next the scolopacidae waders (except the woodcock), next the great birds of the heron and stork and crane families, then the natatores, and lastly the woodcocks, which do not reach Nepal till November. The time of the reappearance of these birds from the south is the beginning of March, and they go on arriving till the middle of May. None of the natatores stay in Nepal beyond a week or two in autumn (when the rice fields tempt them), or beyond a few days in spring, except the teal, the widgeon, and the coot, which remain for the whole season upon some few tanks, whose sanctity precludes all molestation of them. There are cornmigrants throughout the season upon the larger rivers within the mountains, but none ever halt in the valley beyond a day or two; for so long, however, both they and pelicans may be seen occasionally on the banks just mentioned. The kars and sterna are birds which usually affect the high seas, but Mr. Hodgson had killed both the red-legged gull and a genuine pelagic tern in the valley of Nepal. But so had be fishing excursions in truth, he adds, who shall limit the wanderings of these small birds which in the ethereal expanse? Mr. Blyth tells us that many of the feathered inhabitants of the British Islands are found in Southern Asia. The community of species is most remarkable among the diurnal birds of prey, and, as might be expected, among the wading and swimming tribes. The pretty little water-wagtail, usually the first and most welcome harbinger of the coming cold weather, comes and remains whilst the cold season lasts. This bird, and the harsh chattering of a very common kind of shrike (Lanius cristatus) in Indian gardens, are the earliest intimations of the coming change of season. A snipe (Gallinago sterna), and the water-wagtail in their season, and the common sparrow at all seasons, are probably all that the European, versed in the study of ornithology, will be able to recall to mind as yielding associations of home, unless perchance he may also recollect the common kingfisher of India, which differs from the British bird only in its more diminutive size. In the sub-Himalayas, the forms of Europe and of W. and N. Asia prevail more and more towards the N.W.: Malayan forms eastward, and Chinese types, and particular sub-Himalayan genera and species, the range of which extends eastward to China. Again, on the highlands of the Peninsula of India, and still again in those of Ceylon, distinct species of the northern types occur, but no different genera. Thus the jungle-fowl of N. India is replaced by a different species (Gallus Sonneratii) in the Peninsula, and by a third (G. Stanleyi) in Ceylon, and not a few similar instances might be adduced. The grey wagtail of Britain (Calabates sulphurans) is identically the same in India and Java, and a specimen has been seen in a collection from Australia. This delicate little bird, so clean and bright in its appearance, is of very general diffusion over Southern Asia during the cold season, being indeed much commoner than in Britain. The most abundant lark on the plains of Upper India and table-land of the Peninsula is the charandol (Galerida cristata), which is also a European species, though of rare occurrence in Britain; and the song, also its mode of delivery of it in the air, are not very unlike that of the
sky-lark, although it does not soar to so lofty an altitude.

In Bombay, on the approach of the monsoon, nearly all the kites, hawks, vultures, and other carrion birds disappear from the sea-coast, while the crows begin to build their nests and hatch their young just at the season that seems most unsuitable for incubation, for the eggs are often shaken out, or the nests themselves are destroyed. The carnivorous birds, as the rains approach, withdraw themselves from a climate unsuitable to the habits of their young, betaking themselves to the comparatively dry air of the Dekhan, where they nestle and bring forth in comfort, and find food and shelter for their little ones.

In Bengal, the kites and Brahmany kite breed chiefly in January and February, and disappear during the rains. The adult adjutants make their appearance as soon as the rains set in, and, becoming in fine plumage towards the close of the rains, depart at that time to breed in the eastern portion of the Sunderbuns upon lofty trees, and along the eastern coast of the Bay of Bengal upon trees and rocks. Vultures are permanently resident; and the crows propagate chiefly in March and April, their nests being not infrequently destroyed by the fury of the nor'-westers.

Not a few migratory species are common to the polar circle and to Lower Bengal, and even further towards the equator, according to season: but the individual birds may not migrate so far north and south. The Gallope Kamschatkensis, a delicate little bird much like a nightingale, but with a brilliant ruby throat, which is to be seen in the vicinity of Calcutta during the cold season, returns early in April, with the snowfleck, in the lower Kolyma district, in northern Siberia, as we are told by Von Wrangel,—that is to say, before the last of them have left Bengal. Another and non-migratory species of the same genus (C. pectoralis), peculiar, so far as known, to the Himalaya, is enumerated in Mr. Hodgson's List of the Birds of Nepal. The hoopoe (Upupa epops), common in Southern Asia during the cold season, and on the table-lands at all seasons, is to all appearance a bird of fluttering and feeble flight, but has repeatedly been observed, during the seasons of migration, at altitudes considerably above the limits of vegetation. 'On the western side of the Lank pass, about 16,500 feet, I saw a hoopoe,' writes Major Cunningham; and at Momy (14,000) to 15,000 feet elevation), under the lofty little pass in northern Sikkim, Dr. Joseph D. Hooker observed, in the month of September, 'birds flock to the grass about Momay; larks, finches, warblers, abundance of sparrows (feeding on the yak droppings), with occasionally the hoopoe; waders, cormorants, and wild ducks, were sometimes seen in the streams, but most of these were migrating south.' 'An enormous quantity of waterfowl,' remarks Dr. Hooker, 'breed in Thibet, including many Indian species that migrate no further north. The natives collect their eggs for the markets of Lintzi, Gianchhi, and Lhasa, along the banks of the Yarun river, Ramchoo, and Yarbru and Dacchen lakes.' Amongst other birds, the Sarus, or great crane of India (Grus antiquus) (see Turner's Tibet, p. 212), repairs to these enormous elevations to breed. The Sarus also breeds south of the Himalaya; and specimens too young to fly are occasionally brought for sale even to Calcutta. Turner also says the Lake Ramchoo is frequented by great abundance of waterfowl, wild geese, ducks, teal, and storks, which, on the approach of winter, take their flight to milder regions. Prodigious numbers of the Sarus, the largest species of the crane kind, are seen there at certain seasons of the year, and any quantity of eggs may then be collected, found deposited near the banks. The European crane (Grus cinerea), also a common Indian bird, says Major Lloyd, as observed by himself in Scandinavia, usually breeds in extended morasses, far away from the haunts of man. It makes its nest, consisting of stalks of plants and the like, on a cushion of grass and dry elephant grass among willows and other bushes. The female lays two eggs. Major Cunningham, also, in his Ladhak, etc., remarks 'that he shot the wild goose on the Thoghi, Chamno, and Chromirri lake at 15,000 feet; and he and Col. Bates shot three teals on the Suraj Dal, a small lake at the head of the Bhagha river, at an elevation of upwards of 16,000 feet.'

Many highly approximate races (considered, therefore, as species) maintain their distinctness, even in the same region and vicinity, as Falco peregrinus and F. peregrinator, Hypothorctis subbuteo and H. severus, Circus cyaneus and C. Swainsonii in India. Coracias Indica of all India meets, in the Panjab, etc., the European C. garrula; but in Assam, Sylhet, Tipperah, and, more rarely, Lower Bengal, it coexists with the C. affinis, specimens of which from the Burmese countries are ever true to their proper places. C. indicus and C. Indicus are from Upper and South India, but there are several curious and colorable graduation or transition, from one type of colouring to the other, in examples from the territories where the two races meet; so also with the Cricopus phoenicopterus of Upper India and the Cr. chlorogaster of S. India and Ceylon, which blend in Lower Bengal; and Gallophasis albo-cristatus of the W. Himalaya and G. melanotus of Sikkim, which produce an intermediate race in Nepal; and G. Civieri of Assam and Sylhet, and G. lineatus of Burma, which interbreed in Arakan, etc., so that every possible transition from one to the other can be traced. If inhabiting widely-separated regions, the (assumed) distinctness of such races would be at once granted, as with Phasianus colchicus and the Chinese Ph. torquatus, which readily intermix and blend, wherever the latter has been introduced in Europe. Such races as the crossbills, the Bauri and Sashin falcons of Asia, those British Phylloscopus trochilus and Ph. rufus, and the different European sparrows, maintain themselves persistently distinct; and this while the common sparrow of India would probably blend with the British sparrow (though considered distinct by some), if an opportunity should occur of its doing so.

The following British birds are given in the Calcutta Review (March 1857) as common to Great Britain and Southern Asia:

- Gyps fulvus (Vultur fulvus), griffin vulture.
- Neophron percnopterus, Pharaoh's chickens.
- Gypaetus, the lammergeyer.
- Aquila chrysaetos, golden eagle.
- A. moli, imperial eagle. Temm.
- Aquila, spotted eagle.
- Eulophotes fasciatus.
- Hieractus pennatus.
- Pandion haliaetus, osprey.
Falcro luscinia (Falcro gryluleus), kyr falcon.
F. macrorh. Schdl. (F. lanarius, Tenu.).
F. lanarius, Schlegel.
F. peregrinus, Peregrine falcon.
Hydropothirchus subnuptius, the hobby.
Erythropsus vespertinus, red-footed falcon.
E. amplervis (Falcro tahitiis, Vouiial). Timunneus alaudarius, the kestrel.
Astar palmarumius, goshawk.
Acipiter nius, sparrow-hawk.
Buteo vulgaris, common buzzard.
Pernis apivora, honey buzzard.
Cirrus arugosius, marsh harrier.
O. cyanus, hen harrier.
O. cineracea (O. Montagii).
Circaetus Gallicus.
Bubo maximus, eagle owl.
Scops Aldrovandi, Scops-eared owl.
Asio otus (Otus vulgaris), long-eared owl.
A. brachyotus (Otus brachyotus), short-eared owl.
Surninimus aluco (S. striulidum), tawny owl.
Aeneus palustris (Nocuta pascernina), little owl.
Turdus viscivorus, missel thrush.
Oocrocina Whitei (Turdus Whitei).
Turdus pilaris, fieldfare.
T. iliacus, redwing.
T. merula, blackbird.
T. (or merula) simillima.
Gyanecola Wolfi (Phoenicula suecici), blue-throated warbler.
Ruticollis houeii (Phoenicula ruticollis), redstart.
Pratincola rubricula (Saxicola rubricula), stone-chat.
P. rubrica (Saxicola rubrica), whin-chat.
Saxicola canathre, wheatear.
Locustella rayi (Saliarella locustella), grasshopper warbler.
Acrocephalus arundinaceus (Saliaria turdoides), thrush-like warbler.
Sylvia atricapilla (Currucu atricapilla), blackcap warbler.
S. rubecula (Currucu cinerea), common white-throat.
S. curruca (Currucu sylvicula), lesser white-throat.
S. orphea (Crrucu orphea), Orpheus warbler.
Phylloscopus trochilis, willow warbler.
Regulus cristatus, golden-crowned regulus.
Reguloides prorregulus (Regulus modestus), Parus major, great tit.
P. corvulus, blue tit.
P. ater, cole tit.
Orites caudatus (Parus caudatus), long-tailed tit.
Calocastes sulphureus (Motacilla boxarta), grey wagtail.
Pipastes trivialis (Anthus arbores), tree pipit.
Anthus pratensis, meadow pipit.
A. obtusum (A. petrosus), rock pipit.
Corydalla Richardii, Richard’s pipit.
Corydalla campestris.
Galerida cristata (Alauda cristata), crested lark.
Calendrella brachydactyla (Alauda brachydactyla), Cettiaidae desertorum.
Ammomanes Lustica.
Emberiza miliaria, common bunting.
E. citrinella, yellow bunting.
E. cia.
E. fusca of N. Asia.
E. melanocephala of S. Europe.
Fringilla montifringilla, mountain finch.
Passer montanus, tree sparrow.
P. domesticus, house sparrow.
P. vulgaris (vel Hispaniolensis).
Corvus corax vulgaris, hawfinch, qu. C. Japonicus, Schlegel?
Chrysospirita spinus (Cardueli spinus).
Linota cannabina, common linnet.
L. canescens, mealy redpoll.
L. montium, mountain linnet.
Carpodacus erythrinus.
Loxia curvirostra, common crossbill.
L. bifasciata, European white-winged crossbill.
Sturnus vulgaris, common starling.
Pastor rossius, rose-coloured pastor.
Fregilus graculas, chough.
Corvus corax, raven.
C. corone, carrion crow.
C. cornix, hooded crow.
BIRDS.
C. frugilegus, rook.
C. monedula, jackdaw.
Pica cauta., magpie.
Yunx torquilla, wryneck.
Upupa epops, hoopoe.
Sitta Syrus, rock nuthatch.
Trinchromus nurus, wall creeper.
Curruca communis, common cuckoo.
Coracias garrulus, roller.
Mergus apicaster, bee eater.
Hirundo rustica, swallow.
H. urtica, martin.
H. pyrrhopus, sand martin.
H. ruficollis.
Cypsiolus apus, common swift.
C. melba (C. hypoleucus), Alpine swift.
Aegithalos caudicunculatus, large spiny-tailed swift.
Caprimulgus Europaeus, night jar.
Columba livia, rock dove.
Starna cinerea (St eridinae cinerea), common partridge.
Coturnix vulgaris, common quail.
Tetrao urogallus (Otos tetax), little bustard.
Otus montifringilla, Montifringilla’s bustard.
Eidecnum crupians, great plover.
Charadrius hiaticula, ringed plover.
Ch. Cantiana, Kentish plover.
Ch. hydropicus (Ch. minor), little ringed plover.
Ch. pyrrholophus.
Calidris arenaria, sanderling.
Spatula lobata (Sp. lirata), grey plover.
Vanellus cinereus, lapwing.
Steropus interpres, turnstone.
Hainmatopus ostralegus, oyster-catcher.
Grus cincerea, common crane.
Ardea cinerea, common heron.
Ardea purpurea, common heron.
Hirundus alba (Ardea alba), great white heron.
H. garzetta (Ardoa garzetta), little egret.
H. ibis (Ardea ibis), black-headed heron.
Ardeola munita (Botanrus munitus), little bittern.
Botaurus stellaris, common bittern.
Nycticorax Gardeni, night heron.
Ciconia alba, white stork.
C. nigra, black stork.
Platalea leucorodia, white spoonbill.
Falcinellus igneus (Falcinellus igneus), glossy ibis.
Numenius arquata, common curlew.
N. phaephus, whimbrel.
Totonus fusca, spotted redshank.
T. vulgaris, common redshank.
Actitis oocropris (Totonus oocropris), green sandpiper.
A. glareola (Totonus glareola), wood sandpiper.
A. hypoleucus (Totonus hypoleucus), common sandpiper.
Totonus glottis, greenshank.
Recursirostra avosetta, avocet.
Himantopus budus (H. melanoterus), black-winged stilt.
Lagopus caesccephala (L. melanura), black-tailed godwit.
L. rufa, bar-tailed godwit.
Philomachus pugnas (Machetes pugnas), ruff.
Scolopax rusticola, woodcock.
Gallinago aboutalis (Scolopax gallasus), common snipe.
G. gallinula (Scolopax gallasus), jack snipe.
Tringa subarquata, curlew sandpiper.
T. eurystomus, knot.
T. erythropus, broad-billed sandpiper.
T. minutus, little stint.
T. Temminkii, Temmink’s stint.
T. Alpina (Tringa variabilis), dunlin.
Phalaropus fulicarius, grey phalarope.
Phalaropus hyperboreus (Phalaropus hyperboreus), red-necked phalarope.
Crex pratensis, lapland.
Porzana parasus (Crex porzana), spotted crake.
R. pusilla, (Crex pusilla), little crake.
P. Baillonii (Crex Baillonii).
Gallinula chloropus, moor-hen.
Fulica atra, common coot.
Anser cristatus (Anser ferus), grey-geese.
A. brachyrhynchus, pink-footed goose.
BIRDS.

Bernilda rufo collaris (Anser rufo collaris), red-breasted goose.

Cygnus muscius (Cygnus ferrugineus), Hooper swan.

Casmerodius rutila (Tadorna rutila), redsheldrake.

Tadorna vulpansier, common sheldrake.

Spatula clypeata (Anas clypeata), shoveller.

Anas steroa, gadwall.

A. netus, pintail duck.

A. boschas, wild duck.

A. querquedula, gargany.

A. creeca, teal.

A. penelope.

Fuliga ferruginea, pockhar.

F. gy广西, ferruginous duck.

F. marila, scap duck.

F. cristata, tufted duck.

Clangula galmung (Fulica galmung), golden eye.

Mergus albellus (Mergus abellus), sournew.

Mergus merganser, goosander.

Podiceps cristatus, great-crested grebe.

P. phalacrocorax, common cormorant.

Syrichidon Capis (Sterna Capis), Caspian tern.

Sterna paradisae (Sterna Dougallii), roseate tern.

S. hirundo, common tern.

Hydrochelidon Indica (Sterna leucoparica), whiskered tern.

Gelochelidon anglica (Sterna anglica), gull-billed tern.

Sterna minuta (Sterna minuta), lesser tern.

Aneus stolidus (Sterna stolidus), noddy tern.

Onychorhynchus fuliginosus (Sterna fuliginosa), sooty tern.

Xema ridibunda (Larus ridibundus), black-headed gull.

Larus fuscescens, lesser black-backed gull.

Procellaria hositata, capped petrel.

Puffinus obscurus, dusky petrel.

Those birds which are common to India and the polar circle, appertain for the most part to the wading and webfooted orders; and a few of them are of very general distribution over the world, as especially the common turnstone (Strepsis interpres), which seems to be found on every sea-coast. The Lobipes hyperboreus is a little arctic bird, of rare occurrence even in the north of Scotland, Orkney, and Shetland, but a specimen was procured near Madras; and the nearly related Phalaropus fulicarius was obtained in the Calcutta provision bazaar so late in the year as May 11, 1846.

Mr. Blyth remarks that various instances occur of closely-affined Indian and European birds, which every ornithologist would at once pronounce to be distinct, e.g. Oriolus galbula and O. kundoo; Troglydtes Europeus and T. sub-Himalayanus; Certhia familiaris and C. Himalayana, etc. And not infrequently the exact Europe species inhabits India, in addition to another, which would otherwise be regarded as its counterpart or representative, or, according to the views of some naturalists, a mere local or climatal variety of the same species. Falco peregrinus is common in India, together with F. peregrinator, which would otherwise be regarded as its Indian counterpart; Hypothriochis subbuteo found together with H. severus; Hirundo Sinensis (the ordinary Indian sand martin), together with H. riparia; Caculus canorus (the European cuckoo), as also several affined species, and so on. In some cases, a European species may have two or more representatives in India, or vice versa. Thus Nyctornia carvconectes of the pine forests of Europe and Siberia is replaced by N. hemisipla in those of the Himalaya generally, and by H. multicolata about Kashmir; Parus major by P. monticola and P. cinerus, if not also P. nuchalis (in addition to cinereus), in S. India; Picus major by P. Himalayanus; Accipiter alpinus by A. nipalensis. While, on the other hand, Lanius lektor in India is represented both by L. exilicorculor and L. meridionalis in Europe; Sitta cinammonensis by S. Europaea and S. cincasa, etc. Some ornithologists regard the Passer domesticus, P. italiæ (vel Cisalpinus), and P. saltcarius (vel Hispaniolensis), of Europe, as being local varieties merely of the same, yet they hold true to distinctive differences of colouring wheresoever found; and examples of the last-named race from Afghanistan and N.W. of India differ in no appreciable respect from Algerian specimens with which they have been compared; moreover, this race is of far more gregarious habits even than Passer domesticus,—a fact noticed of it alike in N. Africa and in Kohat. The Tibetan raven is considered as a peculiar species by Mr. Hodgson, an opinion to which the Prince of Cuduo seems to incline. It may be presumed to inhabit the lofty mountains of Bhutan to the north; but the smaller crow of Southern Asia is the C. splendidus, while the common black crow of all India, C. culminatus, would seem to stand here alike for the raven, the carrion crow, and the rook. The true rook (Corvus frugilegus), however, is known to inhabit or visit the Peshawar valley, Afghanistan, and Kashmir. The rock of China and Japan is considered a distinct species, C. pistorinarum of Gould, and the jackdaw (C. monedula) is in those countries; while the true northern raven, Corvus corax, is met with not only there, but also over a great portion of the Panjabs as the raven, but the northern raven would make a meal of one and not feel much the worse for it.

Dr. Francis Buchanan Hamilton, remarking upon a falconry observed by him in the Shahabad district, mentions that he saw, in several days' hawking, a large bird of prey, named jumach, attack a very strong falcon as it was hovering over a bush into which it had driven a partridge. The moment the falcon spied the jumach it gave a scream, and flew off with the utmost velocity, while the jumach equally pursued. They were instantly followed by the whole party, foot, horse, and elephants, perhaps 200 persons, shouting and firing with all their might; and the falcon was saved, but not without severe wounds, the jumach having struck her to the ground, but a horseman came up in time to prevent her from being devoured.' The wokhab, Aquila fulvescens, is a small eagle, very abundant in the plains of Upper India, the Dehkan, etc. The Honourable (now Sir) Walter Elliot remarks that 'the wokhab is very troublesome in hawking after the sun becomes hot, mistakes the jesses for some kind of prey, and pouncing on the falcon to seize it. He had once or twice nearly lost shahins (Falco peregrinator) in consequence, they flying to great distances for fear of the wokhab, i.e. the jumach. The principal species employed in Indian falconry are identical with those of Europe, namely the bari of India, which is the Peregrine falcon of the west, and the baz of India, which is the goshawk or gentil falcon of Britain. In a curious Persian treatise on the subject, by the head falconer of the Mogul emperor
BIRDS.

Akbar, the various species used are enumerated, and may be recognised with precision; among them is the shahar, which is clearly the gyr falcon of the north, represented as extremely rare and valuable, taken perhaps once or twice only in a century, and then generally in the Punjab. The shahin (Falco peregrinator) does not inhabit Europe. With five or six exceptions only, the whole of the European diurnal birds of prey are met with in India, many of them being much commoner in India; and they are associated with numerous other species unknown in Europe. The sport of falconry is widely diffused over Asia, even to the Malayas. The bastard "quarry" hawked by Dr. Layard's Bedouin companions on the great plain of Mesopotamia, is the houbara (Houbara Macqueenii) of Sinai and Afghanistan, being a different species from that of Spain and North Africa (H. undulata); the former has unexpectedly been found, of late years, in England and Belgium, if not also in Denmark.

The great spiny-tailed swift of the Himalaya (Acanthylis nudipes of Hodgson) was obtained, a few seasons back, in England. Mr. Gould identifies this British-killed bird with his Ac. caudacta of Australia, but it appears identical with the Himalayan species; upon comparing Himalayan specimens with Mr. Gould's plate, no difference can be detected. The great alpine swift (Cypselus melba) is common to the Himalaya, the Neighgherries, and high mountains of Ceylon, but the great Acanthylis of the Himalaya has never been observed in S. India, and is replaced in the Neighgherries, Ceylon, and also across the Bay of Bengal in Penang, etc., by Ac. gigantea.

Gold and silver pheasants are inhabitants of China; but the golden pheasant, according to M. Temminck, inhabit not only China and Japan, but the northern parts of Greece, as also Georgia and the Caucasus; and it has been met with even in the province of Orenbourg. M. Degland informs us that M. Gamba, French consul at Tiflis, met with this gorgeous bird in numerous flocks on the spurs of the Caucasus, which extend towards the Caspian Sea, and that now it has gone wild and multiplied in some of the forests of Germany.

In Southern Asia, the birds familiarly known as bulbul must not be confounded with the Persian bulbul, which is a species of true nightingale (Luscinia), a genus very closely related to some of the small thrushes of America. There is no true nightingale wild in India; but the shama, Cerocichra taxicinca) macourus, un doubtedly the finest song-bird of this part of the world, is not infrequently designated the Indian nightingale. It is common to India and the Malay countries; and there is a second species (C. Luzoniensis) in the Philippines, and a third (C. erythroterus) in Africa. Oroces cinclorhyclus is also termed shama in the Madras Presidency. The esteemed Indian songster is the mere tricolor of longue queue of Levallant (Oiseaux d'Afrique, pl. 114). The bhimraj (Eolodus paradisiaca) is popularly denominated the mocking-bird by Europeans.

The song of birds is chiefly observed amongst the meruleis, saxicolinae, sylviae, larks, and some finches. In India there are few songsters in the groves, but some of the larks are kept in cages. Amongst Mahomendans in British India, the lark is usually their cage-bird, but partridges and quails are also domesticated. Quails, bulbuls, and cocks are trained to fight, falcons and hawks to hunt on the wing.

The Chinese are passionately fond of singing birds; the wealthy will pay exceedingly high prices for those whose notes are fine, and are as great connoisseurs in the notes of the lark, as Europeans are in those of the bullfinch. A bird is as generally the companion of a Mandarin, as a dog is of an Englishman. These birds have a silk cord attached to their legs, which is entwined around the fingers of the owner. In China it is the Acrideroes cristatus, the Shantung lark. It has great facility in learning sounds, and will bark, mew, crow, cough, and sneeze, sometimes talk; and a single bird will fetch £6. The aeridothres will imitate the human voice accurately. In China, a starling is often domesticated; it is lively, good-natured, and easily tamed. They also tame the fork-tailed parus (Leothrix luteus of Scopoli). It is in form and habit like the robin of Britain; is pretty olive green, black forked tail, with wing primaries bright yellow and red. It turns summersaults on its perch. They have a short, loud song. Canaries are sold in many shops of Japan. The grackle, Entabhus religiosa, called the myna, is largely domesticated. The partridge, the bulbul shrike, are also largely domesticated. The hoopoe is to be seen occasionally. In China the cormorant and the pelican are trained to fish.

Many races have had nightingale birds. The Zend has the coroha; the Persians, the roe and ai-mugh; the Arabs, the Arabs, the Turks, the kerek; the phonix of the Egyptians and Greeks; the ygyrasal of the Edda; the griffin birds of the age of chivalry; the kirni of the Japanese; and the garuda of the modern Hindus. A Hindu legend relates that two lovers were transformed into Brahmany ducks, the Casarea rutula, Pallus, and camed to live at night apart on opposite banks of a river, and all night long each in its turn asks its mate if it shall come across; but the question is always met with a negative. "Chakwi, shall I come?"—"No, Chakwa." "Chakwa, shall I come?"—"No, Chakwi."

Sailors have familiar names for sea birds; amongst others, the Booby, the Nelly, the Noddy, the Reef Bird, the Frigate Bird, the Tropic Bird, the Cape Pigeon, the Mother Cary's Chicken, the Mutton Bird (Estrelata Lessonii), the Whala Bird (Põro� desolatœ). Cape Hen is the petrel, also called Black Night-Hawk; and the Mackerel Bird, King and Queen of "kiker" of sailors, is the tern, Sterna virgata.

Of lant birds with peculiar names may be mentioned the Mocking-bird, the Laughing Jackass, the Slat-bower bird (Pilionornychos holsiticus); in India, the Coppersmith, the satbhai.

ORDER, RAPTORS, Birds of Prey.

Vultur monachus, Linn., great brown vulture.
V. calvus, Scop., Hunter, black vulture.
Gyps fulvus, Gould., large tawny vulture.
G. indicus, Scop., long-billed brown vulture.
G. Bengalensis, Gould., common brown vulture.

Sub-Fam. Neophroninæ, Scavengers.

Neophron percnopterus, Linn.
BIRDS.

**Sub-Fam. Gypaetinae, Bon.**

*Gypaetus barbatus*, Linn. White-eyed marsh dwarf falcon.

*Balaenoptera*. Bone falcon. True Falcons.

*Falco* peregrinus, Gmel., peregrine falcon.

*F. peregrinator*, Storer, the shahin.

*F. tinnunculus*, Schuh., the saker or cherrug.

*F. jugger*, Grey, the leggar.

*F. batis*, Gurney, red-headed lanner.

*Hypothorchiu subbuteo*, L., the hobby.

*H. severus*, Hoffr., Indian hobby.

*H. coslon*, Gm., the merlin.

*H. chionoecera*, Davd., the Turunti merlin.

*Timunculus alaudarius*, Bres., kestrel.

*Erythropus canchurch*, Linn., lesser kestrel.

*E. macrurus*, Linn., red-legged falcon.

*Hierax* encolomus, Hodg., plumey falcon.

*H. melanocephalus*, Bl., Assam.

*H. coerulescens*, Java, Malayana.

*H. sericeus*, China.

**Sub-Fam. Accipitrinae, Hawks.**

*Sub-genus*, Lophopha. Lophophasia trivirgata, Hume, crested goshawk.

*Micronisus badius*, Gm., shikra.

*Accipiter nisus*, Linn., sparrow-hawk.

*Virgatus* temm., beaza sparrow-hawk.

**Sub-Fam. Aquilinae, Eagles.**

*a*. True Eagles.

*Aquilla chrysaetos*, Linn., golden eagle.

*F. pesta*, C tymptilus, imperial eagle.

*F. novaia, Gm., sparrow eagle.

*a*. falvescens, Gurney, tawny eagle, the wokhla.

*a*. hastata, Linn., Less., long-legged eagle.

*a*. pennata, Gm., dwarf eagle.

*Neops* Malakensis, Temm., black eagle.

**Eagle**, Hawkeagles.

*Eulomatocetus eobellii, Hume*, crested eagle.

*Limnaetus nivens*, Temm., changeable hawk eagle.

*F. cristatellus*, Temm., crested hawk eagle.

*a*. nipalensis, Hodg., spotted hawk eagle.

*F. kienieri*, De Sy., rufous-bellied hawk eagle.

*Cracetus Galliaceus*, Gmel., serpent eagle.

*Spinilnus chelae*, Davd., crested serpent eagle.

*s*. bache, Davd., Java.

*s*. spilogaster, Bl., Ceylon.

*H. holosilpis*, Philippine.

*E*. Fishing Eagles.

*Pandion haliaetus*, Linn., osprey.

*Polioptila ichthyopterus*, Horst., white-tailed sea eagle.

*Haliaetus liviventer*, Vieill., ring-tailed sea eagle.

*A*. leucaogaster, Gm., grey-backed sea eagle.

**Sub-Fam. Buteoninae, Buzzards.**

*Buteo vulgaris*, Recht., the buzzard.

*B. desertorum*, Hume.

*B. caniceps*, Hodg., long-legged buzzard.

*B. aquilinus*, Hodg., upland buzzard.

*B. plumipes*, Hodg., harrier buzzard.

*B. pygmonas*, Blu., Tannenboom.

*Polioptila teesa, Freudl., white-eyed buzzard.

*Arcihuteau hemiptilous, Bligh*, brown eagle buzzard.

**Harriers.**

*Circa gyanus*, Linn., hawk harrier.

*C. Swainsonii*, A. Smith., pale harrier.

*C. cinereus*, Montague, Montague's harrier.

*C. melanoleucus*, Gm., pied harrier.

*C. aeruginus*, Linn., marsh harrier.

**Sub-Fam. Milvine, Kites.**

*Haliastur Indus*, Bodd., palm-court-backed, Brahmany kite.

*Mivis gouldii*, Sykes, Parish kite.

*M. ater* of Europe.

*M. melanoctis* of China.

*Pernis cristatus*, Gmel., crested honey buzzard.

*Baza lobochata, Cre*, crested black kite.

*Elanus melanopterus*, Davd., black-winged kite.

**Fam. Strigidae, Owls.**

Sub-Fam. Striginae, Sreech Owls. Strix javanicus, De Wurdeur, sreech owl.

SUB. cantilura, Tickell, grass owl.

*Indica*, Hume.

*Phodilus bidiaus*, Horst., bay sreech owl.

**Sub-Fam. Striginae, Hooting Owls.**

*Sub-genus*, Bulae. Strigina Indranae, Sykes, wood owl.

*Simsonia*, Hodg., Nepal wood owl.

*S. Sinense, Lath., mottled wood owl.

*S. nivilium*, Hodg., Himalayan wood owl.

*Bulae ocellata*, Hume.

**Sub-Fam. Asioinae, Eared Owls.**

*Otus vulgaris*, Fena., long-eared owl.

*O. brachyrhynchos*, Short-eared owl.

**Sub-Fam. Buboninae, Horned, Eagle, and Sreech Owls.**

*Urus Bengalensis*, Franklin., rock horned owl.

*U. coromanda*, Lath., dusky horned owl.

*Hodgilis*, Hodg., forest eagle owl.

*Keuppia*, Ceylonensis, Gm., brown fish owl.

*F. flavipes*, Hodg., tawny fish owl.

*Euphilotes pennatus*, Hodg., Indian Sreech owl.

*E. lettia*, Hume.

*E. lempiti, Horst., large Indian Sreech owl.

*E. bakkamsena*, Hume.

*E. griseus*, Hume.

*Screech rufescens*, Horst., Malayana.

**Sub-Fam. Surnininae, Karp.**

*Athena brama*, Temm., spotted owl.

*A. radiata*, Tickell, jungle owl.

*A. Malabarica*, Bligh, Malabar owl.

*A. cuculoides*, Vigna., large-bared owl.

*A. Persicus*, Hume.

*Glaucidium Brodiei*, Burton, pigmy owl.

*Ninox splendidula*, Recht., brown hawk owl.

**ORDER. INSESSORES, Vigors, Perching Birds.**

**TRIBE. FISIESTRIDE.**

*Hirundo rustica*, Linn., common swallow.

*H. tyttleri*, Hume.

*H. dominica*, Jervon, Neighgerry house swallow.

*H. rufula*, Gmel., Java.

*H. alifera*, Stephens, wire-tailed swallow.

*H. daurica*, Linn., red-rumped swallow.

*H. fluvicola*, Jervon, Indian cliff swallow.

*b*. Sand Martins.

*Ctxyle riparia*, Linn., European sand martin.

*Sub-sec. Hodgs., Hodgs., dusky martin.

*C. Sinesis*, Gray, Indian bank martin.

*c*. Craig Martin.

*C. concolor*, Sykes, dusky creag martin.

*Cupestris*, Sops., mountain creag martin.

*Sub-Fam. Cynips, Swifts.*

*Acauthus sylviatus*, Tickell, white-rumped spine tail.

*a*. gigantea, Temm., brown-necked spine tail.

*a*. caudatura, Lath., white-necked spine tail.

*Gyps melba*, Linn., Alpine swift.

*Apus, Linn., European swift.

*Affinis*, Gray, Indian swift.

*Leuconyx*, Bligh, white-clawed swift.

*Chastantasia*, Gray, palm-clawed swift.

*Colocella nigida*, Latham, edible nest swiftlet.

*l. linchi* (C. fusiphaga), Nicobars to Java.

*Dendrochelidon coronata*, Tickell, crested swift.

*D. blecho*, Malehiana.

*D. sumatra*, Sumatra.

*D. mystaceus*, N. Guinea; and

*Wallacii*, Celebes.

*Batrachostomus moniliger*, Bligh, frog-mouth.

*Otohippro Loddugioni, Gray, frog-mouth.*

*Sub-Fam. Caprimulginae, Night Jars.*

*Caprimulgus Indicus*, Lath., jungle night jar.

*C. Kelaartii*, Bligh, Neighgerry jungle night jar.

*C. albonotatus*, Tickell, Bengal jungle night jar.

*C. macronotus*, Horst., Malay jungle night jar.

*C. stripenis*, Jervon, Ghat jungle night jar.

*C. Asiaticus*, Latham, Indian jungle night jar.

*C. Mahatranensis*, Sykes, Sykes' jungle night jar.

*C. monticolus*, Franklin, Franklin's jungle night jar.

*C. stictosus*, Swinhoe, of China.
HIBERS.

**Fam. Trogonidae, Trogons.**

_Harpactes fasciatus, Gym., Malabar trogon._
_H. Hodgsoni, Gould, red-headed trogon._

**Fam. Meropidae, Bee-eaters.**

_Merops viridis, Linn., Indian bee-eater._
_M. philippensis, Linn., blue-tailed bee-eater._
_M. quinctcolor, Viell., chestnut-headed bee-eater._
_M. apiaster, Linn., European bee-eater._
_M. egyptius, Forsk._
_M. badius of Malacca._
_Nyctornis Athertoni, Jard., blue-necked bee-eater._
_N. amictus of Malaya._

**Fam. Coraciidae, Rollers.**

_Coracias Indica, Linn., Indian roller._
_C. affinis, M'Clell., Business roller._
_C. arrulus, Linn., European roller._
_Eurylaius orientalis, Linn., broad-billed roller._
_E. gularis, V., N. Guinea._

**Fam. Halcyoniidae, Kingfishers.**

_Sub-Fam. Halcyoninae._

_a. Enymerosa._

_Halcyon leucocephalus, Gym., brown-headed kingfisher._
_H. amauropterus, Pearon, brown-winged kingfisher._
_b. Caneropha._

_H. fusco, Bodd., white-breasted kingfisher._
_H. atricapillus, Gym., black-capped kingfisher._
_c. Calinex._

_H. Coromandelianus, Sc., ruddy kingfisher._
_H. myersis, Hum._
_Todiramphus collaris, Sc., white-collared kingfisher._
_Ceyx tristis, Pallas, three-toed kingfisher._
_C. rubidior, Strickland, Malaya._
_C. luzoniensis, the most beautiful kingfisher._

_Sub-Fam. Alcedininae._

_Aledeo Bengalensis, Gym., Indian kingfisher._
_A. euryzona, Temm., great Indian kingfisher._
_A. Menzington, Tenasserim to Java._
_A. Beryllina, Java._
_A. Moluccensis, Moluccas._
_Ceryle rudis, Linnaeus, pie kingfisher._
_C. guttata, Vijora, mottled kingfisher._
_C. lugubris, Sek., of Japan._

**Fam. Eurylaimidae, Sw., Broadbills.**

_Psarisomus Dalhousie, Jameson, yellow-throated broadbill._
_Eurilaimus Javanicus, Malaya._
_E. ochromelas, Malaya._
_Corydon Sumatraeus, Burma._
_Cymbirhynchus macrorhynchus, Burma._
_C. affinis, Arakan._
_Peltops Blainvillii, N. Guinea._
_Calyptomena viridula, Malacca, Archipelago._

**Fam. Bucerotidae, Hornbills.**

_Homnrias bisчисis, Linnaeus, great hornbill._
_Hydrcissa coronata, Bodd., Malabar hornbill._
_H. albirostris, Shaw, Bengal hornbill._
_H. affinis, Hutton, Dehra Doon hornbill._
_H. convexa, Temm., of Malaya._
_H. macrocerus, Malaya._
_M. nigrostris, Malaya, Java._
_M. nigrostris, Malaya, Java._
-Menicerou bischis, Sc., common hornbill._
_Tockus singhalensis, Shaw, jungle grey hornbill._
_Aceros Nipalensis, Hodgson, rufous-necked hornbill._
_Rhinoplax scutatus, Malaya Peninsula._
_Lhytiacerus ruficolli, Tem., Burma, Malacca._
_L. subrubicolli, Blyth, Burma, Malacca._
_R. plicatus, Lath., Burma, Malacca._
_Berenicornus Tickelli, Blyth._

**THIE, SCANSORES, Climbers.**

_Pam. Psittacidae, Parrots. Sub-Fam. Psilorninae, Parrakeets._
_Psillornia Alexandri, Linnaeus, Alexandra parakeet._
_P. torquatus, Bodd., rose-winged parakeet._
_P. rosae, Bodd., rose-headed parakeet._
_P. schisticeps, Hodgson, slate-headed parakeet._
_P. columboideus, Vijora, blue-winged parakeet._
_P. javanicus, Oseeck, red-breasted parakeet._
_P. chilhraphon, Leviathan, Ceylon parakeet._
_P. caniceps, Blyth, Nickars, Penang._

_P. longicauda, Sumatra, Malay Peninsula._

**Sub-Fam. Loricinae, Lories.**

_Loriculus vernalis, Sperling, Indian loriette._
_L. caligatus, Malay Peninsula._
_L. asiaticus, Ceylon._
_Psittinus Madacasseris, Malay Peninsula._

_The little lories inhabit the Moluccas and N. Guinea._

_The cockatoos consist of—_

(1) _White cockatoos, with large crest, from Moluccas._
(2) _Black cockatoos of Australia, forming the created genera Microglossum and Calyptorhynchus._

_The Nesterines have a greatly prolonged upper mandible._
The Pitticacines are found in both continents, and in the E. Archipelago. The macaws have one large-sized group, viz. true Macaws, the other Conurs, smaller._

**Fam. Picidae, Woodpeckers. Sub-Fam. Picinae.**

_Picus Himalayanus, J. and S., Himal. pied woodpecker._
_P. majorculus, Hodgson, Darjiling black woodpecker._
_P. caphtharius, Hodgson, lesser black woodpecker._
_P. nasicus, Viell., Indian spotted woodpecker._
_P. Seindianus, Goudil, Sind pied woodpecker._
_P. brevifrons, Viell., brown-fronted woodpecker._
_P. Mahrattensis, Latham, yellow-fronted woodpecker._
_P. Blanfordi, Blyth, Burma woodpecker._
_P. atratus, Blyth, Burma._
_P. Andamanensis, Blyth._
_P. analis, Temminck, Java._
_P. cabanisi, Malth., China._
_P. pectoralis, Blyth._

_Hypopias hyperythrus, Vijora, rufous-bellied woodpecker._
_Yungipicus rubricatus, Blyth, Darjiling pigmy woodpecker._
_Y. pygmaeus, Vijora, Himalayan pigmy woodpecker._
_Y. Hardwickii, Jerd., southern pigmy woodpecker._
_Y. Moluccensis, Java, Moluccas._
_Y. canaipillus, Bl., Burma._
_Y. gymnocephalum, Bl., Ceylon._
_Y. scintilla, Nett., Himalayas._
_Y. maculatus, Philippinos._
_Y. zizuki, Japan._

**Sub-Fam. Campephilinae.**

_Hemicircus enneus, Less, heart-spotted woodpecker._
_H. concretus, Malay Peninsula._
_Chrysochoplaeus sulphureus, Hodgson, golden-backed woodpecker._
_C. Goensis, Gym., black-backed woodpecker._
_Mulleripicus pulvulentus, Temminck, large white woodpecker._
_M. Hodgsoni, Jerd., great black woodpecker._
_M. Javanensis, Horst, Malacca._
_M. Hodgki, Bl., Andamans._

**Sub-Fam. Gecinninae.**

_Gecinus squamatus, Viel., scaly-bellied green woodpecker._
_G. striolatus, Blyth, small green woodpecker._
_G. occipitalis, Viel., black-naped woodpecker._
_G. viridus, Blyth, Burma._
_G. aboreka, C., Japan._
_G. guerinii, Malt., China._
_G. affinis, Royce, Sumatra._
_G. dimidiatus, Tem., Java._
_Chrysophlegma flavinucha, Gould, large yellow-naped woodpecker._

BIRDS.

A. Trifasciatus, Hodg., common 3-toed woodpecker.
B. viridirostris, Hodg., green-billed woodpecker.
C. cucullata, Hodg., rufous woodpecker.
D. formosus, Hodg., fire-tailed honey-sucker.
E. nigricollis, Hodg., maroon-fronted honey-sucker.
F. Horsfieldii, Bl., green-backed honey-sucker.
G. satara, Hodg., black-breasted honey-sucker.

Sub-Fam. Picumninae, Piculet.

A. Picumnus abnormis, T., Malayana.
B. Yungnie, Wynekecs. fuscata, Hodg., yellow-backed honey-sucker.
C. Picumnus inornata, T., Malayana.
D. Picumnus pulchella, Hodg., common honey-sucker.
E. Picumnus polytes, T., Malayana.
F. picumnus nigricans, T., Malayana.
G. Picumnus opaca, T., Malayana.

Sub-Fam. Indicatorinae, Honey Guides.

A. Indicator indicus, Hodg., chestnut-crested honey guide.
B. Indicator Christini, Hodg., guide.

Sub-Fam. Mmeliophaginae, Bird-waxeaters and Waxbirds.

A. Mmeliophaga alba, Hodg., white waxbird.
B. Mmeliophaga cristata, Hodg., Superior Waxbird.
C. Mmeliophaga dumetella, Hodg., yellow-billed waxbird.

Sub-Fam. Pycininae, Heaven-suckers.

A. Pycinus pycinus, Hodg., Heaven-sucker.
B. Pycinus leucophaeus, Hodg., Heaven-sucker.
C. Pycinus leucopsis, Hodg., Heaven-sucker.

Sub-Fam. Picidae, Woodpeckers.

A. Picus pinetorum, Hodg., Siberian Woodpecker.
B. Picus viridis, Hodg., Eurasian Green Woodpecker.
C. Picus palustris, Hodg., Common Green Woodpecker.
D. Picus canus, Hodg., Oriental Woodpecker.
E. Picus erythronotus, Hodg., India Forest Green Woodpecker.
F. Picus erythronotus, Hodg., India Forest Green Woodpecker.
G. Picus erythronotus, Hodg., India Forest Green Woodpecker.

Sub-Fam. Picinae, Flower-peckers.

A. Picus erythronotus, Hodg., India Forest Green Woodpecker.
B. Picus erythronotus, Hodg., India Forest Green Woodpecker.
C. Picus erythronotus, Hodg., India Forest Green Woodpecker.

Sub-Fam. Picidae, Woodpeckers.

A. Picus viridis, Hodg., Eurasian Green Woodpecker.
B. Picus palustris, Hodg., Common Green Woodpecker.
C. Picus canus, Hodg., Oriental Woodpecker.
D. Picus erythronotus, Hodg., India Forest Green Woodpecker.
E. Picus erythronotus, Hodg., India Forest Green Woodpecker.
F. Picus erythronotus, Hodg., India Forest Green Woodpecker.

Sub-Fam. Picidae, Woodpeckers.

A. Picus viridis, Hodg., Eurasian Green Woodpecker.
B. Picus palustris, Hodg., Common Green Woodpecker.
C. Picus canus, Hodg., Oriental Woodpecker.
D. Picus erythronotus, Hodg., India Forest Green Woodpecker.
E. Picus erythronotus, Hodg., India Forest Green Woodpecker.
F. Picus erythronotus, Hodg., India Forest Green Woodpecker.

Sub-Fam. Picidae, Woodpeckers.

A. Picus viridis, Hodg., Eurasian Green Woodpecker.
B. Picus palustris, Hodg., Common Green Woodpecker.
C. Picus canus, Hodg., Oriental Woodpecker.
D. Picus erythronotus, Hodg., India Forest Green Woodpecker.
E. Picus erythronotus, Hodg., India Forest Green Woodpecker.
F. Picus erythronotus, Hodg., India Forest Green Woodpecker.

Sub-Fam. Picidae, Woodpeckers.

A. Picus viridis, Hodg., Eurasian Green Woodpecker.
B. Picus palustris, Hodg., Common Green Woodpecker.
C. Picus canus, Hodg., Oriental Woodpecker.
D. Picus erythronotus, Hodg., India Forest Green Woodpecker.
E. Picus erythronotus, Hodg., India Forest Green Woodpecker.
F. Picus erythronotus, Hodg., India Forest Green Woodpecker.

Sub-Fam. Picidae, Woodpeckers.

A. Picus viridis, Hodg., Eurasian Green Woodpecker.
B. Picus palustris, Hodg., Common Green Woodpecker.
C. Picus canus, Hodg., Oriental Woodpecker.
D. Picus erythronotus, Hodg., India Forest Green Woodpecker.
E. Picus erythronotus, Hodg., India Forest Green Woodpecker.
F. Picus erythronotus, Hodg., India Forest Green Woodpecker.

Sub-Fam. Picidae, Woodpeckers.

A. Picus viridis, Hodg., Eurasian Green Woodpecker.
B. Picus palustris, Hodg., Common Green Woodpecker.
C. Picus canus, Hodg., Oriental Woodpecker.
D. Picus erythronotus, Hodg., India Forest Green Woodpecker.
E. Picus erythronotus, Hodg., India Forest Green Woodpecker.
F. Picus erythronotus, Hodg., India Forest Green Woodpecker.

Sub-Fam. Picidae, Woodpeckers.

A. Picus viridis, Hodg., Eurasian Green Woodpecker.
B. Picus palustris, Hodg., Common Green Woodpecker.
C. Picus canus, Hodg., Oriental Woodpecker.
D. Picus erythronotus, Hodg., India Forest Green Woodpecker.
E. Picus erythronotus, Hodg., India Forest Green Woodpecker.
F. Picus erythronotus, Hodg., India Forest Green Woodpecker.

Sub-Fam. Picidae, Woodpeckers.

A. Picus viridis, Hodg., Eurasian Green Woodpecker.
B. Picus palustris, Hodg., Common Green Woodpecker.
C. Picus canus, Hodg., Oriental Woodpecker.
D. Picus erythronotus, Hodg., India Forest Green Woodpecker.
E. Picus erythronotus, Hodg., India Forest Green Woodpecker.
F. Picus erythronotus, Hodg., India Forest Green Woodpecker.

Sub-Fam. Picidae, Woodpeckers.

A. Picus viridis, Hodg., Eurasian Green Woodpecker.
B. Picus palustris, Hodg., Common Green Woodpecker.
C. Picus canus, Hodg., Oriental Woodpecker.
D. Picus erythronotus, Hodg., India Forest Green Woodpecker.
E. Picus erythronotus, Hodg., India Forest Green Woodpecker.
F. Picus erythronotus, Hodg., India Forest Green Woodpecker.

Sub-Fam. Picidae, Woodpeckers.

A. Picus viridis, Hodg., Eurasian Green Woodpecker.
B. Picus palustris, Hodg., Common Green Woodpecker.
C. Picus canus, Hodg., Oriental Woodpecker.
D. Picus erythronotus, Hodg., India Forest Green Woodpecker.
E. Picus erythronotus, Hodg., India Forest Green Woodpecker.
F. Picus erythronotus, Hodg., India Forest Green Woodpecker.

Sub-Fam. Picidae, Woodpeckers.

A. Picus viridis, Hodg., Eurasian Green Woodpecker.
B. Picus palustris, Hodg., Common Green Woodpecker.
C. Picus canus, Hodg., Oriental Woodpecker.
D. Picus erythronotus, Hodg., India Forest Green Woodpecker.
E. Picus erythronotus, Hodg., India Forest Green Woodpecker.
F. Picus erythronotus, Hodg., India Forest Green Woodpecker.

Sub-Fam. Picidae, Woodpeckers.

A. Picus viridis, Hodg., Eurasian Green Woodpecker.
B. Picus palustris, Hodg., Common Green Woodpecker.
C. Picus canus, Hodg., Oriental Woodpecker.
D. Picus erythronotus, Hodg., India Forest Green Woodpecker.
E. Picus erythronotus, Hodg., India Forest Green Woodpecker.
F. Picus erythronotus, Hodg., India Forest Green Woodpecker.

Sub-Fam. Picidae, Woodpeckers.

A. Picus viridis, Hodg., Eurasian Green Woodpecker.
B. Picus palustris, Hodg., Common Green Woodpecker.
C. Picus canus, Hodg., Oriental Woodpecker.
D. Picus erythronotus, Hodg., India Forest Green Woodpecker.
E. Picus erythronotus, Hodg., India Forest Green Woodpecker.
F. Picus erythronotus, Hodg., India Forest Green Woodpecker.

Sub-Fam. Picidae, Woodpeckers.

A. Picus viridis, Hodg., Eurasian Green Woodpecker.
B. Picus palustris, Hodg., Common Green Woodpecker.
C. Picus canus, Hodg., Oriental Woodpecker.
D. Picus erythronotus, Hodg., India Forest Green Woodpecker.
E. Picus erythronotus, Hodg., India Forest Green Woodpecker.
F. Picus erythronotus, Hodg., India Forest Green Woodpecker.

Sub-Fam. Picidae, Woodpeckers.

A. Picus viridis, Hodg., Eurasian Green Woodpecker.
B. Picus palustris, Hodg., Common Green Woodpecker.
C. Picus canus, Hodg., Oriental Woodpecker.
D. Picus erythronotus, Hodg., India Forest Green Woodpecker.
E. Picus erythronotus, Hodg., India Forest Green Woodpecker.
F. Picus erythronotus, Hodg., India Forest Green Woodpecker.
Hemicelidon fuliginosus, Hodg.
Alsonax latirostris, Raffles.

C. cinclus, Sykes.
C. rothschildi, Adensa.
C. tenuirostris, Linn.
C. splendens, Vieill.

Sub-Fam. Garrulininae, Jays.

Garrulus bispinicularis, Vig.
G. lanceolatus, Vigors.
Urocissa sinensis, Linn.

Sub-Fam. Dendroicinnae, Magpies.

Dendroicita rufa, Scop.
D. pallida, Blyth.
D. Sinenesis, Latham.
Fregilus Himlayanus, Blyth.
F. ptilurus, Blyth.
BIRDS.

Sub-Fam. Sturninae, Starlings.

Sturnus vulgaris, Linn.
A. fuscus, Wagner.
A. cristatus, China.
A. Javanicus, Java.
Temenus maculipunctor, Linn.
T. Malabaricus, Ga.
T. Ilythlil, Jerdon.
Paeon roseus, Linn.

A. Ginignianus, Linn.

Sub-Fam. Lamprotornithinae, Hill Mynas.

Sarcoglossa apolota, Viguier.
Euloba religiosa, Linn.
E. intermedia, A. Hay.
E. philogenys, Bligh.
Graculus venerata, Temminck.
Amphileptes coronatus, Bligh.

Fam. Fringillinae, Sub-Fam. Plocine, Weaver Birds.

Phoenicurus Daya, Bligh.
P. manyar, Horwood.

Sub-Fam. Estrildinae, Munia.

Mania Malaena, Linn.
M. rubronigra, Hodg.
M. undulata, Latham.
M. pectoralis, Jerdon.
M. striata, Linn.

Sub-Fam. Passerinae, Sparrows.

Passer indicus, J. and S. Patridge.
P. salxicola, Vieill.
P. cinnamomeus, Gould.
P. pyrrhonotus, Bligh.
P. montanus, Linn.

Sub-Fam. Emberizinae, Buntings.

Emberiza pithyornis, Pallis.
E. cinia, Linn.
E. Streakhiyi, Moor.
E. forellana, Linn.
E. Huttoni, Bligh.

b. Yellow Corn Buntings.

Eusisza manolenocephala, Gmel.
E. anreola, Pallis and many others.

c. Crested Buntings.

Melophus melanotus, Gmel.

Sub-Fam. Fringillinae.

a. Grosbeaks.

Hesperiphaus stercoreus, Vogel.
H. affinis, Bligh.

b. Bullfinches.

Pyrrhula erythrocephala, Bligh.
P. erythraea, Bligh.
P. Nipalensis, Hodg.

b. Crossbills.

Lucia Himalayana, Hodg.
Hematoxia ojabilii, Hodg.
Chaunooscoetus papa, Bon.
d. Rose Finches.

Carpodacus rubicilla, Koup.
P. pulcherrimus, Hodg.

C. erythrinus, Hodg.
P. frontalis, Bligh.
Propseras rodopeus, Vigl.
P. thura, Bon.
P. rhochonous, Brandt.
P. rhodochromis, Vigl.

Sub-Fam. Alaudinae, Larks.

a. Bush Larks.

Mirafra Assimiae, M'Cdell.
M. alfinis, Jerdon.
M. cryptherops, Jerdon.
M. cantillans,

b. True Larks and Sky Larks.

Annomomines phaeocinera, Frank.
A. pinicola, Bligh.
A. ruficauda, Semper.
Pyrhrhula grisea, Scop.
Calandrella brachyactyla, Temminck.
Alaudula raiatil, B. H.
Oeceria penicillata, Gould.

c. Desert Larks.

Certhilauda desertorum.

ORDER, GEMILOIDE, Pigeons.

Fam. Columbidae, Sub-Fam. Columbinae, Wood Pigeons.

Palumbus casiotis, Bonap.

Sub-Fam. Columbinae, Rock Pigeons.

Palumbus Eversmanni, C. rupesiris, Pallis.
Columba intermedius, Strick.

Sub-Fam. Macropyginae, Cuckoo Doves.

Macropygia tasali, Hodg.
M. rupestris, Temminck.
M. rupestris, Temminck.

Sub-Fam. Turturinae, Turtle Doves.

a. Auridi.

Turtur rupicola, Pallis.

b. Maculicolles.

T. Cambystalis, Gmel.
c. Tigrini.

T. Suratensis, Gmel.
d. Streptopeliae, Ring Doves.

T. risoria, Linn.

T. humilis, Temminck.

Fam. Gouridae, Sub-Fam. Phapinae, Ground Doves.

Chalophas indicus, Linn.
C. Stephani of N. Guinea.
C. Javanicus, Gmel.

Sub-Fam. Tegellinnae, Mound Birds, Brush Turkey.

T. Cuvieri, N. Guinea.

Sub-Fam. Pterocilidae, Sand Grouse or Rock Pigeon.

Pterocles arenarius, Pallis.
P. exustus, Temminck.
P. Senegalus, Linn.

Fam. Phasianidae, Sub-Fam. Pavoine, Pea-fowl.

Pavo cristatus, Linn.
P. muticus, Temminck.
P. Polypterus Tibetana, Temminck.
P. lineatum, Hardw.

ORDER, RASORES, Game Birds.

Fam. Megapodidae, Sub-Fam. Megapodinae, Mound Birds.

Megapodus nicobaricus, Linn.

Sub-Fam. Talegallinae, Mound Birds, Brush Turkey.

Talegalla Lathami.

Sub-Fam. Pterocilidae, Sand Grouse or Rock Pigeon.

Pterocles arenarius, Pallis.
P. exustus, Temminck.
P. Senegalus, Linn.

Sub-Fam. Phasianidae, Sub-Fam. Pavoine, Pea-fowl.

Pavo cristatus, Linn.

BIRDWOOD, SIR GEORGE CHRISTOPHER.

381
cultural Society of Western India. In 1867 he was sent as Special Commissioner for the Government to the Universal Exhibition held in Paris. Addresses were presented to him on his finally leaving India in 1869, by the Asiatic Society, the Agri-Horticultural Society, the University of Bombay, of which he was then Registrar, and the students of Grant Medical College. On the proclamation of the Queen as Empress of India, January 1, 1877, he was appointed to the Companionship of the Star of India. He has devoted himself to writing on Indian subjects and on Indian art. In 1870 he contributed a paper to the Linnean Society on the Genus Boswellia. It is the record of the discovery of the frankincense trees of the Somali country, made by him in conjunction with Colonel Playfair, then Resident at Aden. In 1878 he wrote the Handbook to the Indians, published in the Paris Exhibition of 1878; and his Handbook on the Indo-Mahotan Arts of India has attracted abiding attention to the traditional handicrafts of India, and created a widespread demand for them all over Europe and in America. He is the author of the Vegetable Products of Bombay, a very valuable book on the economic products, which have gone through two editions.

BIRGO. HIND. Nima quaissioides.

BIJU GAR. one of the thirty-six royal races amongst the Rajputs, descendants of Rama through Lava, his second son. Their opponents, the Cuchwaha, also descend from Rama. The family state that they came from Rajo, the capital of Deoti, in the Mahcneri country. They settled in Dor country, then slaughtered the Mewati and Bhuehar, and are now dwelling from Rohilkhand to Muttra (Mathura), also in Shamsabad, Farrakhabad, Eyla of Mynpuri, and Gorakhpur; and a clan, now Mu. Menees, court sat at in Muzaffarnagar. All the doab clans long since became Pasis, some in the time of Ala-ud-Din, Khilji, but retain the Hindu title of Thakur, with many Hindu customs, as Thakur Akbar Ali Khan. — W.; Elliott.

BIRGUS LATRO, the Tatos of Philippines, the coconut crab, hermit crab, or robber crab of the Keeling islands, is a link between the short and long tailed crabs, and bears great resemblance to the paguri. In the Keeling islands they live on the coconuts that fall from the trees. The story of their climbing these palms and detaching the heavy nuts is merely a story. Its front pair of legs are terminated by very strong and heavy pinchers, the last pair by others narrow and weak. To extract the nourishment, it tears off the husk fibre by fibre, from that end in which the three eyes are situated, and then hammers upon one of them with its heavy claws, until an opening is effected. It then, by its posterior pinchers, extracts the white albuminous substance. It inhabits deep burrows, where it accumulates sufficient quantities of picked fibre of coconut husks, on which it rests as on a bed. Its habits are diurnal; but every night it is said to pay a visit to the sea, perhaps to moisten its branchee. It is very good to eat; and the great mass of fat accumulated under the tail of the larger ones, sometimes yields, when melted, as much as a quart of limpid oil. They are esteemed great delicacies, and are fattened for the table. The Birgos latro, by means of blood-vessels in its walls, breathes air directly. — Bikmore, p. 149; Darwin, p. 552.

BIRHASPATI or Birhispati, the planet Jupiter. BIRRERIA, one of the Chamar tribes. — Elliott.

BIRHOR, a forest race dwelling in the south of Chutia Nagpur and in the Hazaribag district. They live in the jungles on the sides of hills, in small water-tight huts constructed only of branches of trees and leaves. The men snare hares and monkeys, and collect the bark of the Bauhinia scandens for cordage, and the women bring the forest products to the weekly markets. The race claim relation with the Kharris, as offspring of the sun. Their number is estimated at not more than 700 for the whole Hazaribag district. They are quite migratory, wandering about from jungle to jungle, as the sources of their subsistence become exhausted. Amongst themselves they speak the Koi language, but can also converse freely in such Hindi as is spoken in this province.

The Birhor in Chutia Nagpur proper and Jashpur live in an equally wild state, but communicate with each other in a dialect of Hindi. They are a small, dirty, miserable-looking race, who have the credit of devouring their aged parents; and when taxed with it by Colonel Dalton, they admitted that their fathers were in the habit of disposing of the dead by feasting on the bodies; but they declared they never shortened life to provide such feasts, and shrank with horror at the idea of any bodies but those of their own blood-relations being served up to them. The raja of Jashpur said he had heard that when a Birhor thought his end was approaching, he himself invited his kindred to come and eat him. The Birhor brought to Colonel Dalton did not acknowledge this.—Dalton, Ethnol. of Bengal, 220.

BIRI, HIND. Erna Javanica.

BIRJA. HIND. Turpentine of Pinus longifolia; Galbhum. See Biroza.

BIRJEE PASS, one of the passes from Kunwar to the Outer Himalaya.

BIRJIA. HIND. One of the Ahir tribes.

BIRK, also Virk, a distinguished Jat tribe.

BIRKAIA. TEL. Cucumis acutangula.

BIRKAT-EL-HAJI, the Pilgrim's Pool, four leagues eastward from Cairo. It is a considerable lake, which receives its water from the Nile.

BIRM. DUK., Trichosanthes incisa. Cratavea nurvala; also C. tapia and Taxus bacatta.

BIRMM-BHAT, a branch of the Bhat tribe, whose office is the recitation of ancestral exploits at family festivals. They are hired for the occasion. They reside permanently in villages and towns, and do not lead a migratory life like some of the other Bhats.

BIRKOTA. HIND. Zizyphus nummularia.

BIROZA, HIND., also Ganda biroza and Sat biroza. Pinus longifolia.

BIRRA, HIND., also Bejar in E. Oudh. Gram and barley sown together as a mixed crop.

BIRRI. HIND. Picea Webbiana, P. Findrow, the silver fir; also Cleenatis Nebalensis.

BIRS NIMRUD, ruins six miles from Hillah, in the province of Baghdad, the site of the ancient Borsippa. According to Bunsen, the bilingual inscription found on the original spot by Rawlinson, on the walls of the temple, among the ruins of Birs Nimrud, teaches us that this building, which forms the nucleus of that mound, was the sanctuary of Maradach, erected by Nabopolassar.
and Nabukodonosor. The term is Turkish, and
means the tower or Akron of Nimrud. The Jews
style it Nebuchadnezzar's prison. It was con-
sidered by Niebuhr, Rich, and others, to be the
ruins of the temple of Belus. The Qamis gives
Birs as the name of a town or district between
Hillah and Kufah, which is still known, and is
conjoined with Babel in the Chalbic Sidra Ittaba
of the Sabceans, under the name of Barsaf; whence
the Borosippo of Strabo, and other ancient
authors, directly proceeded. — *Meynun's Travels,*
250, 252; *Husen,* iv. 414; *Rich's Babylon,* 34.

**BIRSON.** Anan. Gossypium Indicum.

**BIRT.** also Brita and Burt. Hind. A grant of
land under stipulations. It also means proprietary
right, endowment, maintenance, custom, or
privilege derived from the performance of offices,
religious or secular. It conveys an unreserved
proprietary right of inheritance, share, transfer,
and alienation in perpetuity. The Brita is the
owner of the soil. — *Elliot.*

**BIRTH,** second birth or 'twice born' are terms
frequently met with in writings on the Hindu
people, and indicate that the person to whom it is
applied has received the zonar or sacrificial
cord. In this respect it resembles the confirma-
tion of the Episcopal Church of England. The
term is also often used by Sudra Hindus to
imply conversion of heart. Hindus and Mahome-
dans have many child-birth ceremonies. The
Mahomedans of N.W. India, on the birth of a
child, show it a sword or knife, to ward off evil
from it. There, also, on the birth of a child among
the Sudra Hindus, a Brahman is at once sent for,
who announces the nakshatra or planet under
which it has been born. A Brahman or wife of a
Chamar, is also summoned, for the purpose of taking
charge of both mother and infant. She remains
for six days, and then leaves, after receiving
clothes and other perquisites. Her place is
supplied by a Nain, or barber's wife, who con-
tinues her service for a month or upwards. On
the sixth day the mother is allowed to bathe,
according to the time fixed by the Brahman, and
her friends visit her, bringing with them spices,
clarified butter, and articles of clothing for the
child. She also bathes on the twelfth day, and
is considered to be ceremonially clean. Her
friends now approach her person, which they are
permitted to touch, offering their congratulations.
During the whole of the first twelve days the
women of the neighbourhood gather themselves
daily at the house, and sing songs, called Sohar,
in honour of the occasion. If the infant is born
in the Mil-nakshatra, the woman remains impure
for twenty-seven days, as amongst the Brahmanas.
On the occasion of a birth, in a Chinese house,
large bunches of evergreens are suspended above
the house door. In Japan, annually, in front of
every house where a child has been born, a huge
paper fish, from 3 to 25 feet long, is hoisted on
a bamboo pole. Theatrical representations last
throughout the day.

**BIRTHWORT,** Aristolochia bracteata, Retz; A.
longa.

**BIRUNI,** the takhalus or non-de-plume of Abu
Khalu, author of the Tarikh-i-Hind, or history of
India, A.D. 1331. See Al Biruni.

**BIRUN-JASIF.** Pesh.? Artemisia vulgaris.

**BIRZUD.** Pers. Galbanum.

**BIS.** Hind. Myricaria Germanica, also Salix
alba, and S. tetrapetra. Kaia biaa, Hippoboe-
rhomboides.

**BIS.** Hind. Twenty. See Bisa.

**BISADE or Bassea,** in mediæval Greek called
Vesade, are alluded to in the tract of Palladins
de Moribus Brachmanorunum, written about A.D.
100. The same name is applied by Ptolemy to a
similar race inhabiting Northern India.

**BISAHAR MOUNTAINS,** an offshoot of the
Western Himalaya, extends for almost 60 miles
from the lofty cluster of Jumnotri peaks to the
Sutlej, below Shatul. The Bisahar peaks range
in heights from 16,092 to 20,916 feet, the highest
being the peaks of Jumnotri. Its passes are from
14,891 to 16,035 feet in height. The great mass
of this range is granite. The people speak a
Hindi dialect. See Ladakh; Thoji-chamno.

**BISATI.** Hind. A podlar, from Bisat, stock;
one who hawks his goods from place to place,
and keeps no shop for the exhibition of his wares.
He is commonly found seated on the ground, with
his goods spread out for sale on a mat before him.

**BISAYA,** a group of islands in the Eastern
Archipelago. Am.herokuapp is frequently gathered
in considerable lumps in the vicinity of Samar
and the other islands of the Bisaya group, as well
as mother-of-pearl, tortoiseshell, and red and black
coral; of the latter kind shafts occur as thick as
the finger and 6 or 8 feet long. — *Walton's State*,
p. 49, 39.

**BISCHOFFIA JAVANICA.** Bl. Red cedar.
B. trifoliata, Hook. *Styliodites trifoliatus,* B.
Andracea trifoliatus, B. *Microcerus Esperianus,* W.

This very large and valuable timber tree has a
wide range; in the Peninsula of India it ascends
the mountains to 5000 feet elevation, and it is
found in Northern India, Borneo, the Archipelago,
S. China, and the Philippines, but appears to be
absent from Ceylon; it is the only known species of
the genus. It flowers in February, and ripens its
seed in May and June. It has an immense
trunk; the timber is reddish, very hard and
durable, and much in use in some parts with
planters and others for building, planking, etc.,
but it is very little known or utilized. — *Beddome,*
*Pl. Sylle.*

**BISCUIT.**

Biscotto, Anglo-Hind. *Biscotto, galetta.* \( \text{Fr.} \)
Skibatbeak, DAY. *Biscotto.* \( \text{Port.} \)
Scheepsschuit, DUT. *Bort Saecher.* \( \text{Rus.} \)
Biscuit, \( \text{Fr.} \)
Bizeocho, galetta, \( \text{Ger.} \)

Biscuit, from the two Latin words, bis cocta,
twice baked, is an unfermented bread, which, if
properly prepared, can be kept a great length of
time, and hence its use as a common form of bread
sea. — *Told.* Faulk. See Bread.

**BISSEN.** Hind. A powerful tribe of Rajputs
in Cawnpur and the eastern parts of the N.W.
Provinces. Their chief is the raja of Silempur
Mahijahali.— *Elliot*; Wilson.

**BISEWARA,** a Hindu deity. Near this idol is
the temple of Anna Purna, the Indian Cybele, or
the Anna Perruna of the Romans. To heighten
the devotional feelings, her image is placed in a
dark recess, and is veiled from the public gaze.
It is of marble, and has its face covered by masks,
of which there are two, one of gold, the other of
silver.

**BISFAJ.** Hind. Species of Polypodium and
Adiantum.
BISH.

BISH. HIND. Any vegetable poison; Aconitum ferox, and other species.—Wall.

BISH-BANS. Beesha Rheedii, Kwanth.; Bamboo baccifera. See Bamboo.

BISHEN GANGA. On its bank is built Bada-rinath, in lat. 30° 46′ N., long. 79° 32′ E.

BISHKHAPRA. HIND. Primula speciosa; also Triantehma decandbr and Tr. pentandra; the latter is used in N. India medicinally. It spreads over the ground, and forms a circle nearly a yard in diameter.

BISH-KOPRA. HIND. Iguana. (Qu. Bish Kobra, or poison cobra.) A lizard found in Gujerat. It has been described as venomous. Ghoom, the Hindu patriot calls them; Tuckhub and Tuckoo in Bengal, the word Tuckoo being in consonance with the call or song of the reptile. In Baratich in Oudh it is called Bis-kopra. It is described as flat, about 1½ inches in breadth, and ½ inches in length, with a head very like a snake's in point of shape. It possesses fangs; and a small dark-greenish bag under the tongue, and in close proximity to the teeth, indicates the poison bag. It is a venomous-looking creature, and possesses to a remarkable degree the pugnacity of the venomous snake when assailed. All this seems a popular delusion, a venomous lizard being an anomaly unknown in creation.—Z.

BISH-KUCHOO. Beng. Arum fornicium, poisonous Calla.

BISHMAN. Beng. Colocasia esculenta.

BISHNAVI, a Hindu sect in Rohilkhand and the Doab. The author of the volume Tanbih-ul-Jahlin remarks that most of the teachers of the reforming Hindu sects, the Kabir panthi, Parma, Daud panthi, Sadh, Sat nami, Kalal panthi, and Bishnawi, have been Mahomedans. The Bishnawi are, however, said to have been founded by Bishno, a Tuga Brahman, a pupil of a Mahomedan faikar. Professor Wilson says the sect is of growing importance in some parts of the N.W. Provinces, combining Hindu and Mahomedan practices and belief, generally terming themselves shaikhs, but adding this title to a Hindu name. The Bishnawi is the most common sect in the desert and in Sind. In the desert, where 'they are a law unto themselves,' they wear the junooz or zonar; they cultivate, tend cattle, and barter their superfluous gli for other necessaries.—Elliot; Rajasthan, i. 319.

BISHOP, the episcopos of the Greeks, is a title given by Christians to the overseers of their churches. Bishop of Babylon is the title of the Romish prelate for the pushalk of Baghdad. The Protestant bishops of distinction in India, since the early part of the 19th century, have been Heber, Corrie, Middleton, Milman, Caldwell. Bishop's College, Calcutta, on the bank of the Hoogly, was established for the education of clergy for the Episcopal Protestant Church. Bigandet was an eminent Catholic bishop.

BISHOPS'-WEED SEED.

Anethum sowa, Roxb. | Sison Ammi, Linna.

Aymadum, | CAN. | Ajowon, | HIND. | Ajooan, | DUKH. | Oumun, | TAM.

These carminative seeds yield by distillation a very useful oil, which is given medicinally as a stomachic. The distilled water is used as a carminative in every nursery of Madras, under the name of omun water.—Ainslie, p. 269.

BISH TARAK. Beng. Argryia speciosa; also Lettsonia nervosa.

BISH-ul-YUKURUNI. ARAB. Menispernum covedolium.

BISH-UMBA. Beng. Cucunis colocythis.

BISHWA TULSI. Beng. Oeimium sanctum.

BISH-U. A fiscal division of a district paying revenue under the Hindu government of Orissa.

BISH. HIND. A measure of weight, commonly a vis; in Garhwal and Kamaon, a dry measure; in Rampur, a land measure.

BISH. HIND. Unclean.

BISINDI. CHEKAR. Gardenia retropesma.

BISIR. HIND. Pyrus Kamaonensis.

BISLOOMBAH, HIND., also Bisloombhee. Colocynthis; Cucunis pseudo-colocythis.

BISMISSAH means literally, in the name of God; and Mahomedans never commence, or leave off, eating without saying it. It is often used by them, also, in commencing a book, or on rising up or sitting down; and by the pious on every occasion, however unimportant. It answers to the Christian grace before meat. It is also used as a sacrificial prayer; directing the victim's face towards the Kaba, the person cuts its throat, ejaculating, 'Bismillah! Allah Akbar!' The camel is sacrificed by thrusting a pointed instrument into the interval between the sternum and the neck. This anomaly may be accounted for by the thickness and hardness of the muscles of the throat. Burckhardt makes the Mahomedan say, when slaughtering or sacrificing, 'In the name of the most merciful God!' But Mr. Lane justly observes that the attribute of mercy is omitted on these occasions.

Bismillah-ur-Rahman-ur-Rahim, in the name of the merciful and element God, is a frequent prayer of Mahomedans. Zamakshari, in his Commentary on the Koran, observes, Rahman denotes a more extensive idea than Rahim; for this reason people say, in speaking of God, 'The merciful (Ar Rahman) in this world and the next,' and 'the element or compassionate (Ar Rahim) in this world.' The correct pronunciation to a European are, Bismillah irrahman irrahcem. The words are first taught to Mahomedan children at the age of four years four months and four days, with certain ceremonies. It is their christening or initiation into the church.—Herk.; Burton's Pilgrimage, iii. p. 303.

BISMUTH. Mr. Piddington found bismuth in one of the ores sent him from the antimony mines near Mountein; it is found in connection with silver in Burma, and has been obtained in small quantities in Kashmir, from the Jammu territory.

—Mason; Pocrell, Handbook.

BISON. Gavseus gaurus.

Ban-gau, Vana-go, BENG. Jangli Khulga, | HIND. Kar-kouah, | CAN. Ban-parah, | MUNDAH. Gav-seus, | MAH. Gourai Gai, Gaur, | HIND. Katu Yoni, | TAM.

Gavceus gaurus, is the bison of sportmen in India. It inhabits all the large forests. In its range in the Western Ghats, or Syhad mountains, some of the bulls attain a height of 19 hands at the shoulder. It is not, however, a true bison. It is the Bos gaur of Traill, the B. asseal of Horsfield. Bibos cavirones, Hodgson, and Bibos assel, Hors, are, however, separated by some authors, and the term bison is very indiscriminately given to bovine animals to whom it does not pertain. The genus bison proper comprehends two living species, one of them European, now become very scarce, and
BIS PANTHI

verging towards extinction; the other American and, notwithstanding the advances of man, still multitudinous.—*Engl. Cyc.* p. 482; *Cat. Museum, India* II. See Botany.

BIS PANTHI, a Jaina sect.

BISRAMPUR, in the centre of the Sarguja State, in Chutin Nagpur, is the name given to a coalfield occupying an area of 400 square miles.—*Imp. Gaz.

BISRU. HIND. Cedrela toona; C. serrata.

BISSAHRI-PALA. HIND. Diospyros lotus.

The fruit is sweet and pleasant.

BISSEM KATAK, a Kandal Mutta in the Vizagpatan district, where the Meriah sacrifices were largely made.

BISSOI, Bishayi, or Bissay, in Orissa, a chief of a district; an officer of the Kandali race.

BISTANG or Bartang, of Kangra, an astringent used in diarrhoea and dysentery.

BISWA, Bisuan. HIND. In the Central Doab, the twentieth part of a bigha. Each estate or village is considered an integer of one bigha, which is subdivided into numerous biswa or biswans, to show the right of any particular villager. The As of the Romans was similarly used, thus, 'heres ex semuncia,' heir to 1-24th; 'heres ex decemta,' heir to 3ths; 'heres ex ase,' sole proprietor.—*Elliot.*

BITHU. HIND. Chenopodium, *sp.*; also *Amaranthus anardana.*

BITHUA. HIND. Heliotropium Europaeum.

BITHUR, a town with 8322 inhabitants, in lat. 26° 37' N., long. 80° 19' E., in the Cawnpur district of the N.W. Provinces, and 12 miles from Cawnpur. It was the residence of Dandhu Punt, styled Nana-Iato, also Nana Sahib, who instigated the Cawnpur massacre during the mutiny of 1857-59.

BITI. TAM. Species of Dalbergia.

BITIKH. ARAB. Musk melon.

BIT-LABAN. HIND. Black salt.

Sanchul, ... GUJ. | Sochul, ... HIND. Kala-namak, ... HIND. | Bit Noben, ...

A medicinal salt, prepared by melting together, for about 6 or 7 hours, in an earthen pot, an impure muriate of soda, called samur, and embibe myrobalans, in the proportion of fifty-six ounces of the muriate to twenty ounces of the dried myrobalans. It is met with in most Indian bazaars, and is used by native practitioners as a tonic in dyspepsia and gout, as a stimulant in chronic leucotism, etc.—*Faukner; Aulick.*

BIT-MIAKI. CAN. Bustard; Otis tarda.

BITTER HERBS, of Exodus xii. 8, Numbers x. 11. Of these the Jews mention five kinds,—buzareath, or lettuce; Usin endive or succory; *luna, probably tansey; Charab bivum or camile; and Meror, or sow thistle, or wild lettuce. They were ordered to eat the passover with bitter seris.

BITTERN, of Isaiah xiv. 23, xxxiv. 11, and Zephaniah xi. 14, has been interpreted to be a bitter, an owl, and an otter. The Arabic version makes it al-Hombara, the bastard.

BITTERS. In all parts of the world bitter sub-

stances are regarded as febrifuges. The beautiful Menyanthes trifoliate and the Tormentil are as popular in northern regions, as the Chirettas and its various substitutes in tropical countries of the east. They are mild tonics, improve digestion, and are admirable adjuvants of the true antipodece. The chief of the musclagious bitters is the Golnucha, the Bioblab, and Cetaria. Aromatic bitters were formerly in high repute as febrifuges. Bitters containing alkaloids or tannin comprise all the most important antipodece, and the most valuable of them all is quinine. No Indian tree comes so near the cinchona in its botanical affinities as the Hymenodictyon excessum.—*Ind. Ann. Med. Sci.* 1856.

BITTER WOOD, Picroma excessa, *Lil.* in the West Indies, and Quassia amara, *L.* in Surinam; the former of these being one of the sorts employed to make the bitter cups, which communicate a taste to water left in them. Quassia chips are used medicinally as a tonic, etc.

The bitter wood tree used for boats in the neighbourhood of Amherst, Mr. O'Byle states, is exempt from the attack of the teredo. Its leaves and fruit indicate it to be a species of Ternstedtia, and of the section Pentapetala. The good timber and bitter bark assimilate it to Roxburgh's *P. arjuna,* but the foliation is different.

BITTURNEE, a river near Akoo pudds in Balasore. It is the Hindy Styx.

BITUMEN, Asphalt, petroleum. Kier, qier, ... ARAB. | Asphaltum, ... LAT. Shih-tsiih, ... CHIN. | Bitumen Judaicum, ... MALAY. Shih-lau-yu, ... Malak. Judenlym, ... DUT. | Nift-rumi, ... PERS. | Bitume de Tonkin. | Bitum de Tonquin. Judenpech, ... GER. | Asaf, ... RUS. | Umqur, ... HEB. | Asaflo, ... SP.

Bitumen is a name applied to several combustible mineral substances of different consistence and character, such as mineral pitch, earth, oil, petroleum, naphtha, maltha, and wax, the properties of which, with regard to fluidity and colour, greatly vary. At Hilt, the Is of Herodotus, near Babylon, it is very abundant; and ancient geographers suppose that the Babylonians obtained here the bitumen used as cement for fastening their bricks. Arrian says that the temple of Belus was of bitumen cemented with asphaltus. It is a product of the districts in the N.W. of Persia, where, at the town of Ai, the momai is produced. Several places in China, Burma, and Yunnan produce petroleum,—in China in the provinces of Yen-nung-fu, and Canton, and in the S.E. corner of Sech-uen. Hit is mentioned by Herodotus as the great place for bitumen, and in Lower Mesopotamia boats are still smeared with it.—*M'Culloch; Skinner,* ii. 113; *Mipnum,* p. 166; *Faukner, Eng. Cyc.*

BIXA ORELLANA.
There are two varieties of this small tree, α. Carthboca, with rose-coloured flowers, cultivated in the West Indies, and β. India, with white flowers, cultivated in India. In the native of India the flowers are white, and the immature capsule green; while in the plant from West Indian seed the flowers are rose-coloured, and the immature seed-vessel red; and the eastern plants do not furnish so much or of so good a colour. The plant is cultivated in Singapore, in Mysore, largely all over Pegu, and is a favourite dye with the Burmese; it is grown in Dacca, the Malac Peninsula, the Eastern Archipelago, the Hawaiian islands, Tongatapu, Rio Janeiro, Peru, and Zanzibar; the shrub rises to the height of seven or eight feet, producing oblong heavy pods, somewhat resembling those of a chestnut. Within this there are generally thirty or forty irregularly-formed seeds, which are enveloped in a pulp of a bright red colour, and a fragrant smell; the pulp forms the arnotto of commerce. The dye is usually prepared by macerating the pods in boiling water. When they begin to ferment, the seeds are strongly stirred and bruised with wooden pestles, and the seeds are set down in red slops. This process is repeated several times, till the seeds are left white. The residuum is dried in the sun, and made up, while soft, into balls or cakes of 2 or 3 lbs. weight. The dry hard paste is the best of all ingredients for imparting a golden tint to cheese and butter. The Spanish Americans mix it with their chocolate, to which it gives a beautiful rich hue. It imparts a pale rose colour to silk and cotton. The imports into Great Britain of arnotto for home consumption are from 200,000 to 300,000 pounds per annum, price 1s. the pound.—Simmonds’ Commercial Products, p. 448; Mrs. Roxburgh, Voigt, McLeddian. See Dyes.

BIYAWAK. Bewak, also Manawak, Malayian iguana.

BIYOM, Lepteromyx magnificus, Hodgson, Blyth.

BIYOM CHIMBO, Sciuropus caniceps.

BIYU-KANTYEM, Biot. Talpa mierura.

Biyu-Khawar, Tel., Melliwora indica, Jerdon.

BIZUDA-KHWAN. Hind. Astragalus multiceps.

BIOO. Beng. Dillenia pentagyna.

BJORNSTJERNA, Count, Swedish ambassador to England; author of the ‘British Empire in the East.’

BLACK.

Aswad, ARAB. Niger, LAT.
Meh thee?, BURM. Itam, MALAY.
Net thee? Nek Nek, Siah, PER.
Noir, FR. Kara-karpa, TAM.
Soor, NEP. Kara-kalla, Tel.
Kala, HIND.

The commercial substances commonly so named are ivory black, lamp-black, and smoke-black. The last is prepared by the combustion of different resinous bodies, especially of pitch, burned in large vats under a dome or chimney, within which cloths are suspended, to which the soot becomes attached. It is employed in the manufacture of printers’ ink, and of blacking for shoes, etc. Amongst Mahomedan women, the lamp-black, Kajil, is largely used for painting the eyelashes. Indian ink or China ink is made from lamp-black. Many animals, minerals, and vegetables of this colour have the term prefixed, as—

Black bird, Merula, sp.
Black bear cat, Arctiae binotaurum, Jerd.
Black buck, or Indian antelope (Antilope cervicapra).
Black cat, Felis aurata, Temmin.
Black cheeta, or black panther, Felis pardus, Liion.
Black dammer tree, Canarium strictum, Roxb.
Black fish, the smaller whales of the genus Phoecena.
Black hellicere, Hellicerus aiger.
Black Miss, See Hira Kasis.
Black partridge, Francolinus vulgaris.
Black sesamum, Sesuam orientale.
Black swan of Australasia, Cygnus stratus.
Black-naped hare, Lepus nygittos, F. Cuv.
Black popper-vine, Piper nigrum.
Black wolf of Tibet, Canis chaco, Gray.

BLACKER, Lieut.-Col. V.A., Quartermaster-General of the Madras Army, author of Memoir of the Operations of the British Army in India during the Maharrat War in 1817–19.

BLACK HOLE of Calcutta was a room at the southern end of the barrack of the old fort. By order of nawab Suraj-ud-Dowla, in June 1756, 146 British were thrust into that room, 18 feet high, 18 wide, and 14 deep, and before morning 123 of them had perished. The Black Hole was at the corner of tank square, close to the place where, in 1834, was Lyell, Mackintosh, & Co.’s office.

BLACKING, shoe-blacking.

Noir (de cordonnier), Fr. Nero da unger-le-scopare, Ger.
This is used in blacking leather articles. The principal ingredients are oil, ivory, gall, copperas, black.—Tomlinson.

BLACK LEAD, graphite; plumbago.
Pottl or Pottlott, DUT. Pombagino, Corezzo, Fr.
Plomb-dc-minne, Karri Jam, TAM.
Pote-lot, Fr. Nalla Sisam, Tel.
Reislei, Ger.

This mineral is of a dark steel-grey colour, and a metallic lustre; it is soft, has a greasy feel, and leaves a dark-coloured line when drawn along paper. It is a carburet of iron; and when pure, sells at 30 shillings the pound. It is used in the manufacture of pencils, for making crucibles, in compositions for protecting iron from rusting, and for diminishing friction in machinery. Good plumbago is procured near Bawrdlawle, in Cumberland; it has also been largely worked in America; Ceylon largely produces it, also Travancore and Vizianagram. It occurs in veins, and in kidney-shaped lumps, in gneiss, mica slate, and their subordinate rocks, but that at Bawrdlawle occurs in transition slate.

Black Lead pencils. Pencils.
Pothootpen, DUT. Karra-naschii, Rus.

Pepereno, IT. Nalla Miriului. TEL.

This small, pungent, aromatic fruit is the product of the Piper nigrum, grown in Malabar, Malacca, Siam, and on the islands of the Archipelago. See Pepper; Piper.

BLACK RACE, the Kar-a-chi.

BLACK SEA, on the N.W. side of Asia, forms in part the boundary between Asia and Europe.

BLACKSMITH. The Lohar, or blacksmith of India, is one of the five artisans who wear the zonar, or pottu, or sacred string, the other four being the goldsmith, stone-cutter, carpenter, and coppersmith. The blacksmiths of India who make iron, obtain a great heat by throwing a quantity of (bhusa) rice-chaff on the top of their fire. The chaff being composed of silica and vegetable matter, the latter burns, and so forms potash, which alkaline combines with the silica and forms a glass or vitreous cake. The coal-worker throws dried cake of water on the fire to make the mass cake.

BLACK SOIL, or black cotton soil, or cotton soil of Southern India, is met with in great tracts of country. It is remarkable for permanence of fertility, yielding crops without manure for a thousand years. It is supposed by some to be decomposed trap, but others regard it as a true alluvium, deposited from still water. It is called regur in Hindi. During the dry season, it rends into great gaping cracks, but it is highly absorbent of moisture, and very retentive; and during the rainy season it presents a uniform glazed surface of black tenacious clay. It can absorb more than one-third of its entire weight of water, and it has in a very remarkable degree the power of absorbing moisture from the air. Thoroughly dried cotton soil in one night absorbed 7-99 per cent. of water. It is the soil in which cottons, sorghum, wheat, and maize are largely grown. In many parts it is 15 and 20 feet deep, and is to be seen everywhere in the Peninsula of India in patches of greater or less extent, but it covers the whole surface of the greatest outburst of volcanic rocks in the world, in the western part of the Dekhan, Central Provinces, and Berar.

BLACK STONE, the Hajar-ul-sawad of the Mahomedians, now built into the wall of the Kaba at Mecca, is said to have fallen from paradise with Adam. It is kissed by each pilgrim.

BLACKWELLIA CEYLANICA. Gardner. B. tectandra, W. I. | Leeyang-gass, SINGH. |
This tree grows in the moister parts of Ceylon up to 3000 feet. It attains a height of 30 to 40 feet.—Thor. Zeyl. i. p. 79.

BLACKWELLIA TOMENTOSA. Vent. The Myout kyan of the Burmese, a tree of British Burma; wood tough, of a light yellow colour, used for the teeth of harrows. A conic foot weighs 56 lbs. The average length of the trunk to the first branch is 70 feet, and average girth at 6 feet from the ground is 6 feet. B. spiralis, festiva, proppucha, Cochin-Chinensis, paniculata, Nepalensis, and padillorn also occur in India.—Volgt; Dr. Brandis.

BLACKWOOD, Rosewood.

Bitt, CAN. | Era potta, TAM.
Siam, GEI. | Bitti-marana, TAM.
Sib, Sit Sal., HIND. | Iruguva chetta, TAM.

This is a commercial term for several dark-coloured timbers, and every locality has a wood which is known by this name. The timber known in Britain as East Indian blackwood is from the Dalbergia latifolia of the Malabar coast, where it grows to an immense size. The wood of the trunk and large branches is extensively used for making furniture; it is heavy, sinking in water, close-grained, of a greenish-black colour, with lighter coloured veins running in various directions, and takes a fine polish. Bombay acacia-wood, however, is probably the timbers both of Dalbergia latifolia and D. sissoo, brought from Cochinn and other places lower down on the Malabar coast. It sells for about the same price as teak. It is a brittle, open-grained wood, not at all a favourite with cabinet-makers of England, where the highest prices ever realized for it in the state of log were about £10 per ton. The principal furniture-dealers in Bombay are Parsees, mostly from Gujerat. The pattern meant to be carved is first carefully drawn on paper; then on the wood. The tools used are the native adze, chisel, and drill; the centre-bit and other tools of English pattern, from which so much assistance might be obtained and noted. The general design of the various pieces of furniture is mostly excellent, the patterns elegant and tasteful; the finish for the most part is poor, the joinery always execrable. Concealed joints never seem to be thought of; pins which might be kept out of view are made as conspicuous as possible; and great clumsy screw-nails, which might, without trouble, be hid, are fully exposed to view. Considerable quantities of blackwood furniture are sent to Britain annually by residents in Bombay for their own after use, or for the service of friends. It is packed up without being jointed or polished, and is put together by English workmen, who, it is believed, think but lightly of its merits. The principal furniture shops in Bombay keep from five to ten workmen each, and probably turn out Rs. 25,000 to Rs. 30,000 worth of furniture amongst them annually.

BLACKWOOD’S HARBOUR is a sheet of water between Armagon shoal N. of Madras, and the mainland.

BLADDER WORM, Measle. See Cysticerus. BLAIR, Lieutenant Archibald Blair, R.N., in 1777 and 1795 made a circuit of the entire Andaman Archipelago, and embodied the result of his researches in general charts, plans, and a report containing useful information for mariners. He surveyed also the Kattyawar coast, Salsette, and other patches here and there.—Marine Survey.

BLANAH. MALAY. In Burma, a well-known palatable fish.

BLANKET.

Bett decke, Windel, GER. | Coperta di lana, IT. | Kamal or Kamil, HIND. | Manta, SR.
A soft, loosely-woven woollen stuff, used as a bed covering by night and cloak by day. Most of the blankets or Kamli manufactured in India, are of a coarse description, and only used by the poorer natives. Blankets are manufactured in Mysore from half-bred merino wool, half-bred but wool: warp wool Mutilum wool, common
country wool and Mundium wool. Those of Kachnar sell well. The white blankets made at Rampur in the Western Himalaya, and known as the Rampur chad, are sold in London at £3 and upwards. They have a sale in Great Britain. The Kamli or cumblies made in the Ceded Districts are of a superior texture. A woollen manufactory is working at Bangalore.

BLATTA ORIENTALIS, the cockroach; a very troublesome insect in houses and in ships; lodging in cupboards, presses, and amongst books, and soiling by their exuvia whatever they approach.

BLATTI. MALEAL. Somneriata acida.

BLEACHING.

Nikharna, . . . Hind. Salary panukiramu, TAM. Kumbi karna, . . . , Nana padam, . . . Tel.

In India, the substances present in goods which oppose the bleaching process are first removed by scouring in an alkaline lye; afterwards natives usually dungen the cloths which are to be bleached, and then steam them over the mouth of an earthen pot set in a clay fireplace. But little science enters into the process, and generally good results cannot be expected from the water in which they are scouring being overcharged with lime. Bleached cloth, particularly of tents, is far less durable than that which has merely had the dressing and finish thoroughly removed by washing. This is easily explained, as cotton goods have a certain resinous substance in them that obstructs the absorption of moisture. Besides the removal of this, cloth sustains much damage from the abuse of the caustic lye bath. Cloths should be scourd more than once at intervals during the process of bleaching, because many of the substances cannot be removed but after exposure to the light and air.

Wool, also, is protected by a peculiar varnish, exceeding three per cent. of its weight, which must be removed by scouring. Warm water must be employed. Wool is further bleached by sulphurizing, which is done by pouring in a large number into the water and by the sulphuric bath. In either case it acquires a brittleness which must be removed by washing in soap and water.

Several seats of the cotton manufacture, such as Dacca and Baroach, are famous for their bleaching. This has been ascribed to the excellence of the water in the neighbourhood of these places. At Dacca fine muslins are merely steeped in water; other cloths are first washed. But all, of whatever texture they may be, are next immersed for some hours in an alkaline lye, composed of soap and of sajji matte, that is, impure carbonate of soda. They are then spread over the grass, and occasionally sprinkled with water, and when half dried are removed to the boiling-house in order to be steamed. This is effected by twisting the cloths into the form of loose bundles, and placing them upon a broad clay platform, which is on a level with, and surrounds, the neck of a boiler sunk into the ground. The cloths are successively laid in circular layers, one above the other, around a bamboo tube, which is kept upright by means of transverse supports projecting from it, the whole forming a conical pile that rises to a height of five or six feet above the boiler. The fire is kindled in the excavation below, and as the ebullition of the water proceeds, the steam diffuses itself through the mass of the cloths above, swelling by its high temperature the threads of the latter. The operation of steaming is commenced in the evening, and continued all night till the following morning. The cloths are then removed from the boiler, steeped in alkaline lye, and spread on the grass as on the preceding day, and again steamed at night. These alternate processes of bucking and crowthing, as they are technically called, during the day, and of steaming at night, are repeated for ten or twelve days, until the cloths are perfectly bleached. After the last steaming, they are steeped in clear filtered water acidulated with lime-juice, in the proportion generally of one large lime to each piece of cloth. Lime-juice has long been used in bleaching in all parts of India; and Tavernier describes Brouch as famous as a bleaching station on account of its extensive meadows, and the large quantity of lemons reared there. Mixed fabrics of cotton and Muga silk are steamed in water mixed with lime-juice and coarse sugar, which latter article is said to have the effect of brightening the natural colour of the silk.—Royle, Arts, etc. of India, 3rd edition, p. 793.

BLEEKER, Dr. P. A. Dutch naturalist, who from 1845 to 1860, in numerous contributions on the fishes of the Eastern Archipelago, added greatly to the stock of knowledge of the fauna of the region from Penang to Japan. He gave a catalogue of 780 species of fish found at Ambonaya.

BLENDJU, in Java, a substance prepared as a paste, frieet with oil, and eaten with coffee.

BLENNIDJ5, of the Blennies, the Blenby family of fishes, comprising many East Indian genera. Blennies, with protruding eyes, are to be seen hopping about the muddy banks of rivers, and perching on stray logs like frogs.—Adams, p. 67. See Fish.

BLEERONG or Bulerang, May. Sulphur.

BLETTIA HYACINTHIANA. R. Br. One of the Orchideae, a plant of China and Japan, with bright purple flowers.—Veitch, 625.

BLIGHT. Sclerotium, Br., or Cupania sapida, Caul. The Akse Boble, or the Sapindaceae, has been introduced from Guinea into India. It rises 30 to 40 feet. The fruit has the size and shape of a pear, and is of a red colour. It is much esteemed in Guinea and the West Indies. The genus was named after Captain William Bligh, R.N., master of the 'Bounty,' whose crew mutinied, and he and the officers took to the boats.

BLIGHT. The grains or ears of nearly all the cereal grains are subject to several well-marked diseases, resulting from attacks of parasitic fungi, animalcule, and insects, causing great losses to the agriculturist. The liability of the seeds of grasses to parasitic infection is explained by the large amount of nitrogenized matter contained in them, and to their softness of texture. The diseases generally alter the perisperm, sometimes destroying it altogether; and three minute cryptogamic plants are the most frequent, viz.:

Curvula Uredip, carries attacks wheat, usually sparses the pericary, but changes the perisperm into a black fetid powder. The component globules are devoid of pellicles. The disease is highly contagious.

Carbon or smut, Uredo segetum, occurs under the epidermis, is composed of spherical globules, attacks all the cereal grains indiscriminately, and resembles black dust.

Ergot or spur, Sclerotium clavus, is elongated.
BLIMBI. MALAY. Averrhoa bilimbi. The fruit of the plant known as the tree cucumber; has various terminations, Blimming basin, Blimming bulu, Blimming teres, perhaps varieties. Blood manis, Averrhoas carambula, Lion. Blimming saga, Cicca disticha.

BLISTERING BEETLES of India, Pan-man, CHIN., consist of several species of Mylabris. About 180 lbs. forwarded by Dr. Birdwood to test the market value in England, were sold there at 3s. 8d. per lb. Several kinds of beetles, when applied to the skin, cause great irritation, inflammation, and blistering. These consequences are occasioned by an acid principle called Cantharadin contained in these insects. The ancients chiefly employed two species of Mylabris, one of which, the Mylabris cichorei (vern. Telini, HIND.), has been used for ages, and is so at present by the European and Native physicians of India and China. The Cantharis vesicatoria, or Spanish blistering fly, is the species official in the British Pharmacopoeia. Its colour is bright shining green or bluish, length about 4ths of an inch, breadth 4th to 3d of an inch. It occurs in the south of Europe generally, especially in Italy and Spain, and is found occasionally in England. The blistering flies of India are chiefly the Mylabris or Meloe cichorei, the Cantharis gigan, and the Cantharis violceas. The Mylabris cichorei is common in the neighbourhood of Dacca, in the Hyderaband country, in Kurnool, and numerous other localities. The insect is about an inch long and 3d broad; the elytra or wing covers are marked with six cross stripes of deep blue and russet brown. The Buprestis of ancient writers is met with in the bazars under the name of the golden fly (sonamukhi). The Cantharis violceas is often mixed with species of Meloe, and is found in the bazars. The Telini fly, if procured before the mice have commenced its destruction, yields on an average one-third more of cantharadin than the Spanish fly of the European shops. The blue fly is of uncertain strength; the Buprestis, in all the specimens obtained, was quite inert. A species, called Meloe triantheme, from its being usually found on the Trianthema decandra (Biscopra, HIND.), was described by Dr. Fleming. A tincture, acceous plaster, and ointment of the Meloe chichori are given in the Bengal Pharmacopoeia. Some prejudice exists against the article, on account of its alleged excessive severity of action, owing to the presence of a greater quantity of cantharaid than that contained in the common fly. Diluting the tincture, and adding to the proportion of lard and wax in the plaster and ointment, perfectly assimilate the action of the indigenous and the imported insects. At the Madras Exhibition of 1866, specimens of Mylabris postulata and M. punctum were exhibited by Mr. C. Collas of Pondicherry. Both insects are found in large quantities at certain seasons all over Southern India.—O'N'Sh.; Dr. Hunter in Tr. As. Soc. v. p. 216; Madras Exhibition. See Cantharides; Insects.

BLOOD.

Blood for blood, the vedette of the Italian is the law of most rude populations, but most of the settled races occupying the south and east of Asia are dwelling under civil laws administered by officers of justice. The Vedas, which all Hindoos acknowledge, enjoin the offering of bloody sacrifices to the gods, and amongst many Saiva sectarians this rite is continued. The non-Hindu aboriginal races also offer bloody sacrifices to demons, and to the Gnamma devata, or village tutelary deities. The investing tika mark of chieftship, placed on the forehead of their Rajput ruler by the Bihl, is blood drawn from the arm of a Bihl. The Karen of Burma and the Kyan of Borneo, in swearing brotherhood, drink water in which the blood of the parties has been mixed. The old Mongolians mingled gold and blood in their cup of peace. The custom of the old Hungarians in their Allmos (alliance), was to open reciprocally a vein in the outer arm of the drinker and pour the blood out of one cup. The Turks practiced the same observance in their alliances with the Hungarian Christians, as is noticed by Petechiv's History.

Blood-coloured water is noticed in Exodus vii. 19.; and Homer alludes to blood rain. In the Red Sea, periodically, a blood-red colour is observable in the water; and a similar occurrence was noticed at Pincenium, B.C. 323.; in Italy, A.D. 787.; in the Volinian lake, B.C. 208.; mentioned by Livy; in a Venetian lake, B.C. 586.; in Lake Wan, A.D. 1110. Pliny mentions a lake near Babylon which had a red colour during eleven days of summer, possibly from a red conferva.

Blood-money, Duja, ARAB., is payable in Lahej by a criminal to the relatives of the murdered person; for wilful murder, 100 female camels, or 1000 Venetian sequins; manslaughter, 700 dollars; death by misadventure, the culprit is not imprisoned, but is allowed to appeal to the civil courts, and escaping from a cruel death, which the nearest relative inflicts; should the nearest of kin be a child, the punishment is postponed until he reach manhood.

Blood - showers is a term given to substances of a red colour which occasionally appear; also what have been called showers of pearls, of manna, of spiders, of toads, of fish. In India, in 1825, a shower of red fluid at Jeyesulmire is mentioned in the Asiatic Journal. In 1828, very heavy rain fell at Angur in Kandesh, accompanied by hail, single pieces of which weighed as much as half a seer. This was followed by drops of red rain, descending from the sky. In 1855, a shower of red rain, or of flesh, as the natives called it, fell near Shikarpur in Sind. Another shower fell in the Jellaisore district over an expanse of above fifty bighas. The carmine colour of snow has been ascertained to be due to a kind of algae, called Protococcus nivalis or Protococcus hematococcus. Until lately, much perplexity was occasioned by the same form of organism sometimes appearing red, sometimes green. It is still, indeed, matter of question whether the protococcus or the hematococcus are most nearly allied to the vegetable.
or to the animal kingdom. It is a simple cell, which lives for itself and by itself; and is dependent upon nothing but a due supply of matter and the appropriate stimuli for their continuation and growth, and for the due performance of all its functions, until its term of life is expired. Klaproth in 1815 ascertained that the red appearance in the sea was produced by an albuminous vegetable matter.—*Jum. Ed. Journ.* ii. 830-31; *Captain Prideaux, the Arab Tribes; Forbes; Vambery, Bohkara, p. 151; Moor, Buat, Cat.*

**BLOODSTONE.**

This quartzite mineral is of a deep lead-green colour, and has red spots scattered through it, caused by iron. Masses of it are obtained in the trap formation of the Dakhan, but it is chiefly brought to Bomhoy from different parts of Gujerat, etc., and is re-exported largely to Europe. It is used for seals, rings, and brooches.—*Madras Museum.*

**BLOOD- SUCKER,** a name applied to the Ciatoles viridis, Gray, G. opiomachus, and C. veri- coker, and also to Sitana Ponticheriana Cuv. They are all unsightly reptiles, with large heads and powerful jaws, so that even the bravest crow attacks them cautiously. There are 11 species of Ciatoles and two of Sitana in India. Mahomedans dislike the blood-sucker, as the creature often raises and lowers its head in the manner of these religionists when at prayer. See Ciatoles; Reptiles; Sitana.

**BLOOD-WOOD** of Port Jackson is a species of Eucalyptus, sp. The blood-wood tree of Norfolk Island, Baloghia lucida, *Lindlitcher,* grows to 40 feet in height. It yields a blood-red sap, which has been utilized as a paint. It is obtained by an incision 8 to 10 feet long, tapering to a point; a gilt to a pint from each tree.—*Von Mueller; G. Bennett,* p. 346.

**BLOW-PIPE** is in constant use in India, in the arts, amongst goldsmiths, tinmiths, bangle-makers, and others; the cook-room of every house also has one of bamboo. The Malay races also use the blow-pipe, sumpitan, for projecting pens, small pellets, and wooden and iron arrows. The accuracy of fire with these is great; little birds can easily be destroyed, but even large birds like the crow can be brought down by the earthen pellet from a blow-pipe. It is used as a weapon by the Malays of Borneo, by the Lao-Ti on the Meckong river, by the Orang-kubit and the Sennang on the Peninsula of Malacca. The paradise birds are killed and stunned by wooden arrows from the blow-pipe. The Indians on the Amazon use it, and, it is said, can throw the arrow to 250 feet.—*Pecheh.*

**BLUBBER.**

Blubber is the thick fat or adipose of the whale or the porpoise. In Europe, it is boiled down into train-oil. It is eaten by the Eskimo and the sea-coast races of the Japanese islands, and of the Kurriles.

**BLUE DYE,** Marsdenia tinctoria.

Blue dyeing rosey, Nerium tinctorium.

Blue fish, Coryphaena socialis.

Blue gum tree, Eucalyptus, sp.

Blue noddy or reef bird, Sterna cerula, Bennett.

Blue petrel, sperm bird, Prion pachyptila.

Blue blow. It is worn by the Jews of Egypt, Syria, Palestine, and Central Asia.

**BLUE MOUNTAIN,** a peak in the Yoma range, at the N.W. of the Akyab district in British Burma. It is in lat. 22° 27' N., and long. 93° 10' E., and rises to 710 feet.

**BLUESTONE.** Sulphate of copper. Cupri sulphas.

This salt is not known to occur in nature, but it is largely made in several parts of India, by boiling sheet copper or copper filings in sulphuric acid, and evaporating the remainder, on which the crystals form. It is also obtained from copper ore by pulverising the ore, which is then thrown into earthen vessels filled with water, and, after filtration, the crystals form. The colour is a beautiful blue, and it is largely used in surgery and in the baths of Mc Culloch.

**BLUMEA BALSAMIFERA.** *De Cand.*

It grows in the Konkans, Assam, Malay Peninsula, Moluccas, and Java. It is used as medicine and as a seasoning for food, and has a stimulo-diaphoretic action.—*Roxb.*

**BLUMEA GRANDIS.** *De Cand.*

Conyza grandiss, Wall. | Pung-ma-theing, . . . . BURM.

Abundant throughout the Tenasserim Provinces, growing six or eight feet high, with leaves like mullen, which, when bruised, emit a strong colour of camphor. The Tavoyiers informed Dr. Mason that they made an impure camphor from the weed by a very simple process; and Mr. O’Hiley of Amherst made more than 100 pounds, which he sent to Calcutta, and it was reported 'in its refined form to be much superior to all its properties with Chinese camphor.' The plant is so abundant, that these provinces might supply half the world with camphor. Wherever trees are cut down this weed springs up, and often to the exclusion of almost everything else, so that an old clearing looks like a field under cultivation. B. lacera, D. C., of all the East Indies, is used in dyspepsia.—*Roxb.; Mason. See Camphor.*

**BLUME, CAR. L.,** an eminent Dutch botanist. He was educated as a medical man. In Java, in 1823-24, he conducted a botanical exploration, and in 1825 he commenced the Bijdragen tot de flora van Nederlandsch, Indie, and, on his return to Holland, the flora Javae was begun in 1828, and the Rumphia in 1835, each of which consists of several folio volumes, illustrated with a profusion of admirably-coloured plates. These are amongst the most splendid and learned botanical works of the age. The *Museum Botanicum Lugduno-Batavum,* a periodical with outline plates, commenced in 1852, contains careful descriptions of genera and species of Java, Borneo, Moluccas, and Japan plants.—*H. et T.*

**BLUNJIPAT.** BENG. | Cochorus oligotinus. | BLYTH, EDWARD, for many years Curator of the Museum of the Bengal Asiatic Society, the

BO or Bodhi, also Bodhi-druma, a tree sacred to a Buddha or Tirthankara. See Bo Tree.

BOA or Boc, sometimes called Poam by the people of Malabar, has wood much like the timber called in Ceylon Palari or Palsi and Irambu, or, as known by the English term, ironwood. It is a strong, heavy wood, and is considered durable. It grows from 20 to 30 feet high, and from 12 to 30 inches in diameter.—Edge, M. and C.

BOA. Linn. A genus of innocuous serpents, of the family Pythonide, order Ophidia, sub-order Innocues. The genus, as defined by Linnaeus, belongs to the New World; but in India the term Boa and Boa-constrictor is applied to species of Python in the tropical parts of South-Eastern Asia, some of which are of considerable size, and able to kill large four-footed animals. A female python 20 feet long, captured in Ceylon when in a torpid state, was taken to the London Zoological Gardens, and before the end of six years it had grown to 29 feet in length, and was as thick round as a man’s thigh. It was very vicious at all times, but at length destroyed itself by swallowing a blanket. The pythons on the western coast of India and in Ceylon are amongst the largest met with. The organisation of the boa and pythons is directed to the slaughter of their prey by compression, and to this end are given to them enormous dimensions and power of muscle. When a boa dashes at the prey, it generally preserves its hold of the tree by a coil or two towards the tail; it seizes with widespread jaws, and throws with rapidity the folds of its body round and round its victim. Tightening, and crushing rib and limb when the body is pressed, the folds remain so until life is pressed out. The serpent then pauses for a few moments. Soon, however, it begins to touch the carcass gently with its muzzle; the jaws again and again dilate, until the skin is strained so tight that every scale is isolated. Then grasp following upon grasp gradually and irresistibly engulfs the body, which, in its passage through the folds, has been compressed and attenuated into the most convenient possible form for this final opera-

tion. Death inflicted by such overwhelming action is almost instantaneous, in small animals especially.

BOAR or Bod, a tributary state in Oriassa, with an area, including the Kandhl-Mals, of 2064 square miles, and a population in 1872 of 108,868. The aboriginal tribes are the Pan, Kanth, Dimal, Golah, Sud, and Kent. Bod, the chief town, is in lat. 29° 50’ 20” N., and long. 84° 21’ 41” E. The reigning family is Kshatriya Hindu.

BOALEE. Beng. The jawbone of this fish is used in carding cotton for the Dacca muslins, as a substitute for the hecket and hand cards.—Royle.

The boar is the male of the hog or swine. Of these, in Asia, are seven wild species, viz. Sus scrofa, Linn. var. S. indicus, Bengaleensis, Andamanis, Malayanesis, Zeylanesis, Babyrussa, and Pappensis. When the wild boar of India, the Sus Indicus, has the run of cultivated lands, it eats daintily; but when stinted for food it will revel on a dead camel, and when pressed by want it prowl around the villages in search of refuse. The wild boar of India is shot and hunted with dogs by natives, but British sportsmen hunt it with the horse and spear; and of all the wild creatures in India, the boar exacts from its pursuers the greatest care.

The Sus Indicus of Pallas, Sus scrofa of other naturalists, the common wild boar, is supposed to be the parent of one of the two groups into which domestic pigs are arranged. The Sus scrofa group or breed is known as the Chinese breed, and extends into Europe, North Africa, and Hindustan; but in the latter country the boar of the N.W. Provinces is not higher than 36 inches, though that of Bengal attains 44 inches. The parents of the other group are unknown.

Sus scrofa is not known in a wild state, but its domesticated forms come near to S. vitatus of Java. The Roman or Neapolitan pig, the domesticated breeds of China, Cochín-China, Siam, the Andalusians, Hungarian, the swine of S.E. Europe and Turkey, and the Swiss, are all of the Sus scrofa group, which, a Chinese author says, can be traced back for 4000 years. The Japan masked pig is the Sus pliciceps of Gray, and has a deeply plicated or furrowed skin.

Porcula sylvaria, the pigny hog of the sal forest of North India, is called by the natives Sano Banel, also Chota Sur.

With the great Chalukya dynasty of the Peninsula of India and Gujerat, their boar standard was two of the sacred icons of the Hindu gold piece with the emblem of a boar. One of the great protecting incarnations of the Hindu god Vishnu was in the figure of a Varaha or boar.

In the mythology of the ancients, the wild boar was sacred to Typhon. In India, the Rajputs, on the first day of spring, worship Vasanthi, or spring, Basanth, personified; prince and vassal then chase, slay, and eat the wild boar. Personal danger is disregarded on this occasion, as want of success is deemed an omen that Oomra, the great mother, may refuse petitions during the year.
The boar hunt in spring-time is a Scythian custom. Amongst the Scandinavian Asis, the grand festival to Friya was in spring; then boars were offered to her by the Scandinavians, and boars made of paste were eaten by the people. Baking in the shape of a boar were widely spread, as shown by the baking of 'cochelins' for New Year's Day in France. The Egyptian custom of baking swine-shaped pieces of dough is mentioned by Herodotus.

The Rajput festival is called Ahairea, and has a religious origin. The boar is the enemy of Gouri of the Rajputs. It was so held of Isis by the Egyptians, of Ceres by the Greeks, and of Friya by the Northman, whose favourite food was the hog; and of such importance was it deemed by the Franks, that the second chapter of the Salic law is entirely penal with regard to the stealers of swine. The heroes of the Edda, even in Valhalla, feed on the fat of the wild boar Scrimmer, while 'the illustrious father of armies fattens his wolves Geri and Freki, and takes no other nourishment himself than the uninterrupted quaffing of wine;' quite the picture of Har, the Rajput god of war, and of his sons the Bhyru, Gora, and Kala, metaphorically called the 'sons of slaughter.' The cup of the Scandinavian god of war, like that of the Rajputs, is the human skull (supra.)—

_Tods Rajasthun_., i. p. 566; Darrein.

BOARD. Under the East India Company, the military and civil administration of British India was conducted by officials assembled in Boards. In the year 1784 the Government of India was placed under a Board of Control, composed of the king of Great Britain's ministers, who in that capacity bore the title of Commissioners for the Affairs of India. This system continued until the year 1858, when British India was taken under the direct control of the Crown. In that interval, however, the Home Government of India consisted of a board of 18 members, called the Directors of the East India Company and the President of the Board of Control. The Directors had mostly all the patronage as to appointments, except the higher offices and commands which were made in communication with the British Ministry, who likewise originated all questions of peace and war, possessed the power of reversing the Acts of the East India Company and of the Government of India, and also of sending out instructions on special matters to the Governor-General without consulting the Directors. The Presidencies were under a Council of four, and the subordinate administrations were under the Justice Court of Sadr and Faujdiri Adawat, the Revenue, Military and Marine Boards. Since India came under direct British control, the Court of Directors has been replaced by a Council, and the Military, Medical, and Marine Boards abolished.

BOATS and SHIPS of BABYLONIA. 

BOATS and SHIPS of BABYLONIA.

The difference as to size between the boat and the ship, so marked in Europe, is less observable amongst the communities of Eastern and Southern Asia; and the Kishi of the people of India, the Prahu and the Kora-kora of the Malay, the various kinds of Manche of Panamb, Mangalore, and Panyani, and the Patamar, range from a few tons to a few hundred tons. In India the Nao and the Kishi, in Burma the Thu or The and Serpa, are boats that might be described separately. In Britain, even, a boat may be a large or small vessel, used for traffic and passage, rowing or sailing on seas or rivers, and receiving names according to the construction, form, or purpose to which it is applied, as the wherry, punt, gig, pinnace, yawl, skiff, lugger, ferry boat, steamboat, packet boat, jolly boat, long boat, lifeboat, and canal boat; and in size they may range up to 15 tons burden. The sea-going vessels are known as sloop, smack, cutter, clipper, schooner, brig, brigantine, barque, and ship, and range from 15 to 3000 tons. The boats in use along the coasts of the Peninsula of India well illustrate the readiness with which seafaring people adopt their materials to the requirements of their respective localities, and the rapid sailing boats of Bombay and the vicinity of Cannanore, and the Catamaran and Masula boat of the Coromandel coast are illustrations of this adaptation.

_Ganja_ is a boat used for travellers on the Nile. _Mepe_, of Zanizbar, called Muntafiyah by the Arabs, is a sailing ship with a beam one-third of its length. Its planks are pegged together, not nailed, and it carries from 12 to 20 tons.

_Badan_, a sailing ship of Sur, Sohan, and Muscat, has a standing plank covering; makes 11 knots an hour.

_Kelek_ is a leathern raft in use on the Euphrates and Tigris, and was known to the ancients as the 'Navigia Corinicea.'

_Kafa_, the circular bowl-shaped basket-boat (from the Arabic word, which means basket), is also used in China by the Chinese traders. Its fabric is of close willow-work, well coated, and made water-proof with the bituminous product of the country. It holds about three or four persons, with room enough, though not in the most agreeable positions. It is moved across by paddles. Herodotus notices the different kinds of boats plying on the rivers of Babylon, mentioning them as composed of willows and the skins of animals; and adds, that on their arrival at the great city, the owners sold all the material of the boats excepting the skins, and those they packed on the backs of asses, and carried whence they came. A raft is made of full-grown sheep and goats' skins, which are taken off with as few incisions as possible, and then blown up like a bladder and dried. A square framework, formed of poplar beams, branches of trees and reeds, is constructed of the size of the intended raft; the inflated skins are secured to it by osier or other twigs, the whole being firmly bound together. The raft is then moved to the water and launched. Care is taken to place the skins with their mouths upward, that, in case any should burst or require refilling, they can be easily opened by the raftmen. Upon the framework of wood are piled bales of goods and property, belonging to merchants and travellers. When any person of rank or wealth descends the river in this fashion, small huts are constructed on the raft, by covering a common wooden taktit or bedstead of the country with a hood, formed of reeds and lined with felt. In these huts the travellers live and sleep during the journey. The poorer passengers bury themselves,
to seek shade or warmth, amongst the bales of goods and other merchandise, and sit patiently, almost in one position, until they reach their destination. They carry with them a small earthen mangal or chafing dish, containing a charcoal fire, which serves to light their pipes and to cook their coffee and food. The only real danger to be apprehended on the river is from the Arabs, who, when the country is in a disturbed state, invariably attack and pillage the rafts. The raftmen guide their rude vessels by long oars (straight poles), at the end of which a few split canes are fastened by a piece of twine.

A curiously-formed vessel, of a crescent shape, carrying one mast and a large lateen sail, trades between Baghdad and Basra; under a fair wind, it can reach the latter place in six or seven days. The Kashmir boats are the Bayola, a large vessel; the Parinda, a light, fast-sailing boat; the Bhatta, a large-sized barge for loading grain; the Dunga, for ordinary merchandise; the Shikari, and the small Banduri Shikari.

On the Indus, five kinds of boats are used between Attock and the sea. On the Kabul river and on the Upper Indus it is still the custom to stuff skins with reeds or straw, as floats. General Ferrier descended the Kabul river from Jalalabad to Attock on a raft so constructed. The best known are the Zoruk of the Upper Indus, the Dunda or Dundi, which plies from Mithancote to the sea, and the Dugga, which, from its strong build, is specially suited to the navigation of the rapids between Attock and Kalabagh. The better kinds of wood used in their construction (sisse and large babul) are procured with difficulty; and various timbers are generally seen in one boat, such as sissu, babul, deodar, chir, bann, and karil. Malabar teak is much prized in the Lower Indus, and fetches a large price. The ordinary ferry boats are constructed by the sides and bottom being prepared separately, and brought together to be secured by knees or crooked pieces nailed to the bottom and sides. The bottom is made of sissu, the knees of mulberry or olive, and the side planks of deodar. The wedges and treenails are usually made of tut and kahu. Ropes for rafts and boats are prepared either from hemp (Cannabis Indica), sirki (Saccarum spontaneum), Typha altifolia, dib, or other reeds, common on the river bank. Munj (Saccarum munja) is also largely employed by the native boatmen. The great boat-building localities of the Panjab are Pind Dadum Khan, Wazirabad, Jhelum, Attock, Nowshera, Hashtnagar, Mokhud, and Kalabagh.

The Panjnad boats, ships, oars, etc., are made of Acaea speciosa, Capparis asphylia, Cedrus deodora, Dalbergia sissu, Fraxinus floribunda, Olea Europaea, Pins longifolia, Populus euphratica, and Salvadora persica.

The boat in common use for transport in Sind and the lower part of the river is the Dunda or Dundi; it is flat-bottomed, with a slight convex inclination, for the additional facility of getting off sandbanks. The Dundi consists of three distinct parts, the two sides and bottom, the latter being adjusted to the others by warping the end up to the slope required, and then strengthened with joints or ribs (as they are termed); the boat thus admits of being dismembered and transported, a fact corroborative of the accuracy of Alexander's historians.

On the Sutlej, in the Indus and lower stream, the Zoruk is frequently seen. It differs from the Dundi in having no elevation at the stern, is square built, fore and aft, is of 40 to 50 tons burden, and carries no sail. The Zoruk is the common cargo boat at the Upper, as the Dundi belongs to the Lower Indus; it sails pretty fast, and sinks with prodigious facility.

The Dundi is well adapted for the transport of goods, but from insufficient construction many are annually lost. From the scarcity of large trees and the high price of teak planks, the carpenters are obliged to use the small wood, and most of them are formed of innumerable pieces fastened by bamboo pegs, nailing being employed only to secure the knees and ribs. It has one mast, square-rigged, and can only sail before the wind. Those that the Khori and Pharan branches of the Indus are from 20 to 30 candelas burden.

The Dunda and state, being made up of three parts, are distinguished as Dunda and Dundi, and are both of the same kind, differing only in size, the Dunda being larger. The Dundi is the larger, and is generally used for cargo purposes, while the Dunda is more common for passenger traffic. The Dundi is a flat-bottomed boat, with a slight convex inclination, and is generally used for cargo purposes. It is square-built, fore and aft, and is frequently used for transporting goods on the Indus river. The Dundi is constructed by splitting the sides and bottom separately, and then fastening them together with knees or crooked pieces nailed to the bottom and sides. The bottom is made of sissu, the knees of mulberry or olive, and the side planks of deodar. The wedges and treenails are usually made of tut and kahu. Ropes for rafts and boats are prepared from hemp, sirki, Typha altifolia, dib, and other reeds, common on the river bank. Munj (Saccarum munja) is also largely employed by the native boatmen. The great boat-building localities of the Panjab are Pind Dadum Khan, Wazirabad, Jhelum, Attock, Nowshera, Hashtnagar, Mokhud, and Kalabagh.

The Panjnad boats, ships, oars, etc., are made of Acaea speciosa, Capparis asphylia, Cedrus deodora, Dalbergia sissu, Fraxinus floribunda, Olea Europaea, Pins longifolia, Populus euphratica, and Salvadora persica.

The boat in common use for transport in Sind and the lower part of the river is the Dunda or Dundi; it is flat-bottomed, with a slight convex inclination, for the additional facility of getting off sandbanks. The Dundi consists of three distinct parts, the two sides and bottom, the latter being adjusted to the others by warping the end up to the slope required, and then strengthened with joints or ribs (as they are termed); the boat thus admits of being dismembered and transported, a fact corroborative of the accuracy of Alexander's historians.
BOATS AND SHIPS OF MALABAR.

these boats are thus formed into rafts, cattle and burdensome articles are conveyed across the rivers, as also the native regiments, with all their followers, horses, bullocks, baggage, carts, etc.

Pamban Manche, the Snake Boat of Cochin, is a canoe of great length; they are used by opulent natives and Europeans as boats for the conveyance and despatch of persons on the numerous rivers and backwaters, particularly on that between Cochin, Allepey, and Quilon, which is about 80 miles southward, and on that which runs to Ralfpact and Trichoé; the former place being about 20, the latter about 60 miles to the northward. These boats are from 30 to 60 feet in length, without any regard to breadth or depth, as they are worked from the solid tree. The breadth do not exceed 5 feet. Those of the raja and officers of state are very handsomely fitted up, and carved in a most fantastical manner; they are made very neat, and even splendid, with painting, gilding, etc. The largest boats are sculled by about twenty men, double-banked; and when pressed, their velocity is surprising, as much as a mile in five minutes. Mr. Edye had himself been sculled in one of them a distance of forty-eight miles in six hours. These boats are peculiarly adapted to the rivers; for it frequently occurs that in the dry season there are sand-banks, perfectly dry, nearly a hundred yards in breadth, over which they must be drawn by the strength of the few men who are in them, the smaller size having only six rowers and a coxswain. Those natives who can afford the expense, have the cabin neatly fitted up with venetian blinds on the sides, but generally the cæscus or grass-mat is substituted. This boat is formed from the angely-wood, which is very durable if kept oiled.

Cochin Bandar Manche, or Canoe of Barthen,—are canoes which are cut and formed from the largest and softest timber of the forest. They are from 20 to 50 feet in length, their breadth and depth being proportioned to the full size of the tree, so as to reduce its dimensions as little as possible. They will carry about 18 tons burden, and are made from 3 to 5 inches thick at the bottom; but at the top of the side, or gunwale, about 1½ to 2 inches, with a proportionate increase of thickness at the extreme ends to protect the end-grain of the wood, and withstand any shock that they may meet with. At the distance of about 5 feet on the inside there are ribs about 6 inches broad, projecting about 2 inches from the side of the boat, for the purpose of giving support and strength to the body of the canoe. These boats may be considered valuable for the service of the port at which they are used, and, notwithstanding their heavy appearance, they are very buoyant, and go very fast through the water. In one of about 35 feet long, with six men, and a tindal (coxswain), they paddled the Minden's (Capt. admiral's ship) barge, which had twelve men on board, and in a distance of four miles to that ship's anchorage he gained on them by time about twenty minutes, although there was a strong sea-breeze and swell against him. At Cochin, these boats are used for the purpose of conveying various articles of burden and water to the ships in the roads.

Mangalore Manche of the Western Coast of the Peninsula is a flat-bottomed boat of burden, about 25 to 35 feet long, 6 to 7 feet broad, and 4 to 5 feet deep. It is formed to meet the river, which is very shallow and flat; and to land the cargoes of the Patamars, which are discharged and loaded at the mouth of the rivers. These boats are sewn together similar to the masula boat and other native vessels; they are forced along by bamboo poles, as the water is not more than from 6 to 10 feet deep, except in the south-west monsoon, when the rapids swell, and the whole of the river is considered impassable; and at this period all the vessels are taken to the shore and laid up.

Calicut Manche is a boat very similar to that of Mangalore, with the exception only of a taking stem, for the purpose of taking the beach, as the port of Calicut is open to the coast and there is no river. These boats are propelled by the paddle and sail, and generally carry eight men; they are much employed in watering and completing the sea-stock of ships homeward-bound; also in loading ships with pepper, timber, etc., for Bombay; and in shipping the produce of Canara and Malabar, all of which is rafted off to vessels called Dow, Boatile, Patamark, etc.

Panyani Manche is a coating boat, of about 50 feet long, 10 to 12 feet broad, and 5 to 7 feet deep. It is framed with timbers and planks, which are sewed together. The timbers are about 4 feet asunder, and on them, inside, some few planks are placed as bands and clamps, which are nailed to the frame. These are very rudely put together, and not of much importance either in form or construction. During the south-west monsoon, or from June to November, they are laid up at Baiapur river for safety, and are only used in the fine-weather season. They carry the productions of the coconut tree, viz. coir, copra, cajan, the leaf of the Corypha umbraaculifera, which is used for coverings of houses, also for books, and various other purposes; jagari, oil, and arrack, to Cochin and Mangalore; and bring from these ports rice, cloth, salt, etc. They work along shore, and take advantage of the sail in rowing. They have generally from eight to ten men, who are fishermen of the Mopila caste of Musalmans, descendants of the first Arabian settlers on the shores of the Peninsula, and who, marrying the daughters of the country, obtained the name of Mapilai.

The Boatila Manche of the island of Ceylon navigates the Gulf of Manar, and the southern part of the Peninsula of India. This boat, which is about 50 to 60 feet in length, 16 to 18 feet in breadth, and 8 to 10 feet in depth, has more of the European form than of any of the Indian-built vessels that are met with. The after part shows the origin to be of Portuguese construction, as it is very similar to that of many of the boats still in use by the people of that country, which are said to be of the same shape as the vessels in which Vasco da Gama sailed to India. They have a deck fore and aft, and are built with all sorts of jungle wood in a very rough manner, and fastened with nails and bolts. They are equipped with one mast, which inclines forward, and a square lug-sail; also a small bowsprit, at about the angle of 45°, with a sort of jib foresail, one pair of shrouds, and a backstay, which closes the rigging. These vessels carry on the trade of the island across the gulf. The exports are rice, tobacco, etc., and the imports, cloth.

The Bombay Fishing Boat is one of the swiftest
and most elegant sea-going vessels of that coast.
A complete set of models of the native vessels
plying on the coast, at an estimated price of Rs. 15
each, or about Rs. 1,000 in all, was sent to the
Exhibition of 1851. The mode of building is
precisely the reverse of that pursued by Europeans,
who begin with drawing the lines, then lay down
the keel, ribs, and frame, and finally applying the
planking. In India, drawn lines are dispensed
with altogether. Having laid down the keel, the
Indian shipbuilders fasten on the planking, leaving
the ribs and frame to the last. The keel having
been laid, and the stem and sternposts put in
their places, they are fashioned in both sides with
a groove. The lower edge of the plank next laid
is made to conform in shape to this. The under
groove is smeared over with red ochre and water,
and the edge of the plank that follows is tried on
from time to time till it takes a tinge everywhere,
showing with what exactness it coincides. It is
then steeped in water, and bent over a fire of wood
in the proper shape, and applied to the hull. When
all is ready, the channel in the lower plank is
filled up with cotton and tar. The two planks
are now sewed together in the following manner,—
a pair of holes are bored in the upper and a
 corresponding pair in the lower plank, all along
 at intervals of a foot or two, according to the
 nature of the lines; a strong coir string is laced
 through this in the form of the letter X, the knot
 being inside. A stout wedge of wood is next
 driven through the strings outside, so as to bring
 the planks perfectly in contact. The planks being
 put sufficiently in their places, when gunwale high
 is attained, the timbers are put in; when the
 planks have been nailed to them, the sewing holes
 are filled up either with nails when opposite a
 timber, or with wooden pins. The masts rake
 forward instead of back; the keel is hollow in the
 middle, and not so long as the sternpost; the fore-
 part of the boat sharp, with hollow lines, the stern
 plumb and round. The Bombay fishing boats
can beat the best of the English yachts. There
 are three great fishing villages in Bombay island,
at Wocrli, Sion, and Mahalunge. A Patamun
 employs from 15 to 20 men, a fishing boat from
 10 to 15, a canoe from 3 to 4. Canoes are chiefly
 employed in the coast fishing, and attending the
 men on the mud banks, and in landing cargo when
 there is no depth of water sufficient for larger
 vessels. They are hollowed out of a single log,
 and are very serviceable, handsome-looking, well-
 finished craft. They are impelled either by
 paddles or sail; when the latter are employed, an
 outrigger is resorted to; they will bear a surpris-
ing stretch of canvas, and make their way rapidly
 through the water.

The Patamun vessels sail remarkably well, and
 stow a good cargo. They belong principally to
 Bombay merchants, and partly carry on the coast-
ing trade to that port. They are grappled, that is,
 with a prow stem, which is the same length as the
 keel; and the dimensions of the large class are
 76 feet 6 inches in length, 21 feet 6 inches in
 breadth, 11 feet 9 inches in depth, and about 200
 tons burden. They are planked with teak, upon
 jungle wood frames, and are really very handsome
 vessels, being put together in the European
 manner, with nails, bolts, etc.; and their bottoms
 are sheathed with inch-board, and a layer of
 chunam mixed with coconut oil and a portion of
 damar (country rosin); this is a very durable
 substance, and a great preservative to the plank
 against worms. Some of the smaller of these
 vessels, of about sixty tons burden, are sewed
 together with coir, as other native boats are.

The small class has one, and the large class two
 masts, with the lateen sail; the foremost raking forward,
 for the purpose of keeping the ponderous yard
 clear when it is raised or lowered. The yard is
 slung at one-third of its length; the tack of the
 sail is brought to the stern-head, through a fixed
 block, and the sheet hauled aft at the side, as
 usual. The lateyard is a pendant and treble
 block from the masthead aft to midships; thus
 acting as a backstay for the mast’s security,
 together with about two pairs of shrouds. These
 vessels generally export salt from Bombay to
 the coast, and take back coir, rice, cocaanut,
copper, oil, timber, sandal-wood, pepper, and
 various articles, the production of the coast.
 They are navigated with much skill by men
 of the Mopila caste, and other Musulmans,
 and have an across of ten or twelve men and a
 tindal, who are good pilots. The navigators off the
 coast from Bombay to Cape Comorin,—
generally speaking, honest and trustworthy.

The Arab Dow is employed in the trade between
 the Red Sea, the Arabian coast, the Gulf of
 Persia, and the coasts of India, in Cutch, Gujerat,
 and Malabar. They were also used in the Persian
 Gulf for war and piracy. They are always manned
 by Arabs. The Arab Dow is 50 to 500 tons,
 but usually of about 150 to 250 tons burden by
 measurement; grappled, with 10 or 12 ports;
 about 85 feet long from stern to stern; 20 feet
 inches broad, and 11 feet 6 inches deep. Of late
 years this description of vessel has been built at
 Cochin, on the coast of Malabar, most perfectly
 in the European style. These vessels have a great
 rise of floor, are calculated for sailing with small
cargoes, and are fully prepared, by internal
 equipment, for defence, with decks, hatchways,
 p.g., poop-deck, etc., like a vessel of war; many
 of them are sheathed on two-and-a-half-inch plank
 bottom, or may be covered with a full sheathing
 of chunam and oil, as before described, which is
called galgal, put between the planks and sheath-
ing-board, causing the vessel to be very dry and
durable, and preventing the worm from attacking
 the bottom. The worm is one of the greatest enemies
 in India to timber in the water, while the white
 ant is as much so out of it. On the outside of the
 sheathing-board there is a coat of whitewash, made
 from the same articles as that between the sheath-
ing and planks, which coat is renewed every
 season they put to sea. These vessels have gener-
 ally one mast and a lateen sail; the yard is the
 length of the vessel aloft, and the mast raking
 forward for the purpose of keeping this ponderous
 weight clear in raising and lowering. The tack of
 the sail is brought to the stern-head, and sheets
 aft in the usual way; the halyards lead to the
taffrail, having a pendrel with double purchase
 block, which becomes a halyard, and the preparation
 of the mast when the sail is set; this, with three
 pairs of shrouds, completes the rigging, which is
 very simple, the whole being of coir rope. (The
 Ki-Dow is a small Dow.) Several of these vessels
 were fitted as brigs after their arrival in Arabia,
 and armed by the Arabs for cruising in the Red
 Sea and Arabian Gulf, as piratical vessels: they
were also the class of vessels of which Tipu Sultan's fleet at Onore (Hunawar) consisted. When armed, they were too powerful for the Bombay marine brigs, but this never happened but when in great numbers and the brigs weak and unsupported. Sir John Malcolm says the large Dow ships make generally one voyage in the season to the southward of Arabia, taking advantage of the north-east monsoon to come down, and the south-west to return with an exchange cargo. They generally bring dates, fruit, preserves, Shiraz wine, and horses, and take back rice, coir, canvas, coconuts, oil, timber, damar, etc., various articles of cloth of the country manufacture; and from Bombay, European articles of every description. The trade in those vessels, extending from Allipoy, the southernmost port on the coast of Malabar, up to Bombay,—all the trade to Bengal,—is carried on by ships which are called 'country traders,' from the Gulf of Persia and Arabia.

The Bagla or Bulgerow takes its name from an Arabic word, the feminine of baghl, a mule. The Bagla is engaged in the trade of Cutch, Gujerat, and the Malabar coast, to the Gulf of Persia, the coast of Arabia, and the Red Sea. They are Indian vessels, and manned with Indian seamen called lascars. It is one of the most ancient vessels to be met with in the Indian seas. Their extreme length from stern to taffrail is about 74 feet, the breadth about 25 feet, and the depth in hold 11 feet 6 inches, with about 150 tons burden. The peculiarity of form and extraordinary equipment of these vessels is said to have been the same from the period of Alexander the Great. They are armed with two guns on the afterpart or right-af of the stern, for defence against pirates, and have their poop-deck heightened with a high stern, their extreme sections about the centre or middle of the vessel; they are very broad in proportion to their length, with a sharp rising floor; the stern is straight, and rakes very little more than the stern-post. These vessels are constructed with timbers and planks, which are nail and trenail fastened in the most rude and unsafe manner possible. The topside above the deck is barricaded with mats on the outside of the timbers, which run up to about eight feet from the deck; and when they have no cargo on board this barricade is removed. They have only one mast, with a huge yard made from two spars, the small ends lashed together, and a lateen sail, the tack of which goes to the stern-head; they generally trade like the Dow, and are navigated by Arabs and the people of Cutch. This singular and rude vessel, as well as the Arab Dow, is peculiarly adapted to the nature of the trade and the winds, which are subject to periodical winds, during which these vessels are navigated with much ease.

The Sambuk is a small coasting vessel from 15 to 50 tons burden, trading in the Red Sea.

The Doni of the Coromandel coast is a huge vessel of the ark-like form, about 70 feet long, 20 feet broad, and 12 feet deep, with a flat bottom or keel part, which at the broadest place is 7 feet, and at the fore and after parts of the vessel it breaks into 10 inches, which is the sideing of the stern and stem post. The fore and after bodies are similar in form from midships. Their light draught of water is about 4 feet, and when loaded about 9 feet. These rude, unshapely vessels trade from Madras and the east coast to the island of Ceylon and Gulf of Manar. They have only one mast, with a long sail, and are navigated from land to land and coastwise in the fine season only. The rate of current in the Bay of Bengal is very great at the change of the season or monsoon, as much as sixty miles in twenty-four hours. When they are off a port in a calm, their sailors throw a handful of sand or shells and feathers in the calm sea, and by the drifting of the feathers on the surface, and sinking of the sand or shells, a calculation of the rate of current is formed, and they anchor off the coast accordingly. The anchor is made by lashing together three crooked branches of a tree, which are then loaded with heavy stones, and their cable is formed from coir yarns. In fact, the whole equipment of these rude vessels, as well as their construction, is most coarse and unsavoury, and far behind those of any other part of India.

Mr. Edye remarks that among all the numerous vessels of every class and description which traverse the ocean, there is a peculiarity of form and construction intended to meet the various localities of the ports or seas in which they are navigated; and perhaps in no part of the globe is this principle more fully displayed than in the Indian seas, and on the coasts of the southern Peninsula of India, including the island of Ceylon, where the nature and change of the season, the monsoons, and the navigation of the seas and rivers, are singularly well provided for by the truly ingenious and efficient means adopted by the natives in the formation of their rude but most useful vessels.

Catamarans of Ceylon, and of the Eastern and Western Coasts of the Peninsula, are formed of three logs of timber, and are used by the natives for similar purposes; the timber preferred for their construction is of the duf wood, or chenne maran (piney tree). Their length is from twenty to twenty-five feet, and breadth two and a half to three and a half feet, secured together by means of three spreaders and cross-lashings, through small holes; the centre log being much the largest, with a curved surface at the fore-end, which trends and finishes upwards to a point. The side logs are similar in form, but smaller, having their sides straight, and fitted to the centre log. The Catamaran is generally navigated by two men, sometimes by one only, but with great skill and dexterity; they think nothing of passing through the surf on the beach at Madras, and at other parts of the coast, where the boats of the country could not live in the breakers; and they are propelled through the water to ships on the coast by propelling them off the bank construction and form would swamp. In Ceylon the man, when a sail can be got on them, a small outrigger is placed at the end of two poles as a balance, with a bamboo mat and yard, and a mat or cotton cloth sail, all three parts of which are connected; and when the tack and sheet of the sail are let go, it all falls fore and aft alongside, and, being light, it is easily managed. In carrying a press of sail, they are trimmed by the balance lever by going out on the poles, so as to keep the log on the surface of the water, and not impede its velocity, which in a strong wind is very great. They are frequently met in with ten or fifteen miles off the southern part of the island of Ceylon, and will convey any letter or despatch to the shore with
safety; but as to its dryness, the man who takes it has nothing but a pocket made from the leaf of the areca tree (A. catechu, Linn.), which is tied round his waist, and is the only article about him. These are the persons who are employed in the pearl fishery.

Canoes are largely used in India as ferry boats, and have shapes and forms to suit the rivers and waters. Small canoes are formed of hollow palmyra tree, two of which lashed to a couple of spars form the usual mode of crossing lakes and rivers in the Circars; the root forms the head of the canoe, the smaller end is either elevated out of the water by the form, or some six inches of the pith is left at that end. As this decays, a lump of clay supplies its place. Formerly, sewing vessells were planked with this wood, but the iron fastenings are soon destroyed. Boats planked with it were till lately common on the Godavery, being built probably where sawyers were not procurable. Canoes of Calcut are hewn out from the trunk of the jack-fruit tree, Artocarpus integrifolia. Canoes of Point de Galle and the Malabar coast have weather-boards on an outrigger in the form of a smaller canoe; they are sharp at both ends, and boat to windward without tacking. The Jangar of the Malabar coast, for rivers, is a kind of canoe.

The Point de Galle Canoe, or Market Boat, is formed from a single stem of dup wood, or piny varnish-tree. They are from eighteen to thirty feet in length, from eighteen inches to two and a half feet in breadth, and from two or three feet deep, exclusive of the wash-board, which is about ten inches broad, and sewed to the gunwale by coir yarns, with loose coir padding on the joints, in the same manner as the other boats used in India are sewed together, which will be more fully described below. These boats are fitted with a balance log at the end of the bamboo outrigger, having the mast, yard, and sail secured together, and, when sailing, are managed in a similar way to the Catamarans. Vessels passing the southern part of the island of Ceylon are generally boarded by these boats, even at the distance of twenty to twenty-five miles from shore. They will sail at the rate of ten miles an hour in strong winds, which are generally prevalent there, and with a crew of five men. As the outrigger must always be kept to windward, and shifting it from side to side would be impossible, the canoe is so constructed as to proceed with either end foremost. This form of canoe is common wherever the Malays have extended themselves, throughout Polynesia and the coral islands of the Pacific, and to Madagascar and the Comoros, where a Malay colony settled. The great canoes of Ceylon called Ballam or Vallam are usually made of the Artocarpus hiranta, the angley or angelica tree.

Mudras Musala Mouche is used all along the eastern coast of the Peninsula. It is planked with a flat bottom, for the purpose of taking the beach in the surf, when European boats cannot approach it. These boats are beached in the third surf, and taken most completely out of the water, on the immediate receding of the swell, by natives. They are 30 to 35 feet long, 10 to 11 feet broad, and 7 to 8 feet in depth. Their planks are sewed together with coir yarns, crossing the seams over a wadding of coir, which presses on the joints, and prevents leakage. By this peculiar means of security, the boat remains pliable, and yields to the shock which it receives on taking the ground; whilst boats with framed timbers and planks, nail or trenail fastened, would be broken to pieces from the heavy surf, that at times runs as high as from six to ten feet. The Catamaran can be kept in attendance as a life-preserver in the event of any accident to the Musala boat by upsetting, or in case of any of the Europeans being washed out by the surf. The crews of the Musala boats are brave, self-reliant men. The Musala boats receive their cargoes and passengers from the ships outside the surf, and land them in perfect safety. They are rowed by twelve men, in double banks, with paddles, that is, a board about ten inches broad and fourteen inches long, fixed at the end of a pole. They are steered by a tiubal (cock-swain), and one or two men constantly bale out the water. The steersman gives time by a song, which is sung by all the boatem, and, according as its modulations are slow or quick, the oars are piled. These modulations are regulated by the waves, as they may be slow or rapid in succession.

The Ganges boats are the Begurder, Boleah, Panswah, Palwar, Puteli, Bhur, Oolak, and Dengi. The bulky Oolak, or baggage boat of Bengal, is sometimes as large as the Puteli, and used for the same purposes. The Palwar and Bhur are rowing ships.

The Puteli is a large boat used for goods traffic.

The Palwar, also a cargo boat, from 15 to 20 tons burden, was originally built at Dacca.

All the common arts and manufactures of Bengal are carried on at Dacca, but in none of them do the Dacca workmen show more superior skill than in that of boat-building. For their work in this art they have been celebrated since the reign of Jahangir, when the Nowarras was established here for the protection of the lower districts of Bengal against the incursions of the Mugs of Arakan.

The Tista river in the Terai at Leelpigoree is navigated by canoes, 30 to 40 feet long, some being rudely cut out of a solid log of sal, while others are built, the planks, of which there are but few, being sewed together, or clamped with iron, and the seams caulked with the fibres of the root of the dhak (Butea frondosa), and afterwards smeared with the gluten of Dipsyps embrypertis. The bed of the river is here three-quarters of a mile across, of which the stream does not occupy one-third; its banks are sand-cliffs, fourteen feet in height.

On the Brahumbi rivers, two kinds of vessels, of entirely different structure, are used, the larger of which may reach to 120 or 150 tons burden.

The larger boats are termed Huun, and are of the form of construction more commonly met with. The keel-piece is a single tree hollowed out, and stretched by the aid of fire when green, to a complete canoe, in fact. From this, ribs and planking are carried up. The bow is long, with beautiful hollow lines, strongly resembling those of the modern steamers. The stern rises high above the water, and below the run is drawn out fine to an edge. A high bench or platform for the steersman, elaborately carved, is an indispensable appendage. The rudder is a large paddle lashed to the larboard quarter, and having a short pillar passing athwart the steersman's bench. The most peculiar part of the arrangement of these vessels is in the spars and rigging. The mast consists of two spars; it
is in fact a pair of shears, bolted and lashed to two
posts rising out of the keel-piece, so that it can be
left down, or unshiped altogether, without any
difficulty. Nearly the same kind of mast is used by
the Ilanun pirates of the Eastern Archipelago.
When chased, they are thus enabled to run into a
creek and drop the mast instantaneously, so that
it gives no guidance to their whereabouts. Above
the mainyard the two pieces run into one, forming
the topmast; wooden rounds run as ratlines from
one spar of the mast to the other, forming a ladder
for going aloft. The yard is a bamboo or a line
of splited bamboo of enormous length, and, being
perfectly flexible, is suspended from the masthead
by numerous guys or halyards, so as to curve
upwards in an inverted bow. A rope runs along
this, from which the large mainsail is suspended,
running on rings, like a curtain, both ways from
the mast. There is a small topsail of similar
arrangement.

The staves of the ususal teak, bamboo, or other,
lightest stuff, is used for clothing. If of any heavier
material, it would be impossible to carry the
enormous spread of sail which distinguishes these
boats. The mainyard of one vessel was found to
be 130 feet long, and the area of its mainsail
would not be very much less than 4000 square
feet, or one-twelfth of an acre. From their rig,
these boats can, of course, scarcely sail but before
the wind. But in ascending the Irawadi, as on
the Ganges during the rainy season, the wind is
almost always favourable. A fleet of them speed-
ning before the wind with the sunlight on their
bellying sails, has a splendid though fantastic
appearance. With their vast spreading wings
and almost invisible hulls, they look like a flight
of colossal butterflies skimming the water.

Pae-go or Pae-go-na is another description of
Burmanse boat, and it is said to be the peculiar
craft of the Ning-the or Kyempwen river. Though
it traffics to no parts of the Irawadi, it is exten-
sively used at Ye-nan-gyoung for the transport of
petroleum. It is flat-bottomed or nearly so,
having no canoe or keel-piece like the Hnau,
but being entirely composed of planks, which ex-
tend throughout the length of the vessel, wide in
the middle and tapering to stem and stern like the
staves of a cask. A wide gallery or sponson of
bamboo, doubling the apparent beam of the boat,
rans the whole circuit of the gunwale. These
boats are generally propelled by oars or a pole,
though occasionally carrying sails, but not of the
same spread of cloth as the Hnau. The prow of
a Burmanse boat appears to be regarded by the
Burmanse boatmen with almost as much supersti-
tious veneration as the quarter-deck of a frigate
is by an English post-captain.

The buoyancy of the Pein-go boat is increased
by one or two large hollow canoes being lashed
with rattans along the water-line. When laden
with rice or bagged paddy, about 8 or 4
feet bread, made of bamboo, with a rail, is
thrown out the whole length of the sides, for
increase of stowage. The cargo is protected by a
thatch roof. The steerman sits at the stem on
a high chair, elaborately carved, and having a little
thatch roof. When not favoured by a breeze
the boat is propelled by 6 or 8 rowers.

Longy-yuet, is a round-bottomed boat, with
tem and stern high but rounded in or curved in;
in other respects like the Pein-go-na.

Longy-go.—Bottom made up by scooping out a
very large log. The depth of the boat is increased
from two to three feet, by having nailed on planks
running from stem to stern. Six to eight feet of
the stern end is covered in by a hood of bamboo
matting, made water-proof with earth oil or earth
air and dammer; here the crew and family live.
The large boats of this description have a mast
and sail; the smaller ones, when favoured with a
breeze, put up two bamboo ten or fourteen feet
in length, joined at the top and spread out at the
bottom, and for a sail both men and women's
clothes are spread out. The crew are three or
four and a steersman, generally the owner.

Ka-do-lay, a ferry boat, bottom made from a
single log, sides planked, the whole length from
1 to 2 feet in breadth; about 5 or 6 feet of the
stern end is covered with a rounded hood of thatch
and bamboo. The steersman sits at the extreme
term end and steers with a paddle, while the boat
is propelled by two oars.

Scot-dho, a canoe made up from one log, vary-
ing in length from 6 to 15 feet and 2 to $\frac{1}{2}$
in breadth.

Canoes of two different forms are in use on the
Irawadi, some of which are ridiculously small
in proportion to the number of persons they carry.

Longy, a racing boat, bottom made up of one
large long log, from 30 to 40 feet or more in
length, with a side planking like the Ka-do-lay,
paddled by 25 or 40 men according to size.

Gandoo.—This is the largest kind of native
trading boat; it is built on a canoe of a single tree
of the largest size, chiefly of peeggado, but teak
and thengan canoes are also used for this purpose.

These canoes are from 25 to 30 cubits long and 3
to 4 cubits wide; ribs are fastened inside the
canoe, and planks are then built on them up to the
size required; the largest are 35 to 40 cubits long
and 8 cubits deep, with a breadth of 15 cubits.

Burden from 40,000 to 60,000 viss, and have a crew
of from 40 to 50 men. They are built principally
in the Henzadhah district; they have two masts, and
are rigged with square sails on the foremost, gen-
ernally two of very large size. They trade to Arakan
and Dacca chiefly, the cargo consisting principally
of cutch and cotton, which they exchange for
beteel-nut and tobacco, and generally realize large
profits.

Koton.—This form of trading boat is an improve-
ment on the foregoing. It is built with a thick
plank from a keel, in the same way as ordinary
vessels, and usually with the forepart in imitation
of the Chinese junk. The largest kind carry
about 20,000 viss, and the rig is similar to the
junk, two or three fore-and-aft sail, which enable
them to beat when the wind is adverse.

Stampen, a Chinese ferry boat shaped much
like a spoon with just the handle cut out, leaving
and shaping the bow. The boat is flat-bottomed,
built of teak planks nailed to ribs set about 8
inches apart; over the ribs are planks loosely fitted
on and forming a deck. The boat is propelled by a
single Chinaman, who stands in the bowel of
the spoon with his face to the head of the boat.
Sometimes a large square sail is used, when a large
square rudder is shipped to guide the boat. A
very unsafe boat under sail. It is painted like
the junk in the forepart and stern. About two
feet of the head of the boat is plankd up, and
serves as a box. Cost of Stampen, Rs. 50 to Rs. 60.
The Stampen boat at Singapore is remarkable
for its swiftness both with sails and oars. When skilfully managed, they are exceeding safe, and are sometimes employed on rather distant coasting voyages, from Singapore to Penang, for example. The passenger Sampan is employed at Singapore and on the Irawadi chiefly in conveying passengers between the shore and the shipping.

**China, Malacca, Archipelago.**—The boats of the Straits of Malacca are the Prawu, Sampan, Loretta, Pakat, Chompren, Sekong, and Tong-kong or Ting-king. In the Eastern Archipelago, the generic name for a boat or vessel, large or small, is Prawu, a word which belongs equally to the Malay and Javanese languages, and from these has been very widely spread to others, extending as a synonym to the principal Philippine tongues. The usual name for a canoe or skiff, both in Malay and Javanese, is Sampan. The large vessels which the natives of the Archipelago used in war and trade were called by them Jung, which is the word, corrupted Junk, that Europeans apply to the large vessels of the Chinese, of which the proper name is Wang-keng. For a square-rigged vessel or ship, the natives have borrowed the word Kapal from the Teling people.

The Chompren is a river cargo boat. The Sekong is made of one log of wood, very sharp fore and aft, with long outriggers to prevent its upsetting.

**Pantjdlang,** of the Malay, is a canoe made from a tree in Palembang; some of them are 42 feet long. The paddlers were liable to be seized by crocodiles.—Court.

The Biduk is a canoe of Sumatra similar to the Pantjdlang, but with gunwales raised by additional planks. It is a safe boat; used for goods.

The Malay war Prawu is built of timber at the lower part; the upper is of bamboo, rattan, and kajan (the dried leaf of the Nipa palm). Outside the sides, about a foot from the waterline, runs a strong gallery, in which the rowers sit cross-legged. At the after part of the boat is a cabin for the chief who commands, and the whole of the vessel is covered by a strong flat roof, upon which they fight, their principal weapons being the kris and spear, both of which, to be used with effect, require elbow-room.—Marryat's *Ind. Arch.*

The ordinary Prawu made of by the Malay pirates at the present day, are from eight to ten tons burden, very well manned, and exceedingly fast. Usually they are armed on the bows, centre, and stern with swivel pieces.

The most common pirate vessels made use of among the floating communities from the Straits to the south-eastern groups, are the Penjajap and Kakap, with Padukan, and Malay boats of various size and construction.

The Penjajap Prawu is of light build, straight, and very long, of various dimensions, and carrying usually two masts, with square kajan sails. This boat is entirely open, except that aft is a kind of awning, under which the head-man sits, and where the magazine of arms and ammunitions is stored away. In front it carries two guns of greater or less caliber, of which the muzzles peer through a wooden bulwark, always parallel to the line of the keel. Penjajap of large size generally carry, in addition to these, some swivel pieces, mounted along the timber parapet; while boats of inferior tonnage are armed only with two lelah, elevated on a beam or upright. From twenty to thirty rowers, sitting on benches well covered with mats, communicate to the vessel with their short oars a steady and rapid motion, the more swift as the Prawu is small. Large ones, therefore, are often kept hidden in some creek, or little maze of islets, while the light skiffs, flying through the water, proceed on their marauding errand.

The Kakap Prawu is a small light boat, provided with a rudder only, but with no other oars or sculls. It carries only one mast, with a single quadrangular sail. Like the Penjajap, it is built of very buoyant timber, planks being held together by wooden pins, and lashed with rattans. The pirate never goes to sea with a Kakap alone, and the voyager may be sure, whenever he describes Kakap, that a Penjajap is not far behind, moving along, perhaps in the shadow of the high coast, or lurking behind some island, or lying within the seclusion of some woody creek. Eight or ten of the best fighters are, therefore, chosen to man these light skiffs, which remind us of those long Prahus of the Ladrones. In calm weather, they run along in these buoyant galleys along the shore, or mount the small rivers, confiding in their agility; and, knowing well that if surprised they may fly into the woods, they bear their little skiff with them, and launch it again at some spot unknown to their pursuers.—Kolfi, *Rapport,* 1851.

The Padukan have a single mast in the form of a tripod, and carry a large lateen sail of mat. They are from twenty to fifty tons burden, and of great beam, with lofty sides, and little hold in the water. They are steered by two long rudders, which are lifted up when the vessel is moored or passing through a shallow.

The trade with New Guinea and the Eastern Islands (commonly called the Bogis trade), and the trepang fishery on the north coast of Australia, is carried on chiefly in the Padukan. These leave Macassar and the other parts of Celebes for the Eastern Islands during the westerly monsoon, returning with the south-east trade wind.

A second-class *Ilamou* pirate Prawu of Mindanao carries a crew of about 60 men. It has a stage or platform suspended to the mast, with grappling hooks attached to the end, which is used as a bridge for boarding a prize. The first-class *Ilamou* pirate Prawu of Mindanao carries a crew of 100 men or thereabout. In this description of vessel, the tripod mast, the two after feet of which work on hinges, is used as a bridge in boarding.

**Kora-kora** is a boat of the Malay Archipelago, near Batchun, some of them being of 5 or 7 tons burden. They are open, have a bamboo outrigger five feet on each side, which supports a bamboo platform; they are low in the water. A boat having two outriggers, with balance logs, is used by the natives of some of the islands in the Eastern Archipelago. The natives of New Holland appear to use this for war contrivance, but of a more simple construction.

The Chinese, besides their ocean-going ships, have Junks for war and peace, and for their rivers, *Koo-Tay,* or fruit boats.

*Si-qua,* lighters for tea; *cassia,* passenger, mandarin, flower, bed-chamber, and Hong boats; floating kitchens, and floating homes for sailors.

*Nam-no-Teng.*
BOATS AND SHIPS OF CHINA.

Shu-Teng or Sampans, hawkers' Sampans, ferry boats, dragon boats, post boats; floating rice stores, rafts.

The ocean-going War Junks of China are of great size, have several water-tight compartments, with very high bulwarks. They are three-masted, and generally fly at the main a flag with a representation of the Yin and the Yang, or the male and the female principle. The sails are of matting, the mainsail, shaped like a butterfly's wing, of matting and cocoanut fibre; and cotton cloth, with ropes made of bamboo, rattan, coir, or hemp, the cables as a rule being of rattan.

A smaller war Junk with two masts is employed on the rivers and creeks; the Hi-Fi, or Fast Crabs, also two-masted, are of great length, very narrow in the beam, and cost from 2677 to 4978 taels of silver, or from $800 to $1200. In a calm, oars are used. Their first frigate on the European plan was launched at Shanghai on the 24th May 1872, but since then a powerful war fleet has been built for them in Britain.

Trading Junks of China, that traverse the ocean to Batavia, Singapore, Malacca, Siam, Shanghai, Tien-tsin, and Chefoo are also in water-tight compartments, some of them equal to several thousand tons. The sails are of matting, gunny, or cotton cloth. On the stern-board is painted a Foong, on a large board, with outstretched wings, represented standing on a rock in the midst of a troubled ocean. There are also figures of the sun and moon. On each side of the prow or stern is the figure of an eye, by which the seamen imagine the vessel can espy sunken rocks, shoals, and other dangers of the deep. Every large Junk has the idol of Tien-how, the queen of heaven, carefully enclosed in a glass case and daily worshipped. They have four masts.

In the Yang-tse-kiang river the ships are flat-bottomed. Koo-Tay, or fruit boats, are numerous in the Canton river. They are 90 feet long, and 20 or 25 feet in beam, with two masts.

The Si-qua are so named from their resemblance to a water melon. They are one-masted, with a large mat sail, and have two large sculls, each requiring six or seven sailors.

The Ma-Yong-Shun are larger than the Si-qua. Their mast is of the form of shears. They cannot tack, and, having no sculls, have to be towed in contrary winds.

The Sun-Fo-Teng are cargo boats on the Yang-tze; are of great length.

The Hooe-Two-Shun are the tea boats of the Canton river. They have an arched deck; are about 90 feet long, and 15 feet in beam. The hold is 4 feet deep, with several water-tight compartments for storing the tea and other produce.

The Cha-Shun of the Canton river is another tea boat of great length and narrow beam.

The Too-Shun boats, for passengers on the Yang-tze, are in five classes, from 38 feet to 72 feet long, and with 10 to 15 feet beam. They have one mast and one sail. They are licensed, and under very strict surveillance. A class of vessels trading between Canton and Hong-Kong, 100 feet long and 26 feet broad, also bear the name Too-Shun.

The Cho-Ka-Shun are boats in which the mandarins travel. They are not unlike large floating caravans. Their mast is in the form of a pair of shears. They are poled or towed in contrary winds. Their saloons are spacious and comfortable.

The goddess Loong-Moo, or dragon's mother, is the deity invoked by the sailors of the coast and river boats, as the queen of heaven, Tien-how, is of the sea-going Junks.

The Wang-lau and Fu-Shun are flower boats of the Canton river. They are floating cafés, the saloon extending the whole length of the boat, profusely decorated and ornamented.

The Che-Tung-Teng are floating hotels, and sometimes hired for travelling in.

The Ten-Poo, or bed-boats, are much frequented by Chinese travellers, who pay from 50 cents. to a dollar for a night's lodging. Assignations also are kept in them.

The Cha-Teng, or floating kitchens, in size and shape resemble the flower boats, but have no decorations; the stern is fitted up as a humble café. They are largely used at boatmen's marriages for providing the dinner banquets.

The Koong-Sze-Teng or Hong-Me-Teng, known as Hong boats, are 30 to 40 feet long, and somewhat resemble the gondola of Venice. They have carvings and gildings, and their saloon may hold ten or twelve persons. They are propelled by a scull.

The Lou-Shun, or chamber boats, on the Canton river are floating temples or shrines, at which the boatmen solemnize their marriages by Taoist priests, who also, in them, say masses for the repose of the drowned and the unclaimed dead.

Nama-Mo-Teng are boats used as residences by the Taoist priests, whose services day and night are required by the boat population. They are similar in construction to the Chee-Tung-Teng boats, but have no glass windows, only sliding wooden shutters. They are stationary.

The Cho-Ke-Teng are very similar to the Nama-Mo-Teng, only smaller. They are stationary river dwellings for sailors and river boatmen. They are numerous, and anchored in streets.

The Sha Teng, or Sampans, are river boats up to 28 feet long, in great requisition by persons moving about on business. There are many kinds, some with a saloon and benches; some with stools, and navigated by a man and his wife, or by one or more women.

Ma-Leng-Teng is a shallow boat, shaped like a China slipper, and the boatman faces the bow of the boat as he pushes the oars from him.

Wang-Sheew-Too of the Canton river are ferry boats. They are propelled by a scull made to rest on a pivot at the stern. Each is licensed to carry six to fourteen passengers. Many of them are of great length, with a flush deck on which cattle and horses embark.

The Two Boats of China are long and narrow, capable of holding forty to eighty men. They are employed by the Chinese in their boat races and rowing matches, in the festival of the fifth day of the fifth month, usually falling in June, and seemingly relating to the summer solstice.

Chaong-Loong, or Long Dragon boat, are much used by pirates who infest the Chinese rivers, creeks, and seas.

There are snake-like craft on the rivers, creeks, and canals of the Eastern and Midland Provinces, used as post boats.

Tcha-Ho-Teng boats on the Canton river are somewhat similar to the Chaong-Loong. They are used by the river police.
BO-AY-GY-IN.

Sampan means three boards, and is the ordinary name for small boats or punts propelled by short oars or paddles. They are very narrow, without keels, and draw very little water.

The Chu-Teng, or hot congee boat, has a small galley for the purpose of enabling its owner to heat rice water, calling out, Mi chuk! Congee for sale.

Other boats of China are the—
Chay-Teng, or sugar-cane boats.
Cho-y-Teng, or vegetable boats.
Chu-Yuk-Teng, or pork boats.
Fu-Teng, or flower boats.
Kow-Teng, or cake boats.
Kung-Nya-Teng, or chinaware boats.
Mi-Teng, or rice boats.
Nga-Yuk-Teng, or meat boats.
Na-Chay-Teng, or green-pea boats.
Sau-Kwo-Teng, or fruit boats.
Tchi-Teng, or reedwood boats.
Tai-Tou-Teng, or barbers' boats, which are the smallest of the lot.

Yu-Teng, or fish boats.

You-Teng, or oil boats.—Layard, Nincech, ii. 97; Drew, The Northern Barriers; Ferrier's Journ. 429; Yule, Embassy; Marraty, Ind. Arch.; Bunsen's Egypt, v. 233—264; Miyanah's Travels, 242; Postans Pers. Observ. 124—7; Burton's Scinde, ii. 296; Cunningham, Hist. of the Punjab, 19; Dr. Taylor; Hooker's Him. BOBAN ESWARA. Lee, Karli.
BOBARRU. Tel. Dolichos Sinensis, L.

BOBBERRY. Angelo-Hind. for Ba-ri. Oh! thou Father! a very disrespectful address; to create aobby is to cause a disturbance.

BOBBILL, a zamindari estate in the Vizagapatam district of the Madras Presidency. It has been in the possession of a Hindu family since A.D. 1652. Its fort was the scene of a tragic occurrence in 1757, when it was besieged by M. Busy, on the instigation of the raja of Vizagapatam. M. Busy offered terms, which being refused, M. Busy then in one day thrice stormed the fort; and on at last gaining admittance, he found that the garrison had destroyed their women and children, and only dead and desperately wounded men remained, with the infant son of the raja, Ranga Rao, and an old man. Four others of the defenders had not perished, and two nights later they crept into the tent of the raja of Vizianagram, and killed him with thirty-two wounds. Other troubles followed; but in 1794, the son, Ranga Rao, was restored to his father's zamindari. Bobbili town is in lat. 18° 34' N., and long. 80° 25' E. The estate has 154,413 inhabitants.—Orme, ii. p. 258; Imp. Gaz.

BOD, in lat. 29° 50' 20" N., and long. 24° 21' 41" E., is the chief town of the tributary estate of Bod in Orissa, which has a population of 108,868 souls.—Hindus, with 23 per cent. of the population of the native tribes, mostly Kandis, with Pani, Damal, Guala, Sud, and Kent. The Mahanad bounds it on the north. The ruling family are Kshatriya The tribute is Rs. 8,000 annually.—Imp. Gaz.

BODANTA. Tel. Bauhinia purpurea, L.
BODARA. Hind. Marlea begonfolia.

BODASARAM BODATARAPU. Tel. Sphagnetic hirtus.

BODDA. Tel. Ficus glomerata, B.; F. racemosa, Wild. Bodda, Atti and Medi are applied indiscriminately to various kinds of Ficus, but most frequently to F. glomerata. Bodda-mar, fibre of F. racemosa.

BODDAMA KAIA. Tel. Bryonia callosa. Its bitter seeds are given in worm cases, and yield also a fixed oil, used in lamps. —O'Sh.

BODDA MAMIDI. Tel. Cupania canescens.

BODDI CHETTU. Tel. Macaranga Roxburghii, R.

BODDI KURA. Tel. Rivea hypocritiformis, Ch. The leaves are used as a vegetable in the Bodo; as a food or choice of R. Bona-nox in Bengal. The buds of Calonyction and some sp. of Ipomées, especially I. reptans, are also eaten as vegetables (kura).—Voigt; Elliot.

Boddu Pavili Kura or Ganga Pavili Kura, Portulaca oleracea, L.

Boddu Malle, Jasmium sambac.

Boddu Tunga, Hymenochaete grossa, Nees.

BODDI. Burm. The pipal tree, Ficus religiosa, under which Gautama attained Buddhahood. See Bo Tree; Buddha.

BODDI-SATWA, a Buddhist saint, who in the next birth becomes a Buddha; a candidate for the superior Buddhahship in Buddhism; an actual experimental religiousist. A mortal who has arrived at supreme wisdom (Bodhi), and yet consents to remain as a creature (satwa) for the good of mankind. The Boddi-satwa, Avalokiteshvara, was the Chinese Kwan Yin.—Hardy's Eastern Monarchism, p. 434; Grose, p. 96.

BODDI, or Choli, is worn everywhere in the south of India. It is cut in square pieces, which meet in front, and are tied by the ends in a strong knot under the breasts; and the sleeve, which in some instances reaches below the elbow, and in others above it, is put into the opening left unseen in the upper part of the square body piece. The construction of this article of dress is very simple, and most women make their own. In the south of India, bodiccs are not worn by the women of some races. It is only, they say, courtresses who are ashamed of them who hide their bosoms. A form of bodice, named angia, is entirely closed in front, and is shaped out to fit the bosom. This garment is worn alike by Mahomedan and by many Hindu women. The dress of Mahomedan women further consists of petticoats, generally very wide indeed, and falling in heavy folds. Some wear an underp Petticoat of fine calico as a protection to the costly stuff of which the outer garment is composed, or to escape friction. The stuff—satin, silk, or cotton cloth—is gathered into a strong band of tape, which is tied over one hip, and the plaits or garters are carefully made, so as to allow the cloth to fall in graceful folds. Over the choli or angia bodice is a light muslin shirt, which continues below the waist, called a koortni; and over all a scarf of white or coloured muslin of fine texture, do-patta, passed once round the waist, and thence across the bosom and over the left shoulder and head, like the sari, completes the costume. Where the langa or petticoat is not
worn, paizama or trousse take their place. These are sometimes worn loose, as in Oudh and Bengal, and elsewhere as tight as they can be made. The cutting out of these tight troupes is no easy matter, for they have several gores on the inside of the thigh, and are contrived so that they are flexible, however tight, and do not hinder the wearer from sitting cross-legged. With these troupes, which are tied at the waist, are worn the angia or choli bodice, the koorti or shirt, and the do-patta or scarf. In full dress, a Mahomedan lady wears the pealwah or Persian robe, in which dancing-women usually perform. It has long tight sleeves, a tight body crossed in front, and a very voluminous muslin skirt, the most fashionable amplitude being about forty or even sixty yards in circumference. This garment is often trimmed in a costly manner with gold or silver lace, and is only worn as a bridal dress or at domestic festivals. Any additions to the above consist only in variations of the component parts; cloth for bodices is made like saris, with coloured borders. In the cutting out of the bodice, it is contrived that each sleeve ends with the border, and that the seams round the bottom of the garment, if not entirely, at least to some extent. Bodices are also made of English white muslin, jacquct, or fine calico, and of chintz, provided the colour is fast. Many are of silk and cotton mixed, others of silk or cotton only.

The silk sari, and also the pitambar, or men’s silk waist-cloths, are worn by Hindus at entertainments and festivals, as also in religious worship. Saris are nearly universal for Hindu wear; and soussi, made into petticoats and troupes, is as universal for Mahomedan women and men also, and it has this advantage over saris, that the colours and patterns differ very little anywhere within the confines of India; whereas the saris, dihotis, and loongis must be made to suit particular localities, and the patterns of one locality would inevitably be rejected in another. A kind of soussi is produced in France, blue striped, closer in texture than the Indian, perhaps, but belonging to the same class or category; and another, called grivas, in particular, near Vieil, both excellent and fast-coloured fabrics, and both used for troupes and bouses. The Indian soussi are always striped or checked, woven in narrow patterns, with coloured yarn, blue and white, black and blue, red and blue, yellow, white, and blue, green and chocolate, as detailed in Dr. Watson’s list; and they are worn, fine and coarse, literally by millions of the people of the middle and lower classes. In Sind, under the shift, but of cloth called kanjari, the choli or gaj conceals the bosom. When it passes round the side like a bodice and is fastened behind, its name is puth. This article of dress is very often omitted in Sind, a fact which may in some measure account for the pendent shape which the bosom assumes even in young women after a first or second child.—Watson, Burton’s Seinula, p. 391.

BOEDANA. *A* Jakun tribe inhabiting Queclah. BODO JAMO. Uri. Eugenia jambolana.

BODOKA. *Uri.* In Garjum and Gunusur, a common timber tree, extreme height 35 feet. It has a light, white wood, used for seabards, bazar measures, boxes, bulklo yokes, the poles of palanquins, tonjons, and toys.—Captain Macdonald.

**BOEHEMIA INTERRUPTA.**

BODON. *Hind.* A tree of Chutia Nagpur, with a hard, reddish-grey timber.—Cat. Ex. BOD-PA, a name of Tibet.

BOEHMERIA, a genus of plants belonging to the nat. ord. Urictaceen. The species in the East Indies are—macrostachya; macrophylla, *D. Don*; platyphylla, *D. Don*; frutescens, *Thunb.*; frondosa, *D. Don*; ternifolia, *D. Don*; interrupta, Wild.; gogalado. Many of these are staining netels; B. nivea, the Urctes tonacissina of Roxb., yields the Rhee fibre of Assam. B. salicifolia has an edible berry.—*Roxb.* 590; *Royle*, 372.

BOEHMERIA FRUTESCENS. *Thunb.*

This plant grows wild, to a height of 6 or 8 feet, in the mountain valleys of Eastern Nepal and Sikkim, and in the hills near the Terai, to elevations of 1000 to 3000 feet. Its fibre is used for twine, rope, fishing-nets, and game-bags, and could be woven into sailcloth. When to be used as a fibrous material, it is cut down when the seed is formed, as with the common flax in Europe. At this time the bark is most easily removed, and the produce is best. After the seed is ripe it is at least deteriorated. As soon as the plant is cut, the bark or skin is removed, and is then dried in the sun for a few days; when quite dry, it is boiled with wood ashes for four or five hours; when cold, it is beaten with a mallet on a flat stone until it becomes rather pulpy, and all the woody portion of the bark has disappeared; then it is well washed in pure spring water, and spread out to dry. After exposure for a day or two to a bright sun, it is ready for use. When the finest description of fibre is wanted, the stuff, after being boiled and beaten, is daubed over with wet clay, and spread out to dry. When thoroughly dry, the clay is rubbed and beaten out; the fibre is then ready for spinning into thread, which is done with the common distaff. The Pooh is principally used for fishing-nets, for which it is admirably adapted on account of its great strength of fibre, and its extraordinary power of long resisting the effects of water. It is also used for making game-bags, twine, and ropes. It is considered well adapted for making cloth, but is not much used in this way. Pooh fibre, when properly dressed, is quite equal to the best Europe flax, and will produce better sailcloth than any other substance seen in India. If potash were used in the preparation (which is invariably done with Russian hemp and flax) instead of clay or mud, the colour would be improved, the substance rendered easy to dress, and not liable to so much waste in manufacturing. Captain Thompson thought that it would be worth twelve rupees a maund in Calcutta.—*Royle*, p. 368.

BOEHEMIA INTERRUPTA. *Wild.*

Urctes interrupta, *Linna.*

Grows in the Bombay and Bengal Presidencies, and in Burma. Its hairs sting like those of the nettle.—*Voigt*, 281.
BOEHMIA NIVEA. Hooker and Arn.

Urtica nives, Linn. [Urtica leschinius, Roxb. candidans, Burch.]—Boehmia candidans.

China grass. Exo. Raha, Dom Raha, Hind. [Boehmeria candidans, var. ptiloides, Linn.] This plant is cultivated in the eastern parts of India and in China for its fibres, which are second to none in strength and beauty, and are used for textile fabrics. It grows rapidly and luxuriantly, and can be cut three or four times in the course of the year; the young shoots are those which are used, and on the stem being cut down, numerous straight simple shoots spring up from one to eight feet high.—Drury's Useful Plants. See Raha.

BOEHMIA PUJA, Royle, is botanically a different species from the B. nives, though its fibre is almost identical with that furnished by B. nives. It flourishes at Darjiling, Darha Doon, and other places in the north of India. Its commercial value is the same as that of Raha, affording the Puja fibre of Northern India.

BOEHMIA RUGULOSEA, Wedd., grows in Garhwal and Darjiling Teral.

BOEHMIA SALICIFOLIA. D. Don.

Urtica salicifolia, Roxb. Siharu. [Panji.] A plant of the Maluccas and of the Himalayas, as far as Darha Doon, found in Simla and in Garhwal, and in the Sutlej valley between Rampar and Sungrah, at an elevation of 6000 feet. Used for making ropes. Its berries are edible.—Royle; Voigt, 280; Clegghorn, Panjib Report, p. 68.

BOEHMIA UTILIS. Royle. Raha.

Bun or Bun Raha. [Leipeeh of Nepal.] Jungle Raha is common in Nepal and the Assam forests, and thrives best in the vicinity of water or of running streams. When unmoistened it grows to a tree, but, by proper management, the divided roots afford numerous shoots, and the plant can be propagated by slips as well as by the seed. Its cultivation for its fibre might be carried on, as with the willow in Europe. It is said to be exported into Southern, from Northern China. It is cultivated largely by the hill tribes north-west of Yunnan, and by the Singhpoas and Dhoomnas of the north-eastern frontier of India to a slight extent only, for a coarse cloth, but chiefly for nets. It is sometimes recognised as the Leipeeh of Nepal (Journ. Agri.-Hortic. Sec. vii. p. 222). This fibre is well adapted for rope-making. It is about five feet in length, brown in colour, strong, and flexible. It is all that can be desired either for canvas or lines, and only requires to be known to be generally used for such purposes. It was made into a five-inch rope by Messrs. Huddart, along with the Dom Raha or China-grass, and broke with a weight of about nine tons, or precisely 21,025 lbs. Since then, it has been made up into ropes of various sizes, which greatly exceed in tenacity those made of Russian hemp of the same size. It has also been made up into lines and cords, some of them almost fine enough for fishing lines; in which it displays its fitness for all such purposes, from the union of strength and flexibility. It was valued at £5 a ton.—Royle, Fl. IV. p. 363.

BOERHAIAXIA ERECTA. Linn. Hog-weed.

procumbens, Roxb., W. Ic.

Tikri. [Hind.] Mukaratay kiny. [TAM.

Tamiramana. [Malay. Ataka mamidi. [TEL.

Sindikia. [Sansk. Adavi mamo.] [Tel.

Var. a. Roes, Gada-pooma, deep-tose.

Var. b. Alba, Shwol-poorna, white.

BOHIRA.

A very common, troublesome weed. The long fusiorm perennial roots strike so deep as to render it no easy task to dig them up. It produces blossoms and ripe seed during the whole year. Horsfield says that in Java this is deemed emetic. The native practitioners of India reckon the root amongst laxative medicines, and prescribe it in powder. The small round leaves which grow at the joints of the stalks of the plants are eaten.—Roeb. ii. 146; Ains. 68. Sch. Voigt, 329.

BOGAIA. Singh. Ficus religiosa.

BOGLE, GEORGE, in 1743 was deputed to Tibet by Warren Hastings as ambassador.

BOGNO or Bounigo, Japan. A governor.

BOGRA, a revenue district in the Rajpoot, Koch-Bihar, division, between lat. 24° 32' and 25° 18' 30" N., and long. 88° 54' 15" and 89° 48' E., with an area of 1491 square miles, and a population of 689,476 souls, chiefly semi-Hinduised aborigines of the Kochi, Pali, and Rajbansi races, and the Ghatwal. There are also a large number of Kailbart cultivators, with boating and fishing castes. The mound of the ruined city of Mahasthan is, as the shrine of Shah Sultan, largely visited by Mahomedans.—Blang. Dir. Impr. Gov.

BOGSHA, a tribe occupying the low Terai adjoining Rohilkhand.

BOHIN, the Bohi, were captured by the British navy on the 25th February 1841.

BOGUM - WANLI. Tel. From Sanskrit Bhogam. Common women. See Basaya; Murli.

BOHRA. Hind. Bignonia undulata.

BOHINI. Hind. With shopkeepers and hucksters, the first money received of the day; it is the handsel of the British. Throughout India, credit for such transaction is not allowed; it must be a ready-money transaction.—Elliot.

BOHIRA. Many of the Mahomedan shopkeepers on all the western side of India, and as far east as Secunderabad and Bellary, are Bohra, and they are in many parts of Central India and the N.W. Provinces; in the Rajput states, on the north-western coast of peninsular India, and are gradually extending to the south. They call themselves Insull, acknowledge an Arabian dree or religious chief, and are an active, intelligent, mercantile body. They are scattered all over the country, but are found principally in Gujarat and the adjoining provinces of Cutch, Sindi, and other parts of the Bombay Presidency. They are a peaceable, inoffensive body of men. They are fair, robust, somewhat taller than the average Englishman. Wilson says that these appear to have originated in Gujarat, where they became converted to Mahomedanism; but they seem to have come from Sindi. They are engaged in every branch of commerce as wholesale merchants of the first class, as well as pedlars; and sometimes both characters are to be found in the same person. They are a chief medium through which the retail trade in European articles is carried on. The good understanding in which they live with each other strengthens their association; and though they have in former times suffered from the violence of power, few of the ingenious classes have escaped so well, during the worst of times, as the Bohra. They are united under the spiritual rule of their elected mujah, or priests, to whose orders, in conformity with the ancient precepts of the remarkable sect of Mahomedans to which they belong, they render
implicit obedience, corresponding in many respects
with the Imamiyah, the Ansaribah, the Mutawilah,
and the Drusos of Syria, and holding the doctrine
of the divine character of All. They are of the sect
of the Hasani, the Assasins once so dreaded in
Egypt and Persia, for the murders perpetrated in
blind obedience to the mandate of their spiritual
chief, so famous in the crusade history under the
name of the Old Man of the Mountain, or Shaki-
ul-Jabal. At Oojein, in Sir J. Malcolm's time, 1200
families lived in four mohal or wards connected
with each other, but separated by strong gates
from the other parts of the city. No one except a
Bohra is allowed to penetrate without leave. The
chief mullah, who resided at Oojein, was
appointed by the high priest of this class at
Surat, and his authority extended over all his
seet. His orders regulated their most minute
actions; and he promulgated annually a table of
rules for their guidance. He estimated the Bohra
in his diocese or charge at nearly 10,000 families,
or about 45,000 souls. They seem to abstain
wholly from political intrigue, are liberal-minded
and open-handed, and as good citizens far excel the
Mahomedans either of Arab or Persian descent.
The name is said to be derived from Beohar, trade.
Wilson says the word is derived from the Gujeratí
words, Vohora, Wohoro, and Ohoro. The Boira
in the N.W. Provinces of India and the
Upper Doab have a humber branch, called Koyan
or Rabie, who are money-lenders. Sir J. Malcolm
says that besides the Mahomedan Bohra, there is
a tribe of Brahman from Nat’hdwar in Mewar,
who have likewise this appellation.— Elliot: Mal-
colin's Central India, ii. p. 111; Census.
BOI, Tel., also pronounced Bhui. On the
Madras side of the Peninsula, a palanquin-bearer;
fisherman employed also as a house-servant.
BOIDU. Tel. A man of the cowherd or
shepherd caste.
BOIL. The Delhi boil, Sind boil, and Aleppo
boil are very intractable diseases. The Aleppo
boil, about the size of a shilling, occurs in the
Tehe-
ran. It is of a livid colour, not painful; its pro-
gress is slow. It is called the Hebt-us-Simne, or
the Blotch of a year, also the Haleb-chiban. It
is seldom cured in 8 months.
BOIS. Fr. Wood; hence Bois à batir, Bois
decharpente, timber.
BOJ. HIND. Acorus calamus, also Typha
angustifolia.
BOJA. Tel. Inga xylecapra.
BOJAI. HIND. Eleusine coracana; beer made
from this grain.
BOJAVA. JAV. Crocodile.
BOJH, also Boha. HIND. A weight, a load.
BOJDAN, the root of a small plant brought
from Dehli to Ajmir; used as an aphrodisiac.—
BOKA. HIND. A basket, pall, or leather bag;
for throwing water to a higher level. It is the
source of the English word bucket.—Ell.
BOKAARA GAS. SINGH. Gomphia angus-
tifolia var. Vahl.
BOKADA. Tel. Clerodendron viscosum.
BOKARO, a mile west of the Hazaribagh dis-
trict of Bengal, covering an area of 250 square
miles on either side of the Kokaro river. The
quantity available is estimated at 1500 millions of
tons. It is regularly worked.—Imp. Gaz.
BOKAT. HIND. Asphodelus fistulosus.
BOKENAKOO. HIND. Zanania nodiflora.
BOKHARA, a khanate in Turkistan, of small
extent, surrounded by a desert. It lies between
the parallels of lat. 37°–45° N., and long. 60°–65°
E. It is an open champagne country of unequal
fertility, and intersected by the Amu or Oxus on the
southern border. Its rivers are the Amu or
Oxus and Sýr or Jaxartes, the Kolkh or Zar-afshan
and the river of Karshi and Balkh. It is ruled
over by an Amir. The population was esti-
mated by Irving (1809) at 3,500,000, by Burnes
1,000,064 by Fraser at 2,500,000, and by Balbi
(1826) at 1,200,000. A considerable por-
tion of the khanate consists of a clayey, saline
soil, and sandy steppes, with a visible slope to
the south-west, while it is barricaded to the
north-east by huge ranges of mountains. The
prior occupants are the Tajak, whose time of immi-
gration into Bokhara is unknown. Previous to
the conclusion of the first century of the Hijira,
the followers of Mahomed penetrated there, and
forced them at the point of the sword to embrace
the new
creed. At that period Bokhara was governed by
the Samanides. In the 10th century the weak
rule
of these princes was totally overthrown by the
Uzbaks, whose power was not of long dura-
tion; for in the 12th century the khanate of Bok-
bara was deluged by the overwhelming flood of
the Moghul hordes of Chengiz Khan, and the
Uzbaks were driven by the Moghul into the
desert to the west of the Sýr-i-Darya. Bokhara
has often changed its rulers and modified its
inhabitants. At each successive influx new tribes
were added to the bulk of the population. This
intermixture was more particularly felt whenever the
Uzbaks re-entered the khanate. Of the Tajak
there is but a remnant left in the city of Bokhara.
Owing to their peaceful disposition, not to use the
word cowardliness, they abstain from taking any
part in warlike achievements. The most salient
traits of their character are avarice, falsehood,
and faithlessness. They are usually tall; have
a white skin, with black eyes and hair. In their
dress they strictly adhere to the rules of the
Koran, and there is much greater affectation than
is observable among the Uzbak. Their politeness
in conversation often becomes disgusting, especially
if they require the assistance of the person to whom
they address their words. The number of
the Arabs is somewhat greater than that of the Tajaks.
They are chiefly dispersed over the northern parts
of the khanate, having their headquarters in the
vicinity of Vardanzi and Samarcaund. They have
not relinquished the habits of their ancestors, and
continue to lead a wandering life, with this differ-
ence, that the severity of the climate has induced
them to exchange their tents for the kibitki.
Such only as are compelled by the nature of their
occupation, live in fixed habitations. Their fea-
tures betray their origin. Their large eyes are
black as well as their hair; and their skin, which
is very susceptible of the effects of the sun's rays,
often becomes nearly black from exposure. They
speak Arabic amongst themselves.
Bokhara has grain, fruit, silk, cotton, dyes, and
cattle, all unrivalled of their kind. Their horses
are celebrated throughout Asia; their camels sur-
pass all the other sorts of this most useful domestic
animal in the south and west of Asia; and their
mutton is equal to any in the world. The hilly
country east and south of Samarcand is rich in minerals.

The Uzbak are undoubtedly the preponderating race in Bokhara, not so much from their number, as by the ties which bind them together. They are divided into stems and sections, like the Kirghiz, and have their elders or boys, who enjoy a certain consideration among them. The Uzbak branches, with some of their subdivisions, are enumerated in the work called Nasedd-Mameti-Uzbekia. Many of their tribes are in this khantate.

Manghit encamp at different places, partly in the neighbourhood of Karshi, and partly near Bokhara, and it is out of one of its branches, called Tuk, that the reigning dynasty proceeds. Uzbak are generally middle-sized men; the colour of their beards varies between a shade of red and dark brown, whilst few are found with black hair. Their dress is very plain, consisting chiefly of khalat, or flowing dresses of alaja. The wandering Uzbak live, like the Kirghiz, in kibitka. The external felt is usually of a black or dark grey colour, but the interior is more tastefully ornamented than the tents of the latter; for the Uzbaks hang small carpets of home manufacture along the sides, and, through the work be coarse, and the colours generally of a sombre hue, dark red or brick colour in particular, their presence sets off the tent to advantage, and gives it an appearance of cleanliness. Their meals are very monotonous, the staple article being constantly mutton. Kumis (fermented mare’s milk) is only drunk by those who keep large herds of horses. Their chief occupation consists in breeding flocks. Children all but naked are seen driving the sheep round the aul, while the chief sits listlessly in his kibitka, leaving all the household affairs to the care and management of the women, who do not differ in dress from the Kirghiz women. In the interior of the aul, half-naked children may be seen romping about and fighting with dogs.

Bokhara has a considerable number of Persians, especially Persian captives, who are brought thither in small parties. The greater majority, however, of this people were transplanted from Merv, in the reign of Amir Sepid, when that city fell under his sway. With a view of weakening it, and the chance of seizing it for himself, he ordered all its inhabitants and families to be transported from Merv to the neighbourhood of Samarcand. It is from them the Persians of Bokhara chiefly descend.

The Persian population are easily distinguished by the regularity of their features and their bushy black hair. They profess outwardly the Sunni faith, though in their hearts they remain Shia. The Jughi, Mezeng, and Luli are classed among Musalmans in Bokhara; their women go unveiled, and the men are careless in their religious duties. Numbers of them are established at Bokhara and other towns as medical men, fortune-tellers, and horse-dealers. Such as lead a wandering life encamp in tents of a coarse cotton stuff called bez. They have permission to halt near all the lakes and rivers of the khanate whenever those places are not previously occupied by Uzbaks; in consequence of which a great number of them are dispersed along the banks of the Zar-afshan, near Samarcand, while others encamp in the neighbourhood of Karakul Bokhara and Samarcand are the centres of Mahomedan theology. There are no Mahomedans so strict as the inhabitants of Bokhara, but it was the most shameless sink of iniquity in the east. They have a monastery at Bokhara, dedicated to the famous darvesh Mulana Jalal-ud-Din, who centuries ago went from Bokhara to Leonium. Its houses are built of mud and wood. The rooms have no furniture; and glass for windows is unknown, oiled paper being used in lieu. Bokhara and Turkestan send out raw silk of various sorts, called shilja jalier, vardanzwi, lab-i-abi, churki, from Khojan, Balkh, Kunduz, Akcha, Shibarghan, etc., Bokhara gold coins are buduki and tila. Broadcloth is little used, only cotton cloths (alaja), and silk, loose silken garments. Women’s clothes are of a dark colour, often blue, and fit tightly, with a horsehair veil.

Bokhara city, in lat. 39° 46' 45" N., long. 64° 26' E., is about 7 miles from the left bank of the river Zar-afshan. It is about 75 miles in circumference, and is surrounded by a clay curtain, with bastions at intervals. It has about 15,000 houses, and a population of 75,000 souls. The ark or palace was built by Alp Arslan. The foreign traders have their respective caravansaries. It has numerous mosques, and about 140 schools and colleges. The inhabitants consist of the Tajak, Nogay, Uzbak, Arab, Jews, Persians, and a few Russians. The Jews are dyers and silk traders, and must wear a small cap and girdle around their waist. The speakers of the Russian are called Mahomedans. There are merchants from Sind, and many darvesh. Whole streets contain nothing but shops and magazines for merchants from all parts of Turkestan, Kashgar, Hindustan, and Russia. There are, all around, numbers of country houses, with gardens.

The brothers Polo stayed three years in Bokhara in the time of Barak Khan (A.D. 1264-1274); and Anthony Jenkinson, who together with the brothers Johnson travelled in Central Asia as agent for Russian cloth manufactures, was in Bokhara A.D. 1558-59. It was visited in the early part of the 19th century by Sir Alexander Burnes, Dr. Joseph Wolff, Colonel Stoddart, and Captain Conolly. The two last fell victims to the fanaticism of the people. It was taken by Russia in 1868—Wolff’s Bokhara, ii. pp. 3, 4; De Bode, Bokhara; Teisserenc de Bort, personal Narrative; Pierson’s Journey; Max Müller; Porell’s Handbook; Trotter, Central Asia.

BOKHARA CLOVER, Melilotus, a genus of plants of the nat. order Fabaceae, several species of which, native and foreign, are grown in India, Melilotus arvensis, Italicus, lecanthus, officinalis, parvillora, and sulecta. M. arborea is the Bokhara clover, and affords two or three cuttings in a season; most of them are grown as clover.

BOKHARA, LITTLE, a name of Chinese Tar-tary or Eastern Turkestan.

BOKHARI, one of the six principal collectors of the hadis or traditions of Mahomed. The other five collectors were, Muslim, Abu Daud, Tirmidizi, Nassar, Ibn Maja or Ibn Khoezima. Bokhari was a takhallus or literary appellation. His real name and cognomen are Abu Abdulla Muhammad Ismaill. He was born A.H. 194, and died A.H. 236.

BOKHARIAN HAKIM. See Gia-i-Khatal.

BOKHDI. See Aryan.

BOKHEE. Dukh. Hipette madalobta.

BOKKADI. Tel. Ehrutia, sp.

BOKKENA. Tel. Zapania nodilora, Lam.

BOKKUDU. Tel. Hydrocotyle Asiatica.
BOLARUM, B. Hort., Jav., Fr., but pass common of infantry, of productions, that the every ascent, are the valley south, the gum, lower this camels over Kohilkhaud. BOKSA, the great BOKSA, BOKLA. BOLLA, Bola. B. Balsamodendron myrrha, Needs ab Jenny.; also myrrh. BOLA. Beng. Paritium tiliaeceum, St. HIL. BOLA of Bengal, the fish Corvinus chapitis. BOLAN, a pass in Saharanwan in Baluchistan, 614 miles long, leading through the Haiz Mts. from Kutehi to Daski-ib-Baulat. It is a succession of valleys, bounded by mountains. The road is good over the bed of the torrent, from which large stones are removed. It is better adapted for camels than horses or wheeled conveyances. It is the principal route for the traffic from Sind to Afghanistan. In 1838, the British Indian army, 13,050 strong, and Shah Shuja's army, 6070 strong, with 40,000 followers, marched through this pass. The water of the Bolan or Kahi river disappears in the shingle at Ab-i-gum, to reappear lower down. The British Indian army again, in the war of 1878-79, marched through the Bolan to Kandahar. The entrance is 800 feet; Ab-i-gum, 2540; crest, 5793 feet. Dr. Hunter says 8500 feet. Average ascent, 90 feet per mile. The Bolan, with the Moolla pass far to the south, are the only practicable routes intersecting the great chain of mountains, defining, on the east, the low countries of Kutch Gandava and the valley of the Indus; while westward it supports the elevated regions of Kalat and Saharanwan. There are two passes over this chain, but all of them from the east have a steep and difficult ascent, and conduct to the brink of the plateau or table-lands. Such are the passes of Takari and Nagow between the Bolan and Moolla routes, and there are others to the N. of the Bolan. This pass is particularly important, as occurring in the direct line of communication between Sind and the neighbouring countries, with Kandahar and Khorasan. It also constitutes, in this direction, the boundary between the Sard Sair and Garm Sair. The natives say that all below the pass is Hind, and that all above it is Khorasan. This distinction is in great measure warranted, not only because the pass separates very different races from each other, speaking various dialects, but that it marks the line of a complete change of climate, and natural productions.—Masson's Journeys, i. p. 338.

BOLARUM, a military cantonment of the Hyderabad contingent, ten miles north of the city of Hyderabad in the Dekkan, continuing to the north of the Secunderabad cantonment. The force comprises a regiment of native cavalry, one of infantry, and a battery of artillery.

BOLPHYLUM, a genus of plants belonging to the natural order Orchidaceae. B. auricomum, Careyanum, flexuosum, fuscosenus, Jenksenonii, serpens, and sunippia, occur in Nepal, the Khassya hills, Burma, and Tenasserim. The most highly valued of the orchid order among the Burmese and Karens is a sweet-scented bolophyllum, which Karen youths wear in the lobes of the ear, and maidens in their hair. It abounds in almost every part of the jungles, throwing down delicate steam-coloured racemes over the rough grey bark of old Lagerstromia trees. B. Careyanum is common in the vicinity of Moumein, and easily recognised by a long leaf at the apex of a false bulb, and by its small purplish flower.—Masson.

BOLE ARMENIAN, Berlin red.

Boj-Armeni, Ab. Harazni, Panjab. Bole de armenie, Fr. Harmouchi, • Gil-armeni, Pers. Gurukutta, Sanske. Gheru mitti, Sine kavi kallun, Tan. Tannam Foo, Jav. Sina kavi rai, Tel. An earthy mineral of a fine red colour, one of the hydrous silicates of alumina. That found in the island of Lennos is white, and called Lennos earth. Armenian bole is in use in India amongst native practitioners as an astringent; it is largely employed by fraudulent dealers to colour articles of food, etc. It is employed in native painting and gilding. In many countries, Bengal and South America especially, this and other unctuous earths are eaten occasionally by pregnant women, to allay the craving for food so common in that state; and in times of scarcity it has been used by both sexes as a mechanical substitute for proper food. It consists of alumina, silica, magnesia, and oxide of iron. It is brought to India from the Persian Gulf; but it also occurs of fine quality in the Rajmahal hills, also in Mysore, Bellary, and other localities. Reduced to very fine powder, it is used as an absorbent application, sprinkled over ulcers or other raw surfaces. The boles of Biols, Sisela, Lennos, Armenia, and other places are celebrated. They do not effervesce with acids; are astringent, contain silicate of alumina, and a varying proportion of iron and magnesia. The red varieties are called Armenian bole, and the white varieties are Lennos earth.

—O.sh.; Smith.

BOLEDI, a tribe of Arab descent in the Kaj district of Baluch Makran. They were in brief authority in the early part of the 17th century.

BOLEOPHTHALMUS BODDERTI, the leaping fish of the seas of the E. Archipelago. They are salamandrine-looking creatures, scarcely distinguishable from the mud on which they lie, but make a series of leaps on being alarmed. They are 3 or 4 inches long, wedge-shaped, with flat pointed tails, head, and prominent eyes. They are called by sailors Jumping Johnnies. They lea by means of their ventral fins.—Collingwood.

BOLETUS DESTRUCTOR, dry-rot fungus.

BOLETUS IGNARIUS, Agaricus albus.

BOLINTRABOLUM. Tel. Bol ka gond, and Bijs bol, Hind. A dark, reddish-yellow opaque gum, is supposed to be true myrrh. It is considered a woman medicine; is given to children in enlarged abdomen, mixed with aloes, as a dosistri-ment, and is also used in making native ink; one seer costs eleven annas.—Gen. Med. Top.

BOLKUKI. Beng. Adolia castanacarpa.

BOLO CHAPITIS. Buech. Corvinusbola, M. Catt. Corvinus chapitis. A whiting that furnishes isinglass; the jawbone of the fish is described as Boalee.—Masson. See Bola.

BOLOR MOUNTAINS, the mountains of Bali, extend for 300 miles, from the sources of the Gilgit and Yasan rivers in 73°, to the 77th degree E. long., the source of the Nubra river. The Bolor mountains form the western boundary of Chinese Turkestan and Dzungaria. Bolor pro-
duces much gold. The higher mountain range
abounds in rock-crystal, called Bilor-stone. The
people of the neighbouring Dardu districts on the
Indus know Balti only by the name of Patolo.
Balti is still famous for its gold washings. Ptolomy
calls the people Bötarä, or Byltoc.—Yule.

BOLUNGE AND BANSO. Tel. ? Uria? Two
rare bamboos of Ganjam and Gumur; extreme
height 25 feet, circumference ½ foot.—Captain
Macdonald.

BOLU, amongst the Mahrawtas, the cere-
mony of conducting a bride to her husband's
house; also dismissal of the bridge-groom's friends
and attendants. Also, the ceremony of propitiating
the Bhuta or spirits of deceased persons (pestilences)
who have entered a village, inducing them to leave the village
and conducting them across the borders with music and a procession.
The exercise of the Bolu is a cause of great
anger to the villagers to whom the pestilence is
led. Perhaps from tiluna, to call.—Wilson.

BOM or Bun-zu or Bom-du are closely allied
tribes, termed collectively Lungka, Kungye, or
Kuki, who occupy the highlands of Tipihar, and
extend S.E. towards the head of the Koladyn.
Both the Bun-ju and Kuki appear, like the Ku-mi,
to belong to the Burman family. The Kuki
represent its most archaic and barbarous condi-
tion. The tribes that have been exposed, on
the seashore of Arakau or in the basin of the
Irawadi, to the influence of the Chinese, Shau, Mon,
Bengali, and more distant commercial nations,
have attained a comparatively high civilisation.
The Singpho, although much behind the
Burmans, are greatly in advance of the Kuki; and
the Burmese seem, at a very ancient period, when
their condition was similar to that of the Kuki,
and perhaps in many respects more barbarous, to
have spread themselves from the upper Irawadi
to the south and west as far as the highlands of
Tipihar on the one side, and Pegu on the other.
Wherever the stock from which they have been
derived was originally located, they probably first
appeared on the ultra-Indian ethnic stage as a
barbarous Himalayan tribe, immediately to the
eastward of the Mishmi, if indeed they were not
identical with the Mishmi of that era. The upper
Irawadi was probably then occupied by the ruder
and inland tribes of the Mon-Anan alliance.

BOMA-PAPATA. Tel. Stylocoryne Wehera.

BOMBACEAE. Several genera of this group
of plants, as the adsonian, bombax, durio, ochrona,
gossamipinus, and salmalia, grow in the East
Indies. Salmalia Mahabara and Gossamipinus
have a soft down attached to their seeds, and
yield a powerful paste. Some authors regard this
group as a section of the Sterculiaceae.

BOMBAREK, a rock which British sailors so
call. It is the Koh-i-mubarak, also Has-mobarak,
the fortunate or auspicious mountain, or headland,
of the Arabs.

BOMBARIMASA. Tel. Citrus deccanensis.

BOMBAX CEIBA. Linn.

Muh-nien, . . . CHIN. | Pan-chi-hwa, . . . CHIN.

A tree of Jamaica introduced into the E. Indies.
In South America and the West Indies it is used
for canoes. It is common at Canton; and the
fleshy petals of the flowers are sometimes prepared
as food. It is said to be a large tree of the
Burmese country, and its beautiful and soft floss

is used for pillows and thin mattresses by the
natives. The juice of the root is aperient, and its
bark emetic.—Veitg: Malcom's Travels, p. 187;
Riddell: William's Middle Kingdom, p. 284.

This large and stately tree grows in most parts
of British India, and is often from 80 to 100 feet
to the first bough. It occurs wild in the Siwalk
tract up to 3500 feet, and beyond the Indus, and up
to 6000 near the Tavi; and its wood is used there for
planks, boxes, water tanks, carvings, troughs,
bridges, and scabboards, and light work, its bark
being whitish, coarse-grained, weak, brittle, and
very subject to the attacks of white ants, but it
stands water well. In the Bombay Presidency,
both on the coast and inland, it is one of the most
common trees, and the planks are extensively used
in making light packing-boxes used in the export
of bulky goods from Bombay and other
places; also for fishermen's floats when the Adan-
sonia is not at hand, and for canoes. It is abun-
dant in the plains of British Burma, where its
light and loose-grained wood is used for coffins.
A cubic foot weighs 28 lbs. When the trees grow
large, the stem spreads out towards the base, at
intervals, into buttress-like projections. In spring,
huge Magnolia-shaped scarlet blossoms cover the
trees, and in some places the young flower-buds are
cooked and eaten. Its cotton is used for
stuffing cushions and pillows. In a full-grown
tree on good soil, the average length of the trunk
to the first branch is 60 feet, and average girth
measured at 6 feet from the ground is 15 feet. It
yields the Mocceus-resin, and its roots constitute
the Safed Mooli of the bazaars, which, powdered,
forms a thick mucilage with cold water, and
answers admirably as a nutritious demulcent for
convulsive persons.—Drs. Wright, Brandis, Gib-
son, O'Shauffhney, Stewart; Mr. Thompson;
Captain Beddome.

BOMBAY, in lat. 18° 55' 5" N., and long.
75° 53' 55" E., is situated on an island of
that name, with an area of 18-22 square miles, and
gives its name to a presidency under the rule
of a Governor and Council; also to the army
which holds the Bombay territories and the
peninsula of Aden; also to the small naval force
of the Bombay Marine; and likewise to a group
of islands off the coast of Aden. The Enghsh name
is a changed form of Mumbai-devi, a local Hindu
goddess. The countries under the Bombay go-

dernment present markedly differing features,
like in their physical aspect, in the races occup-
ing them, and in the languages that they speak.
In the times preceding and following the Christian
calendrical vices, the territories under notice were
distinct nationalities,—Kathiawar, Maharashtra,
Gujaratshara, Saunarashtra, and Sindhu; and a power-
ful ancient dynasty seems to have had their capital
at Wallabhi, in the modern Gohilwad, another
being the great Chalukya empire of the Dekhan,
in the Dekhan part of the Bombay territories, on a

407
portion of the plateau between the rivers Nerbudda and Kistna, elevated about 1700 feet above the sea. What is known of the history of these regions while under their early rulers is chiefly derived from legends handed down by traditions relating to the various sectarian religions that were acknowledged, and by the architectural and sculptured remains and rock-inscriptions, which Colonel James Tod, Mr. James Ferguson, Colonel Sykes, Mr. James Prinsep, General Cunningham, and Mr. James Burgess have investigated. But since the time of the Arab, Turk, Moghul, and Pathan conquerors, all of them Mahomedans, and all of them credibly recording races, followed by the Portuguese, the Dutch, and the British, the eventful changes in these countries have been well known. The first of these, after the Seythlic and Rajput occupancy, was Mahmud of Ghazni, who in 1024-6 captured and sacked the Saiva temple of Somnath in Gujarat, carrying back with him immense booty. From that time, the Rajput rulers of Gujarat, whose capital was at Anhalwara Patan, had to meet waves of invasion, until their dynasty was at last subverted in 1297 by Alaf Khan, the general of the Turki emperor of Delhi, Ala-ud-Din Khalji. In 1403, Jafar Khan, a Rajput convert, assumed independence, and the dynasty advanced to high power and splendour. The annual revenue rose to 11 millions sterling; and the ruins still at Ahmadabad and Champaner bear a mournful testimony to its former greatness, and to the revolutions to which it has since been subjected; for, in 1573, Gujarat was conquered by the emperor Akbar, and has repeatedly since then changed masters. The Bahmani kings, 1347-1526, the Nizam Shali dynasty in 1490-1595, at Ahmadnaggar, the Adal Shahi, 1498-1579, at Bijapur, the great Sivaji, 1627-1674, carved out kingdoms for themselves; and on the death, in 1707, of Aurangzeb (Alamgir 1.), the disorders led, in 1757, to the cession of the Gujarat Province to the Maharrattas, under the joint rule of the Peshwa and Daimaji Gaekwar. While such changes were occurring in these northern tracts, natives of western Europe had appeared on the southern sea-board,—Vasco da Gama, a Portuguese leader, in 1498; the great Albuquerque, 1508, and that nation possessed of Bombay island in 1532. A ship from England visited Surat in 1608; and the English in 1613 obtained permission from the emperor Jahangir to erect a factory there, which in 1618 was also granted to the Dutch. In 1661 the Portuguese gave Bombay island to Charles II. of England, as part of the dower given with his bride; and Charles sent the Earl of Marlborough, a most experienced sailor, with a strong fleet, to receive it from the Portuguese. In 1668 Charles transferred it to the English East India Company, for an annual rent of £10. In 1686 it was declared the chief seat of the English on that side of India; and in 1708 the territories attached were created the Bombay Presidency. All that remains of the Portuguese power on that coast is the territory of Goa, Daman, and Diu, an area of 1146 square miles, and 438,555 inhabitants.

Since the middle of the 18th century, the Bombay Presidency has been sometimes aggressive, sometimes on its defence. In 1756, in alliance with the Peshwa, the stronghold of Savandrug was captured, and the same year Admiral Watson and Olive stormed Ghoria or Vizadurg.

The first war with the Maharrattas, 1774-1782, ended ingloriously, some districts being retained and some delivered up. In the second war, 1802, the British regained some tracts in Gujarat; and in the third war, 1817, the Peshwa Baji Rao was defeated in the Dekhan, and the greater part of what is now the present Bombay territories, Ahmadabad, Nasik, Ahmadnaggar, Poona, Belgaum, Dharwar, Kalgagi, Sholapur, and the Konkan, fell to the British. At the same time Kandeh was obtained from Holtekamp of Sind was conquered. In 1848 Satara lapsed from want of heirs. In 1860 Sindia ceded the Panah Mahals; and in 1861 North Canara was transferred from the Madras Presidency. The territory thus noticed lies between lat. 13° 53′ to 28° 47′ N., and long. 66° 43′ to 76° 30′ E. Its seaboard, and the rivers Indus and the Gulfs of Cutch and Cambay, 8000 square miles, and the harbours of Bombay and Karwar afford every facility for commercial operations. Its fertilizing rivers being the Mahi, Sabarmati, and Tapti; and its mountains, the Suliman in Sind, the Sahyadri, the Satpura, and the Satwala or Ajunta, are marked features in the landscape. The Manchur lake is on the right bank of the Indus, near Sehwan, and the Ran or Rumm, is a level tract partially flooded during the rainy season of the S.W. monsoon. Thurr and Parkur, in Sind, is a sandy desert. The desert talaqas of Sind consist of a narrow strip of sandhills and waste lying north of the Rumm of Cutch, and stretching about 130 miles from District Mahomed Khan’s Taunda on the west, to the Jodhpur frontier on the east. The principal town is Omerkot, situated between the desert and the plains. It has long been the acknowledged capital of that part of the country, and with its mud fort was considered the key to the desert commanding the high road between Marwar and Sind.

Aden is under the jurisdiction of Bombay. Almost the most southerly point on the Arabian coast. It is situated in lat. 12° 47′ N., and long. 45° 10′ E. It is a peninsula of about 15 miles in circumference, of an irregular oval form, 5 miles in its greater, and 3 in its lesser diameter, connected with the continent by a low narrow neck of land, 8300 yards in breadth, but which is in one place nearly covered by the sea at spring tides. Bombay city in 1872 had 644,405 inhabitants. In 1881 the number was 773,196. The island has two hills of very moderate height, which rise from low lands formerly liable to be flooded. A stone embankment called the Vellaurl was built in 1833–34, to connect the Colaba and the Bombay islands. Malabar Hill is on the south-western side of Bombay island. At the north is Mahalakshmi, a ridge 200 feet high, with a handsome Hindu temple. About its centre are the Parsee dokhmas, or exposure towers. At the south end is Walkeshwur, a Brahman village, with interesting temples. Malabar Point, or Shigundi, its south extreme, forms the north-west limit of the Back Bay. Back Bay lies between Malabar Hill and Colaba, is 23 miles wide, and unsuccessful efforts to reclaim it have been made.

The Bombay group, indeed, consists of fifteen or twenty islands in all,—the island of Bassin, about thirty miles to the northward of that which gives the cluster its name; Drayve and Versova, just off the shore of Salsette; Salsette, by much the largest of them all; Trombay, conspicuous for
the mountain called Neat's Tongue, which attains the altitude of 1000 feet; Bombay itself, united on the northward to Trombay and Salsette, as these are united to each other by bridges and embankments, and to the southward are Old Woman Island and Colaba. Henery and Kenery are far south. In the spacious harbour formed by the islands of Caranja, Colaba, Bombay, Salsette, Elephant, Trombay, and the continent, several smaller rocky islands are scattered, bearing different names. Of these are Elephantana, and Butcher Island, called Dipa-devi, or the island of the gods, or holy island; it is low, less than a mile from Elephantana, in the direction of Salsette. Bombay harbour is very capacious, being from N. to S. 8 or 9 miles, with a general width of from 4 to 8 miles; its shores are irregularly indented by bays and inlets. Bombay Island has five or six banks of trap rock, chiefly greenstone and amygdaloid, separated by beds that have an appearance of being of sedimentary origin. The sea-breeze is felt through the island: the anchorage extends along the eastern face; and it is along this face of the island that the most densely crowded parts are. Owing to the value of property in that quarter, much new land has been reclaimed from the sea. The chief public buildings are the fort, the town hall, the government house, and docks.

For administrative and revenue purposes, the Bombay Presidency is arranged into twenty-four districts, which enclose nineteen Native States under British protection. In 1881 the population of Bombay was 11,025,593, and that of Sind 2,494,954; the Native States, 6,837,505.

  - Other towns: Dekhan (pop. 5,204), Kanher (pop. 2,519), Surat (pop. 1,586), Broach (pop. 1,586), Kutch (pop. 1,586)

### Bombay Island

- The total area is 191,855 square miles, and the population 20,180,721.

- The various castes and sects in the British districts professing Hinduism, number 12,606,904 and Mahomedans, 2,504,338 others, 185,469.

- But of these, 163,972 are descendants of races from beyond the British frontier, viz., Arab, Baluch, Makran, Persia, and Egypt. The aboriginal races of this part of India, Koil, Bhill, Kolamb, Ahir, and others, are given as 709,025. The number of castes was about 200; and the Sudra were returned, in 1872, as 10,901,339; these being chiefly the cultivators of the Kumbi and Mali sections.

In 1716 the population of Bombay Island was estimated at 16,300.

- First Maurya, 516,119
- Second Maurya, 644,465
- Third Maurya, 1,588,605

- The vernacular languages spoken are English, Canarese, kokani, gujerati, maharati, indi, and urdu.

- Several of the races are keenly engaged in trade and in banking. Amongst the Hindus, the Bhatia race and the Marwari, Rajput tribes from Central India, and the Banya of Gujerat; amongst the Mahomedans are the Khoja, Borah, and Memon sects; the Lohani of Sind and the N.W. Frontier; with commercial men from Europe and America, Egypt, Arabia, Africa, and Persia, the Parsee (66,493) and a small number of Jews. The Khojas are converts from Hinduism to the Ismaelit sect of Mahomedanism, and acknowledge the Islam of the Ismaeli as their spiritual head. They have large trading colonies along the east coast of Africa.

- Cotton, opium, salt, cereals, are the chief articles of the foreign trade; for domestic use, the principal products and manufactures are, cotton-woolving by hand and steam, cotton thread, woolen fabrics, rugs, carpets, working in leather, gold and silver, and silk lace, kimkhab or brocades, silk fabrics, embroidery, edgings, paper, pottery, carving from sandal-wood, blackwood, ebony, etc., Bombay or Multan work, and blackwood furniture.

- The land-revenue system is the Kayotwari, not, as in Madras, with annual fresh assessments, and the cultivator is part owner of the land. The Government rates levied are Rs. 912 per acre on dry crops, Rs. 393 on rice lands, and Rs. 311 on garden lands. Each village has its patol, who is the head of the village for both revenue and police purposes; the tattali or kulturni, who is the clerk and accountant; the mhar, who is a kind of beadle; and the watchman. The potol, or kulturni, either hold a certain quantity of rent-free land, or are remunerated by a cash payment equivalent to a certain percentage on the collections. The mhar and watchman, in common with the other village servants, also hold land on more or less favourable terms as regards assessment, and receive, besides, grain and other payments in kind from the villagers.——Imp. Gaz.: Horsburgh; Finlay: Census Report.

---

**BOMBAY DUCK.**

Bummalo of ... Bengal | Bania of ... Bombay.

This little fish, Saurus neurechus, B. Ham, in-
hhabits the seas of the S.E. of Asia. Its total length is 11 inches. The upper part of its head, back, and sides, light grey or dust-coloured, semi-transparent like gelatine, with minute starlike black and brownish dots; anterior part of abdomen pale silvery bluish; rest whitish; cheeks and opercles, pale silvery bluish, dotted like the body; fins transparent, coloured like the body, but more closely dotted, so as to appear blackish. The fish is of most voracious habits, gorging itself with other fishes of nearly its own size, also with its own species and with prawns. It is frequently taken with the stomach and the jaws expanded with prey. It is very short-lived. The whole body becomes at certain seasons brilliantly phosphorescent. In the Straits of Malacca it is at times very numerous, although less so than it is at the Sunderspur or in the months of the Ganges. Although very rich, it is a great delicacy immediately after it is taken. Salted and dried, it is also highly valued; and in this state large quantities are annually exported from Bombay and the Malabar coast to all parts of India.

BOMBAY MARINE. See Indian Navy.

BOMBAY WORK. The inlaid work of ivory, white and dyed, of ebony or other coloured woods, for which Bombay has long been famous, is said to have been introduced from the Punjab, and is also familiarly known as Multan work. The art dates from a remote period, and paper-cutters, work-boxes, writing-desks, and similar articles are its chief products. The effect of a large mass of it is very poor; the pattern is too fine for being distinguishable, and it fills the eye with a general greysih tint. In articles which do not present more than a foot or two of surface it is very pleasing. The ground of the inlaid pattern is generally scented cedar or sandal-wood, the joinery exhibited in which is very indifferent. The inlaying material is prepared as follows: The wood or ivory is cut into slips of a lozenge or triangular section, as may be required, by a long, thin-bladed, fine-toothed saw. The tin is drawn through between a pair of grooved rollers, like those used for laminating or extending iron; they work together by teeth at the extremity. One or two draws through extends the metal into the length desired. The wires and splints are nearly all either lozenge-shaped or triangular, the triangles being equalateral, the lozenge composed of two equilateral triangles. A pattern being fixed on, the splints are built up into pieces about eighteen inches long, and from a quarter to two inches in thickness, firmly glued together. In the case of borders, or continuous pieces of work, the rods and splints are fixed together between pieces of ivory, or wood and ivory alternately, so as to form straight lines on each side of the pattern. When about to be used, they are sawn across the thickness of a sixpence, and arranged in a box divided into compartments, something like a printer's case. They are then picked up in succession, and applied with glue to the box or other article to be inlaid.

Work-boxes, Rs. 4 to 125  
Writing-desks, 6, 75  
Portfolios, 6, 18  
Watch-stands, 5, 8  
Do. cases, 5, 8  
Embroidery frames, 25, 10  
Inkstands, 8, 10  
Baskets of sizes, 3, 20  
Jewel boxes of sandal-wood, 5, 60  
Do. open work, 5, 10  
Cheroot cases, 3, 4  

Carol-cases, Rs. 1.8 to 5  
Paper-weights, 1.8, 3  
Paper-cutters, 0.8, 8  
Table trays, 10, 15  
Pincushions, 3, 5  
Diapered inlay, 2 to 20  
Jewel stands, 5, 8  

BOMBAZINE, a fabric of worsted and silk, the warp being of silk, and the weft or shoot of worsted.—Tom.

BOMBA, at Gaya, a guide-conductor who precedes Hindu pilgrims, making a noise by beating his mouth.

BOMBYCINA, a group of lepidopterous insects, which, in their metamorphosis, construct a covering or case, generally called a cocoon. Each tribe of the Bombyces produces a cocoon of a peculiar form. They are said to spin or weave their cocoon, and are usually styled silk-moths. The valuable product of the silk-moth is the cocoon; and races have been produced differing much in their cocoons, but hardly at all in their adult states. Several distinct species exist in China and India, some of which can be crossed with the ordinary silk-moth, Bombyx mori. This is believed to have been domesticated in China n.c. 2700. It was brought to Constantinople in the 6th century, whence it was carried into Italy, and in 1494 to France, and has since been transported to many countries, where food and selection have produced many varieties. It is only in some districts of each country that eggs come to perfection. Captain Hutton was of opinion that at least six species have been domesticated. B. Cynthia feeds on the castor-oil plant, and spins very soft threads. Eastward of the city of Canton, on a range of hills called Lo-fau-shan, there are butterflies of large size, and night-moths of immense size and brilliant colouring, which are captured for transmission to the Chinese court and for sale. One of these, the Bombyx Atlas, measures about 9 inches across; the ground colour is a rich and varied orange-brown, and in the centre of each wing there is a triangular transparent spot, resembling a piece of mica. In their scientific classification, the Bombyces are arranged into eight stripes or types, according to the forms of their larva, and those known to occur in India have been classed into 105 genera and 272 species. The most important of these, in a social point of view, are the silk-producing moths, belonging to the genera Bombyx, Criocula, Salassa, Antheraea, Actias, Saturnia, Attacus, Caligula, Nocoris, Ocimaria, Rhodia, Rinaea, Theopilia, and Trilochea. At Simla, nine species of Bombyx, Saturnia, and Actias occur, nearly the whole of which might be turned to account in producing silk.

1. Bombyxmori, Linn., the common domesticated or Chinese silk-worm moth, the Sericaria mori of Blanchard, and the 'pat' of Bengal. It is a native of China, but has been domesticated there and in Siam, India, Persia, France, America, and elsewhere. In China is that this was discovered n.c. 2640, in the reign of the emperor Hwag-To, by his queen. The culture now flourishes principally about Nankin, in lat. 32° N.; but in India, into which it was early introduced, none of the silk filatures extend beyond 26° N. They have been found in a wild state in Kent in England, on shrubs, but the mulberry tree leaves are its favourite food.

2. Bombyx religiosa, Helfer, Deo-mooga, Hind., Joree, Hind., is found in Assam and Cachar, but is supposed by Mr. Moore to be identical with B. Huttoni. This feeds on the Ficus Indica and Ficus religiosa. Its cocoon shows the finest filament, has very much lustre, is exceedingly smooth to the touch, and yields a silk, if not superior, yet
certainly equal to that of B. mori. It has not been domesticated.

3. Bombyx Huttoni, *Westwood*, is found in the Himalaya, about Mussoor. where it occurs abundantly from the Doon up to at least 7000 feet. It feeds on the leaves of the wild mulberry, and breeds twice a year. It has not been domesticated, but feeds on the trees. It spins its cocoon on the leaf, which is cloisoned; the silk is very fine, and of a very pale yellow tint. It is found in the Western Himalaya in great profusion, at elevations of 3000 to 8000 feet above the sea-level. It occurs in the height of the rainy reason, when the hills are enveloped in dense mists. Its eggs are deposited on the trees, and subjected to the influence of the frosts and snows of those mountain winters. The Agri-Horticultural Society of India declared that silk of the very best description can be obtained from its cocoons by careful reeling. The silk is fine and tough, though perhaps somewhat less soft and silky to the touch than that of the Chinese worm, and was valued by the Delhi shawl merchants at 25a. the pound.

7. Bombyx yana mai, the oak silk-worm of Japan, has been naturalized in England. In Japan it is the most precious for the produce, and is a monopoly of the royal family. The cocoons are of a beautiful yellowish-green colour. The silk is as fine, thin, and light brown as that of the mulberry worm.

8. Bombyx Pernyi, of the north of China. It produces the gridelin cocoon and silk.

9. Bombyx Myilita, of India, produces a large cocoon. It feeds on the leaves of the Rhamnus jujuba, and furnishes a dark-coloured or grey silk, coarse but durable, inferior to that of the B. yana mai. Other species are B. Arracanensis, Fortunatius, sinensis, and textor.

10. Cicuta trifenestrata, *Helfer*, has been arranged under the genus Saturnia, Euphranor, Antheraea, and Phanaeus. It occurs in N.E. and S. India, in Sylhet, Assam, Burma, and Java; and feeds on the Protium javanum, Canarium commune, Mangifera indica, and Anacardium occidentale. Its cocoon is constructed like network, through which the enclosed chrysalis is visible. It is of a beautiful yellow colour, and of a rich silky lustre. C. drepanoides also occurs.

This has been classed in the genera Phalanca, Saturnia, Bombyx, and Attacus. It is known to occur in Ceylon, S. India, N.W. and N.E. India, Bengal, Behar, Assam, Sylhet, and Java. It feeds on the Shorea robusta, Zizyphus jujuba, Terminalia alata, T. catappa, T. indica, Bombax heptaphyllum, Tectona grandis or teak, and the mulberry or Morus Indica. The insect has not been domesticated, but is watched on the trees, and, in parts of India, is found in such abundance that the people from time immemorial have been supplied with a very durable, coarse, dark-coloured silk, which is woven into the well-known tassie silk cloth. In the Bhatgolpur district the cocoons are collected in earthenware, and are much used, cut into thongs, as ligatures for binding the matchlock barrel to the stock. In the rainy season the perfect insect appears from the cocoon in about twenty days. But tassie moths are hatched twice in the year, in May and August. The caterpillar first draws a few leaves together, as if to screen itself from observation, and then spins a strong cord, composed of many threads, till about the thickness of a crow quill, at the end of which it weaves the cocoon. For the first 36 hours the cocoon is so transparent that the larva can be seen working within; but it soon acquires consistence, and is then rendered quite opaque by being covered with a gluttonous substance. The moth generally deposits its eggs within a few yards of the cocoon. These the villagers collect and keep in their houses for about ten days, until the young caterpillars come forth, when they are placed on the Assan trees in the jungles, and in eight or ten days more they prepare for change to the chrysalis state. The owners tend them carefully, to protect them from the birds by day and from bats at night, and practise many superstitious ceremonies to aid them in their care.

20. Antheraea Assama, *Helfer*, the Saturnia of Westwood, the Mooga or Moonga of the Assamese, is found in Ceylon, Assam, and Sylhet. It can be reared in houses, but thrives best when fed on its favourite food which are the Adda-kor tree, Champa (Michelia) Soom, Kontooolva, Digluttio, and Souhallo, Teutrathera diglottica and T. maccrophyla, and the Pattee shoba or Laurus obtusifolia. There are generally five broods of Moonga worms in the year.

22. Antheraea —— sp. This is a native of Manchuria, in a climate as rigorous as that of Britain. It feeds on a species of oak. Its silk is strong, with little lustre, and resembles strong yellow linen. Introduced into France. A. Andamanana and A. mezaankooria are also named.

24. Actias clione, *sine*, syn. Tropaeas, Electropterion, Phalaen, is a native of India, but Mussoori and Darjiling, from 5000 to 7000 feet. It feeds on the Coriaria nepalensis, or Munns, Hince, Vandruma ovalifolia, and Carpinus. The eggs are laid for a few days after the visit of the male; they hatch in about 18 days, and the larva begins to form its cocoon when 7 weeks old.

27. Saturnia pyrotorum, Boisdewal, China.
29. Attacus Atlas, Linn., syns. Phalena, Bombyx, Saturnia. This is the largest of all known lepidopterous insects. It is found in Ceylon, all over India, Burma, China, and Java, and the tasar silk of the Chinese is said to be obtained from its cocoon.

30. Attacus Edwarsi, White, a native of Darjiling, of an intensely dark colour.
31. Attacus cynthia, Drury, syns. Phalena, Bombyx, Samia, Saturnia. This is the Eri, Eria, or Arindi silk-worm of Bengal and Assam, which occurs also in N.E. India, Tibet, China, and Java. It feeds on the foliage of the Ricinus communis, the castor-oil plant; hence its name, the Arindi. It spins remarkably soft threads.
32. Attacus ricini, Boisdewal, syns. Saturnia and Phalena. This is found in Assam, Ceylon, and is the Arindi or castor-oil silk-worm of Bengal, so called because it feeds solely on the common castor-oil plant, with which, also, they are fed when domesticated. This is reared over a great part of India, but particularly at Dinajpur and Rangpur. The cocoons are remarkably soft and white, but the filament is very delicate; the silk cannot be wound off, and it is therefore spun like cotton. The yarn thus manufactured is woven into a coarse kind of white cloth, of a seemingly loose texture, but of incredible durability; a person rarely can wear out a garment made of it in his lifetime.

The species of Bombyx called Bhoca, Buro bho, Hind., and Kala Janga, attack the maturing poppy plant in February and March in Lower Bengal.—Major Hutton in No. 8 of Universal Review; Horsfield and Moore’s Lepidopterous Insects, 1858-9; Silk-producing Moths; Proc. Zool. Soc. 1859. See Lepidoptera.

BOMERANG. A projectile used by the Marawar of the Toundamari country, also in Gujarat, and in Australia; it is made of wood, ivory, iron, and wood and iron. The Indian bonemonger, the katureea, is used by the Koli of Gujarat in the same manner as that of Australia. The distribution of the bonemonger corresponds nearly to that of the Australian race as defined by Professor Huxley.

BOMKAR. MAHR. Weavers in Kandesh. BOMILE-MARA, a tree of Canara and Sunda.

Wood very serviceable for planks.—Gibson.

BOMMA JEMUDU. Tel. Euphorbia antiquorum.

BOMMA Kachchhika, Costus speciosus, Sm. Bomma Medii, Ficus oppositifolia.

Bommidapu, Indigofera glandulosa, Willd. BOMMIGAL. TAM. Toya.

BOMNI AMLI. DUKH. Adansonia digitata. BOMORI, a town in Orchastati, Bundelkhand, in the N.W. Provinces, in lat. 25° 26° 20’ N., and long. 79° 54’ 40” E., has an artificial lake four miles long and two miles broad.—Imp. Gaz.

BOMRAJ, an estate in the Nellore district, Madras. In the 18th century, Bomraj, Venkatakri, Kalastri (Kalashiati), and Sayyidpur constituted the district of the Western Palayams.—Imp. Gaz.

BOM-ZU or Bun-zu, Bom-du of the Rakhoing, dwell north of the Kolayen, inhabiting chiefly the upper basin of the Kurnfuli, or eastern branch of the Chittagong river. To the north of the Bomzu are closely allied tribes, termed collectively Lepidopterous. Lepidoptera. Kunya, who occupy the highlands of Tipralal, and extend S.E. towards the head of the Kolayen. Both the Bun-zu and Kuki appear, like the Kumi, to belong to the Burman family. The Kuki represents its most archaic and barbarous condition. The tribes that have been exposed on the seaboard of Arakan or in the basin of the Irawadi, to the influence of the Chinese, Shan, Mon, Bengal, and more distant commercial nations, have attained a comparatively high civilisation. The Singpho, although much behind the Burmans, are greatly in advance of the Kuki; and the Burmees seem at a very ancient period, when their condition was similar to that of the Kuki, and perhaps in many respects more barbarous, to have spread themselves from the Upper Irawadi to the south and west as far as the highlands of Tipralal on the one side, and Pegu on the other.

BONAI, a small tributary state in Chutia Nagpur; area, 1297 square miles. It was ceded to the E. I. Company in 1826. Its Dravidian and Kolarian races are the Bhiyai, Gond, and Kolitas. Tigers, leopards, wolves, elephants, and bison are numerous. Population, 24,832.

BONANG. MALAY. A musical instrument of Java.

BONDARA. MAHR. Lagerstræmia regia. BONOCUT NUT. Seeds of Guifandina bonduc, L.
BOOK THA.

BOOK THA. BURM. A scarce tree on the sea-coast from Amherst to Mergui. When seasoned it floats in water. It is used by the Burmese for shelves, but rots quickly.—Captain Dauce.
The Abor language belongs to the old Assam alliance, but it has been greatly modified by Tibetan. It has a strong ideologic resemblance to the Dhimal, Bodo, Garo, and Naga. — *Jour. Ind. Arch.* 1853; *Treaties*, vii. p. 343; *Indian Annals*; *Latham's Ethnology*.

**BORA-CHUNG**, or ground-fish of Bhutan. It inhabits the jihls and slow-running streams near the hills, but lives principally in the banks, into which they penetrate from one to five or six feet, and are found generally two in each chamber, coiled concentrically like snakes. The entrance to these retreats leading from the river into the bank is generally a few inches below the surface, so that the fish can return to the water at pleasure. It is believed that the fish take possession of holes made by land-crabs. The bor-chung appear to be an Ophioccephalus, probably the O. barks described by Buchanan as inhabiting holes in the banks of rivers tributary to the Ganges.— *Tennent's Ceylon*, p. 367.

**BORAGINACEÆ**. *Linnaeus*. The boraginace tribe, comprising the genera anchusum, borago, colenias, cynoglossum, echinospermum, echium, eheurtia, heliotropium, l洞spermum, messerschmidya, myosotis, onosma, tariadum, tournfortia, and trichodesmu. Borago officinalis, *Linnaeus*, Ch'ot'a Kulpa, *Hind*, a plant of Europe; is grown in India as a pot herb, and the young shoots and leaves for salad; requires treatment similar to Angelica. It is suitable for the flower garden. Country borage is the Coles Ambiocinics.

**BORASSUS LABELLIFORMIS**. *Linn.* Lontar domesticus, *Rumph.*

To eastern nations, the palmyra tree is only inferior in usefulness to the bamboo, the date tree, and the cocaean palm. It grows straight to a height of 70 feet, with a girth of 5½ feet at bottom and 2½ at top. A Tamil poem of Ceylon, the *Tala Vilisaan*, enumerates 801 purposes to which the palmyra may be applied. The trees have to attain a considerable age before they become fit for timber, as their wood becomes harder and blacker by age, and the harder and blacker it is the better. The wood near the circumference of old trees is very hard, black, heavy, and durable. A cubic foot weighs 65 lbs, and it is calculated to last 80 years. In some parts of the Ceylon and Madras coasts, this tree is very abundant, especially in sandy tracts near the sea, though it is to be seen in most parts of India, and occasionally so far north as 30°. It is used chiefly for rafters, joists, and reevers. When of good age, the timber is very valuable for this purpose. The trunk is split into 4 for rafters, into 8 for reevers; these are dressed with an adze. Those of the Jaffna palmynas are famous, and were, in former times, largely exported. From the structure of the wood, it splits easily in the direction of its length, yet supports a greater cross strain than any other wood. Old black palmyra wood was, next to the casuarina, the strongest wood that Dr. Wight tried. One specimen bore upwards of 11,000 lbs, and an average of the trees was about 97 lbs, though he found some very bad. Mr. Rohde also remarks that it is the strongest wood he tried, retaining for a length of time the position it assumed when loaded, without increase of deflection. Iron nails soon rust in this wood. The thickness of rafters when trimmed up rarely exceeds two inches four feet from the ground, and one inch at twenty or twenty-four feet from it.
The fruit and the fusiform roots of the young trees are used as articles of food by the poorer classes, the fruit when young being jelly-like and palatable. Next to Caryota urens, it is the largest palm on the coast of the Peninsula. The dried leaves are used for writing upon with an iron style; also in thatching, making fans and light baskets for irrigation. The fibres of the pectoiles of the leaves (Palmyra mat) are employed for making twine and small rope; they are about two feet in length. The large carpenter beetle, Xylocopa, delights in boring this hard wood, though cumboo wood is still more attractive to it. Small canoes are formed of this tree. Two of the stems lashed to a couple of spars form the usual mode of crossing lakes and rivers in the Circars; the root forms the head of the canoe, the smaller end is either elevated out of water by the form, or some six inches of the pith is left at that end; as this decays, a lump of clay supplies its place. Formerly sea-going vessels were planked with this wood, but the iron fastenings were soon destroyed. Boats planked with it were, till the middle of the 19th century, common on the Godavery, being built probably where sawyers are not procurable. The peculiar structure of the wood of all the palms deserves attention; it appears formed of a series of hard, stiff longitudinal fibres, not interlaced or twisted, but crossed at considerable intervals at various angles by similar fibres, which proceed from the soft heart of the tree to the outer part, probably to the leaf-stem. A radial section of palmaya rafter shows this. The interstices are filled up with pitch, the proportion of which increases with the distance from the outer part. The wood, known as porcupine wood, is used in England for veneers and inlaying. In Ceylon it is used for rafters, pillars, and posts of native houses. In the sandy parts of Jaffna, in Ceylon, a hollow palmaya is inserted to form a well. The dark outside wood of very old trees is used, to some extent in Europe, for umbrella handles, walking-canes, paper-rulers, fancy boxes, wafer stamps, and other articles. The timber of the female tree is the hardest and best; and that of the male tree is never used unless the tree be very old. At certain seasons of the year, thousands are employed in felling and dressing it. Each tree has from 25 to 40 fresh green leaves upon it at a time, of which the natives cut off twelve or fifteen annually, to be employed as thatch, fences, manure, mat, and mat baskets; bags, irrigation baskets, winnows, hats, caps, fans, umbrellas, etc.; books and oyl, tatakoy or putty, for writing on. In the Northern Konkan it is in some parts so abundant that it might be termed a forest. It is a rare tree in the southern jungles of the Bombay Presidency. The wood, when protected from moisture, is very durable, and may be used with advantage for terraces, etc., when the upper part is completely left. Its fruit is of the size of an ostrich egg, grows in clusters; but trees from which toddy or palm wine is drawn, cannot bear fruit. When the spathes of the fruit-bearing trees appear, the toddy drawer, climbing to the top of the tree, binds the spathes tightly with thongs to prevent their further expansion, and thoroughly bruises the embryo flowers within. For several succeeding mornings this operation of crushing is repeated, and each day a thin slice is taken off the end of the racemes, to facilitate the exit of the sap and prevent it bursting the spathe. About the morning of the eighth day, the sap begins to exude, when the toddy drawer again trims this truncated spathe, and inserts its extremity into an earthen pot to collect the juice. These vessels are emptied morning and evening, and the palmyra will continue for four or five months to pour forth its sap at the rate of three or four quarts a day; but once in every three years the operation is omitted, and the fruit is permitted to form, without which the nates assert that the tree would pine and die. The tree, during the first part of the season, yields a pretty large quantity of palm wine. This is either drunk fresh drawn from the tree, or boiled down into a coarse kind of syrup called jagari, or it is fermented for distillation. The date tree in South India also furnishes toddy, and the amount of daily drunkenness exceeds all that is ever witnessed in Europe. A farina, called Ha-panuuki jangun navii, is obtained from the root by treating it as in manufacturing manioc. It is very nourishing to the palate, the germinating seeds (Ponato, Sing.) are boiled and eaten in Ceylon as a vegetable.—Seemn: Simannah: Drz. Wight, Cleghorn, Gibson; Mr. Rolhe; Hartwig, p. 139; Sir J. E. Temmert, ii. p. 523.

BORAX.

Borax, Bi-borate of soda, Tineal.

Boruq, Tunker, Arab. Pijer, Jax, Malay.
Kuddia-khar, Beng. Soda-bhoras, Lat.
Yueh-shih, Pwan-sha, Ch. Chaulanaya, Nep.
H'wang pung-sha, Tunker, Pers.
Korean, Dutt, Tunkana, Sans.
Borak de soude, Fr. Lapsuscanra, Singh.
Tunkun-khar, Gujar. Vengaram, Tam.
Boraces, Fr. Velligaram, Tel.
Solaha, Hind. Tsale, Tin.

The greater part of the crude borax or tineal met with in commerce, was formerly obtained from lakes in Tibet, the waters of which yield a yellowish-white mass, containing from 39 to 50 per cent. of real borax. That was refined chiefly at Venice and Amsterdam. Recently, a lake with waters similarly impregnated has been discovered at California. But, for a long time past, in Europe, the borax of commerce has been obtained by treating with carbonate of sodium, the boric acid obtained from the volcanic district of Tuscany, where jets of vapour issue from the ground. Natural borax is obtainable in large quantities in the valley of Puga, in Ladakh, from Lake Jigatzii in Tibet, 20 miles in circumference; also in the course of the Sanpu river, and from the Chaha lake beyond the Kylas hills. It is collected on the borders of the Tibetan lakes as the water dries up, then smeared with fat to prevent loss by evaporation, and transported across the Himalaya on the backs of sheep and goats, then refined at Umritsar and Lahore by washing with lime water. The salt and borax fields of Gunri, called Lha-thaka or Lhalu-thaka, are to the north of Bongbra Tal. Borax is procurable at Rudok in Changtan at ten annas per maund, of such quality that only about a quarter is lost in refining. That obtained at Puga, in the territory of the maharaja of Kashmir, loses one half. The Rudok borax is conveyed on sheep to Rampur on the Sutlej, at the rate of two miles a day, so that the price on the plains of raw borax rises to 7 rupees the maund, and of refined borax to 25 rupees.—M. and M. Pr. 1872-3. It is largely imported into Digarchi, whence it is distributed to other parts of Tibet and to India.
via Nepal, Sikkim, and Bhutan. It is used in the arts to clean metals before soldering; to form a glaze on earthenware, and in the preparation of varnishes. It is employed as a chemical flux, and in experiments with the blow-pipe, and in the moist way as a solvent for gum-lac. It is much used by the goldsmith, tinters (Cannar, Tam), and tinnmen (Tagara-velecarer, Tam), to facilitate the fusion of their metals. With it and lime-juice, the vaishnava Hindus prepare the irred Tiruchurnum, with which they mark their foreheads perpendicularly. Borax is readily purified by simple solution and crystallization. It is sometimes adulterated with alum and common salt; but ammonia gives a white precipitate (alumina) if the former, and nitrate of silver a white precipitate if the latter, be present. Price of raw borax, 4d. per lb.; of refined borax, 6d. per lb.—Beng. Phar.; Ains. Mat. Med.; Cat. Cat. Ex. 1862; Powell, Handbook.

BORE or Tidal wave.

The seeson... in China. Arrian (Exp. Alex. vi. 19) mentions how this phenomenon astonished the soldiers of Alexander, who had been accustomed to the tideless waters of the Mediterranean. The bore is a tidal wave which comes rolling in from the sea. In the Hoogly this is called Bora or Bore; in China it is known as Eagre; in the mouth of the united Tigris and Euphrates it is called Bar; in the Dordogne in France, it is called Mascaret; in the Maranon it bears the name of the Rollers; but by the American Indians it is called Pororea. This phenomenon is connected with the tides, as it always occurs at the springs.

The crest of the tidal wave in the Bay of Bengal, to the south of the bay, is almost a straight line running N.W. and S.E. between the south coast of Ceylon and the southern coast of Java. As it proceeds up the bay, it becomes convex towards the shore, and near the estuary of the Megna encounters at an obtuse angle vast quantities of fresh water coming down the three channels. When the tide is more than usually strong, as at full moon or under the influence of a strong S.W. wind, or when the river is heavily flooded, the opposing masses of water accumulate more rapidly, and the bore is produced. But when this occurs there are always two bores, one of salt water up the Sundip channel, known as the Chittagong bore, the other, called the Dania bore, up the middle and western channels. These two bores meet to the north of Siddhi. When the bore is violent, as during the equinoxes, and also when the S.W. wind is strong, it advances as a wall of water several feet high, stretching across the channels, and is so dangerous that native boatmen will for no consideration venture out into the river. Dr. Hooker mentions that, at the mouth of the Megna river, the great object in the navigation is to keep aloft and to make progress towards the top of the tide and during its flood, and to ground during the ebb in creeks where the bore (tidal wave) is not violent.

Similarly, the bore in the Hoogly is occasioned by the flood-tide, driven into the narrow river through the broad estuary, overcoming the fresher sent down by the heavy rains of the S.W. monsoon. It occurs between May and October, but is heaviest between July and September, between two days before and two days after the full moon. It also occurs at the change, but not with such violence. The wave usually rises on the Diamond Sand, where the river suddenly contracts and comes in 12 or 15 feet perpendicular with tremendous noise, carrying everything before it, though not with equal force, on both sides of the river, as it goes from point to point in the reaches, travelling at the rate of nearly 20 miles an hour to above Calcutta. There are generally three rollers following one another in quick succession, at 13 to 15 feet apart. When the S.W. monsoon has set in, the bore, for three or four days at the full and change of the moon, may be seen racing up the Hoogly river at the rate of twenty miles an hour, dashing from side to side of the river according as the bends or reaches deflect it in its course. Upon the approach of this wave a distant murmur is heard, which soon turns into the loud, fierce Bora! and, from the mouths of thousands of people, boatmen, sailors, and others, who are on the look-out for this much-dreaded wave. This cry is the signal for all sorts of small craft to push out into the centre of the river, the only spot where the wave does not ever over and break. Should any boat or small craft be caught in that portion of the wave that breaks, instant destruction is inevitable. Numerous boats from the up-country provinces are lost every year, from the crew being ignorant either of the existence of the bore, or from not knowing the correct position to take up so as to meet it. Ships at anchor in Calcutta, though not exposed to the breaking portion of the wave, frequently part their cables when struck with the wave. Standing on the shore during the rapid rushing passage of the bore, it is a curious sight to see the lower portion of the river, that nearest to the sea, the actual water one or two feet higher than the upper portion of the river; the tide rising that number of feet in an instant! The height of the bore in the Hoogly varies from five to twelve feet; it is exceedingly dangerous in some parts of the river, but more moderate in others; it never breaks on both sides of the river at the same time. Deep water engulfs its force but shallow water, or a sandbank, brings out all its power and fury. The bore, in 1782, flowed as far as Nuddea in the Hoogly, but at the present day it falls short of that place by many miles, not ascending much beyond Sooksagar. It reaches Dacea on the Buree Gunge, and Casteo on the Horinghatta branch.

In the Sреги river, of Burma, its fury is great, and occasions much loss of life. Burmans name 30 feet as the height to which it occasionally rises, and this may perhaps be the case in the bends of the river, where the rush has attained its full speed, before being reflected to the next bend. Even in the Hoogly at Calcutta, near the bend at Chandpal Ghat, the pointed curling wave may be seen several foot high.

The bore of the Tsien-tang river, in China, according to a Chinese proverb, is one of the three wonders of the world, the other two being the demons at Tang-chan and the thunder at Lung-chan. As in other countries, it appears generally on the 2d or 3d day after the full and
change of the moon, or at what are called spring tides, and particularly in spring and autumn, about the time the sun is crossing the line. Should it so happen that strong easterly gales blow at these times, the eagre rolls along in all its grandeur, and carries everything before it. Dr. Macgowan gave an account of it at Hang-chow-fu.

Mr. Fortune, from a terrace in front of the Tri-wave temple, saw on a sudden all traffic in the thronged mart suspended; porters cleared the front street of every description of merchandise; boatmen ceased lading and unlading their vessels, and put out into the middle of the stream; so that a few minutes sufficed to give a deserted appearance to the busiest part of one of the busiest cities in Asia. The centre of the river teemed with craft, from small boats to large barges, including the gay flower boats; looking from the fleet unmasked the appearance of the flood, which seemed like a glistening white cable stretched athwart the river at its mouth, as far down as the eye could reach. Its noise, compared by Chinese poets to that of thunder, speedily drowned that of the boatmen, and as it advanced, at the rate of 25 miles an hour, it assumed the appearance of an abaster wall, or rather of a cataram, four or five miles across, and about thirty feet high, moving bodily onward. Soon it reached the advanced guard of the immense assemblage of vessels awaiting its approach, all intently occupied in keeping their prows towards the wave, which threatened to submerge everything afoot; but their boats all vaulted, as it were, to the summit with perfect safety, and when the eagre had passed about half-way among the craft, on one side they were quickly exposing on the surface of the unruffled stream, while those on the nether portion were pitching and heaving in tumultuous confusion on the flood, and others were scaling with the agility of salmon the formidable cascade. This grand and exciting scene was but of a moment's duration. The wave passed up the river in an instant, but from this point with gradually diminishing force, size, and velocity, until it ceased to be perceptible, which Chinese accounts represent to be eighty miles distant from the city. A slight flood continued after the passage of the wave, but it soon began to ebb. The Chinese say that the rise and fall of the tide is sometimes forty feet at Hang-chow. The maximum rise and fall at spring tides is probably at the mouth of the river, or upper part of the bay, where the eagre is hardly discoverable. In the bay of Fundy, where the tides rush in with amazing velocity, there is at one place a rise of seventy feet, but there the magnificent phenomenon in question does not appear to be known at all. It is not, therefore, where tides attain their greatest rapidity, or maximum rise and fall, that the wave is met with, but where a river and its estuary both present a peculiar configuration.—Fortune, A Res. among the Chi, p. 316; Colcutta Review; Avrion; Geog. Mag. 1877; Findlay.

BORECOLE. Brassica oleracea, var. Scottish Kale; winter greens of England and Scotland.

BORECOLE and Boregaurm are names for numerous owns of British India, many seemingly obtaining their designation from the Hindi word Burha, meaning old. Boregaurm would be old town.

BOREE. SIND. Typha elephant."
BORNEO.

BORNEO, after New Holland, is the greatest island on the globe. If we compare the numerous archipelagos by which the island is enwrapt, this group may be said to occupy more than eleven degrees of longitude and about ten of latitude, between lat. 7° N. and 4° 20' S., and between long. 106° 40' and 116° 45' E. Its length from north to south will be about 300 leagues, and its breadth varying from 250 to 500 leagues. Its superficies, calculated by Melvill von Carnebeeck, and published in Le Moniteur des Indes, gives Borneo a surface of 12,741 square leagues, or 6992 myriametres, which makes it 2589 myriametres greater than Sumatra, and 5723 myriametres greater than Java. A native of Portugal, Lorenzo de Gomez, was the first of the European navigators who approached the northern part of this island, in 1518, in the ship St. Sebastien, on his route to China. He says that the natives termed it Branaui or Brauni, but the aborigines do not use any name appropriated to the whole extent of the country. The island is well known to the savage and wandering tribes, who are separated by great distances from each other. The different tribes designate themselves by the names which they give to the rivers on the borders of which they have established their abode; it is thus that all the Dyaks of the great river Duson (the Banger of the maps) call themselves Orang Duson, and those of the river Sampit, Orang Sampit; Raja Brooko makes mention of Dyak tribes under the names of Sarebu, Sakarran, Lundu, Sibnuw, etc., established on the rivers which bear those names. Lofty ranges of mountains are in the centre and the north-west. Mr. St. John, in 1838, found each range looking more lofty as he approached the interior, but presenting one uniform aspect of forest, covering hill and valley. The great mountain Kinibaloa, in the N.E., is 13,000 feet high. The land on all sides gradually slopes towards the coast. The Sultan of Brau nei claims an immense territory. The Dutch claim a territory exceeding 200,000 square miles on its western and south-eastern sides, with a population in 1881 of 1,014,547. The Spaniards till lately claimed territorial rights; and in 1881 Great Britain allowed a British company to obtain from the Sultan 30,000 square miles and 500 miles of seaboard, with the royal rights of life and death. Lubnan has belonged to Great Britain since the middle of the 19th century, and Sarawak to the Brooke family.

Its inhabitants are generally recognised as of the Malay, the Kyan, and Dyak stocks. The Malay are settlers along the coast from Sumatra, Java, and Malacca; the Dyak is the name for the prior races, divided into land and sea Dyak, the latter being richer and more powerful, those of the interior being broken up into innumerable clans, some of them being tributary to the Sultan of Branaui, some of them under the Dutch in the south and west of the island, and some under the Sarawak Government. The Milianowe are on the north-east of the Sarawak territory. They are of a fair complexion, and are occupied with agriculture, trade, and peaceful pursuits. The Kyan are a powerful tribe of about 100,000 souls, who occupy the country from the south of the kingdom of Branaui right away into the interior; they strongly resemble the Dyak. The Dyak are generally well made, with a muscular, well-knit frame, and are rather under than over the middle height. Their features are regular. Their colour is a dark brown, occasionally varying to a lighter shade. They dwell in very long houses, occasionally large enough to contain a community. From their supposition that the owner of every human head which they can procure will serve them in the next world, the system of human sacrifice surpassed that which was practised by the Batu of Sumatra, or, it is believed, by any people yet known. A man could not marry until he had procured a human head; and the possessor of several was distinguishable by his proud and lofty bearing. The chiefs sometimes made excursions of considerable duration for the sole purpose of acquiring heads, proceeding in their canoes to the more distant parts of the country, to which the numerous ramifications of the rivers afford them easy access. Upon their arrival near a village, if the party were small, they would take up their position in the bushes some parasay, and attack a passer-by unawares. A larger party would attempt perhaps to surprise a whole village; would remain concealed in the jungle on the banks of the river during the day, and at night surround the village so completely as to prevent the escape of the intended victims; an hour or two before daybreak, the attack commenced by setting fire to the houses, and their victims were destroyed as they endeavoured to escape. Apparently head-hunting was only general among those tribes inhabiting the banks of the large rivers, on which distant voyages can be made with facility, the Dyak race in the northern parts of the island being content with an occasional human sacrifice on the death of a chief. The sacrifice of a cock is sacred, as with the Karen and Chinese, and they believe that the Divine Being eats the spirit or essence of the offerings made to him. Head-hunting is now scarcely heard of. They are brave, hospitable, simple, and truthful, loyal, bountiful, and willing to receive instruction. Chastity before marriage is not insisted on, and they marry when grown up. The men wear a narrow cloak passed between the thighs. The women have a still narrower strip, allowed to fall from the hips half way down the thighs, and affords little concealment. The clans have different languages, and they had no written character. With some Dyak tribes the couvade custom prevails. Among the Milianowe Dyaks the custom prevails of burying a slave at the foot of the excavation for a house post. The Milianowe, southward and westward, living on rivers near the sea, an industrious, intelligent people, who occasionally took heads, but have not the ferocity of the Kyan.

Orang Pooman, a forest race near the territory of the Moorish sultan of Koetei. Their tribe is like the Veddahs of Ceylon, pass day and night entirely in the open air, with no other shelter than a mat. They keep up fires all night. They wear a head-dress and a waistcloth of bark, and eat monkeys and game, which they kill with the sumpitan or blow-tube and poisoned arrows. The women are fairer than the Dyaks, but very dirty in their persons. They welcomed Mr. Bock by asking for beads and tobacco.

Mr. Carl Bock, writing in 1881, mentions his visit to a chief of the cannibal Dyaks, who had just slaughtered, and, with his followers, eaten up
and presented the author with two crania and a shield, in return for rice, beads, and twenty-four yards of calico. A high priestess of these savages stated that the palms of the hand were considered the best eating. A war-dance was executed by a Dyak, with much shouting, stamping, and flourishing of a sword. A Dyak is never without his sword, and his basket for betel and tobacco. Generally he wears a cloth or piece of bark round his loins, and a covering for the head of the same material. The lobes of their ears are hideously enlarged by artificial means; and when a warrior has secured a good many skulls, he is allowed to deck his ears with the canine teeth of a leopard. The Dyak, in their physical and social characteristics, resemble the Tarajah of Celebes.

The Idaam, occupying the northern parts of Borneo, suspended human skulls in their houses. The dominant Malay and the colonists of China are an active and industrious but turbulent and intractable part of the population (Revue de deux Mondes, ii.).

The orang dusun villagers of the north are agricultural; the Murut in the inland parts of Brunei; the Kaduans of the same country, are industrious, peaceful nations, valuable for their qualities.

The Kayan are more numerous, more powerful, and more warlike than any other in Borneo. They are an inland race, inhabiting a district extending from about sixty miles up the interior from Tanjong Barran to within a similar distance on the eastern shore. Fierce, reckless of life, and hot-blooded in their nature, they are nevertheless represented to be hospitable, kind, and faithful to their word, and honest in their dealings. The Kayan, on the Kapuas, are said to have been cannibals, eating the flesh of their enemies. They prize heads like the Dyaks. They carry spits in the scabbards of their swords. The Dyaks of Jiangkang also are said to be cannibals. They live between Sangow and Sadong on the Sakiam, a branch of the Sadong river. The Jiangkang people eat Malays or Dyaks or any one else whom they kill in war, and they kill their own sick if near death, and eat them. Whilst a party of these people were staying at Sangkang, one of them fell out of a mango tree and broke his arm, besides being otherwise much hurt, and his companions cut his throat and ate him up. The Jiangkang Dyaks are said to eat only the tongue, brain, and muscles of the leg. The men of this tribe file down their front teeth to a point, like the teeth of a saw. They cut off their beards.

The Taituts, Balinians, and Kanaوات have dialects of their own, and are wild and savage in their manners. Nine vocabularies have been collected, the most extensive by Mr. Robert Burns, and it is that of the most numerous, advanced, and powerful tribe in the island, the Kayan or Kaiin, whose possessions extend from the northern to the southern coast. No native tribe of Borneo has ever invented letters. Mr. Crawford had seen the names of at least sixty of these small nations who have no common name by which to distinguish themselves from the people of other regions. The many languages of this island belong to the same class of languages as the Malay and Javanese; and the aboriginal inhabitants of Borneo are all of the same race with the Malays and Javanese.

In 1824, out of the forty wild tribes in its interior, eight had adopted Malonomanian and the Malay language. Amongst those were the Dyak race of Suguam, who long since abandoned the cruel practice of head-hunting. There are twelve tribes located between the Malay of the coast and the Kayan, namely the Kanawit, Bakatan, Lugan, Tan-gong, Tatan, Balinian, Puman, Sokapan, Kawayan, Bintulu, and Tifan, the majority of whom are tributary to the Kayan. The six first mentioned are all more or less tattooed, both male and female, and certainly have all sprang from the one called Kanawit, who in habits closely resembles the Dyak of all Saririus, whose neighbours they are. The tribes Puman, Sokapan, and Kawayan are the chief collectors of camphor and birds' nests. The trees, which produce excellent timber, amount to upwards of sixty species.

At the mouths of most of the rivers on the east coast of Borneo, and also on the north and north-east coasts, the orang bauu are found. They dwell in boats of eight or ten tons burden, which are covered, when in harbour, with a roof of matting. Each boat contains about fifteen inhabitants, men, women, and children, who employ themselves chiefly in catching and curing fish and trepang, and in making salt from seaweed. The latter they dispose of to the Dyaks. The women are equally skilful with the men, both in fishing and in the management of the boats. During the south-east monsoon, when the weather is fine in the southern parts of the island, they cruise about Passir and Pulo Laut; but when the monsoon changes, they sail on the northern parts of the island. In addition to these, living in prahus, and wandering about the shores of the southern Lauts of Bintulu, from Magimiano, and the orang tidong, country unknown. Bruzen images, ruins of temples, and other remains of Hindu civilization, are still to be seen on the southern coast. The coasts of the island are inhabited by several nations, totally unconnected with each other, governed by their own laws, and adopting their own peculiar manners and customs. The west coast is occupied by Malays and Chinese, the north-west coast by the half-caste descendants of the Moors of Western India, the north part by the Cochin-Chinese, the north-east coast by the Sult., and the East coast by the Bugis tribes of Celebes. The greater part of the coast of Borneo is rather dotted than peopled by Malay settlements, according to the Malays themselves, the result of migrations from Sumatra dating as far back as thirty generations. A small portion of the eastern coast is occupied by settlements of the Bugis of the Celebes of more recent date. The aboriginal inhabitants are thus in a great measure locked up in the interior, and precluded from access to that commerce with strangers which might civilise them. The Malays and natives of Celebes, by their superior civilization and power, dominate over the rude aborigines, without, however, being able to penetrate into the interior, or to dispossess them of their land. The Malays build their houses 18 or 20 feet high, to avoid the Dyak spears. All the houses in a kampong are erected on posts 10 or 12 feet high, and are all under one roof, with only a slight partition separating the families.

Borneo, as a mineral country, is very rich, producing gold, coal, antimony, and iron, while caoutchouc and gutta-percha are amongst its
vegetable products. From the river Baram coal is traced to the upper parts of the Bhitaul, and thence southward to the Rajang river, on the left bank of which, at Tujol Nang, there is a seam exposed, upwards of thirteen feet in thickness. At different other parts of the river, and also in several of its branches, coal is in abundance. From Tujol Nang the strike of the coal is southward across Dragon's plain. It is again found in the river Lang-Tha (a distance from the former place of about fifty miles), where it remained in a state of ignition for several years. Iron ore, yielding from 60 to 80 per cent. of iron, abounds in the Bakuw or Rajang district, over nearly one-half of the extreme breadth of the island. The iron is preferred to that of Europe.

The varieties of animal life are great. Some species of Actinia of enormous size occur in the China seas and on the coasts of Borneo, and fish live within them. Of 29 species of birds in Borneo and 21 in Sumatra, 20 are common to both islands. Of 29 in Borneo and 27 in Java, 20 are common to these islands. Of 21 of Sumatra and 27 of Java, 11 are common to both islands. The remarkable coleoptera beetles found in Borneo by Mr. Wallace, were the Necocerabys aneas, Cladognathus turandus, Diurus furcellatus, Ectatorrhinus Wallucei, Megacriodes Saundersii, Cyriopalus Wallacei. He collected about 2000 distinct kinds of beetles.

On every mountain-top is the pitcher plant, climbing over trees or running along the ground. The finest are on the summit of Kinabalu; and the pitcher of the broad sort, Nepenthes raja, will hold two quarts of water. Another, the Nepenthes Edwardsiana, has a narrow pitcher twenty inches long, and grows to a length of 20 feet. Ferns are abundant. The Vanda Lowii, one of the Orchidaceae, grows on the lower branches of trees. Its flower-spikes, 6 or 8 feet long, hang down to the ground, bearing large handsome flowers, 3 inches across, colours varying orange to red. The Polygonum or tender rice rises from a pyramid of roots, which descend for 70 or 80 feet to the ground below.—Wallace, i. 37, 161; Journ. Ind. Arch. 1845, 1849; John's Ind. Arch. ii. p. 265; Quarterly Review, No. 222; Marriage's Ind. Arch. p. 10; Earl's Ind. Arch. p. 270; Voyage of the Menander in J. I. Arch. 1853; Carl Bock's Headmasters of Borneo; Regering's Almanac; Low's Sarawak; p. 59; Pritchard's Researches.

BORO or Bodo, a race chiefly found in the forest tract, 15 to 20 miles broad, between the Himalaya mountains and the plains. They entered from northern Assam along the southern side of the Brahmaputra to the Surma, and along the skirts of the Himalaya as far west as the Konki, and are also spread in large numbers over the eastern portion of the space between these two diverging lands, that is, Middle and Lower Assam, outside the forest limits, between lat. 25° to 27° N., and long. 88° to 93° 30'. It is the northern section to which are said to have occupied the eastern part of Assam, and to have conquered Kamrup about 1000 years ago, spreading over Assam, Cachar, Tiperah, and Sylhet, and it is presumed as far as the present western boundary, on the north. The Rangtesa have for many centuries been intermixed with Nagas and Mikiris. The Hajong, who are found along the foot of the hills from Gauhatti to Sylhet, appear to preserve the same name. Mr. Hodgson considers that they and the Rabhas of the same tract are Bodo. The Rangtsa, according to their own traditions, come from the N.E. of Assam, where they conquered Kamrup, and extended their sway over all Assam, Cachar, the Barak valley, and Tiperah, nearly four centuries before the Ahom invasion. The period falls within the era when Tibetans spread into the Sub-Himalayas and Bengal; and as the conquest or resumption of Kamrup by the Koch took place some time before the beginning of the 12th century, the event was probably connected with the decay of the Tibetan or Tibeto-Himalayan predominance. They seem to have been the principal Tibetized tribe of Lower Bhutan. The ruling families in Hirumha (Cachar) and Tiperah appear to have remained Cachari; and it is probable that the Cachari retained a certain degree of independence along the skirts of the Himalaya. The Hirumha tribe call themselves Rangsa or Ramsa, and give the same name, Ramsa, to the languages of the Cachari of the plain; Bodo, their own tongue being called Hojo or Hojai. The Hojai, according to Mr. Grange, is totally different from that of the Cacharis of the plain.

The western branch of this tribe belongs to Behar and Bengal, and to the Sikhim and Bhutan frontiers; the eastern branch occupies Assam and Koch-Bihar. They reside in villages of from ten to twenty huts; their clothing consists of cotton and silk materials. Fermented barley, rice, or millet is used by them as a slightly intoxicating beverage, which resembles the aji-mana of the Newar of Nepal. They do not occupy a locality permanently, clearing and cropping and moving again to clear and crop another spot. A Bodo and Dhimal will only touch flesh which has been offered to the gods by a priest. The bridegroom purchases his bride either by money or labour. Polygamy is rare. There are professed exorcists among them.

The eastern Bores in Cachar are called Borro, and are divided into the Cachiari of the hill country and those of the plains. They are partly Hindu and partly pagan. Those in the plains in Assam are called Hazai, Hojai, or Hajong; are of the Hindu creed, and speak a Hindi dialect. The hill Cachiari is stouter, harder, and more turbulent, and lives in villages of from 20 to 100 houses. Like the Naga, their young men reside together in a large building. Chatgari, a frontier district between Desh Durnig and the Bhutan hills, is the chief locality of the Boro of Cachar, the numbers there being about half the whole Boro population. Of the three separate people, the Kochh, the Bodo, and the Dhimal, the faintly yet distinctly marked type of the Mongolian family is similar in all three, but best expressed in the Bodo features and form. When the Mahomedan power was established in Bengal, the Kocchh (Kochh or Kowadh) kingdom extended from 58° to 93° E., and from lat. 26° to 27° N., from the south-eastern extremity of Nepal along the southern extremity of Sikhim and Bhutan into Assam, with Koch-Bihar as its capital; and the people consisted of the present Kochh, Dhimal, and Bodo. They dwell in the sal forests with impunity.—Latham's Descrip. Ethn.; Hodgson. See Cachar; India; Kocch.
temple at Gaya. It was designed by artists from the west of India, and is supposed to have been erected during the latter half of the 7th century A.D. It must have taken about 100 years to complete. Its figures show that the Buddhist Mahayana doctrines prevailed.—Ferg. p. 315.

BORODA. Uta. Bauhinia variegata.

BOROJUAN. Beng. Psychotria ajwain.

BOROKOLE. Tel. Uta. This tree is supposed to be a species of Zizyphus. Planks, doors, boxes, matchlock stocks, and palanquins are made of its wood; the leaves, pounded and mixed with turmeric, are said to be efficacious in curing rheumatism; the seeds are also used medicinally in diseases of infants; the tree yields lac.—Capitan Macdonald.

BORERA ASHNEH, Royle, is the Chilichilhera lichen of the Himalaya. With ammonia it gives a reddish-brown colouring matter, and is used accordingly as a dye-stuff. Dr. J. D. Hooker found only this Borera on the Donkia pass of the Himalaya, above an elevation of 22,990 feet; it migrates over the lofty slopes and ridges, blown about by the violent winds.—Royle; Hook. Hist. Journ.; O'Sh. p. 672; Z. in Indian Field.

BORSIPPA. See Birs Nimrud.

BOS, a genus of bovine animals. See Bovinæ. BOSCA TRINERVA. Rozb. A large tree of the Circar mountains.—Rohe, MSS.; Rozb.

BOSCAVEN, a British admiral, who in 1747 sailed for India with a great armament. On his arrival at Fort St. David, he took command of all the land and sea forces, and marched against Pondicherry, to which he laid siege on 23d June 1748, but raised it in November. In 1749 he took part in the war against Tanjore. In August he received Madras from the French, and in October returned to Britain.

BOSWELLA glabra and B. thurifera occur in India. They yield a fragrant gum-resin, called in Arabic Luban, also Kundur, supposed to be the same as the Lysimachus of Theophrastus and the Theonas of the Romans. It seems to be olibanum, and identical with the frankincense that was used by the ancients in their religious ceremonies. Dr. Carter described and figured the frankincense tree of Arabia; and Captains Cruttenden, Vaughan, and Kempthorne have noted the presence of frankincense trees in the Somali country. Dr. Birdwood described three of these trees, with figures, and is of opinion that the frankincense or olibanum of commerce is obtained from the Somali country, and from Hadramaut in Arabia, being partly re-exported from India to Europe. He described five plants under this genus, and named the three new ones, Boswellia Carterii (Moor-Madow of the Somali), Boswellia Bhan Dajiana (Moor Adh of the Somali), and Boswellia Freecanea (Yegar of the Somali). B. glabra yields a resin used as incense and as pitch. Resins analogous to the ambabam are obtained from species of Croton, Bailliera, Amyris, Icica, and Lestia of America.—Birdwood.

BIRDWOOD. BOSWELLA GLABRA. Rozb. p. 384.

Kungli, . . . Tam. | Anduga, Gugalu, . . . Tel. The Gum-resin, Olibanum. Koundrienn, Male., Tam. | Salaca Gond, Gugal, Hind. Captain Beddome says this fragrant resin-yielding tree is very common in many of the dry sub-alpine jungles of the Madras Presidency, particularly on the eastern side of the presidency, on the Vellore, Cuddalore, North Arcot, and Kurnool hills; Mysoore, Guzzlederry pass, etc. etc. It grows also in Kumaon, though rare; on the west of the Jumna, but it does not occur in Ceylon. It flowers in January and February, generally when quite destitute of leaves, and the tree is of good size. The gum-resin is the olibanum of commerce, and is much used as a fragrant incense, and (when boiled with oil) as pitch. It is said to possess stimulant, astringent, and diaphoretic properties. It is largely used in some parts of India as an application to indolent sores, and is supposed to form the chief ingredient in 'Wroughton's ointment.' It is well deserving of careful attention, and can be procured in almost any quantity. The substance is better and pungent, and is soluble in ether and spirits of wine. In Kumaon nothing is known of its yielding the salace, gum-resin. Its timber is said by the natives to be of little or no value.—Hook. Manual: Econ. Prod. Panph.; Rohe, MSS.; Besant, Fl. Syl. p. 121; Mr. Thompson See Olibanium.

A large tree with pinnate leaves, which grows on the hills of the Dekhan, in the Konkan jungles, above Rajoo, in the hill of Shedur, in the Belgaum collectorate, in Bundelkhand, the mountainous tracts of C. India, Chutta Nagpur, Ajmir hills, and very common in the Shahabad country. Dr. Hooker, in ascending from Belcquip in Behar to the height of 1380 feet, came upon a small forest of it, conspicuous from its pale bark and spreading curved branches, leafy at the top; its general appearance was that of the base of the mountain ash. The gum, celebrated throughout the east, was flowing abundantly from the trunk, very fragrant and transparent. Ganda biroza is prepared from the gum-resin of this tree, and is similar in appearance and qualities to Venice turpentine. It is brought from Mewar, Haraoit, and the Shkhowatthi hills, and is considered stimulating. An oil is distilled from it said to cure gonorrhoea. It is much used in painting, and by the lakheri, one maund costing twelve rupees from the Shahabad country. At Chandlagar it is termed, in the dry state, sukha biroza. B. glabra and B. thurifera both furnish the male frankincense of Dioscorides. The resin olibanum occurs in reddish or pale yellow tears, oval, oblong, and obtuse, sometimes in dense, opaque, brittle masses. The ganda biroza of the bazaars is soft, of a dull, metallic, or white, and white. The colour is balsamic and resinous, especially while the resin is burning; the flavour balsamic, and rather bitter. The powder is citron yellow. It is frequently adulterated by dammer, sandarach, and other cheaper resins; when chewed, the hard variety softens, and dissolves partially in saliva, which it renders white and emulsive. Used for incense; also medicinally as a stimulant, astringent, and diaphoretic in affections of the...
chest, also in chronic affections of mucous membranes, but chiefly in plasters, ointments, and for fumigation.—Royle, p. 383; Hooker’s Illus. Jour. p. 29; Med. Top. of Ajmir; O’Sh. Beng. Phar. p. 383; Faulkner; Birdwood; Roxb. ii. 383; Powell, Handbook, i. p. 336; Cal. Cat. Ex. 1862; Mr. Rohde, MSS.

BOT. also written Bhot, the race occupying Tibet, Bhutan, Ladakh, and Balti. Their language is the oldest of the Turanian formations. See Bhot; Bhutan.

BOTA KADIIM, also Botta kadapa chettu, Tel. Naneela purvifolia. The Telugu is from the resemblance of the capsule to the stamp used for impressing the botto or seational marks of the Madhavacharya Brahmans.

BOTANY is the Ilm-i-Nabat of the Persians. There has not been any branch of natural science, in its relation to the East Indies, so devotedly followed out as scientific and economic botany. Whether we regard the numbers working, the personal labour undertaken, the vast sums expended by its cultivators, or the important advantages which eastern countries have derived from them, their names ought ever to be kept in remembrance. During the past 300 years, amongst others who have worked in the East Indies, may be named, Governor Henry van Rheede, George Everhard Rumph, Leonard Ploenkct, Koenig, Dr. John, Klein, Rottler, Sonnerat, Thunberg, the elder John Burman, and the younger Nicholas Laur. Burman, Herrman, Father Loureiro, Leeschena, Forskal, Kempter, Swartz, Jack, Carey, John Gerard, Jones, Fleming, Hunter, Anderson, Berry, Heyne, Buchanan, Russell, Noton, Shuter, Govan, Finlayson, Roxburgh, Wallisch, Royle, Binme, Horsfield, Spry, Voigt, Griffiths, Wight, Sir Joseph Dalton Hooker, Thomas Thomson, J. L. Stewart, Baden Powell, Hugh Cleghorn, Heber Drury, A. Moon, W. Munro, Arnott, J. E. Stocks, Edward Waring, K. Aitchison, Macelland, Sir Whitehall Ainslie, Sir William Hardwicke, Sir William O’Shanghnessy, Sir Stamford Raffles; Colonel Beddome, Sir George Birdwood, Edgeworth, C. B. Clarke, Clement Markham; Drs. Mason, Thwaites, Jameson, Brandis, Forskal, Don, Bentham, Bidic, and Kurz; and notices of them will be found in this work under their respective headings.

In the 18th century Madras was the great home of research. In the 19th century the botany of the Bombay Presidency was greatly advanced by Mr. John Graham, Mr. Joseph Nimmo, Mr. Law of the Civil Service, Mr. Dalziel, and Drs. Lush, A. Gibson, and Natali. In the 19th century, under the Presidency of William Roxburgh, Nathaniel Wallich, John Forbes Royle reigned supreme; and many younger men are treading in the footsteps of the above.

Agri-Horticultural Societies and their gardens have been formed at Calcutta, Saharunpur, Dapoolie, Bombay, Madras, Bangalore, and Ootacamund, to attend to the introduction of new plants into India, and to the useful application of the natural products of the country.

In March 1768 a Botanical Garden was established in Calcutta, under the care of Colonel R. Kyd. In 1793 Dr. Roxburgh was put in charge; and its superintendents have been successively, Dr. Roxburgh (obit 1814); H. T. Colebrooke, Dr. Francis Hamilton, Dr. Nathaniel Wallich, Mr. Bentham, and Assistant-Surgeon W. Griffiths.

The Botanical Gardens at Peradenia are about five miles from Kandy, in Ceylon, and occupy a considerable extent of ground.

Baron Ferdinand von Mueller, of the Melbourne Gardens, has written a volume of great value (Select Extra-Tropical Plants, 1880), enumerating the plants which could be beneficially introduced and interchanged between Australia and the East Indies. In the middle of the 19th century, Clement Markham, C.B., devoted years of his life, risking life and health in a residence in South America and voyaging to the Neighberry hills, in order to introduce there species of the Cinchona trees; and his efforts were so eminently successful, that the Cinchona alkaloids by 1852 were being sold at a rupee an ounce.

The total estimated number of Indian species are 12,000 to 15,000. The climate of India is generally tropical, and even on mountains of 4000 to 5000 feet the vegetation is temperate. The perennially humid forests are uniformly characterized by the prevalence of ferns; and at elevations below 5000 to 7000 feet, by the immense number of epiphytal orchidaceae, orontiaceae, and seitanineae. They contain a far greater amount of species than the dry forest of North India, and are further characterized by zingiberaceae, xylidaceae, palmae, pandanaceae, dracaceae, piper, chloranthaceae, araceae, fiiit, urticaeaceae, araliaceae, apocynaceae, shrubby rubiaceae, aurantiaceae, garinelieae, anonaeeae, nutmegs, and dipterocarpaceae.

In the Himalaya, the truly temperate vegetation surpasses the subtropical above 4000 feet, and ascends to 12,000 feet, when it is succeeded by the alpine or tundra.

India contains representatives of almost every natural family on the globe, a very few American, Australian, and S. African orders of plants being the chief exceptions. In India the number of peculiar families largely represented in it is very limited. The Aurantiaceae, Dipteraceae, Balsaminaceae, Ebenaceae, Jasmineae, and Cytandraeae are the only orders which are largely developed in India, and sparingly elsewhere, and of these few contain a hundred Indian species. Sir Joseph Hooker is bringing out a descriptive work on the flora of India.

The species are much scattered. It is believed that nowhere in British India could more than 2000 flowering plants be found in a radius of 10 miles; and there in India an almost complete absence of absolutely local plants. The plains of India are everywhere poor in species, and such a country’s individuals are usually of a woody character. Indeed, there are few other countries in which the vegetation of the more accessible parts presents so little beauty or such short seasons of bloom. The great number of 222 British plants extend into India. Many North African and Arabian forms occur. Several Australian species are found in the Malay Peninsula. Many of the Himalayan, Neighherrues, Khassia, and Ceylon species are found in the Malay Peninsula and in Java. Guatentheria nummularia extends from the N.W. Himalaya to the Java mountains; and plants common to India and Java are Sedgwickia cerasifolia, Griff., Marlea, Cardioptera lobata, several oaks and chestnuts, antidesmea, a willow, and Myrica. The Chinese type is abundant in
BOTANY.

the temperate region of the Himalaya; and plants of N. America, west of the Rocky Mountains, also occur.

An immense proportion of annual plants, which vegetate on the last rainy seasons in the plains, and ascend the lofty mountains, are uniformly distributed throughout India. Of these the most conspicuous are grammineae and cyperaceae, a vast number of small leguminosae and scorpiolariaceae, composite, some labiate, amaranthaceae, convolvulaceae, and acanthaceae.

The winter months of the colder northern countries have a corresponding cold season in India, during which oy-trumpet, cornel, wheat, barley, and more rarely oats, with various kinds of pulse, are cultivated; and many wild plants appear, very many cyperaceae, grasses, and such aquatics as myriophyllum, potamogeton, vallisneria, zannichella, zemna, and others. The mountainous regions of Afghanistan are rich in Himalayan forms, and contain an immense number of European and Persian plants, which find their eastern limits within the British Himalaya; and many plants are found in those mountainous regions common to Europe and the Himalaya. Nepal, Bhutan, East Tibet, and the Khasaya mountains present a flora which has much in common, and, in a geographico-botanical point of view, is one of the most important regions in India, if not in all Asia. In the Himalaya, the genera rhododendron, monotropa, pedicularis, corydalis, nupetea, carex, spirea, primula, cerasus, lonicera, and viburnum attain their maximum of development.

In the Himalaya the truly temperate vegetation supersedes the sub-tropical above 4000 to 6000 feet, an elevation at which there generally is an annual fall of snow.

On the Himalaya, and on the isolated mountain ranges of the Peninsula of India, on the heights of Ceylon, and on the volcanic cones of Java, many plants occur, either identically the same or representing each other, and at the same time representing plants of Europe not found in the intervening hot lowlands. A list of the genera collected on the loftier peaks of Java raises a picture of a collection made on a hill in Europe. Still more striking is the fact that Southern Australian forms are clearly represented by plants growing on the summits of the mountains of Borneo. Some of these Australian forms extend along the heights of the Peninsula of Malacca, and are thinly scattered, on the one hand, over India, and, on the other, as far north as Japan. Along the Himalaya, at points 900 miles apart, glaciers have left the marks of their former low descent; and in Sikkim Dr. Hooker saw maize growing in gigantic ancient morasses. There are plants on the Himalaya and Neelgherries, Ceylon, and the Khasaya mountains, and in the Malay Peninsula, and the moister and more equal parts of India, identical with those of Java. The genus calamus, orchids, araceae, zingiberaceae, and ferns are especially abundant; the genus grammatophyllum, the wonderful nepenthaceae, or pitcher plants, of which solitary species occur in Madagascar, Ceylon, the Socheilles, Celebes, and the Moluccas.

Several species of Australian genera, myrtaceaee, the leptospernum, Brackia, and metrosideros, are found in the Malay Peninsula. The Eastern Archipelago type forms the bulk of the flora of all the perennially humid regions of India, the Khasaya mountains, the Upper Assam valley, the forests of the base of the Himalaya from the Brahmaputra to Nepal, the Malabar coast, Ceylon, and the whole of the Malayan Peninsula, many of the plants being identical with Japanese mountain species. Gualtheriæ moummularia ranges from the N.W. Himalaya to Java; and the more conspicuous of the trees common to Java and India are the Salixgwickia cariosa, Griffith, which is undoubtedly the Liquidambar altingia, Blume, Marle, extending from China to Kashmir. The various Cardiopetria lobata of Java is also a native of Assam; and several oaks and chestnuts, anti-daeame, a willow, and myricas, are common to Khasaya and Java.

The Chinese type is abundant in the temperate regions of the Himalaya, extending westward to Garhiwal and Kamaon, but is most fully developed in Sikkim, Bhutan, and the Khasaya, and, as examples, are species of acaena, Helwingia, stachyurus, onkianthus, Abelia, Skimmia, Adaniba, Benthamia, and corylopsis, all of them genera that have been regarded almost exclusively Japanese and Chinese; also Micropletea pavillora, Hamamelis Chinensis, Nymphaea pygmaea, Vaccinium bracteatum, Quercus serrata, illicium, thea, magnolia, the schizandrace, lardizabela, camellia, dentzia, viburnum, Cornacea, Houttuynia, Bowringia, Wikstromia, daphneae, Henslovia, secqua, antidesma, Benthamia, Goughia. Euryale ferox, which is wild in the Gangetic delta, and is found as far westward as Kashmir, is abundant in China; and Nepenthës phylamphora, a native of the Khasaya mountains, is also found at Macao and eastward to the Louisiane Archipelago.

European forms abound in India. 222 British plants extend into India; and a multitude of mountain plants, and many of the most conspicuous of these, range from the coasts of the Levant and the Black Sea to the Himalaya, as Corylus colurna, Quercus ilex, Ulmus campestris, Celtis Australis, C. orientalis. Few European species, comparatively, extend into Nepal, and still fewer occur in Sikkim.

Egypt, southern Arabia, the warmer parts of Persia, Baluchistan, Sind, and the Panjab, have a remarkable similarity of climate. Many North African or Arabian forms extend throughout all the drier parts of India. Others are restricted to northern and western India; and though tropical Asia and Africa are separated by a vast expanse of ocean, there is a great similarity in the families of the trees and shrubs; and an affinity can be traced between the mountain vegetation of western tropical Africa and that of the peninsular chain. —Royal on the Productive Resources of India; Wight's Prodromus Flora Indica; Hooker et Thomson's Introductory Essay to the Flora Indica; Darwin, Origin of Species; Wallace; J. A. M. Med. Science.

BOTERO. Giovanni Botero, an Italian, in A.D. 1550, was the first European author who treated of the tea-plant. His book was written to indicate the causes of the splendour and wealth of cities.

BOTLA BENDA. Tel. Abutilon Indicum.

BOT-PA, a race occupying Ladakh, or Little Tibet. They speak the Tibetan language, and are Buddhists, with a hierarchy of monks called Lama.

BO-TREE, AngloSingh, F.cnus religiosa, grows...
all over India. One of these is to be found within the precincts of every Buddhist temple in Ceylon, and it is frequently met with in deserted localities, or near the sites of ancient villages, and there the occurrence of a solitary Bo Tree, with its circular buttress of stone work round the stem, indicates the existence, at some former period, of a Buddhist temple in the vicinity. The planting of the Bo Tree in Ceylon, a ceremony coeveal with and typical of the introduction there of Buddhism, is one of the most striking passages in the 18th chapter of the Mahawamsa, entitled 'The obtaining of the Bo branch'; and the 19th chapter describes the arrival of the Bo Tree. A tree of unusual dimensions, which occupies the centre of a sacred enclosure at Anarajapoora, is still reverenced as the identical one which the sacred books record to have been planted by Mahendra 250 years before the Christian era, consequently in the year 560 it will be 2150 years old. 'So zealously is it preserved, that the removal of a single twig is prohibited; and even the fallen leaves, as they are scattered by the wind, are collected with reverence, as relics of the holy tree.'

When Asoka, 250 B.C., sent his son Mahendra and his daughter Sangamitta to introduce Buddhism into Ceylon, one of the most precious things which they carried with them was a branch of that celebrated pipal tree beneath which Sakya became a Buddha, and which is still growing from the top of a small pyramid at Gaya. It was received with the utmost reverence by Devanampiyatissa, and planted in the most conspicuous spot in the centre of his capital. There it has been reverenced as the chief and most important numen of Ceylon. The city is in ruins, its great dagobhas have fallen to decay, its monasteries have disappeared; but the great Bo Tree still flourishes; annually thousands repair to the sacred precincts within which it stands, to offer up prayers for health and prosperity. On the altars at the foot of the sacred tree, the inhabitants scatter offerings of flowers and perform their accustomed devotions. —Tennent's Ceylon; Tennent, Christianity in Ceylon; Hardy's Eastern Monachism.

BOTRYCHIUM VIRGINICUM. This large succulent fern grows plentifully in the Raklang pass in the Sikkim Himalaya. It is boiled and eaten, both there and in New Zealand. Other ferns are used for food. In Calcutta, the Hindus boil the young tops of a Polypodium with their shrimp curries; and both in Sikkim and Nepal the watery tubers of an aspidium are abundantly eaten. So also the pulp of one tree-fern affords food, but only in times of scarcity, as does that of another species in New Zealand, the Cytherea medullaris. The pith of all is composed of a coarse sago, that is to say, of cellular tissue with starch granules.—Hooker, Fl. Journ.

BOTRTIS BASSIANA. See Dry Rot.

BOTTA, French census at Mosul, in 1842 began excavations on the sites of the buried cities of Assyria. He commenced his labours at Kouyunjik, a large mound opposite Mosul. Along with Mr. Layard, he made large researches, and during the entire period of his excavations, M. Botta sent to Mr. Layard not only his descriptions, but copies of the inscriptions.—Layard's Nineveh.

BOTTA-GENDA. Gond. Spilonis cheela.

BOTTA KADAPA CHETTU. Tel. Naucal parviflora. The name is taken from the remen-

blance of the capsule to the stamp used for impressing the bottu or sectarian marks of the Madhavacharya Brahmans.

BOTTLE GOURD, Lagenaria vulgaris. BOTTLIES.

Kacha, bull, balang, MAL.

Skin or glass or stoneware vessels for holding liquids are of various shapes and sizes. The leather bulids in which the people of India carry ghi and oil, is manufactured in many places by stretching skins over a clay model, which is afterwards broken and shaken out.

BOTTLE TREE, Delabecheia rupesiris of Australia. It is one of the order Sterculiaceae. It attains a height of 35 to 55 feet, with huge branches at the summit, and the bark rugged. The foliage is small in comparison with the great size of the tree. The interior substance of the tree and branches in a mucilage resembling gum tragacanth. The circumference of the trees, measured 7 feet from the base, is from 12 to 35 feet. The trees grow very luxuriantly in a soil of sand or sandy loam, and are often tapped by stockmen and others, who procure from them a glutinous and refreshing beverage. Large-sized trees scooped out form excellent canoes. It should be introduced into India. See Brachychiton.

BOTTU. Tel. The sectarian marks of the Madhavacharya Brahmans.

BOTTU KURA. Tel. Cordia polygama.

BOT YUL, the Tibetan name for Tibet.

BOUEROSIA AUCHERI. Dru.

Changi, Char-ungli, Hind. Pawannee, Pawaouke, Panj-angushi, . . . Pers. | PANJ. 

This plant is found in the N.W. Himalaya, Trans-Indus, and Salt Range up to 3000 feet. Its stems, four or five inches long, resemble the fingers of the hand, are juicy, generally eaten raw. —Dr. J. L. Stewart.

BOUEROSIA EDULIS. Edgeworth.

Chang, Pippa, . . . PANJ. | Pippa, Sittu, SHU. Pani.

Suhith Gandhal, . . .

Stem used as a relish for farmaceous food; not uncommon in the arid tract from the Salt Range southward to the boundary of the Panjab, and in Sind.—Edgeworth; Dr. J. L. Stewart.

BOUGHTON, GABRIEL, surgeon of the E.I. Company's ship Hopewell; about the year 1859 was summoned to the Dekhan from Surat to attend on a daughter of Shah Jahan, who had been severely burned. He asked as his reward liberty for the E.I. Company to trade in Bengal free of duties. Orme says he was sent for that purpose from Surat to Agra. The patient recovered; and the emperor, besides other favours, granted him a pension to trade freely of customs throughout his dominions. Boughton proceeded to Bengal, on reaching which he made his peace in order to attend on one of his favourite women, who recovered. Boughton remained in the nawaib's service, who gave him and the English the right to trade; and Boughton induced the Company to send, in 1640, two ships.—Broome, Hist. of the Bengal Army, London, 1850; Orme, ii. p. 8.

BOULMA, a stone procured from the hill state of Dhenkanal in Orissa, used to make small mortars and the little tripods on which sandalwood is ground by natives.—Col. Cat. Ez. 1862.

BOURA CHANG, a fish of Bhutan, believed by
the natives to fall from heaven, from the circumstance of its being found after rain far from the water.

BOURBON, also called Reunion and Mascarennes, is an island of a round form above 42 miles from N.W. to S.E. A volcano near its S.E. part, is in lat. 21° 9' S. It is larger than the Mauritius; but it is only a great mountain except in three places, and clothed with wood, though portions below are cultivated. It was discovered by the Portuguese, who called it Mascarenhas. The French took possession of it in 1675. It was captured 10th July 1810 by the British, but restored at the general peace. Bourbon cotton is Gossypium Barbadense, and Bourbon Tcacuana, Calophyllum inophyllum.—Horshorh. BOURDONNais, La., sailed for India when only 14 years of age. He became the governor of Mauritius and Bourbon in 1734. He returned to France; but in 1746 he revisited India, had an encounter with the British fleet, and on the 10th September he captured Madras, which capitulated, but was ransomed on the 10th October. He sailed for France, but was captured on his way. He was shortly after released, in consideration of his lenient treatment of Madras; but on arriving in France he was thrown into the prison of the Bastile, where he lingered for three years and died. Duplexis was jealous of him, and caused his imprisonment. He introduced cotton and indigo into the Mauritius.

BOURO ISLAND, one of the Moluccas. It is high, and has a semicircular mountain on its N.W. part. The island has two races; the larger number are Malays of the Celebes type, often exactly similar to the Tomore people of East Celebes, who are settled in Batebian; but the other, a taller, bearded race, resemble the Alfurs of Ceram. Amongst its birds are two kingfishers, Tanysiptera acis and Ceyx cajet; a beautiful sun bird, Nectarina proserpinia; and a black and white flycatcher, Monarcha loriaca.—Wall.

BOVID, a family of mammals, comprising the sub-families Antilopinae, Caprinae, and Bovinae. The Antilopinae have been enumerated under their own heading; the others are as under:

Sub-Fam. Caprinae, goats and sheep.

Nemorcoës bubalina, Jordan.
N. procilus, Hodg. | Antilope thar, Hodg.
Ramu, | Kashmir, | Simla, | Sarao, Tibet.
N. | | | |
Sere. | Punjab |

Sub-Fam. Bovinae, cattle.

Hemitragus jemlaicus, Jerdon.
H. quadrians, Hodg. | Capra jemlaicus, Hodg.
Kras, Jala, | Kas. | Jehr, | Simla.
Kart, | Kel, | Eshu, Eshu, | Sutlej.
Jula (m), thar, tharan, | Kun.

The tehr or Himalayan wild goat inhabits the whole of the Himalaya.
tricts infested with the tiger. They have been domesticated in India and the Archipelago.

The Buffaloes.

Bubalus Arni, Jerdon. | B. bubalus, Anderson.

B. bubalus, Blyth.

Mung of BHAGULPUR. | Jangli bhyus (m.), HIND.

Gera eruni, GOND. | mlyus (f.), HIND.

Arna (m.), Arni (f.), HIND.

Occurs wild in Assam, in the Terai from Bhutan to Oudh, in Central India from Midnapur to Rajpur, in the Purniah district, and a few in the N. and N.E. of Ceylon. The domesticated species is little changed from the wild buffalo.

BOYRA KORRO. Prim. A large desert partridge in northern Peru. Pterocles exusta.

BOWRING, Sir JOHN, K.C.B., governor of Hong-Kong, but best known as an author by his political and literary writings. He was born at Exeter 17th October 1792, and became, in early life, a pupil of Jeremy Bentham, maintaining his master's principles for some years in the Westminster Review, of which he was the editor. He wrote Bowring's Siam, and a work on the Philippine Islands. Obit 1872.

BOWSTRING HEMP, fibre of Sansevieria Zeylanica. Very tenacious fibre; the natives make their best bowstrings of it.

BOXWOOD, Buxus sempervirens, Wall. This is a valuable wood of a yellowish colour, close-grained, very hard, and heavy; it cuts better than any other wood, and is susceptible of a very fine polish. It was highly valued by the ancients as a material for musical instruments. It is of use for the turner, engraver, mathematical instrument maker, and pipe maker. The Himalayan box, Buxus sempervirens, Wallich, appears to be identical with the tree common all over south Europe, and extending into Persia, chiefly in valleys, at an elevation of from 3000 to 6000 feet. Dr. Stewart met with it from Mount Tira, near Jhelum, to Wangtu bridge on the Sutlej. It is variable in size, being generally 7 to 8 feet high and the stem only a few inches thick, but attaining sometimes a height of 15 to 17 feet, as at Manikarn in Kulin, and a girth of 22 inches as a maximum. It is found in the valleys of the Sutlej, Parbati, and near Dharamsala, and in the Salt Range. In the Nepal valley it is larger and more abundant than in other parts of the Himalaya. It is made by the villagers into little boxes for holding ghi, honey, snuff, and tinder. It is in demand for plugs for Minie rifle balls, and at Sealkote it is turned into pill boxes. The wood is liable to split in the dry weather, and should be seasoned in store and covered. Thumberg says that B. sempervirens was not uncommon in Japan, in a wild and cultivated state. The annual consumption in Great Britain exceeds 2000 tons, half of which is of foreign growth. The wood of Sarcoceca trinervia also gets this name. The Karens sometimes furnished Mr. Mason with specimens of a wood that can scarcely be distinguished from the boxwood of Europe. Nauclea cordifolia has wood coloured like that of the box tree, but much lighter, and at the same time very close-grained. Dr. Hunter highly praises the wood of the Euonymus dichotomus of the Pulney hills.—Jour. A. H. Soc. xi. 413, 1859; Clegborn, Panjab Rep.; Statistics of Commerce; Thomson's Travels; J. L. Stewart; Pownell's Handbook; Hunter; Royle.

BOY, an Anglo-Indian term applied to a native domestic man-servant, supposed to have come from Bhu, the name of a Teuling tribe.

BOYA, plural Boyadu or Boyidu, also Boyi, Tel. A mountaineer, a forester; was a title of some Teling chieftains, as Avar-Boyidu, Mara-Boyidu, Gondla-prote Boyidu.

BOYAR, a race widely diffused in the hilly parts of Palamau, Singhaja, Singrauli, Korea Bhakhar, Rewa, and other places. They cultivate millets and pulses on the virgin soil of newly-cleared forests. They live in small hamlets or detached houses. They bury their dead, depositing with each body of a male an axe; a knife, and a bow and arrow. The Boyar are generally of a dark-brown colour, fairly proportioned, and averaging upwards of five feet in height. The features have great breadth across the cheek-bones, very narrow forehead, nose broad, nostrils wide apart, the nasal bone more prominent, the mouth so wide as nearly to equal the space occupied by both eyes, lips protuberant, chin receding, but not so the brow, more hair on the face than is generally found amongst the tribes of this class.—Dalton, Ethnol. p. 134.

BOYILLA or Boigigiah, a race in the southern Malratta country, whose sections take the name of Bhaka, Holga, and Berdur. The Bhaka again subdivide into the Ramusi, Yadu, Roray, and Gurgal. The four branches of the Bhaka constitute one people apart from the Holga or the Berdur. They are hardy, active, and enterprising, but predatory, covetous, rapacious, and treacherous.

BOZAH. HIND. A fermented liquor obtained from Eleusine coracana, and somewhat resembling country beer. It is chiefly used in the higher provinces of India, but the materials used in brewing or fermenting it vary in different places. The Sorghum vulgare is occasionally used, and it is occasionally made more intoxicating by the addition of drugs.—Ainslie's Mat. Med. p. 263.

BOZDAR, a border tribe on the N.W. frontier of India, with about 2500 fighting men. They dwell west of the Derajat, in the hills opposite Mungrota, about 50 miles north of Dehra-Ghazi Khan. After a series of troublesome inroads on the plains, a force was sent against them in March 1857, through the Mahvi and Mungrota passes, and, after seeing their green crops destroyed, and seeing the Osterani, a small but warlike tribe, join the British, one morning the Bozdar chiefs rode into the British camp and sued for peace. They were received in solemn durbar; and for every man they had killed a suit of clothes was paid, and 60 rupees for every wounded man, this being the regular price of blood in the hills. A few months afterwards, they furnished a contingent to protect the frontier when the troops were sent to quell the mutiny of 1857. This Baluch tribe occupy the mountains and the low country, and have the following sections—Sehrani, Suwaram, Gulamanni, Jalalani, Chandini, and Shahani. From the Kusranee limits the hills of the Bozdar tribe extend along the British frontier for about 15. or 20 miles. The region is intersected by some nine passes leading into the plains, the chief of which is the Sungur pass, through which there is considerable traffic with Kandahar and the Pandjab. Opposite these hills lies the Sungur lowland (forming the upper portion of
shell bracelets is one of the indigenous arts of Bengal, in which the caste of Sankhri at Dacca excel. The charms of which they are made are large multivalve shells (Turbinella pyrum) from six to seven inches long, and of a pure white colour. They are imported into Calcutta from Rannial in Southern India, and from the Maldives Islands. At Dacca those shells are used for beetle fine muslins, but principally for making the large massive bracelets which are worn by Hindu women. They are sawn into semicircular pieces, and these are riveted and cemented to form the bracelets, some of which are elaborately carved, and inlaid with a composition of lac and a red pigment. A pair of bracelets of this description frequently costs as high as 80 rupees. Of the thick pieces of the shells, beads are made to form the necklaces, which the Bengal sepoyos wear.

Some Marwari women and the Binjara women have the entire fore arm from the wrist to the elbow covered with heavy massive bracelets, and the lower part of the legs covered with anklets. The bracelets of the Binjara women are of deerm horn. Amongst the Rajputs, the women adopt a brother by the gift of a bracelet. The intrinsic value of such a pledge is never looked to, nor is it requisite it should be costly, though it varies with the means and rank of the donor, and may be of flock silk and spangles, or gold chains and gems. The acceptance of the pledge and its return is by the Katchi, or corset, of simple silk or satin, or gold brocade, and pearls. Colonel Tod was the Rakhi band Bhai of the three queens of Udaipur, Boondi, and Kotah, besides Chundbai, the maiden sister of the Rana, as well as of many ladies of the chieftains of rank. Though the bracelet may be sent by maidens, it is only on occasions of urgent necessity or danger. The festival of the bracelet (Rakhi) is in spring. The adopted brother may hazard his life in his adopted sister's cause, and yet never receive a mite in reward, for he cannot even see the fair object who, as brother of her adoption, has constituted him her defender. - Tod's Travels in Rajashan. See Phychitus, Trans. xv. 4. 13.

BRACHYPODA, a class of molluscs, comprising the families Terebratulida, Spiriferida, Rhyonchelida, Orthida, Productida, Cramiidae, Discinidae, and Lingulidae. See Molluscan.

BRACHYCHITON DELABECHIEI, Australian bottle tree, trunk similar to a soda-water bottle. The natives refresh themselves with the mucilaginous sweet substance, and make nect of its fibre.

BRACHYPTERNUS AURANTIUS. Linnaeus, the orange coloured woodpecker of Ceylon. B. Ceylonus and B. rubescens also occur there.

BRACHYPTERUS SCANDENS. Benth. A creeper of Coromandel, Konkan, Travancore, Siam, Bengal, and Assam, with small pale rose fragrant flowers, well adapted for trellis work.

BRADDOCK, Lieutenant, a Madras officer, wrote on balances for delicate weighing in the Mad. Lit. Soc. Trans.; On the Assay of Silver; On the Induration of Channa; On Chemical Tests; On the Sculptures at the Seven Pagodas.

BRADLEY, Dr. W. H., a Bombay medical officer, who wrote a statistical memoir on Cirear Dowlatabad in Mad. Lit. Trans. xvi. p. 481; A Statistical Memoir on the Cir ear of Pytun, ibid.
BRAHMÁ.

Alpani, or As.

Recognise two polytheism, most school learned all posible, to the soon and Apama of ancestors (Hindoo of disciples.

Inanimate objects are woven and a shrub. B. tomentosa is intensely bitter, and used as medicine in Java.—Drury, Useful Plants.

BRAHMÁ, or Para Brahm, Sansk., the Supreme Being, is a name that first appears in Hindu religions books, in some of the best uplished, or appendages to the Vedas, of later date than the first three, and introducing a different and superior theology. It seems to have been a first effort towards the recognition of a Creator; and many Hindus of the present day recognise that the almighty, the infinite, the eternal, incomprehensible, self-existent being, he whose power is too infinite to be imagined, is Brahman, creator, preserver, and destroyer of the universe, from whom all souls come, and to him again return. While the learned Vedants thus acknowledge one God, they have confined their doctrines to their own school of philosophy, and have tacitly assented to, even taught in public, a religion in which the most discordant fictions have been erected, and have woven a mythology of the most extensive character. A philosophic few excepted, Hindus are worshipers of a superstitious and idolatrous polytheism, and Hindus erect no altars to Brahman (Hindoo Pantheon, p. 4). The Narayana of the present Hindus is rather the Spirit of God (Ins. of Menu, chap. i., v. 10), though the two Hindu sects claim for Vishnu and Siva the title of Narayana, and Brahma himself is sometimes called Narayana. At present there will not be found two Hindus who are exactly agreed, even amongst Brahmans, though almost all the educated of the people recognise one God under one name or another.

From time to time great reformers rise, condemning the prevailing Hindu idolatry, and so anxious are the people to know the truth, that every new teacher immediately gathers round him a number of disciples. But it is without the basis of a recognised revealed religion, and the zeal of the pupils soon calms down. In the meantime the bulk of the Hindu people are engaged in spirit-worship and hero-worship; in the worship of the names of ancestors; in the worship of plants and animals; of the inanimate objects of nature and of natural phenomena, of forms of men and women, and of shapeless blocks of stone and wood. Some forms of Hindu belief are systems of rationalism, others are systems of philosophy, and others are physiological doctrines, with emblems to illustrate views entertained as to cosmogony and production which take the place of religion. The human form in its natural state, or possessing the heads or limbs of various animals, the elements, rivers, fountains, stones, and trees, have been deified, and become objects of religious adoration. The sun, moon, and all the heavenly host; fire, earth, and all natural phenomena,—all nature, indeed,—the passions and emotions of human beings, their vises and virtues, are transformed into persons, and act appropriate parts in the history of man.

—Taylor; Moor, Hindoo Pantheon; Coleman; Wilson, See Upishashad.

BRAHMÁ, a word supposed by some to be from the Sanskrit 'vrith' or 'brdh,' to increase. Brahma occurs in a hymn of the Rig-Veda, and, according to Dr. Haug, this word originally meant the stirring of the sacrificial grass on the spot appointed for the immolation. One of the earliest meanings of the word, as used in the Veda, was 'food,' also riches. In the Rig-Veda, a more frequent meaning is sacrificial food. But in the same work Brahma is repeatedly used to express the song of the soma singers, a magic spell; and is applied to ceremonies having a song of praise as their characteristic. In the language of the Zendavesta, 'barseman,' an absolutely identical word, is found, which the Parsees interpret to mean a bundle of twigs tied together with grass, used in the fire-worship like the bundle of kusa grass used by the Brahmins in the soma sacrifices. In both worship the bundle is a symbol of 'growing,' 'increase,' or 'prosperity,' and the name of the symbol was transferred to the texts, hymns, sacrifices, and ceremonies used in the rites. As sacrifice among the Vedic Hindus, he was the chief means of obtaining all earthly and spiritual blessings, but was useless without the Brahma, i.e. success, the latter was at last regarded as the original causes of all being. The Imperial Gazetteer says Brahma means a prayer; and Brahman, a praying person.

Brahma, with Siva and Vishnu, form the triad of Hindu deities. There is nothing extant to show either that Brahma ever had much consideration shown him, or that his worship was overwhelmed by the intrusion of the Vaishnava and Saiva religions. Brahma in former times is said to have had temples the same as Siva and Vishnu, and to have been worshipped separately, but the followers of the two last are said to have entirely destroyed the temples and worship of Brahma. Brahma alone of the three is mentioned by Menn (Kennedy's Researches, p. 270). He seems to have had some sort of pre-relevance in ancient times, but there is no evidence that he was ever much worshipped. According to Colonel Tod, he has now but one temple in India (Tod's Rajastan, vi. p. 774); and though invoked in the daily ritual, his separate worship is almost entirely neglected. His Sakti or consort, Saraswati, has not fallen so completely out of notice. A figure of Brahma is shown in a temple at Gunli, three-faced, seated cross-legged on two hansa, with two female attendants, and to his right is Siva, three-faced, with Nandi below, and two females.

A Saiva legend, in the Tamil book Arumaza Arunam, is to the effect that Brahma and Vishnu endeavoured to overthrow the religion of Siva; that Vishnu abandoned the attempt, and Brahma was overpowered, and condemned to have neither temple nor worship for evermore. Also the Brahma-bord, in Brindapur, is a little square tank, supposed to be of natural excavation, and regarded as the sacred spot of Vishnu's triumph over Brahma. In Benares they make Vishnu worship Siva. In Brindaban they make Brahma worship Vishnu, to assert the superiority of sect over sect (Tr. of Hind. ii. p. 65). At the present
day, Brahma is worshipped or revered at Bittur on the Ganges (Oudh Census, p. 114). He is particularly revered at Pushkara, near Ajmir, as also at Bittur in the Doab, where, at the Brahmavarta ghat, he is said to have offered an Aswa Medha on completing the act of creation. The pin of his slipper is still worshipped there. On the full of the moon Agnayvarta (November and December) a mela or fair, a meeting that mixes piety with profit, is annually held at that place.—(Wilson.) There is no doubt that he is the least important, at the present day, of the Hindu deities, though termed the creator, or the ancestor of gods and men. He has been imagined to correspond with the Saturn of the Greeks and Latins. He is usually represented as a red or golden-coloured figure with four heads. He is said, by the Saiva sect, to have once possessed five; but as he would not accommodate the superi-

BRAHMACHARYA.

BRAHMACHARYA. SANSK. The state or period of pupilage of a Brahuman, Kshatriya, Vaisya, or Sudra youth, who is thus called a Brahmachari. It is also applied to men who are mendicants, but affect to be students. Mr. Sherring says this name is given to a sect of Brahman ascetics who wear red cloth and the rudraksha, let their hair and beard grow, and besmirch their bodies with ashes. They are worshippers of Siva. The Brahmacharis live as recluses apart from their families, and at death their bodies are burnt.—Sherring’s Tribes, p. 265.

BRAHMA DANDA PURANA, a religious book of the Hindus, the object of which is similar to that of the Skanda Siva Purana and Linga Purana, viz. to inculcate the worship of the lingam. See Lingam.

BRAHMADANDI. SANSK. Argemone Mexi-

BRAHMADICA, supposed by Hindus in their mythology to be the first created beings; but in their cosmogonies their origin and names are variously explained. It is said, in the Institutes of Menu (chap. i. 32), that the Almighty Power, having divided his own substance, became male and female, and from that female produced Viraj. Viraj produced the first Menu, named Swayambhu; he, the ten Brahmical or Purvajaputra, whom he calls the ten lords of created beings, also the sons of Brahma. They produced seven other Menu, whose names were Swayambhuta, Swarochohsa, Utamsa, Tamasa, Rivata, Chac-

BRAHMAN.

Atri, Vasishtha, Palashta, Anirv, Palashta, and Kritu. Colonel Wilford, in the Asiatic Researches, has considered the Brahmacica, the Menu, and the Rishi to be seven individuals only. The names of some of the Brahmacica correspond with those of some of the Rishi.—Cole. Myth. Hind. p. 8. In an account of Viraj, translated by Mr. Colebrooke from the White Yajur Veda, it is said He (the primal being) felt no delight; therefore man delights not when alone. He caused his own self to fall in twain, and thus became a husband and wife, and the human race was produced; and, changing their forms, all created beings appeared. Another account makes Rudra assist in the theogony. Brahma said, ‘Risa up, O Rudra, and form man to govern the world.’ Rudra immediately obeyed. He began the work, but the men he made were ferocious tigers, having nothing but the destructive quality in their composition, and they soon destroyed one another, for anger was their only passion. Brahma, Vishnu, and Rudra then joined their different powers, and created ten men, whose names were Narelda, Daksha, Vasishtha, Birigum, Kritu, Pulaha, Pulastya, Angirsa, Atri, and Marichi (that is, Reason, Ingenuity, Emu-

BRAHMAN.

BRAHMAN: roadside or temple of Brahma. In the Buddhism of Ceylon, it is the highest of the celestial worlds, sixteen in number.—Hardy, p. 434.

BRAHMAN. This is written Brahmanna, but the final a is dropped in conversation. It is the designation of the highest of the Hindu castes, whom it is usual to call the priestly class. Their duties, according to Menu, are—(1) Performances of holy sacrifices; (2) assisting at the performance of such by others; (3) reading the Vedas; (4) teaching the Vedas; (5) making gifts; (6) ac-

BRAHMA-LOKA. SANSK. The abode or heaven of Brahma. In the Buddhism of Ceylon, it is the highest of the celestial worlds, sixteen in number.
trading occupations, being restricted, however, as to the articles in which they might trade. But now-a-days Brahmans employed in mercantile functions are considered to be in a degraded position. The author of the Gita says, 'The prescribed duties of the Brahmans are peace, self-restraint, zeal, purity, patience, rectitude, wisdom, learning, and theology' (Gita, p. 130). The word Brahman, according to Weber, means drawing forth, as well in a physical sense 'producing,' 'creating,' as in a spiritual sense 'lifting up,' 'elevating,' 'strengthening' (Weber).

The Mahā-Brāhmaṇa of Hindustan, who performs usual ceremonies, is deemed so unclean that other Brahmans will not touch him. Gunga-putra or Ghat Brahman is a byword; and the Pānda or temple priests, the Bara Brahman who conduct the worship of the lower castes, the Gyawal and Prayagwal who rule over the ceremonies connected with pilgrimages to Gya and Allahabad, the Ojhas exercising the vocation of wizards, the Dayabagya, the Ganak, and the Jaudi Brahmans who cast horoscopes and predict events, are all looked upon by other Brahmans as lower classes. Menu writes in high-flown terms (Instit. chaps. ii. iii. vii. viii. ix.) of the sacred character of the Brahman learned in the Vedas, but comments with an equal severity on the unlearned of this class.

There are ten great divisions of Brahmans, viz., Gaur, the Kanya-Kubhya, Saraswat, Gaur, Maithala, and Uzbek; and five Dravidian, viz., Dravida, Telinga, Karnata, Maharashtra, and Gurjara. These have many subdivisions. The Gaur tribe, for instance, has 56 branches; the Kanouja are divided into Sarwaria, Sanaudha, Jijhotia, and Bhnihar, and these again have subdivisions. Some of the subdivisions' names are taken from the district to which they originally belonged, others are named from their sects, or literary acquisitions. The Chaturji of Benga! are so named from their acquaintance with the four Vedas, Chaturpadya. The Chuckerbutty of Bengal are the Chakravarti, meaning a prince or ruler. Smarta is the name of a religious sect of Brahmans founded by Sankaracharya, whose expositions of the principle of unity, according to the Vedanta doctrine, they professedly follow. Siva is held by them in especial honour.

Brahmans are also recognized as three classes, viz., Loukik or secular; Vaidik or theologian; and Bhikuk, whose sole means of support is the alms obtained by begging.

The Brahman as a distinct class seems to be first mentioned in the Atharva Veda, the oldest of the Vedas. They were known before the great war between the Kaurava and Pandava, but were seemingly in humble positions. Arjuna disguised himself as a Brahman when he competed at the Swayanvara of Draupadi, and won her, as he hit the golden fish with his arrow after all the rajas had failed. Draupadi became the wife of the five Pana brothers.

The great bulk of the Brahmans of India are admirably of Aryan origin,—tall, robust men, and light yellow in colour. In the Tamil and Telugu countries of Southern India, the recognised Brahmans are all undoubtedly of the same stock. Some of them can converse in Sanskrit, although they use the vernacular language of the district in which they reside, and are styled Dravida, Kerala, and Karnatika, etc., with reference to the language of their district. Brahmanical tribes are as much separated as are other castes. Some of them may eat together, but they do not intermarry; and the first approach at union is seemingly to be with the Konkan, Maharata, and Gujarat Brahmans, amongst whom the influence of European knowledge has had more effect than upon any of all the other races in India. Good seed has fallen there on a good soil; and from a body of mendicants, these have become active, powerful, and useful men.

There are Brahmans in the hills north of the Panjab, in the extreme N.W. of India, occupying both the valley of Kashmir and the hills immediately to the west and south of it. Kashmir itself is a Brahman country,—all its people, though long since converted to Mahomedanism, having been of the Brahmanical race. The educated class there, who maintained their own tenets and are still very numerous, are known as pandits, and form quite an aristocracy. They are all educated, are exceedingly clever, and are an excessive and somewhat oppressive bureaucracy, which has ruled Kashmir under every successive government, and has sent out colonies to seek their livelihood in Northern India. The features of the Kashmiri Brahmans proclaim them to be one of the highest and purest races in the world. They are of quite high Aryan type, very fair, with a handsome, well-chiselled figure, with a hand as vigorous as strong. In many the nose is high and slightly aquiline, but not Jewish; but in others the nose is straight. Their brow is a little more raised and their nose more arched than in the Greek statues. The ordinary Kash-miri has a strong athletic figure, but none of them are martial; and the Brahmans in these respects correspond,—they rule by the brain and pen. They have a greater refinement and regularity of feature than the Afghans and others of a rougher type, with, however, a less manly-looking physique, a colour less ruddy, and more induced to a somewhat sallow fairness. The Kashmiri Brahmans eat meat, and are excluded by the Indian Brahmans alike from the five Gaur and from the five Dravid, and form a separate Brahmanical class, being more secular than the priestly Brahmans of Hindustan and the Dekhan, than whom they are altogether looser in their observances.

Kashmiri pandits are known all over N. India as a very clever and enterprising class of office-seekers; as a body, they excel in acuteness the same number of any other race with whom they come in contact. Almost all the secular pandits use the Persian character freely. They are perfectly versatile, and, serving abroad, will mount a horse, gird on a sword, and assume at a push a semi-military air.

The lower classes of Kashmir have long since been converted to Mahomedanism, but they seem to be ethnologically identical with the Brahmans; and tradition asserts that they are of the same race.—Campbell. The Brahmans of Kashmir are regarded by those of Bengal as of an inferior order, and the agricultural Brahmans on the Saraswat banks are similarly regarded. Brahmans are numerous in Kamaon and Garhwal, where education is more advanced and the Nagri character used. People of Brahmanical origin, approximating to the Panjabi, but in language, habits, manners, and dress quite different from the Kashmiri, dwell in the hills between Kashmir and
the Panjab, but they have abandoned the Hindu religion, and are now partly Sikhs and in part Mahomedans. Their language is a dialect of the Panjabi. They are good soldiers. Mr. Campbell thinks that the Brahmans of the frontier hills are even handsomer than the Kashmiri, the people in general of these hills being the handsomest of the human race. The Brahman hills are of Brahmanical origin, but now profess Mahometanism. On the eastern side of the Jhelum the hills are shared with other races by a numerous tribe of Sikhs, converts from Brahmanism. Their Brahman ancestors became converts to the Sikh religion before it became a political power, and entirely threw off their Hindism. They are very useful soldiers and servants. There are some Brahmans at the foot of the N.W. Himalaya. They are not found beyond the Indus, but are pretty numerous in part of the Rawal Pindi district. South of the Salt Range, in the plains, the Rajput and Jat occupy the country. But there are villages of agricultural Brahmans in the fertile plains under the hills in the districts of Sealkote, Goordaspur, and in the valleys of the broken country between Hushearpur and Kangra, and in parts of the Umballa district and the adjoining Sinha hills. They are not numerous near the source of the Saraswati; but lower down its course, in the somewhat desolate countries of Marwar and Jeyulsamir, where the lands are moist, the Brahams are still numerous, and are good cultivators, and claim to have occupied the country before the Jats and Rajputs became dominant.

In Central India, the town of PalI seems to be a Brahmanical centre. The Marwari or Saraswati Brahmas form a considerable portion of the most industrious of the cultivators in Malwa. The Saraswati Brahmas seem to have kept much to the tenets of their forefathers. They are called in the south, Kashastale Brahmas. The oldest of the Brahmanical race are the people of the upper hills in the western Himalayas, who date from a time anterior to Hindism. The Kashmiri were a civilised and literary Brahmanical people, not yet fully Hindu. The Saraswati Brahmas were the earliest, most simple, and pure Hindus of Vedic faith; and those of the Ganges and the rest of India are in various phases of modern Hindism. There are ten classes of Saraswati Brahmas, who are supposed to come from the N.W. of India.

In the Panjab, Sindh, and countries about the Saraswati, having been superseded by other races, there are few Brahmas, except in the eastern part of those tracts, where they are industrious cultivators, and claim to be the ancient occupants of the country.

Hindustan.—The main country of the Brahmas is that part of Hindustan lying between the Vindhya on the one side, and the Himalaya on the north, from the longitude of Kanouj and Lucknow near the frontiers of Bengal, with a large segment of more especially Rajput country cut out of the centre of this tract. The Brahmas of Hindustan are generally good-sized, and, on the whole, well-looking men, with good features, not particularly fair. They are not of the high Arya type. The greater number are quite illiterate. The priests and pandits have never adopted the Persian writing character. They are not very clever, have little social position, but serve humbly as soldiers and servants about courts and jails.

From the Gulcheter down to Delhi, and in the country about Delhi, there are Brahman villages, quite industrious and intelligent, the women working as well as the men; but Brahmas do not form a large proportion of the agricultural population. They were kind to and protected fugitives during the mutiny. Some of the less pure agricultural Brahmas of these parts are called Tuga or Gaur Tuga. All the Delhi country is occupied by Gaur Brahmas. South of Delhi the country of these Brahmas is very extensive; and in the Saharump districts there are a good many Brahmas following secular pursuits, besides the priests of Hardwar.

About Benares and the greater part of Behar are a numerous class of Brahmas called Brahman or Bhawan, or, according to Sir H. Elliot, Bhoonhar, to which the raja of Benares and all the great landholders of Behar belong.

Brahmas are many in the Banda district, and numerous in Bagheleund or Rewah, and there they condescend to yet, menial vocations, and groomed most of the horses on the Jubbulpur road. In the proper Brahman country, some of them affect the Rajput prejudice against actually holding the plough, though performing every other agricultural labour, and take the names of Dobi, Tewari, and Chaubli, i.e. men with a knowledge of three, and four Vedas, and are considered to be of very high caste. Between the Ganges and the Gogra, as we recede from the Ganges, the population becomes more Rajput than Brahman, but there are many Brahmas about Ajodiah, the old Oudh. Beyond the Gogra is a numerous Brahman population, humble, not soldiers. Thence to the north of the Gogra and Ganges, all the way to Tihut, there are many Brahmas. South of the Gogra, and thence across the Ganges into the Arrah district (Bojpur), runs the Rajput dominions.

The Toga Gaur Brahmas seem to be identical with the Bhuinhar, and the Bengali Tagores (properly Thakur) may be an offshoot from them. Like the Bhuinhar, the regular Brahmas repudiate all connection with them; and Mr. Beames even says there seems no reason for supposing them to be anything but low Aryans.

Bengal.—The Brahmas of Bengal are numerous. They claim for themselves a northern origin, but they differ much from the Hindustan Brahmas in language, dress, and habits. They are fairer and larger than the mass of the Bengali population, and some are fine-looking men in size and feature. They are largely employed as clerks and accountants, in learned professions, merchants and bankers, sharing the scriptory work with Kayasthas. They are acute and intellectually capable, but not energetic. In Bengal about nine per cent. of the Hindu prisoners in jails are Brahmas. They will not put their hands to the plough, are aristocratic, but altogether unwarlike and effeminate, and in mercantile business are not equal to the Marwari. They are not numerous in Eastern Bengal. There are many in Orissa and in the Urya portion of the Ganjam district. Many of the Urya Brahmas are cultivators and traders, and are stated to be also brickmakers and bricklayers.
In Gujarat, the Brahmans are numerous, and are employed in public offices and in trade. In the Peninsula, the Brahmans are numerous from Damna to Goa, and from Bombay to Nagpur and the Wain Ganga, that is, all through the Maharrata country. They principally trace their got or clan from Kasyapa, the first Rishi. There are two classes intermixing here,—the Konkani Brahman and the Maharrata Brahman. Maharrata Brahmans are a highly intellectual race, and have been distinguished as accountants and clerks. Some of them, as Peshwas, put aside the descendants of Sivaji, ruled over the greater part of India, and took the command of Maharrata armies. The Maharrata or Deshasth Brahmans are dark, swarthy men, much shorter than the Konkani Brahman, often squat, with large, coarse features, large lips, and becoming in advancing life unwieldy. The men are not good-looking, and the women are decidedly plain. The men are largely engaged in public offices as accountants and clerks. They are stolid men, inactive, and of sedentary habits, with literary tastes, and may be justly proud of their poets.

The Konkans or Konkanistha Brahmans belong to that small strip of land lying between the Syadhri mountains and the Indian Ocean. They are all fair men, not large, but with lithe and agile frames, and decidedly of Aryan descent. They are good-looking, though in this respect inferior to the Afghan and Rajput races; and their women are fair and have pleasing countenances, with good figures, but even by their own relations are not considered to be equal to other of the women of India, amongst whom the fair Jewesses of Western India may be quoted. The race were agricultural until the British became supreme. The men are ready to move abroad in search of employment, and are met with amongst the Maharrata nation, throughout Berar, and are largely employed in the various public offices as accountants, clerks, in the educational department, and in mercantile houses. They are not military nor agricultural, nor do they engage in trade. The Konkan Brahman has a pleasant expression, is easily moved to laughter, much enjoys a joke, and is of an active turn of mind. They are easily distinguishable by the peculiarly large turbans which they wear.

Konkani and Maharrata Brahmans eat together, but do not intermarry. They do not marry in their own tribe or got; but the Maharrata Brahman will marry his mother's sister's daughter, and the Konkani Brahman will not marry a relative unless very remotely related.

The Maharrata or Deshasth Brahman is a reserved man, little inclined to seek friendships, and rarely seen to laugh. They at one time filled almost every office under the Peshwa and under the British, and even in Madras till the middle of the 19th century the revenue accounts were kept in Maharrati by these Brahmans; and in their own states were zamindars, or holders of land, and despahundi, and almost all the village accountants were Deshasth Brahmans. Both these castes have to compete for employment with the writers known as Purshu (Prahbu), of which there are two classes, the Patri Purshu and the Kayasth Purshu.

Mysore.—Mr. (Sir George) Campbell mentions (pp. 74, 130) that in the N. Canara district, in the high lilly country above and about the ghat, and on the adjoining parts of Mysore, there is a large population of Brahmans, industrious and thriving cultivators and landowners. Most of these are called Haiga Brahman, and the culture of the betel-nut is their especial pursuit. They are very fair, with large eyes and aquiline noses. In the Nagar district of Mysore they are very numerous, not very literary or highly educated, but devoted to agriculture.

In South Canara and the Tulwa country are many Brahmans, who do much cultivation; and all down the west coast to the extreme south of India, the country is said to have been extensively colonized by Brahmans led from Calpee by Parasrama.

In the festival of Bhaubij, on the 2d day of the month Kartik, the wives of all Brahmans, whether of the Saiva or Vaishnava sects, worship their husbands, standing before them, sacrificing with the lamp and ghi, and pouring rice over their heads.

Canarese-speaking countries the Brahmans are largely employed as accountants and office clerks. They are much disliked by the Vira-Saiva lingasets. A village of lingasets near Kadigi abstained from digging a well in their village, to avoid attracting Brahmans amongst them.

Among the population of Southern India, out of a total population of about 32 millions, over one million belong to the Brahman caste,—547,027 males and 548,418 females. In 1871, of the 547,027 male Brahmans in the Madras Presidency, 352,934 were occupied as follows:—

Definite and Unproductive, Property, Unproductive, 15,925; Others, 5,884; Total, 352,934;
Over 24 per cent. are agriculturists, and over 11 per cent. are classed as deriving income from property. In the southern districts, especially, a large proportion of the Brahmans are agriculturists. In Tinnevelly over 40 per cent. of them come under this head. But as a rule these Brahmans do not work with their own hands in agricultural pursuits, and employ labourers to till the ground. In the northern districts and Tanjore the Brahman landowners figure chiefly as owners of land, and are relieved from other income from property.

Avocations and Castes.—Among the earliest functions of the Indian priestly tribe was that of Purushottam, or house-priest attached to a princely household. But their character and avocations have altered with changing circumstances. The descriptions in the Vedas show us a primitive race of shepherds and husbandmen praying to the gods for the safety of their flocks and crops, but as the Arians came into India they seem to have risen above manual labour; and Menu (iii. 165, iv. 5) even denounces agriculture as absolutely degrading. There are, however, in Orissa numerous Brahmans who cultivate vegetables, but they are stigmatized as yan-growers, also lokik or worldly Brahman; also brickmakers and bricklayers. In the Himalaya, in Chamba and near Dahlounies, they are shepherds. In Kangra, the Doab, and Benares, Brahmans guide the plough. In Central India there are peasant Brahmans; and in Southern India Brahmans are to be seen as betel-leaf growers and fishermen; while throughout the Tamil and Telugu countries they are to be found as blacksmiths and goldsmiths, who wear the sacred thread, and refuse precedence to the recognised Brahman; and in Ceylon the descendants of an imported race, the Goi Banamo, are cultivators.

Almost every Indian province contains two or more distinct classes of Brahman, descendants of different immigrations. The Chamba Brahman shepherds are a fierce, stalwart race, very fair, and their women singularly handsome. In the Simla hills the Brahman population consists indiscriminately of shepherds, husbandmen, day-labourers, cooks, and menials. In the inner hills they marry the widows of their elder brothers, like the lower castes of Orissa, and sell their daughters into a slavery faintly disguised by the name of concubinage. The Patidra Brahman engage as day-labourers and are palanquin-bearers. Bishnvi cultivators and graziers are numerous in Dhat; Somnun Chore and in Omerkoti; Dharnas, and Merti.

In Benares and the districts along the Ganges to the southward, a large peasant population claim the title of Brahman; and their claim was recognised by the native governments exempting them from capital punishment. The Buinhar or Brahman of Behar, a peasant Brahman, number three-fourths of the whole Brahman population of the Bhagulpur district. They resemble the ordinary husbandmen.

There have been at times large manufactures of Brahmans by rulers. Some princes have imported Brahmans from distant localities, and other princes have raised lower castes to the dignity of Brahman. Jeypore has a class of ploughing Brahman, as regards whom a tradition relates that a warlike prince required a vast concourse of priests to give dignity to his sacrifice, and accordingly created five tribes of Brahmans out of the surrounding populations. They migrated into Oudh, where also is one of the Brahmanical families, who derive their origin from a prince whose self-importance would not allow him to offer sacrifice until he had 125,000 priests in attendance, and who accordingly invested the common people of the country with the sacred thread. In Behar the mass of the peasant Brahman attribute their origin to a manufacture of a hundred thousand priests in prehistoric times. In Mahabharata Parashurama made the whole fisherman population into Brahman. They claim a very exalted rank. The Konkan Brahman also are descendants of a fisher race; and this day the casting of a net and the catching of a fish form part of their wedding ceremonial.

Adilur, the founder of the Sen dynasty, brought from Kanonji five Sangu Brahman of the tribes or gotra, Sambhala, Kasbyapa, Vatsa, Savarna, and Bharudwaja. Several Sudra families, Ghose, Bhose, Dutt, Guha, Mittra, etc., accompanied them, and these take the position of Kulin Kayasthas. In the reign of Bullal Sen, about 284 years before the Mahomedan invasion, all these Kulin Brahman and Kulin Sudras had greatly increased, and, though degenerated in learning, they arrogated to themselves a position above all the Sapta-sala or aboriginal Brahman; and Bullal Sen ennobled those Brahman by giving to them the title of Kulin. The Kulin Brahman subsequently consented to marry the daughters of the aboriginal Brahman, who eagerly seek alliances with the Kulin; and the Kulin have taken advantage of this, and have established a scale of fees for conceding to accept a daughter of an inferior. They marry gold. Of the Kayasthas who came from Kanonji, Bhose, Ghose, and Mittra were ennobled by Bullal Singh into Kulin Kayasthas, and are still in Bengal. The Dass, Dutt, Dutt, Guha, Kar, Paulit, Sen, and Sing hold a second rank.

Kulin Brahman women are married with difficulty, and generally to aged men. In 1868 there were 11 Kulin men in Hoogly and 1 in Bardwan, each of whom had contracted 50 to 80 marriages; 24 in Hoogly and 12 in Bardwan, who had contracted from 20 to 50 marriages; and 48 in Hoogly and 20 in Bardwan, who had contracted between 10 and 20 marriages. Kulinism is thus a great polygamic institution, and a few Kulin women have become prostitutes. In 1867 the abolition of this polygamy was contemplated, and will doubtless soon be carried out (Cal. Rev. May 1868).

Agnivatra Brahman are the remnant of the worshippers of Agni, who still preserve the family fire, but in other respects conform to some mode of popular Hindu devotion. According to prescribed rule, where a perpetual flame is maintained, it is used to light the fire round which the bride and bridgroom step at the marriage ceremony, and the funeral pile of either; but the household fire is preserved only by this particular sect, the Agni-vatra, and the great body of the people have nothing of the kind. In this case they distinguish between the sources whence they obtain the kindling flame according to the purposes of its application, and the fire of the marriage rite is taken from the hearth of a respectable person, except for the funeral pile any unpolluted fire may be used. It is only necessary to avoid taking it from
BRAHMAN.

another pie, or from the abode of an outcast, of a man belonging to the tribe of exegetists, of a woman who has lately borne a child, or of any person who is unclean.

The Agnivada was a supposed Scythic race, whom the Brahmanas, in order to oppose the Buddhists, formed into a religious confederacy.

Aradhy Bhrahmans profess the Jangam creed, but adhere to their caste views. They are chiefly in the Canarese country. In other sects of Hindus, the Brahmanas uniformly take precedence of other castes; but among the Jangam or Vira-Saiva he is degraded beneath all others. Hence there is a perpetual feud between the Aradhy Brahman and the Jangams, who (unless at funerals, where all are bound to assist) treat these Brahmanas with contempt (Brown on the Creed and Customs and Literature of the Jangams. p. 8).

The emigration of the Brahmanas to peninsular India appears to have been subsequent to the first great change in their religious system. The religion they introduced was probably a rudimental form of Saivaism, with a tendency to the mystical and mythological system of the Puranas. There is not the least reason to suppose that the Vedic or elementary system was ever known in the Tamil country, either as an indigenous religion or as introduced by the Brahmanas.

The Brahmanas deeply impressed Alexander by their learning and austerities. One of them, Kalanos by name, was tempted, notwithstanding the reproaches of his brethren, to enter the service of the conqueror. But, falling sick in Persia, Kalanos determined to put an end to his life. Along with the pardon of his philosopher's resolve, vainly tried to persuade him; then loaded him with jewels, and directed that he should be attended with all honours to the last scene. Distributing the costly gifts of his master as he advanced, wearing a garland of flowers, and singing hymns, the Brahman mounted a funeral pyre, and perished in the flames.

The Brahmanas of the present day are a race of the highest culture, the result of 3000 years of hereditary education and self-restraint, and they have evolved a type of mankind quite distinct from the surrounding population. Even the passing traveller in India marks them out alike from the bronze-cheeked, large-limbed, leisure-loving Rajput or warrior caste of Aryan descent, and from the dark-skinned, flat-nosed, thick-lipped, low castes of non-Aryan origin, with their short bodies and bullet heads. The bulk of the Brahmanas stand apart from both, tall and slim, with finely-modelled lips and nose, fair complexion, high forehead, and slightly coconant-shaped skull,—the man of self-centred refinement. He is an example of a class becoming the ruling power in a country, not by force of arms, but by the vigour of hereditary culture and temperament. One race has swept across India after another; dynasties have risen and fallen; religions have spread themselves over the land, and disappeared. But since the dawn of history, the Brahman has calmly ruled, swaying the minds and receiving the homage of the people, and accepted by foreign nations as the highest type of Indian mankind (Imp. Gaz. vol iv.).

Brahmanism is the ordinary designation of the Hindoo religion at present prevailing. It is accommodating to anything that partakes of idol-worship; similarly as a Roman would worship Isis and Osiris, so a Hindoo makes offerings to apotheosised Mahomedans, such as Shaikh Sadu, Ghazi Mian, and Shaikh Madar in Northern India; and throughout all India there are multitudes of figures of local divinities who have been admitted into the Hindoo Pantheon as avatars of Vishnu or Siva, the chief gods of the modern Hindoos. The Vaishnava doctrine raises Vishnu to the highest place, and adores his different avatars, together with a multitude of other deities, powers of nature, and mythical persons. The Siva doctrine places Siva highest in the rank of the gods. The professors of this doctrine number many millions more than the professors of Vishnusm. Although Siva is the god of destruction, he is also the god of reproduction. As regarded with respect to the idea, which ever pervades the doctrine of Brahman, namely, that death is but the recommencement of a new life, Vedantism, so named after the Vedanta of Vyasa, has few adherents, consisting of some philosophical Brahmanas. Of the thousands of temples in India consecrated to various deities, only one, it is said, is consecrated to this doctrine, in which Brahman is worshipped alone.

Various ceremonies are attendant upon Hindu boys between infancy and the age of eight years. After that age, and before a Brahman lad is fifteen, it is imperative upon him to receive the poita, yadvapavita, zonar, janavi, or jhandian, the sacred thread, which the Brahmanas in their secret ceremonies call Yadvapavita. In the investiture, the priest offers a burn sacrifice, and worships Rama, repeating, several times, the vedic prayers. The boy's white garments are then taken off, and he is dressed in yellow or red, and a cloth is brought over his head, that no Sudra may see his face; after which he takes in his right hand a branch of the vilva, Agle marmelos, and a piece of cloth in the form of a pocket, and places the branch on his shoulder, with shoes on feet and umbrella in hand. A poita of three threads, made of the fibres of the surn, to which a piece of deer's skin is fastened, is suspended from the boy's left shoulder, falling under his right arm, during the reading of the incantations or invocations. The father of the boy then repeats certain formulas, and in a low voice pronounces three times, the Gaitri, O'm! Bhrurhuva sauvah, O'm! Tasa vih varamyam, D'haro deva ya dhimani dihiyo yonah praho dayath. O'm! earth, air, and heaven, O'm! 'Let us meditate on the adorable light of the divine Sun (Savitri), may it guide our intellects.' After this prayer the sura poita is taken off, and the real poita, or sacred thread, put on. The receiving of the poita is considered as the second birth of a Hindoo, who is from that time denominated 'dwija' or twice-born. A Brahman boy cannot be married till he has received the poita.

The sacred thread must be made by a religious Brahman. It consists of three strings, each ninety-six saha (forty-eight yards), which are twisted together; it is then folded into three, and again twisted; these a second time folded into the same number, and tied at each end in knots. It is worn over the left shoulder (next the skin, extending half-way down the right thigh) by the Brahman, Kshatriya, and Vaisyia castes. The first are usually invested with it at eight years of age, the second at eleven, and the Vaisyia at twelve.
The Brahman.

The period may, from special causes, be deferred; but it is indispensable that it should be received, or the parties resisting it become outcastes. An individual is not fully a member of this class until he has assumed this emblem. It is like the Roman lad's assumption of the toga virilis.

A Kulim Brahman can marry as many wives as he likes; but there are certain Brahmans in Bengal who find the greatest difficulty in getting married to even one wife. These are the Bangshaja Brahmans of the Shrotiroya class. While a Kulim Brahman gets for every wife that he marries a handsome bride, a Bangshaja Shrotiroya Brahman has to pay down a large sum of money to the father of the girl that he seeks to obtain. The consequence is that, owing to their poverty, numbers of Bangshaja Shrotiroya Brahman never get married at all. To remedy this evil, in Eastern Bengal, when in any village the number of unmarried Shrotiroya becomes inconveniently large, one of the ghatak of the place—those under-servants of Bidhata who take a prominent part in all marriages—goes to Shrihatta in Sylhet. There, with the assistance of his agents in the district, and by means whether fair or foul, he procures a number of girls, to whom he holds out the prospect of a pleasant settlement in life. The girls may not all be Brahman girls, some of them may be of the Chandal caste, and others may be young widows; but whatever may be their caste, character, and antecedents, they are huddled together in a boat, often fifteen or sixteen in number, and taken to the ghat of the Shrotiroya village.

The faces of the old Shrotiroya bachelors become lighted up with joy, when they hear of the arrival of the barge-boat. The agnates which these highly-favoured boats create in Eastern Bengal, is infinitely greater than that produced in Calcutta by the orange-boats of Sylhet, or the mango boats of Malda. The Bangshaja bachelors besiege the boat in numbers. Each one selects a girl according to his taste, a bargain is struck with the ghatak, and the celebration of the rites of marriage, according to the forms prescribed in the Shastras, soon follows. The plain-looking girl, for whom no Shrotiroya may have a fancy, is employed as a maid-servant either of the ghatak himself, or of any other who may stand in need of her services.

The influence on India of the Brahman races has been great. They developed a noble language and literature. They were the priests and the philosophers of their race; also the lawgivers, administrators, men of science, and poets. They have brought together the backward races into the religious and political organization of Hinduism. They wrote the Vedas, Brahmanas, Sutras, and Upanishads, meaning the science of God and his identity with the soul; the Aranyakas, or tracts for the forest recluses; and the more recent Puranas, or traditions. The six Darasana, or schools of philosophy—Sankhya, Yoga, (3, 4) Vedanta, (5) Nyaya, and (6) Vaisheshika—originated from them. They treated philosophy as a branch of religion. They had also a circle of the sciences, the Science of Language. Panini, B.C. 350, was the founder of Sanskrit Grammar. Under every dynasty and government in India, Brahmans have held the highest executive offices alike in the civil executive and in the political administration of the country, for, until the middle of the nineteenth century, all learning and science centered in them. The introduction into India, by the British, of the western forms of education, and the system of grants-in-aid to schools, however, have permitted, particularly in the south of India, all the Sudra and Vaisyas races to compete with the Brahman, who are being largely displaced from their former exclusive position, though they are still a great power in the state.

There is no being more aristocratic in his ideas than the secular Brahman or priest, who deems the bare name a passport to respect. The Kulim Brahman of Bengal poxes himself upon his title of nobility, granted by the last Hindu king of Kanouj (whence they migrated to Bengal), and his virility and majesty is courted. But although Menu has imposed obligations towards the Brahman little short of adoration, these are limited by him to the learned in the Vedas; he classifies an unlearned Brahman with an elephant made of wood, or an antelope of leather, nullities save in name.

Owing to the segregation which all the Hindu races practise, Brahmans have never formed a compact body, and their influence and power have been local. Learned Brahmanas are much respected. At festivals, weddings, and feasts for the dead, they are invited to the houses of the wealthy, are feasted, treated with honour, and on their departure receive gifts of value, dresses, gold and silver vessels, ornaments of numerous kinds, food, and also money. A man of learning often takes one or more of his scholars to such assemblies, both to enhance his own reputation and to accustom them to respect his position in society; and the students also obtain a share of the presents. From gifts of this kind the larger number both of teachers and students in the Hindu schools of learning are supported, their food procured, and their house accommodation provided. Tolas, or native colleges of this kind, are scattered all over the province of Bengal, and one or more may be found in all the great villages. The Zillah of Bardwan, for example, though not particularly celebrated for learning, contained, a few years ago, 190 Sanskrit schools and 1350 students. Some places are more celebrated as seats of learning than others. In North India, for instance, Nuddea, Santipur, Tirihat, and above all Benares, contain a large number of colleges. In South India they are chiefly found in the provinces of Tanjore and Madura. These schools are divided into three classes—those wherein general literature is studied, the schools of law, and those of philosophy.

In the first the subject-matter of study embraces grammar, lexicology, poetical works, and rhetoric. According to Bunsen, Brahmanas have systematically adulterated and adjusted the early history of India (iii. 513). Brahmanas were acquainted with the Tahmi; and Sir W. Jones thought that Genesis ii. 21, 23 is referred to in the form of Siva and Parvati, known as Art'hasvati, of which the right hand half is Siva and on the left hand Parvati.—Brown on the Jangnus; Bunsen's Egypt, iii. 513; Chose-Chose, p. 44; Mullen's Hindu Philosophy, pp. 10, 11; Coleman's Mythology, p. 154; Calcutta Review, May 1868; Tod's Rajastan, i. p. 512; Taylor, Maclear's MSS. BRAHMANA.

Pantheon; Weber's Indian Literature; Wilson's Glossary.

BRAHMANA, Sanskrit prose works, of later date than the Vedas; the oldest is the Aitareya, which has much historical information. The several Brahmana are chiefly liturgical, ritualistic, and legendary, and, in the various Upanishad, passing into the rationalized state, and becoming metaphysical and mystical. Their professed objects are to teach the sacrifice; they appeal continually to earlier authorities, and evolve their dogmas under the guise of free Mimmsā discourse. They are the work of several individuals, and Professor Müller limits their age to the two centuries from B.C. 800 to 600, if not prior thereto. Each of the Sanhitas or collection of hymns has its Brahmana, and these generally maintain the essential character of the Veda to which they belong. The Rig-Veda has the Aitareya Brahmana, also the Kaushitaki or Sanbhayan; the Sajur-Vedas, in its Taetiirya Sanhita, has the Taetiirya Brahmana; and its Vajasaneyi Sanhita has the Satapatha Brahmana. The Sana Veda has eight Brahmanas, and the Atharva one.—Weber; Müller; Dowson.

BRAHMANABAD, a ruined city in the Hyder-abad district in Sind, supposed to have been destroyed by an earthquake; and recent excavations show whole households overwhelmed together, men and women at their work, and cattle in their stalls. Sculptures, engraved gems, carved ivory, earthenware and coloured glass, have been found. Tradition says it was destroyed in the seventh century by the gods, in punishment for king Doloras' iniquities.—Insp. Gaz.

BRAHMANA WANSE, a race in Ceylon who take a high place amongst the Hindu races of the island.

BRAHMANA, in Hinduism, the mundane egg created by Brahma; also the visible sky, which is supposed to be the shell of this egg.

BRAHMANI, a name of Saraswati as goddess of learning; also any Brahman woman.

BRAHMANICAL CAVES. See Architecture. BRAHMANICIDE, the sin of killing a Brahman.

BRAHMANISM. Early writers on the religions of India, who drew their information exclusively from Sanskrit and Brahmanical sources, amongst whom was Klaproth, inclined to favour the pre-tensions of Brahmānism as more ancient than Buddhism; but in later times the translations of the Pali records and other sacred volumes of Buddhism in Western India, Ceylon, Burma, and Nepal, have inclined the preponderance of opinion in favour of at least a contemporaneous development. A summary of the arguments in favour of the superior antiquity of Buddhism is to be found in the notes, etc., by Colonel Sykes, in the twelfth volume of the Asiatic Journal, and in the Essaï sur l'Origine des Principaux Peuples Anciens, par F. L. M. Maupied, chap. viii. The Rev. Mr. Gogerly says the sacred Buddhist books in Ceylon expressly demonstrate that its doctrines had been preached by the twenty-four Buddhhas who had lived in succession prior to Gautama or Sakya, in periods incredibly remote, but that they had entirely disappeared at the time of Gautama's birth, so that he re-discovered the whole, and revived an extinguished or nearly extinct school of philosophy. (Notes on Buddhism by the Rev. D. J. Gogerly, appendix to Lee's translation of Ribeyro, p. 265, quoted in Tennent's Christianity of Ceylon, p. 157.) Bunsen says (iii. 516) the worship by the arian immigrants and the institution of castes seems to have commenced after they crossed the Sutlej river; and the original seat of this worship extended from the Indies to the Ganges and to Bengal (Behar). He adds that Brahmans, after crossing the Sutlej, introduced Siva and other deities, and threw those of the Vedic period into the shade. According to Bunsen, also, it was about the year 3000 B.C. that the schism took place amongst the Aryans, when all India east of the Sutlej adopted Brahmānism, and the religious views, forms, and habits of Bactria were for ever abandoned. According to Menu, the world had passed through four yugas when Brahmānism was introduced.

F. H. von, the Chinese priest of Buddha, who travelled through Tartary to India and Ceylon in the fourth and fifth centuries A.D., mentions that in the whole of that vast route, including Afghanistan and Bokhara, he found a Buddhist people and dynasty, with traditions of its endurance for the preceding thousand years. As to Hindustan itself, he says, from the time of leaving the deserts of Jeyasunirik and Bikanir and the river Jumna to the west, all the kings of the different kingdoms in India are firmly attached to the law of Buddha, and when they do honour to the ecclesiastics they take off their diadems. See also Maupied, Essai sur l'Origine des Principaux Peuples Anciens, chap. ix. p. 209.

According to Strabo (Dionysos, p. 117), Siva was worshipped in the mountains (Rudra, Soma, Siva); Herakles (Indra, Vishnu) in the plains. Brahmānism was found established in Hindustan by Megasthenes, ambassador of Seleucus in the court of Chandragupta, and at the time of the Periplus the very southernmost point of the Peninsula was, as now, a seat of worship of Siva's wife.

From the above it would appear that prior to the preaching of Sakya Sinha, there were in India numbers who entertained doctrines with some similarity to those which he taught; but until Asoka (b.c. 257) adopted the Buddhist beliefs, the followers of the Vedic and Puranic doctrines, as expounded by the Brahmans, were by far the most numerous. The two creeds were, however, co-existent throughout India, and in the same towns, but Brahmānism fell into the shade for about a thousand years, from the time of Buddha, b.c. 629-3, till the reappearance of Brahmans at the court of Vikramaditya, A.D. 490-500, when the religion then recognised began to assume the form which it still maintains in India, confused mass of local superstitions and myths. About b.c. 700-1 Brahmans had become a recognised caste, who shared power with the Kshatriya; the Vaisya, as merchants, had become a power; and the Sudras had become a recognised division of the population. Between the times before Sakya's advent and the centuries after Brahmans began to rise in power, the old Vedic books and their doctrines had been pushed aside by other old writings, now known as the Puranas. The Brahmānism of the Vedas and that of the Puranas are of very different characters; the change having been greatly influenced by the rise and progress of Buddhism which intervened between the two forms.
The change from Buddhism to Brahmanism was brought about often with much violence and cruelty, by great efforts of the Brahmanical sectarins. The great champions of Brahmanism were Kumara Bhatta, who was a violent opposer of the Buddhists; Sankara Acharya, the great Vedantic reformer, who flourished in the 8th or 9th century; Ramanuja, who lived in the 12th, Madhavacharya in the 14th, and Valabhaacharya in the 16th century A.D. The last three were Vaishnava teachers. Ramanuja was the first to introduce Bhakti doctrine, and was followed by several others, including Chaitanya in Bengal. Brahmanism is at present synonyous with Hinduism, and the Brahmanical religionists are of three classes, the worshippers of Vishnu, of Siva, and of the Sakta or female energies of the gods. But it is in some places a nature-worship, in others an idolatry, in others a hero-worship, in others a physiology, in others a philosophy, perhaps in all a spirit-worship.

Learned Hindus, however, have six schools of philosophy, called the six Darasana, viz. Nyaya, Vaiseshika, Sankhya, Yoga, Purva Mimansa and Utara Mimansa. These have one starting-point, ex nikholobhi; fit; and all have the same final object, the emanicipation of the soul from future birth and existence, and absorption into the supreme soul of the universe. Besides these six are a later system, called the Puranie and the Ecclectic school.—Weber’s Indian Literature; Elphinstone’s India; Dutt’s Egypt; Todd’s Rajastahan; Regrov’s Ceylon; Todd’s Christian Raj, p. 199; Calcutta Review; Dowson’s Classical Dictionary; Weber.

BRAHMAN, a river of Orissa, rises in the Palanow table-land, lat. 23° 25’, long. 84° 13’. It is formed by the South Koel and the Santh rivers, at the prettiest spot in the Gangetic state of Chutia Nagpur, from which it passes through the Benai, the Talcher, and Dhenkanal states and the Cuttack district into the Bay of Bengal near, pt. Palmyras. Length, 410 miles. The confluence of the South Koel and the Santh is said by local tradition to be the scene of the amour of the sage Paräsara with the fisher-girl Matsya Gandila, who became the mother of Vyasa, the reputed compiler of the Vedas and the Mahabharata.—Imp. Gaz.

BRAHMAN BULL, a term applied to the humped cattle of India and the Archipelago; the Boa Indicus of authors, partly wild and partly domesticated; also the vovte liberatd bull, set free by Hindu择a roan. See Bovine; Bjar; Brithotsara; Saur.

BRAHMAN DUCK, Casarea rutilla.

BRAHMAN KITE, the name given in the Peninsula of India to the Haliastur Indicus. It receives its name from Europeans because Hindus reverence it, and regard it as the vahan of Vishnu. It is often fed by Hindus, on whose call of Hari! Hari! the birds assemble, and animal food is tossed to them. This is to be seen daily, everywhere. The birds are expert fishers. See Garuda; Vahan.

BRAHMA PURA, the fabled city or heaven of Brahna on the top of Mount Meru.—Dowson.

BRAHMA PURANA, the first of the Puranas. It chiefly relates to sun-worship, hence another name, Sanrya Purana.—Dowson.

BRAHMAPUTRA, a river in the N.E. of India, flowing into the Bay of Bengal. It has not been traced from its source, but is generally believed to rise among gigantic glaciers to the S.E. of lake Manasarowara. An old Lama told Abbé Desgodins that in his youth he had visited nearly the whole of Tibet, and had followed the great river from its source, in or near the lakes of Tso-ma-pung, in the western part of the province of Nogaré, the most western of Tibet, and the Lama said that some days to the east of Lassa the river turns towards the south, making a long bend, and traverses the Tibetan district of Hia-yul, a rich and well-peopled district just to the north of Lhopa. The river enters the country of the wild Lhopa tribe, and winds among steep and rugged bare rocks, without roads, and which can be passed only by means of wretched ladders made of bamboo. In a certain course among the Lhopa, the river falls over a high rock into a valley which is not known. The height of the fall is so great that the Lama said it made him giddy to look down. At this place, he said, the river is almost as considerable as the Kin-sha-kiang at Bathang.

The Imperial Gazetteer says that the Dibang is believed to be the continuation of the Sangpu or Nariehu Sangpu of Tibet, which rises on the further side of the Himalayas, in about 31° N. and 83° E., and flows past Lassa eastwards through the whole of Tibet, but the continuity has not been verified, owing to the difficulties of the mountainous region and to the inhospitable character of its occupants. The main stream in the Assam valley is made up by the confluence of three swift rivers, the Dibang, Dibang, and Brahmaputra proper, in lat. 27° 70’ N. and long. 95° 30’ E.; the two latter are supposed to penetrate the Himalaya by a rocky gorge.

On entering the valley of Assam, the united stream runs for 450 miles from the N.E. to the S.S.W. through the plain, with a vast expanse of water, broken by innumerable islands. On leaving Assam near Dhubri, it turns sharply due S., sweeping round the spurs of the Garo hills, and runs S. for 180 miles through the plain of Eastern Bengal as far as its confluence with the Padma, or main stream of the Ganges at Goalanda. Here the conjoint delta of the two rivers commences. The strong banks of the waters of the Brahmaputra flow toward the S.W., and ultimately reaches the sea by the broad estuary known as the Megna. Shortly after leaving Assam, what is at present (1882) the chief channel of the Brahmaputra takes the name of Jamuna, the bed along which it flowed in the middle of the 18th century running past Maimansingh further to the east, and, retaining the original name, to unite with the larger body of water by means of the Megna. After the confluence of the Brahmaputra, Dibang, and Dibang, as it rolls to the sea it receives successively the Subansiri, 180; Boroholi, Mans, 180; Gadadhur or Sanks, 160; Dhurka and Tista, 313, on the right bank; and the Noa Dihing, 100; Buri Dihing, 150; Di Sang, Dhansir, and Kapli, on the left. All of these are navigable by country boats of the largest size.

The Brahmakund, a place of Hindu pilgrimage, is a very deep basin-shaped enlargement of the river, just before it emerges from the mountains to descend into the plains of Assam. The velocity of the current, which both above and below the Brahmakund is very great, suffers a great diminution at this point. In its S.W. course, along the whole length of the left shore
of the Brahmaputra, and nearly parallel to the broad valley through which it runs, we meet with a longitudinal range of secondary hills, inhabited by the various scattered tribes of the Naga, Khassa, Jaintia, and Garo, in the Patkoi, Khassa, and Garo hills. These latter hills run south-east, skirting the rice-fields of Maimansinh, Comillah, and Noa Colly, and forming the greater part of Chittagong and Arakan down to the Irrawadi. The level of the Brahmaputra at Sadia is 210 feet, the fall from Sadia to the delta consequently amounting to half a foot per mile. Sadia is situated near the spot where the most considerable branch of its affluence from the Assam-Sangphu, viz. the Dihang, a river seemingly identical with the Tibetan Zambu, or Sang-pan. The ebb and flood of the tide extend, in the season when the river is low, upwards beyond Dacca. The branches of the Brahmaputra, together with those of the Ganges, intersect Lower Bengal in such a variety of directions as to form a complete system of inland navigation. The Brahmaputra begins to rise in April, owing to the melting of the snow at its alpine sources. About the 1st July it is at full flood, and all the level country is submerged; herds of buffaloes, deer, and hogs then swim for refuge to the hills. The Brahmaputra drains Assam in every direction. It is known in Assam by the name Hiranyo or golden. In the rainy season it rises 30 or 40 feet above its lowest level, overflows its banks, and inundates the country like an inland sea. In the dry season it is a labyrinth of half-filled channels, rendering the navigation intricate, and fit only for steamers of light draught. It is not navigable for steamers higher than Dibrugarh; 800 miles. As seen from Ogri hill, near Tezpur, the river is sweeping along in a bed of from ten to twelve miles in breadth, with numerous islands, covered with canes and shrubs. The chief towns on the banks of the river are Bishnath, Durrung, Gohwatty, Goalpara, Nasseerabad. It is navigable from the Bay of Bengal to Dibrugarh near the head of the Assam valley, within 500 miles of Pengahaw, on the Yang-tse-kiang river. Of these 500 miles, 300 are known, and if this route can be opened, the rich province of the Yang-tse-kiang may hereafter be opened to India.—\textit{Schlagenuetz\'s General Hypomometry of India}, ii. p. 38; \textit{Imperial Gazetteer}. See Assam; Megna.

**BRAHMA RAKSHASI.** Tam. Fourcroya cantala.

**BRAHMA - RANDHRA, Pinacle gland. See Yug-byass.**

**BRAHMARI.** Tel. Clerodendron serratum.

**BRAHMA-RISH, five patriarchs of the Hindu people who founded clans or gotra of Brahman, viz. Kasypa, Vasishtha, Angriras, Atri, and Brighu.**

**BRAHMA SAMPRADAYI, or Madhavachari, a small Vaishnava sect of Hindos in Southern India, founded by Madhavacharya, a Brahman, son of Madhiga Bhatta, born a.d. 1199 in Tuluva. At Udipi, Madhyatala, Subrahmanyana, and other places, he established temples, and eight mathas in Tuluva, below the Ghats. The superiors or gurus of the Madhava sect are Brahman and Sanyasis, or profess celibacy, lay aside the Brahmanical cord, carry a staff and a water-pot, go bareheaded, and wear a single wrapper stained of an orange colour with an ochre clay. They are usually adopted into the order from their boyhood, and acknowledge no social affinities nor interests. They regard Vishnu as the supreme spirit, as the pre-existent cause of the universe, from whose substance the world was made.—\textit{Wilson}.**

**BRAHMA SAVARNI, one of the 14 patriarchs who are supposed to preside successively over the 14 Manusmrtas of the Calpa.---Warren, \textit{Kala Sanchita}.**

**BRAHMA SIDDHANTA, the second of the authentic Hindu Shastras.**

**BRAHMA SUTRA, or Brahmin Mama Sutra, appendix on the Vedanta philosophy, by Badarayan or Vyasa.---Dowson. See Sutra; Veda.**

**BRAHMA VAIVARTA PURANA contains 18,000 stanzas; a sectarian work on the youthful Krishna and Radha.---Dowson. See Sacta.**

**BRAHMAVARTA, according to Menu, a tract of land immediately to the westward of the Jumna, between the rivers Saraswati (Sersooty) and Drishadwati (Drishladvati) (Cagger), about 100 miles to the N.W. of Delhi, and in extent about 65 miles long and from 20 to 40 miles broad. Its customs are models to pious Hindus. The country between that tract and the Jumna, and all to the north of the Jumna and Ganges, including North Behar, is called Bramashti by Menu; and Brahmanas born within that tract are pronounced to be suitable teachers of the several usages of men.—\textit{Elphin.}, p. 205.**

**BRAHmüESWARA, in Cuttaak, not far from Bhubeswara. Here a slab was found with an inscription in Sanskrit verse. It commemorates the temple of Brahmeswara being erected to Siva by Kolavati, the mother of Udyotaka. The era Samvat 18 is used. The temple was no doubt erected after that to Siva at Bhubeswara, which Mr. Stirling says was completed a.d. 657, and that at Kanarak a.d. 1241. If the Samvat era 18 be that of Gaur of the dynasty that subverted the Bhupala, it corresponds to a.d. 1141.—\textit{J. A. S. B. v. p. 660, vii. p. 557}.**

**BRAHMO, a name applied by Mr. Hodgson to the Kusunda, a Bhot tribe occupying the dense forests of the central region of Nepal.**

**BRAHMO-SAMAJI, a small reforming Hindu sect, who regard their views as a pure aethism; recognise the absolute unity and spirituality of God, the abolition of caste, and the elevation and instruction of woman. During a very few years, Brahmoism ran through three different stages. In the first it had for its foundation Vedtic testimony tempered by reason; in the second stage, reason and philosophy; and about 1870 it was supposed to stand on intuition guided by reason. But quite one-fourth of the total number of Brahmo rest on Vedtic testimony, and nearly one-third look up to reason alone. And though the intuitive Brahmo have done away with Sras, Anoprasinghas, etc., their brethren of the first stage perform those Hindu ceremonies in all their forms. The Brahmo of the second stage hold a middle place. On its decline, another theological body arose, the Dharma Sabha. Brahmoism, in all its phases of development, has carried on a crusade against the institutions and usages of caste. Its leading members have strongly advocated a reputation of two great social customs, that of infant marriages and the prohibition of widow marriages. They have deprecated polygamy, and have striven to place
the marriage institution on a footing similar to that which has received the moral and practical sanction of civilized communities. In 1880 there were 149 Samajhs scattered throughout India. In Calcutta alone there were 20: in Bengal, 54; in Assam, 7; Chatia Naupur, 3; Behar, 7; Orissa, 2; N.W.P., 8; Central Provinces, 1; Punjab, 5; Sind, 3; Gujarat, 3; Bombay, 6; and Madras, 6. Of these, 44 have mandirs, or places of worship. In connection with the society eighteen different periodicals were published. Of these, six were in English, nine Bengali, one each in the Hindi and Urdu languages, and one in Anglo-Mahratti. There are schools kept up by the society, besides schools and classes kept up by the local Samajhs.

**BRAHMYA.** In Hindu astronomy, the Yoga Star of the 28th lunar mansion, 'a Pegasus.—Warren.

**BRAHUI.** The dominant race in Baluchistan. Their tribes, above 70 in number, are nomades, residing in one part of the country in summer, migrating to another for the winter season, and constantly shifting for pasturage. The Baluchi has a tall figure, long visage, and raised features. The Brahui have short, thick bones, with round faces and flat lineaments, are stout and squat, and numbers of their tribes wear hair and beards. Their name is said to be from an affix 'bon,' and 'roh,' a hill; and the name of the Narui, or Baluch, race is said to mean 'not mountaineers.' The Brahui have no religious men, whether syed, pir, mullah, or fakir. The tribes reside in tomans, or collections of tents. These tents are made of goat's hair, black or striped. The furniture is very simple,—a few metal cooking-pots, a stone hand-mill, and some rough carpets and rugs, with a distaff for spinning wool, and a hookah, are all that are usually found in a Brahui tent. That of the chief may perhaps be better furnished, and he is richer than his neighbours in flocks and herds. The dress of the lower orders is made up of a long tunic, trousers loose at the feet. The Kamburani, the chief tribe, are divided into three distinct gradations of rank, called Ahmedzai, Khanai, and Kamburani. The first supplies the khan; the Khanai are of the secondary rank of chiefs. The word Kamburani includes the remainder of the tribe, but in common is applicable to the whole body. They receive wives from, but do not marry their daughters into, other tribes. The typical Brahui are certain tribes in Saharawan and Jhalawan. The Brahui are Sunni Mahomedans. They have, both in feature and speech, indications of a Turanian element. Their political chief is the Khan of Kalat.

They are entirely illiterate; not a single book exists in their language, or specimen of their language reduced to any form of writing. It is called Kur-Gali, and, according to Dr. Caldwell, is mainly Panjabi, with a Dravidian element; according to Mr. Campbell, is mainly Aryan (Iudo-Persic), with a Turanian element. Ethnologists are inclined to consider them to be of the same Scythic stock as the Dravidian races in the Peninsula, and infer from this that the passage of the Dravidian race from Turan was along the valley of the Indus.—Mr. Campbell, pp. 54-56.

**BRAJ or Brah-manial,** a pastoral district extending in a circuit of 84 cos around the town of Mathura, celebrated in the traditions of Hindustan as the country where Krishna pastured his herds. The soil is poor and thin, with few trees, the nim, faras, and species of the fig tribe being the most prominent. The Jumna is the only great river; for the rainy season it is a mighty stream, a mile or more broad, but for eight months in the year, a mere rivulet, between wide expanses of sand. The untidy Sat and Gujar are the chief proprietary classes. Hindustan is celebrated for its water-melons in August, pantanubate its 24 groves or rips ban and 12 ban or woods. The people are still pastoral; the villages contain much horned cattle. Braj-bhasha is a term applied to the Hindi tongue of that district.

**BRAJBAZI,** a native of Braj; an armed attendant, a guard, a watchman or doorkeeper.

**BRAHMA.** Maleal. A small tree on the Malabar coast, used for boats, and for timbers and knees in larger vessels; it is considered strong and durable.—Edge, M. and C.

**BRAHMA.** Hindu. Astragalus multiceps.

**BRAHMANG.** Malay. A sour fruit used for chutnies and in curries, perhaps the Averrhoa bilimbi; also said to mean the onion, Allium cepa.

**BRAH-MUG.** See Insects.

**BRAM.** Hindu. Anemone, sp.; also Takus baccata. Beng. Saracenoma bracteisatum.—W.

**BRANDIS.** Dr., Conservator of Forests of Bengal, author of works on forestry. In 1881 his recommendation to form a school of forestry at Dehra was acted on by the Government of India.

**BRANDY,** Cognac.

Shau-tseu, CHIN. Aquarzente, It.
Hwang-tseu, VINUM AQUA,

**BRAN.** A spirit largely imported into India from France and England, obtained by distilling wine. Its qualities vary with the kind of wine employed. It is manufactured in the south of Europe, from white or pale red wines and the skins of grapes. Cognac is made from the palest, eau de vie from dark red wines; British brandy is a compound of rectified spirits. Brandy began to be distilled in France about the year 1843, but used only as a medicine, and was considered as possessing such marvellous strengthening powers that the physicians termed it 'eau de vie,' the water of life. Raymond d'Albi, a disciple of Arnold de Villiers, considered that it was intended to reanimate and prolong the life of man.—Statistics of Commerce.

**BRANSH BRANTLI.** Hind. Myraine Africana.

**BRANTLEY.**—In Penang, a light, brown-coloured, weak wood, used for building.

**BRARRAH.** A wood-louse in Swat which infests mosques and houses where old mats are lying about; the place bitten by them becomes red and
inflamed. The insect is of the shape of a bug, but larger.—_Lt._ Col. MacGregor.

**BRASS.**

**Hind.** Rhododendron arboreum.

**MALAY.** Rice.

**BRAS-BRAS,** the Glam tree of the Malay Peninsula; furnishes a paper-like bark much used in caulking the seams of vessels. Wood used as floats for fishing nets.

**BRASILLETTO WOOD,** Casalpia sappan.

**BRASS.**

Hwang t’ung, ... **CHIN.**

**MISSING.** Messing; **GIL-**

koper, Geelkoper, **DUT.**

Cuirvre jaune, Laiton, **FR.**

**MESSING.** .... **GER.**

Nehest, Pital, **HIND.**

Ottone, **IT.**

**BRASS.**

Brass is an alloy of copper and zinc, generally the yellow alloy, with about an equal weight of zinc and copper, called yellow brass; copper alloyed with about one-ninth its weight of tin is the metal of brass ordnance or gun-metal. Similar alloys used for the brasses or bearings of machinery are called hard brass, and when employed for statues or medals they are called bronze. Brass is extensively used in India for domestic utensils, and is in greater request than copper among the natives. Generally, Mahomedans use copper, and Hindus brass utensils.

In the Panjab, for smaller work, they prepare the alloy in their own kuthali, or crucibles; for making the larger sizes, however, the gogara, shamadan, etc., they prefer the fine sheet metals imported from Europe. A metal giving a beautiful sonorous ring when struck, and called Phul or Khani, is made in the Panjab; Roin, a genuine bell-metal, is also manufactured; also an alloy called Bath, and an inferior one called Kuth. A good brass may be made by fusing two parts of copper and one of zinc; but various proportions should be used according to the purpose required. The substances used in alloying are in various proportions by native braziers to form brass, gun-metal (lokam), pewter (satki), bell-metal (kansu), and bedery ware. Occasionally silver is added to form gongs and bells. In general, however, the proportions used are regulated by reducing the quantities of the more expensive and increasing those of the cheaper metal, as far as may be practicable. Repeated meltings, by drawing off the excess of zinc, leave a good malleable brass; and for this reason old brass is much sought after by smiths when they desire it for any work requiring it to be particularly malleable. Guns taken at Kurnool were little better than spelter. Ordinary yellow brass is rendered very sensibly harder by a small addition of tin, say a fifth or half ounce to the pound; on the other hand, by the addition of a like quantity of lead, it becomes more malleable and cuts sharply. Brass becomes a little whiter for the tin and redder for the lead; the addition of nickel to brass constitutes German silver. Gun-metal (copper and tin), by the addition of a small proportion of zinc, mixes better, and the malleability is increased without materially reducing the hardness. Lead in small quantities improves the ductility of the metal, but at the expense of its hardness and colour; it is seldom added.—_Tommison, M. E._

Mr. Rohde. See Bolls.

**BRASSAK,** a subdivision of the district of Pangkal-pinang, in the island of Banka, producing much tin. See Tin.

**BRASS CAMPHIRE.**

**Brass—sapur, GEZ.** Hind. | Karpuram, TAM., TEL.

This commercial term is a corruption of Bums campire, also called Borneo and Malay camphor. It is the product of the Dryobalanops camphora of Sumatra, Borneo, and the Malay Peninsula. It is found only in small quantities, in concrete masses, in the fissures of the wood. It is more fragrant, and less biting and pungent, than the common camphor, and is held in much higher repute. It is imported into Bombay from China. — _Paulkener._

**BRASSFOUNDER.** The brassfounder or brazier trade in India is almost exclusively in Hindu hands. They form one of the five Kumalas or artisan classes, the other four being the goldsmith, blacksmith, stonecutter, and carpenter. These castes all wear the zonar or sacred string. They do not allow any Brahmanical interference with them, have their own priests and ritual, and they bury their dead in a sitting posture.

**BRASSICA.** _Linn._ A genus of cruciferous plants, containing several very important alimentary species.

**Brassica campestris, Linn., Sarson, Hind._ This has been supposed to be the source of the Swedish turnip; it furnishes the colza oil of Europe. It is grown as a cold-weather crop in the plains of India, and as a summer crop at Ambala. It is cultivated in Afghanistan, and in Tibet up to 10,000 feet. The seed is being largely exported from Kurachee, but in N.W. India a bland oil is largely expressed from it.

**Brassica erica, Linn., garden rocket.**

**Erica sativa,** ... **LAM.** | Kala Sarson, HIND.

This is largely cultivated in the arid parts of the Panjab for its bitter oil from its seeds, which is used for lamps.

**Brassica erucagrum, Linn., of France, Italy, Switzerland, etc., is largely cultivated in the Panjab and Oudh for its seed and oil. The cost of the (Tecora) oil is from 3 to 10 seers per rupee. It is used for burning.

**Brassica juncea, Linn., Rai, Turia, and Khardil, HIND.,** is grown largely in the Panjab, also in the Himalayas, and up to 10,000 feet in Tibet; also in Afghanistan. Its oil, somewhat acrid, is burned, and occasionally used in cooking. Its seeds are an ingredient in pickles.

**Brassica napus, Linn., rape, wild cabbage;**

colza, cole seed, or sursul of Gujerat. Much cultivated in Europe. Used as salad similar to mustard; the leaves are eaten when the plant is in seed, but it is of no great value as a vegetable. This plant is cultivated for the sake of its seeds, from which oil is extracted by grinding and pressure.

**Brassica oleracea, cabbage.**

_Theem ban mung la, BUM. | Karam, Kopi, Gobi, HIND._

Amongst Europeans, both in Europe and India, a highly-esteemed vegetable; its varieties are—

a. *Acephala, D. C.*

ramosa, cavalier cabbage.

vulgaris, common green colewort.

quercifolia, oak-leaved cabbage.

b. _Bullata, D. C._

major, Savoy cabbage.

a. *Acephala, D. C.*

ramosa, cavalier cabbage.

vulgaris, common green colewort.

quercifolia, oak-leaved cabbage.

b. _Bullata, D. C._

major, Savoy cabbage.

gemmifera, Brussels sprouts.
The cabbage plant is supposed to be indigenous in the Kashmir valley at 5000 to 5500 feet.

Brassica rapa, Linna, the turnip, rape.

Bread.—The materials for bread are 60 lbs. of first sooji, 20 lbs. of second sort or naka sooji, and 20 lbs. of first sort flour. 100 lbs. of these ingredients produce 128 lbs. of bread.

Biscuit is made from second sort sooji and flour mixed in the proportion of 75 lbs. of naka sooji and 85 lbs. of second sort flour. This produces only about 85 lbs. of biscuit, which, after being well baked, is dried for two days in a kiln.

Barm or yeast sufficient for 800 loaves, 1 lb. each, is made from brown sugar 2 lbs. potatoes, 1½ lbs.; hops,½ oz., with half a gallon of water. Boil and mash the potatoes; boil the hops until none appear on the surface of the water; strain and dissolve the sugar in the liquor. The potatoes are then added, and the whole is strained into a jar or small tub. The quantity produces about 3½ pints, and is generally ready for use in twelve hours. The addition of a small portion of the old barm hastens fermentation.
BREAD-FRUIT TREE.

Wheaten bread is largely used in Northern India and by the Chinese. In Ho-nan, Shen-si, Shan-si, and Shan-tung, wheat bread and pastry are staple articles of diet. Chinese bread is free from alum. It is raised by means of leaven, pearl-ash; and the small loaves or cakes are steamed in a very ingenious and simple way.

Cakes of wheat-flour, prepared on the girdle, are a common article of diet amongst the well-to-do races of Northern and Central India. Further south, on the table-lands of the Peninsula, the natives of India use unleavened cakes made of the flour of the Indian corn, the zea mays, rather less nutritious than that made from wheat, but more fattening, in consequence of the greater quantity of oil contained in it. Also, amongst the millets, bread is made of the great millet, Sorghum vulgare; the spiked millet, Pennicillus espicata; and the very poor of the people use the hard raggy, Elenusina cococana, in the form of cakes or porridge. Barley is occasionally used to the westward. Along the seacoast of all Southern Asia, towards the eastward into China, however, boiled rice is the great article of diet, and it is often cooked, with unfermented palm-wine, into the cakes familiarly known in India as 'hoppers,' the 'apa' of the people.

Rice flour is scarcely ever made into fermented bread, although it is said to be occasionally mixed with wheat flour for that purpose. The superiority of wheat to all other farinaceous plants, in the manufacture of bread, is very great. Its essential constituents are starch, also called farina or fecula, gluten, and a little sugar and albumen. It is occasionally adulterated with alum, which is added to whiten the flour, and to enable it to retain a larger quantity of water. Salt is also employed in the adulteration of wheat bread, to whiten the flour and enable it to hold more water; and carbonate of magnesia is improperly used to obtain the same result.

In Eastern and Southern Asia, the well-known sago is made from the starch granules contained in the pith of several species of palms. It is largely used as an article of diet, alike for the robust labourer as for the invalid, and is extensively exported for the use of the sick and the nursery. Amongst the Arabs, burgoult is wheat boiled with leaven, and then dried in the sun. The dried wheat is preserved for a year, and boiled with butter and oil. Leavened bread is called khabz. —Robinson's Travels, ii. 132; Tomlinson: Howell, Simmonds, p. 217; Royle: Bombay Times; Stewart; Smith: Powell; Mc Culloch. See Cereal Grains.

BREAD-FRUIT TREE, Artocarpus incisa, Wilde. When cultivated, its seeds are abortive. It is grown in Ceylon, in some parts of India, and its fruit is a staple food of the South Sea islanders. Their peakan or bread-fruit season is in March and April, but some kinds ripen considerably later or earlier, whilst in some districts the season itself is altogether later, and it may be said that there is ripe bread-fruit, more or less abundant, throughout the year. . . . The fruit is made into puddings, or simply boiled or baked. Quantities of it are preserved underground to make native bread. The tree is hollowed out as a canoe; its gum forms a good pitch; its bark can be made into a cloth. The skin of the fruit being pared away, the pulp is sliced and roasted, or baked in ovens.—Dr. Seemann: Viti; Montgomery, p. 222.

BREJ or Brege pan is an article which is occasionally brought to the Panjab from Siberia (Sebere, Seetha or Seth, by the natives of the N.W. Himalayan and Panjab, Seythia). It is seen usually as a lining for plinths, caps, stockings, gloves, neckties, etc. From its nature it cannot be spun into thread. It is of a white colour, with a certain gloss, and is supposed to be a species of cider down. It is fancy-priced.—Powell, Handb.

BREN. HIND. Quercus annulata, also Bleri, Ulmus crosa.

BRES. HIND., of Kulu; also Karma-bres. Parogyrum esculentum, buckwheat.

Mattone, . . . . It.

A building material formed of clay, hardened either by the sun's rays or the heat of a furnace, the former being called sun-dried bricks, and the latter burnt bricks. The various argillaceous earths are for the most part unfit to be used alone for brickmaking. Some are almost pure clay or alumina, and are strong and exceedingly plastic, but cannot be dried without splitting; light and sandy clays or loams are too loose to be made into bricks without the admixture of lime as a flux to bind the materials; others, again, natural compounds of alumina and silica, if free from lime, magnesia, or metallic oxides, are exceedingly valuable clays, being, from their infusible nature, well adapted for making fireclays for lining furnaces, for making crucibles, glasshouse pots, etc. Fire clay is found in many places in India. Bricks, burnt almost to vitrification, are much employed as a road material on all alluvial lands of India. Sun-dried unburnt bricks of a very large size were formerly employed in building, and they may still be seen in the basements of some of the old ruined Jain temples at Hira Tumbal in the Ceded Districts, Amagerry in the Southern Mahratta country, and in the walls of the mud forts at Guduk, Dummul, and other localities. The bricks appear to have been usually 2½ feet in length by 16 inches in breadth, and 7 or 8 inches in thickness. The seams are apparent from the effect of the weather, but the bricks cannot be separated without breaking. The basement and a good deal of the interior of the solid muntapums or pyramidal towers of these Jain temples were built with unburnt bricks; and the masonry and carved slabs, ornaments, and pillars were erected over this foundation of earthwork. The greatest height which any of these complicated parts of these temples. In the walls of the old forts in Southern India the lower part of the walls is made of unburnt bricks and the upper part of hewn stones. The more modern forts are chiefly constructed of mud embankments, cased in large blocks of stone, very accurately fitted, but not cemented with lime or mortar. In the ancient buildings of India, brickwork does not appear to have been extensively employed, although in some of the temples we find the upper storeys made of brick, while the lower ones are of stone. The earth-walls of the Bellary district are formed of sun-dried bricks of great size.

The material used in Babylon was unburnt
brick. Many of the ancient ruined cities of Persia are built of unburnt bricks, beaten up with straw or rush to make the ingredient adhere, and then baked in the sun. In the days of the Egyptian bondage, Pharaoh commanded the taskmasters of the people and their officers, saying, 'Ye shall no more give the people straw to make brick as heretofore; let them go and gather straw for themselves.' They gave them brick for stone, and slime had they for mortar' (Genesis xi. 3). Assyria abounds with asphalt, or bitumen. Herodotus and many ancient authors affirm that the walls of Babylon were cemented with it; and Arrian says, 'The temple of Belus, in the midst of the city of Babylon, was made of brick, cemented with asphalts.'—Migman's Travels, p. 166; Dr. Hunter in M. E. J. R.

BRICK TEA. Tung-k'au, China, is tea compressed into a solid form. This article, and the khata, or 'scarf of felicity,' are great articles of trade between China and Tibet. A prodigious quantity of these goods is exported annually from the provinces of Kan-su and Seeh-u'en. In Ya-tcheon or Ya-tzon, the last large town of Western China, brick tea gives occupation to thousands of workmen either in its manufacture or transport to Ta-tsi-en-lu. This tea can only be made with a particular leaf. The tree which furnishes it grows on the banks of the river Yaho. It attains often 15 feet in height, and its leaves are large and tough to the touch. The cultivation requires little care. It is planted often on the borders of fields, or round the houses. Each grower gathers his little harvest of leaves, and finds a ready sale for them in the market of the town. The manufacture of brick tea is a monoply secured to the dealers of this town, and for which they pay a considerable sum to the Chinese Government. For the first quality tea, the leaves are gathered in June and July, before the spring rains commence. The leaves at this period of the year are about an inch in length. As soon as detached, they are spread in the sun, and, when slightly dried or withered, they are rolled with the hand until they become humid by the evaporation of the sap. They are then made into balls about the size of a large teaspoon, and left to ferment. When they are in fermentation, they are placed between wooden moulds or lever pressed securely by pegs or bolts. These moulds are then placed over a wood fire. The tea is taken out in a compact mass, and forms the brick tea of commerce. They are then delivered to the merchants of the town, by whom they are wrapped in yellow paper, on which is impressed the stamp of the Government and the mark of the dealer who exports it. They are then packed in baskets of plaited bamboo, about four feet long. One of these baskets, weighing about twenty pounds, is the unit of trade. The baskets are carried on men's backs to Ta-tsi-en-lu, a distance of two hundred miles. There they are carefully wrapped in fresh hides, to prevent the tea from imbibing moisture. They are then fit to be sent to Lassa, or even beyond. A basket costs about twelve taels, that is, at the rate of 4s. 8d. the English pound. A second kind is made with older and yellow leaves. The mode of preparing is the same. It is sent chiefly to Lithang and Batang. At the latter place it sells for about five taels the basket, or at the rate of 1s. 6d. the pound. A third quality is made with the waste and debris of the leaves. The bricks of this quality resemble those sometimes made with the young shoots of the tea tree cut up. The manufacture differs from the two other sorts, inasmuch as it is necessary to add rice water to combine the substance and to make it retain the form of the mould. This quality is only sold at Ta-tsi'en-lu and its neighbourhood, and fetches 9d. per pound. The quantity of brick tea exported annually from Ya-tcheon to Tibet is roughly estimated at six million pounds. The high price of tea in the markets of Tibet arises from the monopoly of the Chinese, which is increased by that of the Lamas, who keep in their hands the retail sale. And as tea is an article of prime necessity in Tibet, the Celestial Empire keeps in dependence the Lamas, and by them the people of Tibet. Brick tea is cooked in a varied manner. Mr. Atkinson (Orient. West. Siberia, p. 477) was given it mixed with milk, butter, salt, and flour, presenting the appearance of thick soup. The form of bricks was doubtless given to it for the convenience of carriage.—Mr. Cooper in Stateroom; Huc, Chinese Empire.

BRIDELIA LANCEFOLIA. Roxb. A tree of considerable size, native of Bengal.

BRIDELIA MONTANA. Gibson.

This is a large and very valuable timber tree. It is common in most jungles and dry forests throughout Ceylon and the Madras Presidency, in Ganjam, Gumsir, Bengal, in the lower spurs of the Himalayas. The wood is of a dirty red or copper colour, very stiff, strong, close-grained, and durable, but not easily worked. Its extreme height is 30 feet, circumference 3 feet. A cubit foot unseasoned weighs 68 to 70 lbs., and 60 lbs. when seasoned, and its specific gravity is 960; it is used for house-building, construction of carts, agricultural implements, railway sleepers, rafters, spinning-wheels, and a variety of other purposes, and it stands the action of water; the bark is a strong astringent. Cattle eat the leaves greedily, and they are supposed to act as a vermifuge.
In Gunsur it is also burnt for firewood, the tree being very common. The leaf is used medicinally for its poisonous, and a preparation of it is often used for the purpose of destroying life, particularly by the Orya widows, among whom suicide is a frequent occurrence.—Captain Macdonald; Beddome, Fl. Syl. part xxii. p. 260.

BRIDELIA SPINOSA. Wilde, Roxb.
Cluyttia spinosa, Roxb. C. Pl.
Assam, Assam, Maleal. Mulla vengay, ... Tas.
Mulla vangay, Maleal. Kora man, Duria
Katu Kote Kola, Singh, madde, ... Tel.

This large tree is a native of several parts of Southern India; in the alpine jungles of Coimbatore it attains one cone. It grows on lands in fields, where its wood is esteemed as very strong and good. It is rather a common tree in the Bombay forests, both coast and inland. The wood is strong and tough, and stands the action of water well; it is often used for the frames of wells, wherein the superstructure of masonry is erected. It is also used as beams for houses. This wood deserves, in Dr. Gibson's opinion, to be more extensively known than it is; cattle eat the leaves voraciously. They are said to destroy worms in their bowels. The odoroo wood of the Northern Circars is a species of Bridelia.—Drs. Roxb., O'Sh., Gibson, Wright, and Clegliorn; Captain Beddome, Flor. Andh.

BRIDGE.
Pont, ... Fr. Basho.
Brock, Steg. ... Gér. Pol, Pool, His, Prus.
Pal ... Ir. Panteo, ... Str.

Bridges in the S.E. of Asia are built of stone, brick, wood, iron, rope, bamboo, canes, and twigs. Hindu and Mahomedan rulers in India built but few bridges. The Bhot, Mongol, and Tartar races of the Himalaya and Burma have numbers of them. In Burma, bridges are seldom wanting near villages where nullahs or inundated fields obstruct the communication; near towns they are sometimes of extraordinary length. The construction there never varies. Large teak posts are driven in pairs or triplets, with bays between, not exceeding twelve or thirteen feet. Mortice holes are cut through those parts in which cross beams are laid, with beams and solid planking over those, and a railing is added.

The most characteristic of Hindu bridges are composed of stone posts, several of which form a pier, and are connected by stone beams. Others are thick piers of masonry, with narrow Gothic arches.

Turner tells us of a simple bridge for the accommodation of single passengers, constructed between two opposite mountains, which consisted of two large ropes made of twisted creepers, stretched parallel to each other, and encircled with a hoop (Embassy, p. 54). This is the original of the jhula or rope bridges of the Himalaya. In the early part of the 19th century, Mr. C. Shakespeare advocated rope bridges in India, and one of 160 feet span was erected over a stream at Benares. The bridges of Kamaon are of four kinds,—a simple spar thrown across from bank to bank; the sanga, by successive layers of timber, those above gradually projecting to form an arch; the jhula of ropes stretched from bank to bank, with a suspended ladder; and (4) a single cable across a stream along which a basket traverses.

In Jummo the chiba or havel bridge is in use; a smooth rope of several strands is hung across from bank to bank, on which traverses a wooden ring, from which is suspended a loop. In this the traveller seats himself, and another traversing rope pulls the ring and traveller across. Down the curve the passage is quick, but the pulling up is tedious. The ordinary bridge is of three ropes, made of birch or other twigs, and hung, one for the foot to traverse, the other two a yard above it for the traveller to steady himself. The jhula consists usually of three ropes stretched across the stream, at a height of 8 or 40 feet, between two battress piers. The three ropes are suspended like the letter V, two parallel ropes forming the upper span and one the lower plane. This disposition is secured by large V-shaped prongs of wood, which at intervals of four or five yards are secured in position above and below by thongs of raw hide, and further strengthened above by a cordage, which is passed across between the two upper points where they are fixed to those ropes. It is crossed by the traveller walking on the lower of the ropes, which is sometimes of double or triple strands, and holding his balance with the hands on the upper ropes, which run at each side on a level with his shoulders.

The Kudal bridge of Kashmir is made of wood, and is very strong and durable. It consists of undressed logs of pine and cedar timber, the undressed trunks of the trees supported on piers 20 to 25 feet apart. The piers rest on a foundation of stones embedded in the muddy bottom of the river, and protected by a cutwater pointing up the stream, and built of loose stones filled into a frame of logs of wood. Those above Serahan, opposite Miru, and at Pooni, whether swinging or suspension bridges, are unsuited for the passage of sheep and mules. The elevation of the rope bridge (jhula) at Tuni on the Tons river is nearly 8000 feet above the sea.

The Nara, over the Nyn Sukh, near its junction with the Jhelum, consists of a single cord stretched across from bank to bank, and secured on either side to some projecting rock or firmly set tree. The cord is furnished with a loop-eradle, which is slung on to it by a forked piece of wood. This last forms the upper part of the cradle, which, when once adjusted, is irremovable from the cord, though it slides freely backwards and forwards on it by shaking the cord. The cord is made of a climbing plant, with the straight twigs of a species of indigofora.

In the N.W. Himalaya the timbers used for ordinary wooden bridges are Alnus, sp., Bombax heptaphyllum, Cedrela toona, C. serrata, Phoenix dactylifera, P. sylvestris, and Salix alba. For swing bridges, Andropogon involuta, Bpetula bhojputra, Cotoneaster obtusus, Indigofera heteranthra, Olae Europaea, Parrotia Jacquemontiana, and Salix alba.

A writer in the Bengal Asiatic Society's Journal (vol. xiii. p. 614) mentions that he had seen half a dozen bridges, within as many miles of Cherra, made by intertwining the growing india-rubber tree. The rope bridges of the Panjab Himalaya, made of the twigs of the Parrotia Jacquemontiana, Decaines, have often a span of 300 feet. Lt. Wlicox, in 1825-26, describes a bridge or satlu near the Dihang river, consisting of two strong canes stretched between stages.
BRIDGE.

of bamboo, which are secured in piles of the largest portable stones heaped up around them; the points of suspension were 80 yards distant. A cradle or long basket, in which a passenger may sit or lie, is hung on the canes by two loops, and two or three men pulled it across when loaded.

The three rivers of Western Yunnan are the Lan, Lu, and Lung. The suspension bridges, which are the pride of Yunnan, are all constructed on the same principle,—five or more chains, formed of oval links about 6 inches in the long diameter and ¾ inch thickness, are strained very tightly across, the ends being imbedded in rock or masonry. The way consists of planks laid on these, not suspended from them; and two other chains, hung from massive gatehouses at both ends, form a protection and assistance to the passenger. In some cases the road chains are tied with bars. The bridges vibrate considerably, but the curve is not great.

It is mentioned in the Bengal Asiatic Society's Journal (xiii. 613), that on the top of a huge boulder by the river-side was growing a large India-rubber tree, elapsing the stone in its multitude of roots. Two or three of the long fibres, whilst still easily pliable, had been stretched across the stream, and their free ends fastened on the other bank. There they had struck firmly into the earth, and now formed a living bridge of great and yearly increasing strength. Two great roots run directly one over the other, and the secondary shoots from the upper have been bound round and grown into the lower, so that the former affords at once a hand-rail and suspending chain, the latter a footway. Other roots have been laced and twisted into a sort of ladder as an ascent from the bank to the bridge. The greatest thickness of the upper root is a foot, from which it tapers to six or eight inches. The length of the bridge is above eighty feet, and its height about twenty above the water in the dry season. One bridge measured ninety feet in clear span. They were generally composed of the roots of two opposite trees (apparently planted for the purpose) bound together in the middle.

On the Wa-lingtia, or larger branch of the river, were several other remarkable bridges. One on the suspension principle, across a precipitous gorge on the road between Cherra and Tringhai, was about 200 feet long. It was composed of long rattans stretched between two trees, at a height of forty feet above the river in the dry season. The footway was a bundle of small canes lashed together, and connected with two large rattans forming hand-rails, but these so low and so far apart, that it must be difficult to grasp both together. The hill Kasaimg brought these straps on it, but the War, or men of the valleys, cross it drunk or sober, light or laden, with indifference and security. Still further up the river, and near the little village of Nonpriang, immediately under Cherra, is another specimen of Kasa engineering and ingenuity,—a bridge of about 80 feet span, composed entirely of strong bamboo, bent into a semicircular arch, affording a sound footing and firm rails for the hand.

The bridge has been metaphorically in use with many nations to indicate the means of passage of the soul of the dead. The Zoroastrians were devout believers in the immortality of the soul and a conscious future existence. They taught that immediately after death, the souls of men, both good and bad, proceeded together along an appointed path to the bridge of the gatherer.

Chinvat-neretu (Hang). This was a narrow road conducting to heaven or paradise, over which the souls of the pious alone could pass, while the wicked fell from it into the gulf below, the place of punishment, in the kingdom of Angromanyus. The good soul was assisted across the bridge by the angel, 'the happy, well-formed, swift, tall, Serosh;' and as he entered, the archangel Vohuman rose from his throne, greeting him with, 'How happy art thou who hast here come to us from the mortality to immortality.' Then the pious soul went joyfully on to paradise.

The modern Parsee has still the bridge Chinvat-neretu that leads to heaven; and on life departing, the dog is brought to gaze on the dead (Sag-di!), that it may know when Chinvat may be secured. And the Mahbheshan has the Dari-Sarat, across which the good walk easily, but it is as sharp a razor for the wicked, whom it cuts in two. There is a bridge for the dead in Java, and in N. and S. America. In Polynesia, a canoe is the object typified, as with the Greeks and Romans, with whom a boat was the supposed means of transport. The river Baitaran of Orissa is the Styx of the Hindus.—Drew, The Northern Barrier; Turner; Drs. Clegghorn, Stewart, and Mason; Jour. of Asia, Soc. xiii. p. 614; G. Rucki. ii. p. 389.

BRIGGS, a general officer of the Madras army, author of Letters on India; Translation of Ferishta, Lond. 1829, 4 vols.; A Short Account of the Sheilhy Family, Lond. As. Trans., vol. vi. 77; Description of a Persian Painting, ibid. vol. v. 314; On the Land-tax of India. Editor of the Persian Tarikh-i-Ferishta. He was Assistant Resident at Poona under Mr. Elphinstone as Resident, and was there when the last Baji Rao moved out of Poona and burnt it down. The Residency, and with it his manuscript of the translation of Ferishta. When peace was restored, he retranslated and printed it.—Dr. Buist's Catalogue.

BRIGGS, H. G., author of Cities of Gujarashtra, Bombay 1849; On the Parsees, Bombay 1852; —Dr. Buist's Catalogue.

BRIGU, in Hindu mythology, is a Vedic sage. Many traditions are related of him; his name is frequently found in the Hindu writings.—Cole. Myth.

BRIHADRATHA, of the line of Pandu, father of Jarasandha, one of the Barhadratha dynasty of Indian kings. According to Bunsen, he ruled B.C. 866 to B.C. 847.—Bunsen, ill. p. 547.

BRHASPATI, also Brahmanspathi, a deity of the ancient Hindus, to whom several positions are assigned.—Dowson. See Hindu; Vrishaapati.

BRIHAT - CHAKRAMED. Hind. Sesbania aculeata.

BRIHATCHITRA. Hind. Cassia sappho.

BRIHATEE. Beng. Solanum ferox.

BRHIAT SANHITA, an astronomical work by Varaha Milirn.—Dowson.

BRIJ BHASHA, the Hindi tongue proper. See Braj.

BRIKHOTSARG, Brishotsarga, or Vrishtotsarga, is the marriage ceremony performed in the name of the bull which the Hindus of N. India liberate on the eleventh day of mourning for a near relative. In the Northern Dekhan, in Oudh.
and the N.W. Provinces, these are known as saur (taurus) bijar, and the British call them Brahman bull. They are a nuisance in the streets.

The strong hair from the back of the hog and wild boar, used by brushmakers, shoemakers, saddlers, etc. Russia is the great mart for such bristles. Those of the elephant's tail, hedgehog, and bandyoot rat, are also utilized.—Faulkner: M. Cuthbert, Dict.

BRISYA, called Vishu in the Karnatic. In Hindu astronomy, the 16th year of the cycle of Jupiter.—Warren.

BRITAIN. The United Kingdom of Great Britain and Ireland is a dominion in the extreme west of Europe, which now sways the destinies of British India, and has many colonies. It is ruled over by a sovereign, with responsible ministers, and two Houses of Parliament, viz. the House of Commons and the House of Lords. And for the government of India, there is, in London, a minister with a council of twelve, composed of men acquainted with India; it also sends to British India for administration, a Viceroy and Governor-General, with a Governor for Bombay and one for Madras; appoints councillors and finance ministers, with judges for the High Courts of Calcutta, Madras, and Bombay, and for the North-West Provinces. For the command of the three British-Indian armies, Great Britain sends three Commanders-in-chief, with several generals of divisions. The United Kingdom of Great Britain has many colonies and dependencies. And its entire dominions are usually designated the British Empire in which it rules by means of viceroy, governors-general with councils, governors with councils, parliaments, and commissioners. The area and population are as under:—

In Europe, it includes Heligoland, with five square miles of territory; Gibraltar, with less than two; and Malta with 115,—the last two being military stations, with garrisons amounting to some 14,000 men. The population of Heligoland in 1871 was 1813; of Gibraltar, 26,216; and of Malta, 29,084.

In America, in the Dominion of Canada, a population but slightly exceeding that of Scotland inhabits a country ten times the extent of Scotland, and is increasing steadily, but not rapidly, at something like an average rate of 14 per cent. in the decade. Of the several provinces of which the Dominion is made up, Ontario (which contains the purest Anglo-Saxon population) had in 1871, 1,620,851 inhabitants, Quebec had 1,191,516, and New Brunswick had 285,594, Nova Scotia had 887,900. Prince Edward Island, which joined the confederation in 1873, had 94,021; and Newfound-land numbers 146,000 inhabitants. Besides these are Manitoba (formerly known as the Red River Settlement), British Columbia, and the sparsely-peopled territory formerly ruled by the Hudson's Bay Company.

With the Bermudas, but excluding the unenumerated provinces of the North-West, the total population of this section of British dominions
is set down at 3,789,670, inhabiting an area of 3,376,295 square miles.

The West India Islands, with an area of 13,109 square miles, have a population of a little more than one million, and there is abundant room for the development of the human race in their splendid climate and genial soil. Jamaica, which had 377,000 inhabitants in 1844, and 441,000 in 1861, reached in 1871 the aggregate of 506,154; and in the last ten years there has been no devastating epidemic. In Barbadoes, the black and mixed population is growing in numbers, while the whites are dwindling.

Passing from the islands of the Mexican Gulf to the continent, there is British Honduras or Belize, a dependency of Jamaica, with a population of 24,710, of whom only 377 are whites. British Guiana reckons 193,491 inhabitants, excluding the 'aborigines,' but including 48,976 'coolies,' immigrants from Asia. The Falkland Islands, with 803 inhabitants, close the list of British American possessions.

The African Continent and the adjacent islands, Britain claims 236,800 square miles of territory, peopled by 1,815,450 inhabitants, of which the island of Ascension has 27, and that of St. Helena 6241. On the mainland, Sierra Leone had 38,936 inhabitants in 1871. The Gambia Settlements, 14,190 inhabitants; the Gold Coast about 400,000. The island of Lagos, which was ceded in 1861, has 62,021 inhabitants, of whom 91 are whites. In South Africa, the colonized or partially colonized settlements—the Cape, Griqualand, and Natal—comprise an area of 229,582 square miles, and have an estimated population of 961,505 inhabitants.

In the Indian Seas, the Mauritius, with its dependent islets, has its area of 708 miles, closely packed with a thriving population of 330,400 inhabitants, the Indian immigration numbering here on the census day 153,703. West Australia has not yet been, in the proper sense of the word, colonized, and has only 24,785 inhabitants to its 978,000 square miles of domain. South Australia, with an area of 760,000 square miles, has 185,626 whites and 3365 aboriginal inhabitants. Victoria, with an area of 81,000 square miles, has 731,528 inhabitants (including 17,935 Chinese and 1300 aborigines). New South Wales has on its 323,437 square miles, 503,931 inhabitants, the population in 1821 having been no more than 29,000. Queensland has 120,104 inhabitants. Tasmania's present population of 99,328 is only 10 per cent. greater than that registered in 1861. Norfolk Island contains a total population of 401 souls. New Zealand white population numbered, in 1871, 256,993, while the aborigines (all, except a couple of thousands, established in the North Island) were estimated at 37,500. In 1851 the immigrant inhabitants were only 26,000 in number.

The island of Ceylon showed a population of 2,802,257. Singapore had 97,000 inhabitants: Penang, 67,000; Province Wellesley, 71,000; and Malacca, 77,000. The island of Hong-Kong and the peninsula of Kow-loon have an aggregate population of 120,000.

India is divided into twelve provinces, two ruled by governors, three by lieutenant-governors, and seven by chief commissioners, the Viceroy being supreme over all; it is distributed for administrative purposes into 53 divisions, 231 revenue and judicial districts, and 1114 executive subdivisions. The village is the 'recognised territorial unit,' and averages in area something like the fourth part of an English parish. The population of the British Empire in India under direct British control, in 1881, was 290,217,901; and within its borders, under sovereigns in alliance or as feudatories, the people numbered 43,323,596, being a total of 322,541,210. In British India and its feudatory states, about 190,000,000 profess some form of the Hindu or aboriginal religions, about 45,000,000 are Mahomceans, and 3,000,000 Buddhists and Jains. The empire possesses 7,769,449 square miles of territory. The United Kingdom, 121,508 square miles; the colonies, 6,685,021; India and Ceylon, 902,820. There are 38 persons to a square mile in the empire; 260 in the United Kingdom, 201 in India, and 141 in the colonies. It should be observed, however, that in some parts of India the density of population more than equals that of Britain. The Empress Victoria, seen against the British sovereigns over 234,762,593 acres; her people dwell in 44,142,654 houses.—Times.

BRITISH GUM, Mien kau, Chuix., is made by heating common wheaten flour up to 400° Fahr. It is very useful in the treatment of stanch bandages.—Smith.

BRITISH INDIA is a name which is applied to a great collection of different races, with different religions and different forms of government. Its people, in manners and habits, are as diverse as their climates, or as the plains and the mountains, fruitful valleys and savage jungles, that they occupy. The British are only recent arrivals. In 1825-26 the East India Company established a factory at Armapurā, on the Coromandel coast. In 1826 a mercantile agency was formed at Surat; in 1834 the emperor of Delhi granted permission to trade in Bengal. In 1845, Gabriel Broughton, a ship's surgeon, obtained for the East India Company the additional privilege of planting factories in Bengal. In 1852 the British territory and those of the allied feudatory chief had a population of 25,541,210, as under:

The island of Ceylon and the Straits Settlements, though in the East Indies, are British colonies, and are not included in British India.

447
The British had been trafficking in the East Indies for some time prior to the grant, by Queen Elizabeth, of a charter to a company of merchants, who, under various re-grants, up to 1653 continued to trade with India, while they were also waging wars with, and acquiring dominions from, its previous rulers. Amongst the earliest of their possessions was the island of Dhoneb, which Charles II. received as a dowry with his Portuguese bride. The British power did not, however, rise to its present magnitude over the ruins of ancient kingdoms, or by dispossessing dynasties that had long held sway. But the fortunes of war set aside a few families whose dominant position was almost ephemeral, and whom the British succeeded in the rule over the various populations. And, briefly, as has been the British dominion, at no period within historic times have so many portions of British India been so long under one paramount rule. The population of all India by the 1881 returns is 252,541,210. Its foreign trade — imports and exports — is £124,840,000, consisting in round numbers of imports, £50,000,000; exports, £74,000,000. Yet, as a recent visitor has well remarked, there has been anything like a British conquest of India. No plan of such conquest was ever formed in Britain. No armament ever left the British shores for such purpose, nor did the British exchequer ever furnish subsidy or supply with that object; and further, no British viking, no one like the Norman chiefs of the middle ages, ever left Great Britain to found a nation or to acquire a principality in the East Indies, but a trading company and their officials gradually became transformed into the most powerful oligarchy that the world has ever seen. The first occasion of the natives of Britain coming in contact with a force of natives of India, was in 1604, when Sivaji attacked and plundered Surat, on which occasion Sir George Oxenden won the applause of Auranz- zeb by an uncommon display of valour. With the foundation of Bombay and the hiring of troops to defend them, was laid the foundation of a central power, which has gradually grown in strength sufficient to control and shelter the various races, and extend its sway from Cape Comorin to the Indus.

Madras was constituted a Presidency in 1639, Bombay in 1662, and Bengal in 1682. In 1773, the Governor of Bengal was made Governor-General of India, with certain powers, chiefly political and financial, over the other two. In 1784, a Board of Control was created in Britain, composed of the king of Great Britain's ministers, who in that capacity bore the title of Commissioners for the Affairs of India; and this system of superintendence continued until the year 1858, when British India was taken under the direct control of the Crown. During that interval the home administrators of India had consisted of a board of 18 members, called the Directors of the East India Company, and the President of the Board of Control. These directors had mostly all the patronage as to appointments, except to the higher offices and commands which were made in communication with the British ministry, who likewise originated all questions of peace and war, possessed the power of reversing the acts of the East India Company and those of the Government of India, and also of sending out instructions on special matters to the Governor-General, without consulting the Directors.

Sir George Birdwood has furnished the following list of the acquisitions of territory:

1754, 30th Dec., the Twenty-four Parganas, from the Nawab of Bengal.
1759, 14th May, Masulipatam, from the Nizam.
1767, 27th Sept., Bardwan, Midnapur, and Chitta-
gong, from the Nawab of Bengal.
1768, 3rd April, Bengal, Behar, and Orissa, from the Emperor of Delhi.
1769, 30th Augt., Chingleput, from the Nawab of Arcot.
1769, 12th Nov., the Northern Circars, from the Nizam.
1775, 21st May, the zamindari of Benares, from the Vizir of Oudh.
1776, 22d May, Salsette island, from the Mahattaras.
1777, 17th June, Nagore, from the Raaj of Tanjore.
1778, 15th Sept., the Guntur Circar, from the Nizam.
1780, Penang island, from the King of Qua Ma.
1792, 17th March, Malabar, Dingilug, Salem, Bara Malal, from Tipu Sultan.
1793-96, Ceylon, from Holland; in 1801, made a colony.
1793, 13th July, Coimatore, Canara, Wynad, Nilgir-
ith hills, from Tipu Sultan.
1795, 25th Oct., Tanjore, from the Raaj of Tanjore.
1800, 12th Oct., the Ceded Districts, from the Nizam.
1801, 31st July, the Carnatic, from the Nawab of Arcot.
1801, 10th Novv., Gorakhpur, Lower Doab, Bareilly, from the Vizir of Oudh.
1802, 31st Dec., Districts in Bundelkhand, from the Peshwa.
1803, 17th Dec., Cuttack and Basarsore, from the Raaj of Sowomtwar.
BRITISH INDIA.

Boundaries.—British India is enclosed on its north, its west, and its east by mountain ranges, amongst which are to be found the highest summits in the world. The seacoast on the south extends from Cape Monze, in lat. 24° 50' N., and long. 66° 43' E., to the Pakhan river in the Mergui district of Tenasserim.

The inland boundary, on the west, extends from the Arabian Sea to the Himalaya, running northward from Cape Monze along the Hala, the Sullman, and the Safed Koh mountains, up to the Kâbul river; thence it skirts the lower slopes of the Himalaya along the plain of Peshawur up to the river Indus, and, crossing this great river, the boundary penetrates the Himalaya up to the north-western extremity of the British district of Hazara, in lat. 35° 2' N., and long. 74° 9' E., separating Kashmir from a group of independent tribes, up to the Chinese province of Hsi Yarkand. The passes through the enclosing mountains are not numerous, and are all difficult, particularly those on the north and on the west. On the north-west are the Khaiber, 3373 feet, and the Kuram, leading into Afghanistan; and on the west are the Gwalari near Dera Ismail Khan, the Tal near Dera Ghazi Khan, and the Bolan, which at top is 5800 feet. The districts on the British side of this western frontier are occupied by many tribes, under the administrative control of the Commissioner of Sind and the Lieutenant-Governor of the Panjab; the foreign side being occupied by similar Baluch, Brahui, and Pathan tribes under democratic constitutions.

On the north, British India is bounded throughout by the Himalayas, the native principality of Kashmir occupying their north-western angle; among their more southern ranges lie the independent states of Nepal and Bhutan and Sikkim; and up to long. 97° 5' E., the mountain face of Assam is occupied by many uncivilised, even barbarous, tribes.

Turning south from Assam in 97° 5' E., the eastern boundary runs conterminous with other tribes, and with native Burma as far as the Karen highlands and the Salwin river, where it joins the frontier of the kingdom of Siam, and runs south with it to the Pakhan river, in lat. 10° 48' 14" N., and long. 98° 55' 40" E.

Several mountain ranges and several rivers traverse the region within these bounds. The Vindhyas north of the Narbada, with the Satpura hills south of that river, separate Hindustan tom the Dekhan, and from prehistoric times their toasts and valleys have given shelter to abandant tribes whom intruding races had driven vast the plains. The Vindhyas run eastwards ruins,ujerat across Malwa and the central parts Sarjooa, rising from 1500 to 4500 feet high, on the Rajmahal Hills jut into the valley of the gharas on long. 80° 45' E., Aoree or pura stretch from east to west for 600 the shore narkantak is their eastern boundary. Mopatax are elevated between 3000 and 4000 Aryabov e the sea.

class the north-east angle of the Himalaya spurs it chains project southwards. They are known knossively as the Abar, Naga, Patkoi, and Barel Siges, culminating, in lat. 22° N., in the Blue mountain, 7100 feet high, and then stretch south under the name of the Arakan Yoma, which also are sheltering many uncivilised tribes. The Arakan Yona range, starting from the Blue Mountain, in 22° 37' N., strikes southwards from the mountains of S.E. Assam, separating Arakan from Independent Burma in the north, and from British Pegu in the south, and terminating at Cape Negrais. The Pegu Yoma, starting from Independent Burma, separates the valleys of Sitang and Salwin, and terminates near the head of the Irrawadi delta. Further southwards, the mountains on the Tenasserim coast mark the boundary line to the Pakhan river, already noticed.

Within these outer barriers are less prominent ranges running north and south, and detached hilly tracts and spurs tenanted by tribes in various stages of civilisation, but mostly of a low type, several of them utterly barbarous, addicted to human sacrifice, and one at least, the Birhor, still cannibal.

On the east of Assam and Bengal, the low ranges and the valleys of Hill Tiperah are occupied by the Tiperah, the Nowattias, and the Rieng populations, numbering 75,792 in an area of 3876 square miles.

The Garo hills, in the S.W. corner of Assam, between lat. 25° 9' and 26° 1' N., and long. 89° 52' and 91° 3' E., are occupied by a race with polyandric customs. The Khasya and Jainits hills have an area of 6157 square miles; they lie between lat. 25° 1' and 26° 14' N., and long. 90° 47' and 92° 52' E. They form the central section of the watershed of the valleys of the Brahmaputra and the Surma. The Garo and the Syn-teng of the Jainits have both fought with the British for independence; the Syn-teng so recently as 1862-3.

In Rajputana, the Aravalli hills, from 6 to 60 miles broad, and rising 1000 to 2555 feet above the sea, run for 300 miles in a N.E. and S.W. direction between the Rajput states and Ajmir-Mahirwarra, dividing the plain of Marwar from the high table-land of Mewar, and merging into the Vindhyas near Abu. It is sparsely occupied by the Mboir and other Mongoloid races. Misairs of the Ajmir-Mahirwarra hill tract are still a small body of 69,234 souls, in an area of 602 square miles. They are brave mountaineers, but were wild and highly predatory, until Lieutenant-Colonel Dixon transformed them into disciplined soldiers.

In Southern India are the Eastern Ghats, commencing in Orissa, and skirting the east coast southwards to Tinnevelly, affording shelter to many large tribes,—Gond, Juang, Kandhi, Saura, Chennur, and Yenadi.

The Western Ghats run from the valley of the Tapti southwards for 800 miles, and terminate in Cape Comorin, presenting several high peaks above Mahabaleshwar above 4000 feet, and in the Nilgherrries up to 8000 feet elevation. In these most northerly parts they give shelter to the Bhil and the Koli, and in their southern forest and hill tracts to the Kadar, Pilliar, Malai Arasar, and Maleali, with Irular, Toda, Badaga, and Kurubar. The great alluvial low-level tract of Northern India, watered by the Ganges and Indus and their tributaries, is known as the Indo-Gangetic plain. It is an immense expanse of flat country stretching from sea to sea, entirely composed of alluvial deposits of very late geological age, and separating the hilly ground of the Peninsula from the various mountain and hill ranges of Sind, the Panjab, the Himalaya, Assam, Burma. The geological formations of the peninsular area are arranged in the
BRITISH INDIA.

Manual of Geology as recent and post-tertiary, eocene, miozoic, paleozoic, and azoic, the last comprising the Vindhyan series, the transition, and the metamorphic or gneissic. The formations in extra-peninsular territories being recent and post-tertiary, plioceocene, miocene, eocene, cretaceous, jurassic, trias, permian, carboniferous, and silurian, and infra-silurian, all the infra-silurian being non-fossilliferous.

Rivers.—The navigable rivers of India are the Ganges, the Indus, the Brahmaputra, the Irawadi. The Ganges rises in the Garhwal State, in lat. 30° 50' N., and 79° 6' E., and enters the Bay of Bengal by many mouths, after a course of 1557 miles. Under the name of Bhagirathi itissue from an ice-cove and the foot of a Himalayan snow-bed, 13,800 feet above the sea. Twelve rivers of British India are deemed holy by the Hindus, and the pushkaram festival is held at them. But the Ganges is the most sacred. To live on its banks, or near it, is a happiness; and to die on its banks, or in its waters, a great privilege. It is used for navigation and for irrigation. Its catchment basin is 391,100 square miles, and maximum flood-discharge 1,500,000 cubic feet per second.

The Jumna, Jamna, or Yamuna, joins the Ganges at Allahabad, after a course of 680 miles. Its source is in Garhwal, in the Himalaya, 5 miles N. of Jumnotri, 10,819 feet above the sea; and its catchment basin is 118,000 square miles. On its banks are the cities of Hamipur, Agra, and Dehli; the eastern and western Jumna canals have been led from it at Faizabad and above Agra, but in the hot weather it dwindles to a small stream. The Jumna at Agra, and at other places, since many years had been bridged by a line of boats, and now splendid railway bridges span it at Dehli, Agra, and Allahabad.

The Brahmaputra river course is 1800 miles; and it is navigable for steamers up to Dibrugarh, 800 miles from the sea. Its drainage basin is 361,200 square miles. Its valley is the province of Assam, and many tribes occupy both its banks. At Golanda, about half-way between the delta head and the sea, the Ganges unites with the main stream of the Brahmaputra, and farther down with the Megna. Their combined waters represent the drainage collected by the two vast river systems from an aggregate catchment basin of 752,000 square miles on both sides of the Himalaya, together with the rainfall poured into the Megna from the Burmese watershed.

The Indus river was known to the Greeks as the Sindhu or Σφογο. It rises in lat. 32° N., and long. 81° E., on the north-western slope of the Kailas mountain, the Sutlej river rising on its southern slope, and the Brahmaputra, under its Tibetan name of Tsang-pu, at some distance from its eastern base, in lat. 31° N., and long. 83° E., and 16,000 feet above the sea, the Dihang river being supposed the connecting link between the Tsang-pu of Tibet and the Brahmaputra of Assam. The Indus pours its waters into the Arabian Sea after a course of 1800 miles, its drainage basin being 372,700 square miles.

The Ravi in the Panjab is the Hydrites of Arrian; the Saptkri, or the Sakrak Airavati. This stream has been utilized to supply the Barī Dōb canal. In March and April its depth on the borders of the district of Amritsar is not more than a foot.

Between June and September it rises to 18 or 20 feet. The main bed alters but little, and the greatest volume of water only floods a mere fringe on either bank. In 1870 it carried away a Sikh shrine near Derā Nanak, and it still threatens damage.

The Irawadi river (Airavati), after a course of 900 miles, disembogues by several mouths into the Gulf of Martaban. It rises, by two branches, from the Patkoi mountains, one of them in lat. 27° 43' N., and long. 97° 25' E., the other a little to the east, the Myit-gye and Myit-gne, which unite about lat. 26° N., and run to the south along a catchment basin of 155,000 square miles. It is 311 miles long. It was explored by Simon de la Loubère, and at Mogong, when at its lowest, the bottom was not sounded at 40 fathoms.

The Kólaḷduṇ or Kuladan, a river of Arakan, is supposed to have its origin near the Blue Mountain (22° 37' N.), and it passes the town of Akyab to enter the Bay of Bengal. It is navigable for 50 miles for vessels of 300 or 400 tons.

The chief rivers of the Peninsula of India, are the Mahanadi, Godavery, Kistna, and Cauvery, and, though not navigable, are valuable for irrigation.

The Mahanadi rises in the Raipur district, in lat. 20° 10' N., and long. 82° 3' E., and, after a tortuous course of 520 miles through the Central Provinces and Orissa, falls into the Bay of Bengal. Its catchment basin is estimated at 43,800 square miles; its flow is rapid, and its flood-discharge 1,500,000 cubic feet per second. An elaborate system of canals has been constructed to husband its water, and designed to irrigate 1,600,000 acres.

The Godavery river, rising near Tribhak, in lat. 19° 55' N., and long. 73° 34' E., 50 miles from the sea, runs through the Hyderabad dominions into the Northern Circars, where it forms a delta of 3000 square miles, and enters the Bay of Bengal by seven mouths (three of which are large), after a course of 898 miles. Its drainage basin, 112,200 square miles. A great dam has been constructed across it at Dowlaishwar, the head of its delta.

The Kistna river is south of the Godavery. It also has been largely utilized for irrigation, by throwing a dam across it at Bezwar. It rises near Mahabaleshwar, in lat. 18° 1' N., and long. 73° 41' E. Its catchment basin is 95,500 square miles, and its maximum flood discharge is 1,188,000 cubic feet per second.

Still further south is the Cauvery, the Xαυρας of Ptolemy, with a river basin of 27,700 square miles. It flows across the southern parts of the Peninsula. It rises in the Western Ghats, in lat. 12° 25' N., and long. 75° 34' E.; and its length is 465 miles. It is one of the twelve holy rivers of the Hindus, who call it the Dakshina Ganga. Crowds of Hindu pilgrims annually visit its banks. Its waters are utilized for irrigation in Mysore and in Coimbatore; and at Srirangam, near Trichinopoly, a prehistoric Hindu king constructed a dam, and led off its waters into the Cauvery proper and Colerun; 385,000 acres in the districts of Trichinopoly, Tanjore, and S. Arcot are now irrigated by it, yielding a revenue of 236,000. In the benefits it bestows on those districts, it rival in usefulness with the canals of the Godavery, the Ganges, and the Indus.

In the river system of British India there is
peculiarity which merits notice. Shortly after issuing from the mountains among which they rise, the rivers run through low-lying valleys to the sea. Their fall is so gentle, that, following their windings for even 1000 miles from the ocean, they are still found in beds only seven or eight hundred feet above the level of the sea. Where the united streams of the Panjab join the Indus, the altitude is only 363 feet at a distance of 450 miles from the sea; the confluence of the Ganges and Jumna at Allahabad, 846 miles from the sea, is 340 feet. This peculiarity is the more worthy of notice, because, throughout these territories, there are no natural inland lakes or seas which can be used for commerce, most of them being only fit for purposes of irrigation. The largest natural waters in the country are equalled, and in many cases surpassed, by the magnificent tanks which have been formed in several places by throwing embankments across great valleys. The many shallow marine lagoons, known as backwaters, found running close around the shores of the Bay of Bengal and of the Indian Ocean, some of them from 20 to 50 miles long, are, however, well meriting notice, and greater attention than has hitherto been given to them, as they afford facilities for a safe inland traffic along the coast line, the violence of the monsoons and the few sheltered harbours on the eastern coast of the Peninsula rendering navigation at times perilous, and periodically impossible. After the East India Railway was opened, steamers ceased to ply upon the Ganges, but they still run on the Brahmaputra and its tributary the Barak, also on the Irrawaddy, and on the Indus.

Ancient India.—Dr. Vincent was inclined to believe that in the very earliest ages, even prior to Moses, the communication with India was open; that the intercourse with that continent was in the hands of the Arabsians; that Thebes had owed its splendour to that commerce; that Memphis, from the same cause, came to the same pre-eminence, and Cairo succeeded to both in wealth, grandeur, and magnificence. Passing by the mythological Bacos, also Semiramis, queen of the Assyrians, who is said to have crossed the Indus about B.C. 1960, and to have been defeated by Sabrobrates, also Sesostris, king of Egypt, who is said to have led an army to the Ganges B.C. 1308, we come to the first mention in the Bible, of India, by that name, in the book of Esther about B.C. 450.

Of the ancient dynasties who ruled in India, Colonel Tod, in his Rajasthàn (t. p. 44), endeavoured to bring together what was known of the Solar and Lunar races. The wretches of almost all the vast cities founded by them are not yet to be traced in ruins,—the cities of Ishwara and Rana on the Sarag, Indraprestha, Mathoora, Scoopora, Poorag on the Yamuna, Hastinapura, Canayucuba, Rajgrah on the Ganges, Maheswar on the Narbada, Aron on the Indus, and Koonauthuli Dwaria on the shore of the Arabian Sea.

Menz calls India Aryavarta, the abode of the Aryas. Bharata or Bhṛata-varsha is the classical Sanskrit name; and in Sanskrit poetry it is mentioned as Jambu-dwipa. The name as known to Europeans is derived from the river Sindhu, pronounced by the Aryans Hindu, and known to Europe as the Indus. The Greeks named the people Ἰδρότης. The seven rivers, Sapta Sinduvah, in old Persian or Zand were called Hapta Hindu; and to the present day, all along the western frontier of British India, a and b continue interchangeable.

The first Greek who speaks of India by name is Herodotus of Miletus, B.C. 459-466. Herodotus, who wrote about B.C. 450, appears to have heard but indistinctly of any but the western part of it, and that only by its being tributary to Persia. He informs us (book iv.) that Durian Hyætæpes had despatched Scylax of Caryandra to explore the Indus, about B.C. 508, and that he departed from Caspatyrus and Patya, which were situated near the head of the Indus. Herodotus continues to say that the Indians who inhabit towards the north, and border on these territories of Caspatyrus and Fason resemble the Bactrians (that is, their neighbours) in manners, and are the most valiant people of all India. The eastern part of India, says he, is rendered desert by sands; which description applies only to the country lying east of the Indus and south of the Panjab, and this was the eastern limit of Herodotus knowledge. Following him, Ctesias, the physician, B.C. 401, brought back from his residence in Persia only a few facts about the products of India.

Prior to Alexander the Great, B.C. 327, there are doubts as to anything historical in the Indian accounts, for the Sanskrit-speaking Indians had no historical pursuits; and east of the Indus was earliest made known by the learned men who accompanied Alexander, and particularly by the writings of Megasthenes, who, B.C. 306-298, was the Greek ambassador at the court of the Hindu prince of Pataliputra-pura. Other of the Greek writers say we have lost, but Strabo, Pline, and Arrian have given us in thin or thick.

Most of the writers about Alexander call the inhabitants of the hilly region to the south of the main ridge of Caucasus and near the Indus, Indians, and also mention an Indian tribe or nation who inhabited the seashore on the western side of the Indus; and close to the Indus, especially on the lower part of its course, there were other Indian tribes, though less considerable than those two. The Indians on the seashore were named Orità and Arabitae, and are recognised by Major Rennell (Memoir, p. 21) as the people called Asiatic Ethiopians by Herodotus. Their country was the narrow tract between the mountains of Baluchistan and the sea, separated from Makran on the west by the range of hills which form Mount Arbo, and on which still stands the famous Hindu temple of Hinglez. The Indians whom Herodotus includes within the satrapies of Xerxes, are probably the more northern ones under Caucasus, for he mentions (Thalia, pp. 101, 102) that those in the south were independent of the Persian monarchy. Arrian (Indic, pp. 8, 9) denies the alleged invasions of Bacos, Hercules, Semiramis, Sesostris, and Cyrus; and Strabo (lib. xv. near the beginning) denies the mythological invasions, adding that the Persians hired mercenaries from India, but never invaded it (see Diodorus, lib. ii.). The other Greek writers, though they speak of Indians beyond the Indus, strictly limit India to the eastern side of that river; and Arrian, though he called the mountaineers Indians, from the place where Alexander entered Paropamisis, is careful to explain that India lies east of the Indus; and Strabo (lib. xv.) declares the Indus to be the western boundary of India from the mountains to
the sea. Pliny, indeed, states that some consider the four satrapies of Gedrosia, Arachosia, Aria, and Paropamisus to belong to India, but this would include two-thirds of Persia. The ancient Sanskrit writers also regard the Indus as the western boundary of India, and class the nations beyond it as Yavana and barbarians; and there is a tradition that Hindus ought not to cross that river, the town of Attock taking its name from this prohibition. Later on, the countries between Hindustan and China came to be called the Further India, or India extra-Gangem; whereas Hind, or India, was restricted to the country of the people called Hindus or those of India intra-Gangem.

Conquerors from the North-West.—From the earliest historic times, Persian, Greek, Scythic, Arab, Turk, Moghul, and Afghan conquerors from the N.W. have been coveting the wealth and the fertile plains of the Gangetic valley, and dynasties professing Buddhism, Hinduism, and Mahomedanism have been striving for possession within.

Scythic races appeared in India in the early centuries of the Christian era. They came from the inhospitable mountain and desert lands in the north and north-west; and after them Turk, Moghul, Arab, and Afghan have continued to the present day to seek dominion in the more genial climate of India, and to engage in its commerce. Darius Hystaspes, b.c. 518, had conquered to the N.W. part of it. The Greeks appeared under Alexander b.c. 327-325, and under Seleucus b.c. 312, and Menander b.c. 181-161. During his two years' campaign in the Panjub and Sind, Alexander captured no province, but he made alliances, founded cities, and planted Greek garrisons. At Taxila (Dera Shahan) and Nikaia (Mong) in the Northern Panjub, at Alexandria (Uchhi) in the Southern Panjub, at Patala (Hyderabad) in Sind, and at other points along his route, he established military settlements of Greeks or allies. A body of his troops remained in Bactria; and in the partition of the empire after Alexander's death in 323 b.c., Bactria eventually fell to Seleucus Nicator, the founder of the Syrian monarchy.

During the next six hundred years the Greeks were followed by Scythic tribes of the Su, the Saka, the Hun, the Naga, and the Geta, who made continuous, several of them successful, efforts to remain. About b.c. 126, the Tartar tribe of Su are said to have driven out the Greek rulers from Bactria. The Greco-Bactrian settlements in the Panjub were overthrown by the Yue-Chi; and during the rule of Kanishka, who held the fourth Buddhist council about a.d. 40, Scythic settlements were formed as far south as the districts now known as the Central Provinces. Scythian races more than once overthrew Scythic rulers and more than once sustained great defeats; but some of the Rajput dynasties, and also the Jat, the ancient Geta, now about 9,000,000 in the Panjub, retained a permanent hold on the country east of the Indus and southwards to the mouth of that river, and Jat princes are still ruling in Bhatpur and Dholpur.

The Sah of Saurashtra (b.c. 70 or 60), the Gupta of Kanauj (a.d. 319-470), and the Valabhi of Cutch (a.d. 480-722), seem to have opposed successive hordes of Scythians. But Mr. Ferguson believes that it was the White Huns who overthrew the Gupta dynasty between a.d. 450 and 475, and that the Saka and the Hun were finally defeated at the great battles of Kauru, near Multan and Maushari, which that learned writer supposes to have been fought between a.d. 526 and 644.

During these struggles for dominion, Vikramaditya, a king of Oojain, about b.c. 57, drove back one Scythic invasion, and his victory gave rise to the Samvat era still current in India. Salivahana, another king of Southern India, is supposed to have successfully checked another Scythic invasion, a.d. 78, from which event the Saka era is reckoned; but the impulse was not permanent, for Kosmas Indicopulestes, who traded in the Red Sea about a.d. 585, speaks of the Huns as a powerful nation in Northern India in his day.

Tradition names Nushirwan, king of Persia a.d. 521-579, as having invaded Western India and left descendants there; but from that time till near the 19th century, it was Arab, Turk, Moghul, and Afghan races who were the invaders, till Portuguese, British, Dutch, Danish, and French appeared on the scene.

The Khilaf Urjan (a.d. 636) sent an expedition to Thanesar and Broach. A few years later (a.d. 662 and 664), raids were made towards Sind, which the youthful Kasim (a.d. 712-714) conquered, again to be lost and again regained (a.d. 828), only to be finally lost again.

The Valabhi dynasty of Cutch, Malwa, and the N.W. districts of the Bombay Presidency (a.d. 490-722), seem to have been overthrown by the Arab invaders of Sind in the 8th century; and since then the Mahomedan dynasties who have ruled in India have come from Central Asia, and their families have reigned for various periods from 20 to 331 years.

The Jat settled in the country as cultivators of the soil, and they continue to the present day engaged in husbandry, but with the Mahomedan dynasties, the Turk Mahmoud, the Moghul Timur, the Persian Nadir, and the Afghan Ahmad seem to have been attracted by the hopes of plunder. Mahmoud of Ghazni twelve times (a.d. 1001-1026) made inroads on the south-western parts of the country, carrying back with him immense wealth; Timur (a.d. 1398-99) sacked Delhi and Meerut, and left fifteen years of anarchy, famine, and pestilence behind him. Nadir Shah (a.d. 1738-39) took away with him from Delhi eight or nine millions in gold and silver money; Ahmad Shah, in his invasions, obtained the Panjub (1751-52) and sacked Delhi (1756); and his invasion of 1759 led to the assassination of Alamgir II, but after he overthrew the Mehrattas at Paniput (1761) he left India never to return to it.

The duration of such the invading dynasties as obtained a hold of the country, was as under:—

- House of Ghazni (Turki), a.d. 1001-1186
- Delhi (Aurangzeb), a.d. 1186-1326
- Slave Kings (scythic Turk), 1290-1529
- House of Khilji (Turki), 1290-1320
- Timur (Moghul), 1320-1444
- Moghul, 1526-1857
- Sikh, 1857-1900
- Lodi (Afghan), 1450-1556
- Baber (Moghul), 1526-1530

Whilst these races were striving for the possession of the Indo-Gangetic plain, several dynasties of prior occupants in the south of India were overwhelmed by Mahomedan armies, and families professing Islam formed kingdoms in Gujerat, Kuburkha, Beder, Golconda, Bijapur, Ahmadnagar, Malwa, Kandeeli, Bengal, Berar, Sind Hyderabad, Mysore, and Arcot.
In the 14th century (1347), Hasan Gaung, surnamed Bahmani, headed a successful rebellion in the Dekhan against Mahomed Taghlaq, and drove the army of Delhi across the Nerbada. Hasan was an Afghan of humble origin, but had attained distinction in the Peninsula, and, declaring for independence of the empire, he fixed his capital at Kaliburg. His descendants reigned 179 years (1347-1526), through thirteen generations. Their territory, when at the height of their power, comprised the central parts of the Dekhan from sea to sea, and from Berrar in the north, southwards to Conjeevarum; and when at length the dynasty became extinct, several smaller houses assumed sovereignty:—

Adal Shahi of Bijapur, 1489-1579
Nizam Shahi of Ahmadnagar, 1490-1505
Kutub Shahi of Golconda, 1512-1580
Imad Shahi of Berrar, 1484-1569
Barid Shahi of Bidar, 1498-1572

Almost contemporaneously (1336-1565) a Hindu race had been dominant at Vijayanagar. But it fell to a combination of four of these Mahomedan dynasties, who were victorious at Taltika. The aged monarch, Rama Raja, was taken prisoner, and put to death by the Kala-Chattras in cold blood. The Vijayanagar monarchy at that time consumed almost all the south of India, but mutual jealousies prevented the victors from extending their respective frontiers, and they, too, in succession shortly disappeared.

During the 14th and 16th centuries, Bengal, Kandesh, Malwa, and Gujerat saw many changing Mahomedan monarchies; but in the 17th century (1662) a great Hindu power was formed in the Peninsula by Sivaji, a Maharrat, a brave and skilful leader, between whom and the Mahomedans no faith was held, and, on his death, a Brahman tribe, with the title of Peshwa, continued to direct the energy which Sivaji had evoked. The emperor of Delhi, Aurangzub (Alamgir I.), during a long life stove to hold the Central Dekhan, but from his death, A.D. 1707, the Moghul dominion there was practically at an end, and for the next fifty years the empire even of all India was uncertain. The separate Maharratas of Poona and the Moghuls of Delhi. The Peshwas, however, never recovered from the destruction of their army at Paniput (1761); and the British under Clive, and Hastings, and Coote, and Laurence, and Hector Munro, obtained a prominence which they still maintain; the Maharrata territories of the Peshwas became partitioned into many separate states, often at war,—Kolhapur, Satara, Gujerat, Gwalior, Indore, Tanjore, and Berrar, with many Hindu chiefships along the valleys of the Kistna and its affluents. During the convulsions, Mahomedans of Arab, Afghan, Pathan, and Turk descent seized on Cuddapah, Hyderabad, Kurnool, Banaganapally, the Carnatic, and Mysore; chief officers of the Maharratas retained the jaghir lands which had been assigned for their own followers and that of their followers; and rajas of Sundur, Mudhol, Akalkot, and sirdars of the Dekhan, still hold these estates. The power of the Wadoja family of Aroost in the Carnatic, closed after a few troubled years. Hyder Ali and his son Tipu, after a brief sway in the Mysore, which they had won, were followed by a Hindu monarch. Numerous Hindu polygar chiefs apportioned among themselves the lands of the Pathans of Cuddapah; Satara, Berrar, and Tanjore disappeared as Maharrata dynasties; and in 1859 the Pathan ruler of Kurnool, dreaming of conquests, was overthrown in battle at Zorapore.

In the north-west, since many thousand years, the Panjab has been a battle-field of the races contending for empire; and within historic times, Greek and Sceytian, Hindu and Buddhist, Turk and Mongul, Aryan, Persian, Afghan, and British have been there. At the close of the 17th century, Ranjit Singh, an able ruler of the Sikhs, established his sway over all the parts of it west of the Satlej, and he conquered also Kashmir. But anarchy followed his death (1839); and the latest contest for dominion was by the East India Company, who fought for safety at Moodkee, Firuzshah, Ailwah, and Sobraon in 1845, and at Gujerat in 1849, on which maharaja Dhunip Singh transferred his sovereignty to the British. A few years later on (1856), the king of Oudh, hereditary wazir of the Moghul empire, was set aside for utter misrule. The following year the titular Moghul dynasty of Delhi threw in their lot with mutineers, and were swept away. And the Mahomedan states of Hyderabad, Bhopal, and Banganapally, with the Hindu kingdoms of Bhatpur, Dhopol, Baroda, Cochin, Mysore, Jodhpur, Oodeypur, and Travancore in Hindustan, in Rajputana and in the Dekhan, respectively dynasties among the princes of India,—the most ancient, perhaps, in the world, being the Rajput houses of Oodeypur and Jodhpur.

Within historic times, except for brief intervals and in very small principalties, the ancient people of India have never had rulers of their own races. Periodical literature not infrequently alludes to British domination as a foreign rule. But the imperial dynasties ruling from Delhi had merely a military occupation; the cultivators of the Rajput states, and of the Gaekwar, of Holkar, and of Sindia, are largely of the Kurni, Kunbi, Kachhi, and Mali races, and of the aboriginal Gond, Koli, Meena, Mhair, Bibi, and others. Hyderabad, in the Dekhan, is a very compact Mahomedan state, with eleven millions of population, but its people are almost all Telug, Cunararch, Mahratta, and Gond, in nearly equal numbers. The language of Mysore is of a most varied character; and the Hindu kingdom of Travancore, another compact state, has rulers of the Nair race, and the bulk of their subjects professing some form of Hinduism, has only 440,952 Nair in a population of 2,311,379.

Cities.—With such continuous revolutions, the people have never had time to collect into large town populations. Tradition tells of Ajodhya as a great city, covering an area of ninety-six miles, but there are now, perhaps, more large towns than India has ever before known, and even yet only 139 of them have more than 20,000 inhabitants. The former unsettled state of the country, and the craving of the people for protection in their peaceful labours, are well illustrated by the histories of the struggle between the British and the Calcutta, Madras, and Bombay. At these three cities, fortresses were erected by the British, and the people have gathered around them. The great capital of British India, which now contains a population of 794,645 souls, was, at the close of the 17th century, a cluster of three small mud hamlets. The only previous notice of ‘Kalikata’ is a brief entry of it as a rent-paying village in the emperor
Akbar's great statistical survey of 1596. But in 1868 the English merchants at Hoogly, being compelled to quit their factory in consequence of a rupture with the Mogul authorities, retreated, under their president, Job Charnock, to Sutiahati, a village on the east bank of the river, now a northern quarter of Calcutta. In 1696 they built the original Fort William, and a few years later purchased the three villages of Sutiahati, Kalikata, and Govindpur from Prince Azim, son of the emperor Aurangzeb. But with the security given by its fortress and its bordering river, the population is now approaching a million of souls.

Madras, as it is called by the British, is still only known to the people as a collection of several hamlets, Chinpatsu, Mutulpat, Vepery, Nangambikam, and others. In March 1689, Francis Day, chief of the commercial settlement at Aram- gon, obtained from the representative of the Vijayanagar dynasty a grant of the site on which Madras now stands, and a factory with some slight fortifications was at once constructed. It may be doubted if there were a thousand people in all the hamlets. But the natives settled around the factory, a better fort was built, and at the census of 1881 the population numbered 406,117.

Bombay Island formed part of the dower of Catharine, queen of Charles II. of England, who in 1668 transferred it to the East India Company for an annual payment of £10. The population was estimated at 10,000 souls. The Company strengthened the fortifications; in 1673 the inhabitants numbered 60,000; piracy was put down; its island position further protected it, and in 1881 its population had increased to 773,196.

Similar increments are going on in and around all the sites taken up by the British as canto- ments and military stations. Secunderabad, for instance, had no existence until the British Sub- sidiary force, during the reign of Secunder Jah (1808), encamped on its present site; but its inhabitants in 1868 numbered 32,000 in 7938 houses.

In the war with Burma of 1852-53, Rangoon, on a branch of the Irrawaddy, was taken by the British, and its population was estimated at 25,000; in 1872 it had 89,897 (99,745) inhabitants, but in 1881 its population reached 134,176 souls.

The great towns, Calcutta, Bombay, Madras, Rangoon, continue to attract immigrants from all parts of Asia. The 1881 census showed the foreign residents to be—Asiatics not natives of India, 540,989; British, 75,754; Europeans, 38,463; Africans, Americans, Australians, 6961.

The 540,989 Africans and Asians not natives of India comprised—

**Abdansians**, 60; Jews, 7,828; Afghans, 3,191; Malay, 1,493; Arabs (Bombay 6008), 5,311; Meckrani in Kuruch, 5,285; Armenians, 1,254; Manipuri (in Assam), 11,866; Balouch, Panjap, 235,123; Nepalese, 31,192; "Boonj", 144,772; Parsee, 68,476; Bhutan in Assam, 339; Persian, 5,946; Brahui, 845; Siamese, 58; Kashmiri, 142; Syrian, 69; Chinese (Burma 12,169), 928; Others, 13,340; 2,056.

Most of the Parsees are permanent residents, and portions of the others must also be so classed, but the numbers suffice to show the continuous stream of immigrant races.

On the other hand, several of the Kolarian and Dravidian races emigrate freely. Rangoon, Tavoy, Mongui, Malacca, Penang, and Singapore contain many of them; and the more distant Mauritis, Bourbon, S. Africa, West Indies, and Central America have received numbers. From 1876-77 to 1880-81, the following—

1876-77 Left British India 10,036 Returned, 4,485
1877-78 25,219 4,400
1878-79 22,092 5,568
1879-80 17,728 7,768
1880-81 16,794 7,061

**Population.**—The census taken of India in 1881 has not yet (October 14, 1882) been checked. It showed a population of 252,641,210 in an area of 1,477,768 square miles. In these numbers, however, are included provinces which are British proper, and also territories belonging to native princes and chiefs under subsidiary, or other alliance, as here shown:

* + Including population details for the Paghani districts wanting.

Food and Races.—Taking the populations and their means of subsistence, from the purely agricultural point of view, the country, as a whole, is under-peopled. In certain districts in Bengal and the N.W. Provinces, there are more cultivators than the land actually requires; but in Assam, the Panjabs, Sind, the Madras plateau, and Burma, there are vast tracts of arable land unoccupied. Even in portions of Bengal there are still reserves of virgin soil. The difficulty is to induce the population to distribute itself; though several of the races of India, the Tamil, and Telug, and Dhangar, in particular, freely emigrate to remote countries.

The supremacy of British India, while it has brought peace within the borders and improved the condition of the inhabitants, has not been unattended with difficulties, and the famine, which was kept down by the wars, pestilences, and famines of former times, has rapidly increased. In the ten years 1871 to 1881, the increase was 12,788,865, notwithstanding the occurrence of a severe famine, causing great loss of life in Mysore, in the Carnatic, in parts of Bombay, and in the N.W. Provinces. In the year 1789, one-third of the land lay unoccupied, but many jungle tracts and swamps have since been reclaimed. Some districts and provinces have become over-peopled; the surplus of some of the races is emigrating to Ceylon, to the Malay countries, to the Mauritius, Bombay, Africa, South America, and the West Indies; and the Government of India is looking at carelessly-peopled Burma as a country to be filled. In Burma, Assam, Berar, and Sind, the increase was the greatest; but in the years 1876 and 1877, a severe famine, and consequent disease, occurred in parts of the Peninsula, which carried off numbers, and in the decade the decrease in the Bombay Presidency was 93 per cent., in that of Madras, 23 per cent., and in Mysore, 1,130,987, or 17 per cent.

During the decline of the Moghul empire and the raiding expeditions of the Marathas, several of the predatory races were actively plundering; armed bands of dacoits made their attacks on large towns; and the armed and disciplined bodies known as Pandaras, composed of all races, traversed the country, till they were finally swept away in the war of 1817–18–19.

But the greatest alteration in the mutual habits of the people has occurred amongst the north-west frontier tribes, who have long been inured to war. When first, after the fall of the Sikh power, the British came in contact with the Pathan, Brahui, and Baluch races of the N.W. Frontier, not a year passed by without raids on the Indian territories, and armies were needed to repel them; but these raids are now extremely rare, and the democratic Councils are ready to afford redress. Perhaps the most remarkable instance of civilising a border race has occurred with the Karen on the borders of British Burma, where the Baptist missionaries, and notably Dr. and Mrs. Mason, have done more to subdue and civilise that race than armies could have accomplished.

India is pre-eminently agricultural. The (uncheck) census shows that the adult male population in 1881 was 62,092,461. Of these, 37,395,655 were engaged in agriculture, 8,137,082 were then labourers, and 8,749,270 were engaged in industrial occupations. Thus the latter, 156,450, are domestic servants, 3,425,738 in commerce, and 2,401,630 in professions and Government service.

The bulk of the agriculturists profess some form of Hinduism. In the extreme south of the Peninsula, the Tamil-speaking race, who assume the titular designations of Mudali and Pillai, are there the most numerous; further north are the Carnatic-speaking race, who are all agricultural; several tribes in Telengana, the Reddis, the Naidu, the Kamavaras, westwards as far as Beder, and southwards to Mysore and the Carnatic are engaged in tillage; further north are the Uria race and the Gond, the great Kunbi and Mali races of the Maratha country; and throughout the plateau and the plains of Northern India, are the Jat, Kurmi, Kachhi, Kori, Lodhi, Mali, Kallabattu, Sadog, Khasa, and Gujar, with the pastoral Ahir, Ahur, Dhangar, Gadariya, Gop, Goela, Kurub, and Rankar, the labouring population being the numerous fanilless, broken, non-Aryan tribes and clans, as the Pahari, Dher, Miar, Mang, Dom, and others, who are dispersed, are scarcely yet freed from a condition of predial slavery, and evince no inclination to abandon their own fetish and shamanistic cults.

The mountain ranges harbour many tribes, who have fled to them for shelter, or been thrust into them by more powerful races; and similarly the corner provinces, as of Kattyawar and Oriasa, have a diversified population. In Kattyawar, of the old ruling races there remain the Jaitwa, Churamasa, Salunki, and Wals, who exercised sovereignty in the country prior to the immigration of the Jhala, Jarija, Pranara, Kathi, Gohl, Jat, Mahomedans, or Mahsalt. So, in Oriasa and Ganjam are the Bhumi; Bhuinya, Gound, Kandu; Khaira, Kol; Pan; Santal, Savara, Telug, and Urya.
The frontiers of British India are nowhere con- 
temporary with any highly-civilised state. On 
the north Kashmir, on the north-west Nepal, and 
in the south-east Burma and Siam, alone can 
claim possession of a literature. Both within the 
British bounds and beyond are many tribes and 
nations under democratic rule. The most power- 
ful of these are on the north-west, and may be 
thus shown:—

Independent Tribes, dwelling along the outer face of 
the north-west frontier, and inhabiting hills, viz.—
Adjoining frontier of Hazara district,—Hussanai.
Adjoining frontier of Peshawur district,—Judoon, 
Bunoorwall, Swati, Ranizai, Osmankhill, Upper 
Mohmand.
Adjoining frontier of Peshawur and Kohat districts, 
Afridi.
Adjoining frontier of Kohat district,—Buzoti, Sipah, 
Orakzai, Zaimusht Afghan, Turi.
Adjoining frontier of Kohat and Dehra Ismail Khan 
districts,—Waziri.
Adjoining frontier of Dehra Ismail Khan district,— 
Sheerani, Oshterari, Kanarsi, Bozdar.
Adjoining frontier of Dehra Ghazi Khan district, 
Khattaristan, Kohat, Lyghi, Gurchani, Murri, 
Bugti, Muzari.

British Tribes within the frontier, and British subjects, 
inhabiting partly hills and partly plains—
Hazara district,—Turnouli, Gukkar, Doodn and Suttli, 
Kaghan Synd, and other tribes of Hazara.
Peshawur district,—Yusufzai, Khaled, Mohmand of 
the plains.
Peshawur and Kohat districts,—Khattuk.
Kohat district,—Bungush.
Dehra Ismail Khan district,—Bunnoochi, Murwutt, 
Butani, chiefs of Tank, chiefs of Kohali, chiefs of 
Dehra Ismail Khan, Nootkani, Lesou.
Dehra Ghazi Khan district,—Dreshuk, Muzari.

The number of their fighting men has been 
estimated at about 170,000, which would 
represent a total population of one million. The fighting 
men of the principal tribes being—

The Himalaya on the north is the meeting 
ground of the Aryan and Turanian races, who in 
some places are curiously intermingled. In the 
extreme north-west are found the Dard, an Aryan 
race abutting on the Afghans on their west, and 
with the Balti, a Turanian race of Mahomedanized 
Tibetans, on the east. Here also are the Champa 
nomades who wander about the high level valleys 
of Rupshu, and likewise the Chadaki cultivators in 
the valleys of Ladakh. The other Aryan races are 
the Pathari or mountaineers, the Kashmiri 
and the Dogra and Chibali who inhabit the outer 
hills.

The people occupying Garhwal and Kamaon are 
the Kanwari inhabitants of Bushahr, the Nilang, 
who do not differ from those of Huned, and the 
inhabitants of the Bhutta Mahal of Kamaon and 
Garhwal, who are of mixed Tartar and Indian 
descent.

Farther to the east of these, the numerous 
valleys interspersed throughout the mountains of 
Nepal are occupied by various races. The features 
of the aboriginal tribes mark them as of Mongoloid 
origin. Proceeding from west to east, the 
following tribes occur in Nepal, Sikkim, and 
Burma, viz. the Tibetans or Cis - Himalayan 
Burta, the Sunwar, the pastoral Garung, the 
Madar, the Jaryia, the Newar, the Dhowar, 
Manjhi, Bhutia, Bhuam, Murmi, Newar, Kiranti, 
Limbu, Lepcha who inhabit Sikkim, and the 
Bhutanese or Lhopa.

Assam and the north-east frontier province of 
British Burma have many tribes in their valleys 
and on their borders, some of them still barbarians. 
Assam province is bounded on the north by the 
Himalaya, the frontier tribes from west to east being 
respectively the Bhutta, Akha, Dofa, Mri, Abor, 
and Mishmi. On the north-east the Mishmi hills sweep 
round the head of the valley. Along its southern 
boundaries are (from west to east) the Kuki or 
Lushai tribes, the state of Hill Tiperah, the Kom 
Naga, Angami Naga, Singpho, Shan, Khamti, 
Kemong, and the races in Mynipur.
Between lat. 25° and 26° N. are tribes in the 
Garo, Karajas, and Jaintia hills, and in the valley 
are the Aham, Chittagong. Chittagong (51,482), 
Kai Bartia (198,525), Koch or Rajbansi (300,000), 
and Kolita (179,000).

Other tribes occur the Abar, Naga, Patkoi, 
and Barel ranges, as also the Chittagong and 
Arakan hill tracts, and the Yoma mountains separ- 
ating British India from Independent Burma. 
These are the Shandoo, Khyen, Ka-mi, Khyen, 
Mri.

There are other and larger tribes of non-
Hinduized aborigines interspersed amongst the 
civilised nations. In 1872, exclusive of those in 
the Madras Presidency and in the Feudatory States, 
they were estimated at 17,716,825.

Bengal . . . 11,116,883 Barar . . . . . . 168,059
Assam . . . 1,499,588 Mysore . . . . . . 80,067

Panjahl . . . . 959,720 Bombay . . . . . . 711,702
Central Prov., . . . . . . 1,669,835

Nearly all that is known of their early history 
or origin has been derived from their physical 
appearance, which has proved them to belong to 
one or other of the great families of mankind, 
Mr. B. Hodgson writing from the Himalaya, and 
Mr. Logan writing from Penang, have laid great 
stress on this means of ascertaining their first 
appearance in India, in preference to the linguistic 
test.

Nearly sixty different tribes are specified among 
the aboriginal races in the provinces of Bengal 
and Assam. The most numerous of these are the 
Santal, of whom there are 850,000 in British 
territory alone, exclusive of others in the Tributary 
Mahals. The Santal dwell in villages in the 
jungles or among the mountains, apart from the 
people of the plains. They give their name to a 
large district, the Santal Parganas, 140 miles 
north-west of Calcutta.

The Gonds are in numerous tribes, many of them 
semi-barbarous, others of them under rulers who 
claim a Rajput descent. They are partly under 
the Hyderabad Government, partly under the 
British in Chutia Nagpur, Berar, Orissa, and 
Gazan, with 1,500,000 of them in the Central 
Provinces. The Maria Gond still use strong 
bamboo bows, which they hold with their feet 
and draw with their hands.

The Bhumi of Orissa, of Chutia Nagpur, 
dispersed through various districts of Bengal,
numbering in all about 200,000, were known formerly as the Chuar, and distinguished for their martial habits.

The Bhil have no language of their own. They are scattered through a wide extent of country, from Dowlatabad in lat. 19° 57' N. to Mewar in 26° 26'. They are careless, indifferent cultivators, are decidedly predatory, and have suffered severely from all the regular governments; but they are unyielding, and only in 1882 compelled the Mewar Government to give in to their wishes. There are from forty or fifty clawless tracts throughout the length and breadth of the Indian Peninsula than the billy region occupied by the Bhil. The natives of Bombay style them Kala-Pur, or black men.

Similar observations might be made regarding the widely-dispersed Gujar race, existing from the Panjab to Gujerat, which takes its name from them; or the great Kol tribes of the Vindhyas; or the Koli of the northern parts of the Bombay Presidency; or the Meo, the Mhair, the Mina, the Ramusi, the Kollari, the Maravar, or the Bairdah (Pindara). In the Animaly Hills are a whole series of broken tribes. Hamlets of long-haired, wild-looking Pulari, who live on jungle products, mice, or any small animals they can catch, and worship demons; Mundaver, who shrink from contact with the outside world, and possess no fixed dwellings, but wander over the innermost hills with their cattle, sheltering themselves under little leaf sheds, and seldom remaining in one spot more than a year. Thick-legged, small-bodied Kaders. 'Lords of the Hills,' a remnant of a higher race, who file the front teeth of the upper jaw as a marriage ceremony, live by the chase, and wield some influence over the ruder forest folk.

Princes and Chiefs of India.—Around and within the borders of British India are many Native States,—feudatories, tributaries, or in subsidiary alliance; and France and Portugal have small possessions, aggregating 1264 square miles, with populations numbering 729,639 souls.

The Native States are as under:

Central India and Bundelkhand (1881 census, 9,200,881), area, 89,098 sq. m.; pop. 3,607,571.

Gwalior, 33,112,500,000 Baghelkhand.

Indore, 8,435,635,450, Agency, 1,250,235,000

Bhopal, 8,500,769,200, Bhopawur.

Rewah, 10,000,035,000, or Bhil.

Dhar, 2,500,150,000, Agency.

Dewas, 2,576,121,800, Ganti Ag., 4,520,157,634

W. Malwa, 22,424,210,000, Baghelkhand.

The British Empire's influence was vast, occupying a large portion of India. This influence expanded through various means such as trade, military conquest, and the establishment of a network of treaties and alliances. The Raj put in place a system of governance that was both authoritarian and paternalistic, aiming to balance the interests of the British Crown, the Indian nawabs and maharajas, and the local populations. The British aimed to stabilize the region, which had been destabilized by various local conflicts and power struggles. The British were keen to ensure that the nawabs and maharajas were aware of their position and duties, as expressed in the passage: "The Indian and Junr. Patharia, pop. cavalry, 1,443 Bijna, Behat, Banswarra, Ajeygurh, Bijawur, Baonee, Bhurtpur, Beronda, Bhujjee, Bhughat, Bijnor, Chief, Bundelkhand."

The British also sought to recognize and foster the rights and interests of the Indian nobility, as stated in the text: "The maharaja of Patiala sought for the recognition of himself and his house as an Indian noble of the British empire. Above all rewards for his great services to the empire in those days, he asked for perpetuity for his house and honours, and Sir John Lawrence, Lieutenant-Governor of the Punjab, worked out the chief's ideas into a recognition of the right of adoption on the failure of natural heirs; and, after a reference to Her Majesty's Government, the following suzum or patent of nobility, of 11th March 1862, was framed:— Her Majesty being desirous that the governments of the several princes and chiefs of India, who now govern their own territories, should be perpetuated, and that the representation and dignity of their houses should be continued: In fulfilment of this desire, this suzum is given to you, to convey to you the assurance that, on failure of natural heirs, the British Government will recognize and confirm any adoption of a successor made by yourself, or by any future chief of your state, that may be in accordance with Hindu law, and the customs of your race. Be assured that no British influence will disturb the engagement thus made to you, so long as your house is loyal to the crown, and faithful to the conditions of the treaties, grants, or engagements which record its obligations to the British Government. (S.d.) Canning.

The following is a list of princes to whom it has been given, but others since have been honoured with it, and all who hold that patent are nobles of the British Indian Empire:

- Ajeaygurh, Raja, Bundelkhand.
- Akukote, Raja, S. Mahratta Country.
- Allpoom, Jaghir, Bundelkhand.
- Bansawara, Chief, Kolhapur.
- Banswarra, Chief, Rajputana.
- Baroda, Naveeb, Baroda.
- Beglah, Chief, Panjab.
- Bheraj, Jaghir, Bundelkhand.
- Bichut, Jagdir, Bundelkhand.
- Belaspore, Chief, Panjab.
- Beed, Chief, Panjab.
- Bera, Chief, Rajputana.
- Bhaghat, Chief, Panjab.
- Bhoyer, Chief, Panjab.
- Bhownaggar, Chief, Shahapur.
- Bhughat, Chief, Panjab.
- Bhuj Chief, Panjab.
- Bhurtpur, Maharaja, Rajput.
- Bikinur, Maharaja, Rajputana.
- Bijaup, Chief, Bundelkhand.
- Boonde, Raja, Rajputana.
- Buxan, Chief, Panjab.
- Buxaundh, Chief, Jaghirdar, Ceded Districts.
- Bussariah, Chief, Panjab.
- Bussar, Raja, Central Provinces.
- Cooch-Bahar, Chief, Panjab.
- Coob-Bahar, Chief, Panjab.
- Coob-Bahar, Tributary Mahals, Oussia.
- Dewas, Chief, Central India.
- Dwipoor, Chief, Bundelkhand.
- Dwipour, Raja, Rajputana.
- Dhoory, Chief, Bundelkhand.
- Dojana, Naveeb, Dojana.
- Durkote, Chief, Panjab.
- Dhaurnpurpor, Chief, Rajputana.
- Donguppor, Chief, Rajputana.
- Duffie, Jaghirdar, Satara.
- Duttia, Raja, Bundelkhand.
- Edar, Chief, Kolhapur.
- Fereen, Chief, Panjab.
- Gerowee, Jaghirdar, Bundelkhand.
- Gourihar, Chief, Bundelkhand.
- Gunvar, Raja, N. W. Provinces.
- Gourihar, Jaghirdar, Bundelkhand.
- Gwakwar, Baroda.
- Hologar, Central India.
- 5 Hazara Raja Jaghirdars, Bundelkhand.
- Hyderabad, Nuzum, Hyderabad.
- Jeychopore, Chief, Rajputana.
- Jheend, Raja, Panjab.
- Jilawar, Rana, Satara.
- Jiggs, Jaghirdar, Bundelkhand.
- Joolni, Chief, Panjab.
- Joshipur, Chief, Rajputana.
- Juss, Jaghirdar, Bundelkhand.
- Koonth, Chief, Panjab.
- Korrwello, Chief, Rajputana.
- Kishengurh, Chief, Rajputana.
- Khana, Chief, Kolhapur, Raja, Kolhapur.
- Koomharsein Chief, Panjab.
- Kohonwala, Chief, Panjab.
- Kotab, Chief, Rajputana.
- Kothur, Chief, Panjab.
- Kothra, Jaghirdar, Bundelkhand.
- Kunnya Dhana, Jaghirdar, Bundelkhand.
- Kuppoorttuda, Raja, Panjab.
- Kutch, Chief, Gujrest.
- Logassie, Jaghirdar, Bundelkhand.
- Makrane, Chief, Central Provinces.
- Mandi, Chief, Bundelkhand.
- M. of Bengal.
- M. of Bombay.
- M. of N. W. Provinces.
- M. of Orissa.
- M. of Rajputana.
- M. of Sind.
- M. of S.-West Provinces.
- M. of West Provinces.
- M. of Bengal.
- M. of Bombay.
- M. of N. W. Provinces.
- M. of Orissa.
- M. of Rajputana.
- M. of Sind.
- M. of S.-West Provinces.
- M. of West Provinces.
- Moodhola, Chief, S. Mahratta Country.
- Mundee, Chief, Panjab.
- Mungul, Chief, Panjab.
- Mungul, Chief, Rajputana.
- Mylog, Chief, Panjab.
- Nabha, Raja, Panjab.
- Nabha, Raja, Rajputana.
- Nahin, Chief, Panjab.
- Nareshwar, Chief, Satara.
- Nowanngur, Chief, Kolhapur.
- Nyagaon Behai, Jaghirdar, Bundelkhand.
- Oodeypur, Maharaja, Rajputana.
- Powrree, Chief, Bundelkhand.
- Puludootthata, Chief, Puludoottha.
- Purn Banda, Jalligor, Satara.
- Partagbarg, Raja, Rajputana.
- 5 Putwurths, S. Mahratta Country.
- Patiala, Maharaja, Panjab.
- Rajpeepa, Chief, Kolhapur.
- Rewah, Raja, Bundelkhand.
- Satara, Jaghirdar, Satara.
- Sawantwar, Chief, Sawantwar.
- Serohi, Chief, Rajputana.
- Shahpurka, Raja, N. W. Provinces.
- Siodin, Central India.
- Suhowai, Chief, Bundelkhand.
- Teles, Chief, Bundelkhand.
- Teg Singh, Panjab.
- Toree, Chief, Bundelkhand.
- Travancore, Maharaja, Travancore.
- Turoch, Chief, Panjab.
- Ulwur, Chief, Rajputana.
- Mysore, Maharaja.

- Prithve, Chief, Kolhapur.
and seven nobles had personal salutes allowed of 13 to 21 guns.

Timur had, as his arms, supposed to represent the three regions over which he ruled. His full titles in the height of his power were Sultan, Kamar, Amir, Khoja-i-Din, Timur. Kur Khan, Sahib-i-Kuran, meaning 'sovereign, ruler, noble, polar star of the faith'; Timur, of the lineage of sovereign princes, lord of the grand conjunctions.' Amongst other titles, three of the emperor of China are, Tien-tse, son of heaven; also Kwa-jen, the man who stands by himself, and Kwa Kuin, solitary prince. Anak-Angon, son of heaven, is a title of the raja of Lombok.

In 1808, Fattah Ali Shah, emperor of Persia, instituted the order of the Lion and Sun, Sueru-Khurshid, to decorate foreign envoys who had rendered services to his government, and it is now given to Persian subjects. In the treaty of peace with Persia of 4th March 1857, the emperor is styled 'His Majesty, whose standard is the sun; the sacred, the august, the great monarch, the absolute king of kings of all the States of Persia.' At the same time, his ambassador, being the court of France, was styled 'His Excellency, the abode of greatness, the favourite of the king; Firokh Khan, Amin-ul-Mulk, the great ambassador of the mighty State of Persia.'

In Mewar, the bala band, a head fillet, the diadem of the Greeks, is the symbol of honour; in Burma, the tsal-tee chain is a badge of nobility; in China, small globes, or buttons, as they are called, of mother-of-pearl and other substances, are used for distinction. In Burma the figure of a peacock and of a hare are painted on the king's throne, a peacock is borne on the royal standard, and No dwet bun yeng, sun-descended monarch, is one of the Burmese royal titles.

The titular designations of the Mahomedan rulers of Southern Asia are almost all formed of Arabic words, with a few derived from the Persian; but in addressing the chiefs of British India, Arabic, Persian, Hindi, and English words are now all intermixed. Along the borders and within, the ordinary royal titles of Mahomedan princes are amir, khan, khanan, malik, malikah (feminine), mir, nazam, nizam, paishah, shah, shahinshah, sultan, bahadur, jung, khan, daulah, umra, jah, and nawab; royal Hindu titles being adira, jam, rae, raja, rao, rana, rawal, maharana, maharawal, rana-raja, siwai, thakur, wall, zamarin; and both Mahomedans and Hindus assume tukhallas or literary titles.

The Indian Government addresses the Rajput ruler of Jumna and Kashmir as 'His Highness Ranbir Singh Bahadur, Grand Commander of the Most Exalted Order of the Star of India, Companion of the Indian Empire, Siqar-i-Sultanat (Shield of the Sovereignty), Councillor of the Empire of India, Honorary General in the Imperial Army, Chief of Jumna and Kashmir,' similarly Kalab-ali-Khan, the Mahomedan ruler of Rampur, is styled 'His Highness Farzand-i-Dil-Pazir-i-Dault-i-Daulat-i-Inglisb, Kalab Ali Khan, Nawab of Rampur, K.G.C.S.I. and C.I.E.,' the Persian words meaning Heart-loved Son of the British Government. The Governors-General have always followed it. In 1805 Sir George Barlow's seal was engraved with Persian words, signifying the crown of the princes, mighty in dignity, high in honour, exalted in position, the noble of nobles, Sir...
BRITISH INDIA.

George Hilaro Barlow, Baronet, Bahadur, Governor-General of the Countries under the Government of the English Company in India, Devoted Servant of the victorious Emperor Shah Alum Bahadur, 1805, year 1220 Hijri. The British Indian Government has now adopted the practice of the native princes in freely granting titles.

Administration. — In 1784, Mr. Pitt, while Prime Minister of Great Britain, brought in a bill to establish a Board of Control over the East India Company. It consisted of six members of the British ministry. It became known as the India Board, and its duties allotted to it were to check, superintend, and control all acts, operations, and concerns which in any way related to the civil and military government of the East India Company's territories; and a secret committee was at the same time authorized, consisting of the President of the Board of Control, with the chairman, or the deputy-chairman, or one of the East India Company's directors.

The directors of the Company consisted of twenty-four members, elected by the votes of the shareholders. The directors elected their own chairman and deputy-chairman, each of whom received a salary of £500 a year, the pay of each of the other directors being £300. Their patronage was great. Governors for India, commanders-in-chief, judges, and bishops were nominated by the British ministers, but the directors appointed all other covenanted and commissioned officers for the civil, military, medical, and naval services — and they averaged about 374 annually.

The mutiny of the Bengal army, and the rebellion in Northern India, was yet scarcely suppressed in 1858, when, on the 1st September of that year, the Court of Directors was abolished, and the government of British India was transferred from the East India Company to Queen Victoria, and a proclamation to the princes, chiefs, and people was made at Allahabad on the 1st November. A Secretary of State, a member of the British Cabinet, with a council of fifteen members, took the directors' places. The Council is now appointed for ten years, but may be re-appointed for a further five years for special reasons. In 1861, the Indian Councils Act was passed, augmenting the Councillors by the addition of non-official members, the Governor-General was raised to the rank of Viceroy; and by another Act the supreme courts of Calcutta, Madras, and Bombay were amalgamated with the courts of Sadr Adalat of the three presidencies, and the united body designated the High Court of Judicature.

In the proclamation of 1858, Queen Victoria accepted all the treaties made by the East India Company, disclaimed all desire for extension of territory, or to impose the Christian religion on the people; the public service was declared open to all the Queen's subjects, of whatever race or creed; and royal clemency was extended to all, except such as had taken part in the murder of British subjects. In that proclamation, the British sovereign was designated —Victoria, by the grace of God, of the United Kingdom of Great Britain and Ireland, and of the colonies and dependencies thereof in Europe, Asia, Africa, America, and Australia, Queen Defender of the Faith. And subsequent to this, on the 28th April 1876, Queen Victoria assumed the title of Indir Imperatrix, Empress of India, with the royal style and titles of Victoria, by the grace of God, of the United Kingdom of Great Britain and Ireland, Defender of the Faith. Proclamation of this was made by the Viceroy on the 1st January 1877, in an imperial camp at Dehli, at which the princes of India were present. The maharajas Sindia of Gwalior and Ranbir Singh of Cawnpore were added to the rank of generals; and the orders of the Bath were bestowed on Sindia and the rajbas of Bundi, Bhatpur, Benares, Kolhapur, Dhar, Dendra, the jam of Nawangar, and the nawab of Banagana-pilly. That part of the 1858 proclamation which related to employment in the public service was a repetition of 3 & 4 Will. iv. c. 85, sec. 87, which declared that no native of the said territories, nor any natural-born subject of His Majesty resident therein, shall, by reason only of his religion, place of birth, descent, colour, or any of them, be disabled from holding any place, office, or employment under the said Company.

The British administration in India was long purely that of a military government, and the entire policy necessarily conform to military necessities. Only towards the middle of the 19th century has the condition of the country permitted its British rulers to throw energy of the government into the path of peaceful development of its resources. The East India Company had governed the country on the simple terms of cheapness and non-intervention. But India has since taken its character from British rule, and has expressed a more positive policy than before. Great improvements in the laws have been made; more economical justice, more extended education, increased irrigation works, and larger appliances of European capital and energy to the undeveloped resources of the country. The prominent Secretaries of State for India have been Lord Stanley, Sir Charles Wood (Lord Halifax), Earl de Grey, Viscount Cranborne, Sir Stafford Northcote, Duke of Argyll, Marquis of Salisbury, Marquis of Hartington.

British India since 1860 has been subdivided into local administrations: Assam, Bengal, Bombay, British Burma, Central Provinces, Madras, N.W. Provinces, Oudh, Punjab, British Iraq, the colonies and protectorates. The Governor-General is temporarily assigned. The Government of India has retained direct control over Ajmir, Berar, the Andaman islands, Nicobar islands, Coorg, the provinces of Central India and Bundelkhand, also over the political relations with Baroda, Hyderabad, Manipur, and Rajputana, and with the princes and tribes on the borders; all these are supervised by a Viceroy and Governor-General in Council. But the presidencies of Madras and Bombay, each with a Governor, Commander-in-chief, and a Council composed of officials, are in direct correspondence with the Secretary of State as well as under the Governor-General. Berar is administered for the nizam of Hyderabad. The provinces are administered by a covenanted civil service, an uncovenanted civil service, and military officers of the staff corps in civil employ. Each province is subdivided into zillas or districts, under collector-magistrates or deputy collectors and commissioners, with joint, deputy, and assistant magistrates. In the Bengal Presidency, these districts are in most cases grouped into divisions, each under a commissioner, supervised by a revenue board or financial commissioner. In
Great Britain, counties average 1000 square miles in extent. In India, the total number of Districts is about 238. They vary greatly in size and number of inhabitants. The average area is 8775 square miles, ranging from 6612 square miles in Madras to 1994 square miles in Oudh. The average population is 802,977 souls, similarly ranging from 1,508,219 in Madras to 161,597 in Burmah. In Bombay there are two revenue commissioners, between whom the superintendent of the collectorates are divided. These revenue commissioners correspond immediately with Government, and are also police commissioners of their divisions.

Madras, Bombay, and Bengal have each a Legislative Council, as well as a High Court of Judicature. These Councils, as well as the Legislative Council of the Governor-General, consist of executive members of Government, of two representatives of the British mercantile community, and two or three representatives of the natives, as extraordinary members. The United North-Western Provinces and Oudh have a High Court, and the Panjab a Chief Court. The Governor-General’s Council for making laws, legislates for all India in general, and for the provinces which have no legislatures of their own, in detail, these provinces being represented by officials. Every Act of the three subordinate councils must receive the sanction of the Governor-General before it can become law; and the Secretary of State for India may advise Her Majesty to veto any act of the Governor-General’s Council.

The following may be accepted as representing the portions of India governed directly by British officials, and those administered indirectly through native chiefs with subsidiary sovereign powers:—

In 1880-81, the Administration cost in India, £1,291,483, which included the salaries of the Governor-General, Governors, Councils, Secretaries, Political Officers, and Revenue Boards. The more eminent of the presidents of the Board of Control were, Viscount Castlereagh, the Earl of Minto, Robert Dundas, afterwards Lord Melville, George Canning, Earl of Ellenborough, Charles Grant, Sir John Cam Hobhouse, and Sir Charles Wood, afterwards Lord Halifax. The famed amongst Governors and Government-General have been, Warren Hastings, Lord Clive, Earl Cornwallis, Marquis Wellesley, Marquis of Hastings, John Adam, Lord William Bentinck, Sir Charles (Lord) Metcalfe, Marquis of Dalhousie, Earl Canning, and Sir John (Lord) Lawrence. Of the financial members of the Government of India may be named, James Wilson, Samuel Laing, W. N. Massey, and Sir Richard Temple. The presidents of mark in the Council of the Government of Fort St. George, were Lord Macartney (1781); Major-General Medows (1788 and 1790) at Bombay and Madras; Lieutenant-General Harris (1798); Lord Bentinck (1803); and Major-General Sir Thomas Munro (1820). Bombay has seen Mountstuart Elphinstone (1819), Sir John
Malcolm (1827), Sir George Clarke, and Lord Elphinstone (1856). Robert Lord Clive (1758 and 1765) distinguished himself alike as a soldier and in civil administration as Governor of Bengal; and since 1854, when Bengal was put under a Lieutenant-Governor, the most eminent have been, Sir George Campbell (1871), Sir Richard Temple (1874), and Sir Ashley Eden (1877-1882).

There were six Lieutenant-Governors of the Punjab in the nineteen years 1859 to 1877, amongst them Sir John (Lord) Lawrence and Sir Robert Montgomery (1859-1865). Between 1856 and 1876 there were seventeen Chief Commissioners of Oudh; and the distinguished Sir James Outram, Sir Henry M. Lawrence, Mr. (Sir) Charles Wingham, and Mr. (Sir) William Muir were amongst the number.

In the Central Provinces there were thirteen Chief Commissioners in eleven years, 1861-1872. Amongst others of the officers who distinguished themselves in civil and political administration, may be named Sir Bartle Frere in Sind, Sir John Peter Grant, Sir Henry Pottinger in Sind and Chinas, Sir Charles Edward Trevelyan, Sir Arthur Playre in Burma, Sir George Balfour in the military finance and control departments.

The appointments of governors, bishops, commanders-in-chief, judges, filled up by the British ministers, were highly paid, the Governor-General's salary being £25,000 annually, but did not carry any pension. It was customary, however, when pre-eminent services had been rendered, for the Directors to reward them in that manner. Amongst civilians who were thus honoured, may be named Warren Hastings, Marquis Wellesley, Marquis Dalhousie; and the following military officers had special pensions for distinguished Indian services:

The East India Company was uniformly just and liberal-handed to its servants. The action of the British nation towards them has been fitful and uncertain. Lord Clive served the East India Company from 1744. He laid the territorial foundations of the British Indian empire, and returned to Britain in 1767. At first he was well received, but he was subsequently impeached before Parliament, and only escaped trial by his death in November 1774. Warren Hastings' service extended from 1750 till his final return to Britain in 1785. He, too, was well received by the King and Queen; but he, too, was impeached by Messrs. Burke, Fox, and Sheridan for alleged acts of oppression. The trial went on for seven years, and he was acquitted in February 1788. He lived till 1818. Shortly before his death he entered the House of Parliament to give evidence, and all the members rose from their seats to do honour to the aged man. Lord Clive had laid the territorial foundations of the British Indian empire in Bengal. Warren Hastings was the administrative organizer of the dominion, reorganized the Indian service, reformed every branch of the revenue collections, and created courts of justice. The Court of Directors allowed him £2000 a-year.

**Arms.—**The native rulers who preceded the British, and all the existing chieftaincies, have had strongholds on which they placed resistance; and Clive's defection for Artoot, the Bhitarpur resistance to Lord Lake, the Gurkha mountain campaign. Mulraj in his hold of Multan, all have indicated that the ways of the people are suitable for that mode of defensive warfare. The British, likewise, have formed fortresses at Calcutta, Madras, and Bombay; also strongholds at Delhi, Allahabad, and Secunderabad; and there are many dismantled forts in various parts of the country, all of which could be held against a sudden rush. But the British have hitherto largely trusted to their readiness to hold the open country. The composition and strength of the British Indian forces have, however, constantly been changed in organization and strength. From the first appearance of the British in India, their soldiers have consisted of European and native troops, the latter being wholly raised and maintained as a part of the Indian army. From 1754 till 1861, the European branch of the army of India has been composed partly of detachments of royal troops of Great Britain, and in part of Europeans specially raised for service in India as a part of the Indian army, both arms being maintained out of the revenues of India.

In 1755 the first British regiment, the 39th Foot, reached India. In 1794 the Indian armies numbered 70,000, including 13,500 Europeans. In 1808, at the end of the Mahratta war, Bengal and Madras had each 64,000, and Bombay 26,500; total, 154,500 soldiers. In 1844 there were 235,446 native soldiers. In 1857 a mutiny occurred of almost all the Bengal native army. At its outbreak, in May of that year, there were in India, as a nominal establishment—European soldiers, 45,000 of all ranks; sepoys, 244,000; semi-military police, 80,000. About 250,000 native troops arrayed themselves against the 45,000 British and about 20,000 native soldiers who stood firm. It was a contest for supremacy, and it was severe; but before the end of the year a Sikh army from the Punjab had increased the reliable native forces to 150,000, before July 1858 the British soldiers had increased to 80,000 of all arms, and before the middle of 1859 India was re-won. After that revolt the established strength was made to stand at about 66,000 Europeans and 120,000 natives of all ranks; and the year 1879-80 saw the respective numbers at 64,520 and 124,978.

| Artillery | 12,232 Europ. 932 Nat. |
| Cavalry | 4,129 | 15,548 |
| Infantry | 47,519 | 102,283 |
| Engineers and Sappers | 33,205 |

The armies of the princes and chiefs of India have always far exceeded those of the British, their numbers being about 300,000, fairly drilled and fairly disciplined. The table given in the London Times of 29th July 1879 shows the strength of the forces kept up by the various princes of India, with the population and revenue of the states furnishing these contingents, viz.:
In addition to the troops which the princes and chiefs retain for their own purposes, several of them subsidize parts of the British Indian army; and, in the year 1880-81, their tribute, chout, contributions for the pay of local corps and success fee amounted to £472,209.

It has been suggested that the troops of the princes should consist of their own subjects, restricted to the number required for their own territories, and that they should be kept at the highest state of discipline, and well armed, so as to be able to hold their own dominions against any foreign aggression, whilst the British attended to the general defence of India. Of the 7428 strength of the Hyderabad Contingent, more than half have been recruited in Hindustan. Nearly all the men in the Bhopal regiments belong to British territories; and recruits for the Nair Brigade are obtained from Tanjore, Madura, and Tinnevelly.

In 1882, the native non-commissioned officers, drummers, buglers, rank and file, serving in the British Indian army, had been drawn from the following provinces:

 Wars.—The Natives of British India have hitherto been largely employed in the British Indian armies, because they have been considered equal to any troops that could be brought against them, and because of their comparative cheapness, being healthier, and receiving smaller pay. The following are the annual costs of an artillery, cavalry, and infantry soldier of the native army:—

<table>

</table>

Difficulties are experienced in separating ordinary and war expenditure, but the total cost of the Afghan War, 1879-82 has been estimated at £21,511,000, namely, £17,551,000 for military operations, and £4,060,000 for frontier railways.

In their wars the East India Company had been almost continuously successful. A reverse was sustained by a brigade in Afghanistan in 1842, and many thousand soldiers and followers perished in retreat. But the most severe trial occurred in 1857 and 1858, in which years the Bengal native army revolted, and many of the Hindu and Mahomedan races rebelled. Much has been put forward as to the causes of that dissatisfaction. In the beginning of 1857 the number of British soldiers had fallen very low. The British regiments withdrawn from India for the operations against Russia had not been replaced in India, and the recruits to maintain the full strengths of the regiments remaining in India had not been supplied, and it has been supposed that the disaffected soldiery of the Bengal army took that opportunity to revolt; but a general impression has been that it had its suggestion in the losses during the Afghanistan and Punjab wars, though doubtless a great change had been effected in the temper of a naturally arrogant oriental race, who respect, almost worship, might, by introducing amongst them rules and regulations suitable only for an army drawn from nations advanced in civilisation.

The contest for supremacy was severe and long continued. In May 1857 there were on the establishment in India—European soldiers, 45,000 of all ranks, furnishing about 36,000 rank and file; native army, 244,000; semi-military police, 80,000; and about 250,000 sepoys arrayed themselves against 45,000 Europeans and about 60,000 reliable native soldiery. The latter, before the end of 1857, were increased to about 150,000, by the addition of a Sikh army from the Punjab, and before July 1858 there were over 80,000 British soldiers in India. The successive features of the revolt and re-establishment of authority were as under:—

Revolt commenced at Barrackpur by the 19th Ben. N.I., 26th Feb. 1857.
Outbreak of the native cavalry at Meerut, 10th May 1857.
Dehli massacre occurred 11th May 1857. At Ghazi-ud-Din Nuggur the mutineers were defeated on the 30th May 1857.
The Shahjahannpur massacre occurred 31st May 1857. 5th June a battle at Mutiny at Jhansi; on the 8th the massacre occurred.
Massacre at Cawnpur of the Fûttebgur fugitives, 12th June 1857.
Massacre at Gwalior occurred 14th June 1857.
Massacre of the British at Cawnpur by Nana Rao, 27th June 1857.
Massacre at Cawnpur, 15th July 1857, by Nana Rao, of British women and children.
20th August 1857—Dehli recaptured.
Lucknow entered 25th August 1857, by Generals Havelock and Outram.
Dehli assaulted 14th Sept. 1857.
The second relief of Lucknow effected by Sir Colin Campbell, 17th Nov. 1857.
Cawnpur relieved by Sir Colin Campbell, 28th Nov. 1857, and the Gwalior Contingent rested.
The battle of Nawabganj in Oudh, 14th June 1858.
Gwalior recaptured by Sir Hugh Rose, 25th June 1858.
10th April 1861—The Indian and British-European armies were amalgamated, and the native armies reorganized.

Since the suppression of the mutiny, the relative proportions of the European and native troops have been changed. The European and native forces in India were as under in the years—

European, Natives.

1859-60, 35,604 199,839
1858-59, 166,290 196,423
1842-43, 46,726 220,947
1856-57, 45,522 232,221
1851-52, 66,066 129,594
In 1857 there were on the establishment, or authorized strength, 6944 European and 8963 native artillery; 3136 European and 30,473 native cavalry. But since the revolt of the native army, the policy has been to augment the European arm, remove all native soldiers from the scientific corps, and reduce their numbers.

The composition and establishment of the Indian army in 1857, 1865, 1879–90, and 1881–82, were as under:

<table>

In 1796 the formation was tried of double battalions, and this continued till the early part of the 19th century.

In 1882 four cavalry and eighteen infantry regiments were reduced, and, excluding local troops, the establishment was fixed at 31 cavalry and 113 infantry regiments, with eight European officers to 550 natives of all ranks in the cavalry, and to 822 natives in the infantry.

Revenue.—Up to the year 1856 the increase of territory had been so continuous that any comparison of the revenue, expenditure, and debt, of preceding with those of subsequent years, would be un instructive, except as a matter of history. Since 1792–93, the Carnatic, the Ceded Districts, most of the Dekhan territory ruled over by the Peshwas, the greater part of the North-West Provinces, all the Panjub and Sind, the Central Provinces, part of Burma, Assam, Tenasserim, Orissa, Oudh, Satara, and other parts, have been added to British territory; and even since 1840, when the Panjub wars closed, about a hundred thousands of square miles of territory have fallen to the paramount power, with a population of over seventeen millions.

It may, however, be interesting from a historical point of view, to contrast the conditions of 1792–9, 1868–9, and 1881–2.

Land Tenure.—During all ages, the rulers of India have regarded the land as the property of the state, and the bulk of the public revenues has ever been obtained from it. In 1856 it furnished more than one-half of the total revenues of the East India Company. In 1861–65, during which other taxes were levied, out of a total of £4,652,897, the large revenue of £2,087,728 was obtained from the land. In 1789–79, when the ordinary revenue amounted to £58,624,372, that from the land was £22,330,586. During the 18 years ending 1778–79, the ordinary revenue has been increasing, other branches of revenue having improved faster than that of the land. In that period the land ranged between £10,570,147 in 1862–63 and £22,330,586 in 1878–79, but the total revenue ranged between £13,829,472 in 1861–62 and £58,624,372 in 1878–79.

There are three great forms of tenure on which the land is held, viz., the zamindari, the pattadari, and the ryotwari. The last-named prevails in Madras and Bombay, but in the North-West Provinces and in the Saugor and Nerbudda territories, the zamindari and pattadari tenures exist co-extensively. In Madras and Bombay, therefore, there is a joint ownership of the ryot cultivator and the Government.

Under native rulers, a fixed proportion of the gross produce was taken; but the British Indian Government deals with the surplus or net produce which the estate may yield after deducting the expenses of cultivation; and the directions to the revenue settlement officers provide that at least one-third of this net produce shall always be left to the cultivator as his profit. The native powers usually took at least a half of the produce, and not infrequently more; the British rulers have reduced the charge to an average of about 5 per cent.

The late James Mill, writing on this part of the revenue, remarked: 'As far as this source goes, the people of the country remain untaxed. The wants of Government are supplied without any drain either upon the produce of any man’s labour or the produce of any man’s capital.' Except the British, under the administrations of Lord Cornwallis and Lord Canning, during whose governments were introduced systems of permanent
settlements of portions of the country and a right to
purchase free holdings, every dynasty has kept
this source of revenue intact. Grants of the
royalties of the lands, in the form of jaghir, were
usual; but the joint-proprietorship in the soil has
remained in the hands of the communities and
descendants of the individuals who cleared it a
thousand years ago. Although Mahomedan
dynasties have been ruling large portions of India
for a thousand years, Mahomedans of Arab, Turk,
or Moghul descent, have few lands. Converts to
Mahomedanism from Indian races, and Pathan,
Brahui, and Baluch tribes, retain their proprietary
customs.

In Bengal, in 1793, Lord Cornwallis made a
permanent settlement with zamindars, a class of
middlemen whom he found collecting land re-
venues, by which these pay direct to Government
a sum equal to a little more than one-half what
they receive as rent. By that measure Government
cessated to have any direct participation in
the agricultural improvement of that part of the
country. Statesmen have deemed that arrange-
ment a grave error, which has lost to the State
several millions of revenue yearly; and there is
now much show of reason in the contention that
the landowners might reasonably be called to con-
tribute more largely than at present to the expenses
of the State. The land is a source of revenue on
which the State can, in all circumstances, con-
fidently rely, and than which none is more easily
collected or more willingly paid; and the most
recent orders permit a redemption only for the
land needed for dwelling-houses, factories, gardens,
plantations, and similar restricted purposes.

About 1839, a thirty years' lease was made
in the N.W. Provinces, and this has been followed
in the Punjab. It is estimated that in this mode
the assessment was about two-thirds of the
surplus, after deducting the expenses of cultiva-
tion, profits of stock, and wages of labour; and in
the revised settlements it was reduced to one-half
the yearly value.

In the Madras Presidency the zamindari tenure
exists in several localities, but principally in the
Northern Circars, since the settlement of 1802.
Another system, that of village-renters, is in
operation, in which the villagers stand in the
place of the zamindar. In the Madras ryotwar
system, the Government, as the joint landlord,
treats directly with the holder, who is regarded as
the proprietor so long as he pays the regulated
assessment. He can sub-let, sell, transfer, or
mortgage it. The assessment is fixed in money,
and does not vary from year to year, unless when
water is obtained from a Government source of
irrigation. An annual settlement is made, not to
reassess the land, but to determine upon how
much of his holding the ryot shall pay.

In Bombay the ryotwar system prevails, but
the assessment is open to revision every 30 years.

The whole or any part of his holding at pleasure.
Where, however, as in Bengal and the North-
Western Provinces, a landlord class intervenes
between the Government and the occupant of the
soil, great uncertainty as to the tenants' rights
prevails, and gross oppression is frequently
practised. The attention of the Indian Govern-
ment has been long directed to the subject. But
though there are certainly not less than seven
million peasants in Bengal with small holdings,
their troubles and grievances are borne with un-
broken silence and in unquestioning submission
to the law.

The North-Western Provinces and the Punjab
have practically one land system. In that part of
India, the village community has preserved its
integrity more completely than elsewhere. Gov-
ernment therefore recognises the village, and not
the zamindar's estate or the ryot's field.

Oudh, the Indian province most recently
acquired, has a peculiar land system, arising out
of its local history. The Oudh talukdars resemble
English landlords more closely even than do the
zamindars of Bengal.

How to provide revenue for legitimate State
expenditure is a constant subject of thought to the
rulers. The poverty of India makes it a country in
which it is a matter of extreme difficulty to
ascertain the necessary revenue. New taxes are not
easily found, and they are accepted with great unwilling-
ness. The country needs opening up by roads, rail-
roads, and navigation canals; improvements of
rivers and of channels, education and sanitation,
are urgently needed; and to accomplish these,
money has been obtained by loans. Up till the
years of the mutiny, the public debt was usually
about eighteen or twenty months of the amount
of the gross revenue. Since the mutiny, the
debt has been equal to twenty-five or twenty-six
months' revenue:

Of the amount raised for revenue, 24 millions in
no sense represent taxation, being derived partly
from opium, partly from the earnings of public
works, and the rest from the gross receipts of
departments, such as the post-office, which are
on the whole an expense to the state. It in no
case exceeds 7½ per cent. of the value of the
gross produce; in Madras it is little over 6 per
cent., and in the Punjab 5½ per cent.; while in
Bengal and the Central Provinces it sinks to
less than 4 per cent. The other items of taxation
bring up the percentage to 4s. per head of the
population.

Dividing it into classes, and appor-
tioning each tax among the classes who pay it,
it may be said generally that the landed class pay,
including land revenue, 5s. 6d. per head; the
labourers pay 7d. per head on salt, or, assum-
ing a family of three persons, 1s. 9d., equivalent
to about four days' wages of a man and his wife.
Artisans contribute 2s. 6d. per year, or say the earnings
of five working days; traders, 3s. 6d.
In 1878-79 the total gross revenue was £58,624,379.

**Land revenue, Tributes and contributions from Native States,** 2,929,380,556

**Forest timber and products, also sawn,** 605,433

**Opium,** 9,380,401

**Services of law, telegraph,** 426,694

**—post-office,** 911,506

**—railways,** 10,522

**Public works,** 571,076

**Canals, Irrigation,** 165,619

**Other sources,** 22,494,548

About £10,000,000 was raised by taxation, viz; 

**Capital tax in Burma,** £2,112,000

**Assessed taxes,** £960,990

**Customs,** 2,206,561

**Excise on spirits and drugs,** 2,613,549

**Provincial rates,** 2,638,835

**Stamps (Judicial),** 3,110,540

**Salt,** 6,941,120

In that year the total incidence of taxation on the 200,000,000 of population was under 2s. per head; adding the land revenue, the total burden was about 4s. per head.

The salt revenue is entirely an impost of the British Indian Government, and the quantities and the duties were as under:

It is a tax which is recognised to press unequally on the means of the people, and there have been repeated modifications of it. In 1882-3, the salt duty was reduced to a uniform rate of 2s. per maund everywhere except Burma and the Trans-Indus districts of the Punjab, where the existing lower rates are maintained. This involved a reduction of duty amounting to 30 per cent. in Bengal, and to 20 per cent. elsewhere. The loss of revenue was estimated at £1,428,000, but this has not been the result. The chief blot on Indian taxation is that it falls too heavily on the poor, and leaves many of the wealthy classes wholly untouched. A rich person, for instance, with a couple of millions in the funds, pays literally no taxation but an infinitesimal charge on the salt which his family consume.

The revenue from opium has been as under:

The opium manufactured in British territory is a Government monopoly; but about an equal quantity is prepared in Native States, on which a limited tax of 3d. per maund is levied. This produces a net sum of £6,000,000 to £7,000,000, and the Indian Government's share is the only real source of revenue which can be raised in India without inflicting some hardship and causing a great deal of discontent. It has been regarded by many persons in Britain as differing from spirits and other drugs, but there is no difference between them.

**Languages.**—The languages of British India have been investigated by many of the learned of Europe, and a fairly continuous series of inscriptions on rocks, on pillars, and on copper plates, enable us to trace back the Indian alphabets to the 3d century B.C. The Asoka inscriptions, 250 B.C., were in two characters. The northern variety, or Ariano-Pali, is recognised to be older than the south Indian variety, or Pali, is believed by some scholars to be of western origin, others holding it to be an independent Indian alphabet; and an attempt has been made by General Cunningham to trace its letters back to an indigenous system of hieroglyphics in prehistoric India.

Arabic is the only one of the Semitic tongues to any extent used, and even that only in the Koran, as the sacred book of the Mahomedans. Sanskrit is known to all the learned Brahmins of India, and is the language of their sacred texts. Neither Arabic nor Sanskrit is vernacular. But the Sanskritoid tongues, Hindi, Urdu, Bengali, Cutchi, Gujarati, Konkani, Marhatti, have many infused Arabic and Persian words, and the Urdu has grown out of the union of all of these. The Hindi abounds in Sanskrit words, and has many dialects. The tongues spoken in the whole of Upper India, including the Punjab, from the Himalayan to the Vindhyan range, may be said to be Hindi, as also the languages of Kanaon and Garhwal, all along the sub-Himalayan range as far as the Gogra river; the impure dialect of the Gurkas, the Brij-bhasa (or Baka, as it is pronounced on the Ganges), the Punjabi, Multani, Sind, Jatika, Herati, Marwari, and, it is said, Konkani; the Bengali is a form of Hindi, but so highly polished as to be classed as a distinct tongue; and Baluchi and Pushu have relations with the Sanskritoid tongues. At the close of the census of 1871, it was estimated that 41 millions were speaking Bengali, 4 millions Urya, 2 millions Assamese, 60 millions Hindi, and 40 millions (40,882,537) Urdu. These and their dialects comprise the languages of the Aryan race. Dr. Hunter (Imp. Gaz.) supposes the languages of the non-Aryan races to indicate that the earlier occupants of India belonged to three great stocks, which he designates the Tibeto-Burman, Kolarian, and Dravidian. He says of the Tibeto-Burman tribes, that in some prehistoric time they had dwelt in Central Asia, side by side with the fathers of the Mongolians and the Chinese; that they crossed over the Himalaya into India by the north-eastern passes, but have continued to cling to the skirts of the Himalaya and their north-eastern spurs; and several of the hill languages in Eastern Bengal still preserve Chinese and Mongolian terms. The Tibeto-Burman tongues prevail southwards through the Eastern Peninsula, till they become intermixed with the Mon Anam, and with the Siamese or Tai group, and finally meet the Malay races in the extreme south of the Malay Peninsula. The Tibeto-Burman tribes have but little amalgamated, some of them being still in a semi-savage state. The known languages and dialects in use amongst them are 468.
above a hundred, and only a few of them are written tongues. The principal are the Aka, Burmese, Cachari or Bodo, Dhimal, Garo, Gurung, Kanawari dialects, Khyeng, Kuki dialects, Lepcha, Manipuri, Mikir, Miri, Mishmi dialects, Murmi, Naga, Newar, Singpho, Tibetan or Bhutia, Tipura or Mrung.

The Kolarian, another non-Aryan race, are scattered in the north-eastern parts of Central India, and in parts of its Western Peninsula. They also are supposed to have entered India through the north-east pass of the Himalaya. The Santal, the largest of the Koi tribes, dwell in the extreme north and north-east of the table-land, where it slopes down into the Gangetic valley; the Kurku, another Kolarian tribe, inhabit a patch of country about 400 miles to the west, and the Santal and Kurku dialects are almost the same. The Savara, once a great Kolarian nation, mentioned by Ptolemy, are now a broken tribe of woodcutters, dwelling in the forests of the northern part of the Eastern Ghats. Other tribes with dialects of the Kolarian group, are the Mundari, Ho or Larka Kol, the Bhumij, the Korwa, Kharia, the Jang, the Kuri, the Kurku, and the Mehta. These mark distinct and isolated tribes, which have never within historic times held any large portion of the country.

The chief Dravidian languages are the Tamil, Telugu, Canarese, Malealam, and Tulu, with several uncultivated dialects of the Tamil and Canarese, viz. : Kudaga or Coorg, Toda, Badaga, Kota, several Gond dialects, also the Kandh or Kur, Singh or Dhangar, and Rajmahal or Maler, the Yerkalaka, Korawa, Tenadi, and other broken tribes.

Neither the time of the incoming of the Dravidian tribes nor the routes which they followed, are known. They now occupy much of the northern part and lowland of Ceylon; and nearly all the Western Peninsula, several of them in great nationalities. Mr. Hislop and Dr. Caldwell suppose that they entered India through the N.W. passes, and that some Dravidian and Kolarian tribes converged and crossed each other in Central India, ultimately taking up the positions which the Kol and the Gond hold in the mountainous tracts there,—the great bodies of the Dravidians, however, swerving to the south of the Peninsula, and into Ceylon. Forty-eight millions of people speak Dravidian tongues.

The census of 1871 showed the people speaking Telugu to be 21,610,000 souls in the Madras Presidency, besides whom the south-eastern portions of Hyderabad, westwards to Beder and Dangapura, have Telugu as their vernacular; and Teling colonies are in Mysore, about three millions more. Tamil is spoken in the Madras Presidency by 14,715,000, with colonies in Ceylon and the Straits, and in all the large cantonments of Mysore and Hyderabad.

The Canarese-speaking people of the Madras Presidency number 1,699,000; but the southern portion of the Bombay Presidency, 2,101,931, and the S.W. part of the Hyderabad Dominions, and most of Mysore, are Canarese, and their total number may be 53 millions. The Imp. Gazetteer says 9 millions; which seems an over-estimate.

Malealam is spoken by 2,324,000 in the Madras Presidency, and by about 1,902,393 in the Travancore State.

The Tuluva people are ceasing to speak Tulu, only 29,000 now using it, and 640,000 speak the Uriya and hill languages.

How languages and dialects become intermixed even at the present day, is shown by the variety of tongues spoken in the N.W. corner of the Peninsula, forming part of the Bombay Presidency. Maharri is spoken there by 7,751,497 persons; Gujarati by 3,103,311; Canarese by 2,101,931; Sinhi by 2,051,726; Hindustani by 871,421; Baluchi by 149,519; Marwari by 141,229; and Brahui by 24,620. Other eastern languages are represented by 5418 persons speaking Arabic, 684 Bengali, 65 Burmese, 31 Chinese, 26 Kashimir, 26 Kungi, 325 Malealam, 2065 Negro dialects, 13 Nepali, 23,966 Panjabi, 8198 Pushtu, 4250 Persian, 45,541 Goanese, 2 Singhalesse, 2 Urija, 7830 Tamil, 110,237 Telugu, 595 Tulu, and 263 Turkish. European languages are represented by 26,340 English, 2 Danes, 3 Dutch, 145 French, 322 Germans, 58 Greeks, 80 Italians, 24 Maltese, 4005 Portuguese.

Mr. E. L. Brandreth, in vol. x. of the Royal Asiatic Society's Journal for 1877, gives the following list of the Non-Aryan languages in India:—

**Dravidian.**

Arabic, Persian, and Urdu are written in modifications of the same character; Sanskrit, Hindi, Marhatti, similarly; but Gujarati, Bengali, Kashmiri, or Canarese, Maleadom, Tamil, Telugu, Tulin, and Uriya have each their own writing character; and since the early part of the 19th century, propositions have been made to substitute for them all the Roman printed and Italian cursive characters, but the suggestion has not been carried out. Sir Erskine Perry, about the middle of the century, successfully advocated the introduction of the Arabic numerals in the official documents of the Madras and Bombay Presidencies.

In summing up this part of the subject, it is necessary to mention that since the middle of the 19th century every educated native of India aspires to an acquaintance with the English; and the public examinations for scholastic and collegiate honours show a comparative neglect of their respective vernacular tongues.

Literature.—The literature of India has marked features. In the north, the Indo-Aryan or Sanskrit language and literature was developed by the Brahmins. To them the Hindus are indebted for their sacred Vedic books, with their Sanhitas, Brahmanas, Sutras, and Upanishads, and for the later Puranas. The Sanskrit writers produced works of great beauty in epic, dramatic, lyrical, and ethno-didactic poetry; from early times, the science of language, philosophy, and astronomy, were highly cultivated by them. Medicine seems to have been an independent development. They advanced the arts of music, painting, sculpture, and architecture. Law and religious worship received great attention; and six darsanas or schools of philosophy grew up amongst them, and are still fully recognised.

During the 18th and 19th centuries, many of the learned of Europe and India engaged in the study of the Sanskrit writings; and Aufrecht, Ballantyne, Bhan-Daji, Buhler, Burnell, Burnouf, Colebrooke, Goldsticker, Hang, Kern, Lassen, Max Muller, Rajendra Lal, Roer, Rost, Roth, Schlegel, William Taylor, Weber, Westergaard, W. Williams, and H. H. Wilson have been prominent.

Until the middle of the 19th century, it was customary for Indian students of Sanskrit literature to commit the books to memory, and manuscripts older than the 11th century have not been found. The Vedas themselves detail the mythology and domestic customs of the East Aryans till their arrival in India. The Mahabharata, an epic by a Vyasa, describes a war between the Pandava and Kaurava branches of the Lunar race. Another epic, the Ramayana, by Valmiki, relates the exile of Rama, a Solar prince, and his expedition to the south to recover Sita, his wife, whom Ravana, a ruler of Ceylon, had carried off, and the recognition of his two sons, Kush and Lava. The Puranas relate to modern Hindoos. The Vishnu Purana is supposed to have been written about A.D. 1045, and the date of the Bhagavata Purana is unsettled. Kalidasa, the author of the Raghuvansha, the Komara Sambhava, the Megha Duta, and Sakuntala, was the father of the erotic lyric. Jayadeva, author of the Gita Govinda; the astronomical works of Varaha Mihira, Brahmagupta, and Brahmacharya; and the writings of the physicians Charaka and Susruta, also of Panini the grammarian, compose 300; and the stories of the Vrata Katha and the drama of the Toy Cart, the Mrishchakatki, and Nala and Damayanti, are known to all Europe. The Hindi vernacular, says Dr. Hunter, owes its development into a written language partly to the folk-songs of the peasantry and the war ballads of the Rajput court bards, but chiefly to the literary requirements of the Vaishnava faith. The three best known acts of their religious treaties are the voluminous works ascribed to Kabir (A.D. 1380-1400) and his followers, preserved in the Kabir Chaura at Benares; also the Grant, or scriptures of various Bhagats or Vaishnava religious founders, especially of Dudi in Rajputana, and of Nanak and succeeding gurus of the Sikhs; and the Bhaktamars, or 'Garland of the Faithful,' compiled by Nabaji about the fifteenth century, and popularized by Nanayans Das (1627-58), Krishna Das (1713). The Prem Sagar, one of the Vaishnava sacred love songs, relating the loves of Radha and Krishna, is prized throughout all Northern India. Chand, the Hindoos court bard of Prithwi Raja of Dehli, wrote the Prithwi Rasam, a ballad chronicle, one of the earliest poems in Hindustani.

But in the south of India the Tamil people, certainly from the earliest centuries of the Christian era, developed an independent literature. Some of their books, written by Pariahs, take a very high place in ethics, as the Tolkappayam; Kural of Tiruvalluvar, a Pariah; the five books of Anavaiyur, the Matron, also a Pariah; the Chintamini; and Nallun. The Rev. Dr. Bower says of Anavaiyur, She sang like Sappho; yet not of love, but of virtue.

The literature of foreign countries has also ever been largely available. Aryans, and Semites, and Turks, and Moghuls, brought with them the writings of their own nations, and, while dominant, contributed largely to the literature of the country. The Arab, Moghul, Turk, and Persian were adopted literary. Timur wrote his Institutes; the autobiography of Baber was written in Chaghatai Turki; Akbar spoke and wrote in Turki; and up to comparatively recent times, the Turk and Persian formed two distinct, often opposing, parties at Dehli. Sir Henry Elliot and Mr. Dowson's labours in writing a history of India, as told by its own historians, have made known many Arab authors. Persian, during the 18th and 19th centuries, was the court correspondence language of all Mahomedan and Hindu rulers; and since the latter years of the 18th century, the dominations of the Moghuls have given to India numerous works in English, and have made widely known the writings of preceding races. The scheme on which this Cyclopaedia has been planned requires separate notices of the chief authors, and their names will therefore be found in their respective places, but Sir William Jones, Mountstuart Elphinstone, Sir Henry Pottinger, and Sir John Malcolm are recognised to have led the way to history and travels. The better known of the Asian writers have been as under:—

All new books in India are registered under Act xxi of 1867, and the publications in 1878 were 4,913, and in 1879, 4,689, as under:—

A few officers of the East India Company’s service—Gilchrist and Roebeck for Urdu, Brown and Morris for Telugu, and Molesworth for Marathi—have done much to purify the vernacular tongues. The Christian missionaries have prepared hundreds of works, suited both for schools and for general circulation, in the fifteen most prominent languages of India and in several of their dialects; they are the compilers of several dictionaries and grammars, and they have written important works on the native classics and the Hindu and Buddhist systems of philosophy. During the ten years from 1862, they issued 1,654,940 copies of the Scriptures, chiefly single, and 8,604,053 school-books and books for general circulation. During the ten years between 1862 and 1872, they issued 3,410 new works in thirty languages, and circulated 1,516,503 copies of books of Scripture, 2,754,000 school-books, and 8,750,129 Christian books and tracts. In 1870-71 two valuable works were brought to completion, the revision of the Bengali Bible, and the first
The Jews on the western coast (7626) are of little social influence.

The Parsees, another small body (69,476), are chiefly in the Bombay Presidency. They follow the modified Zoroastrianism which their ancestors in Persia had formed. They are wealthy and enterprising, are largely engaged in foreign trade, and are taking their share in all municipal and civil duties; but they have never served in the Indian army, nor aided, in arms, any of the Indian rulers who have protected them, and they have hampered themselves with some Brahmanical restrictions. There are Jews of fair and others of black skins, showing that at some former time they made converts, but at present neither they nor the Parsees proselytize; and the same may be said of the Jains and of the Buddhists of India; but Sir J. E. Tennent describes as violent the polemical literature of the Buddhists of Ceylon.

The Christians of British India proper, at the last census, were found to be 897,682. They are chiefly numerous amongst the non-Aryan races, particularly in Southern India and in Burma, 533,760 being in the Madras Presidency, 128,063 in Bombay, 84,219 in Burma, and 25,676 in Mysore. In 1875, in Travancore there were 468,518 Christians; in Cochin, 140,417; in Puducherry, 11,360. Christians of the Romish sect in French territory number 33,544, and in Portuguese territory 245,318, which makes 1,038,940 Christians for British India and the Native States. Almost all the Christian sects have missionaries from the Mediterranean to China and the Archipelago, zealous propagandists. The Romish clergy have been the more successful, though the effect of Dr. and Mrs. Mason's teaching amongst the Karen, and of Dr. Caldwell's amongst the Shanars, has been great. The Protestant missionaries have largely used their influence to promote secular education, and Hindus have widely taken advantage of the opportunities their schools have afforded, to acquire a knowledge of English; the Catholic missionaries from France and Italy having rather fostered the vernacular tongues.

The Sikh religiousists, 1,174,435 in number, are almost exclusively in the Panjab. They had their origin in the semi-Hindu semi-Mahomedan teachings of Nanak. In the early part of the 19th century they were a compact body, and zealous. They were almost exclusively converts from amongst the Jat, who have largely colonized the Panjab and the Indus valley, and have spread eastwards into the N.W. Provinces. Under the maharaja Ranjit Singh, in the early part of the 19th century, they became a truly formidable sect. Nanak preached the abolition of caste, the unity of the Godhead, and the obligation of leading a pure life. From Nanak, ten gurus are traced down to Govind Singh in 1708, with whom the succession stopped.

The Buddhists and Jains, in the 1871 census returns, numbered 2,832,851, and of these 2,447,831 were in Burma. But Chinese from Yunnan are immigrating in great numbers into that part of India, and 3,251,589 was the number returned as dwelling there in 1881.
with them into Burma, a knowledge of the moral philosophies of Confucius, of Lao-tze, and Mang-teze, the Mencius of European writers.

The Mahomedan in 1881 numbered in India 40,867,125. They are partly descendants of immigrants from Arabia, and of invading and immigrating races from Persia and Central Asia; but the ancestors of the bulk of those in Bengal (and in 1881 these were near twenty millions [19,553,831], with 1,104,601 in Assam) are recognised to have been of a Mongoloid family whom the Mahomedan conquerors found in that region. Their sacred book, the Koran, has been translated into Persian, Urdu, Tamil, Burmese, and Malay, but it is chiefly read in the original Arabic, and their haddes or traditions have almost equal authority with the Koran.

The political animosity which resulted in the death of Ali and his two sons, continues to separate these religious sects into the two great sects of Sunni and Shia, who, even in British India, barely restrain their animosity. It is a feud of 1300 years. The small Mahdavi sect are fanatical. The Ismaili in India are comparatively unimportant, and the recognition of sects to which the designation Wahabi has been given, are apt in their zeal to inflame political questions into their social life. They all distinguish their ethnic, or race, descent by the terms Syud, Shaikh, Pathan, and Moghul, as of Arab, Afghan, Persian, Moghul, and Turk origin respectively, and all the converts are classed as Shiahus. The Syuds, descendants of Mahomed and Ali, are not numerous, and are quiet-mannered men, and mostly Sunni. Many of the Jat and some Rajput clans, during imperial Moghul sway, adopted the Mosalman faith.

Hindu is a term ordinarily applied by Europeans to all the idol-worshippers of India, to all who are not Jews, Buddhists, Jains, Parsees, Christians, or Mahomedans. The people themselves restrict the term to their Sudra section, and distinguish by their caste names the higher caste Brahman, and the Rajput, Khatriya, and the Seth, Chettiars, Banya, Vasis, and servile classes. Some of the non-Aryan castes and some latter races are never called Hindu. Hindus are eminently followers of some part or other of the religious or philosophical doctrines which the Brahmanas teach regarding the chief deities and their incarnations, and to some extent are versed in the mythologic tales about Brahman, Vishnu, and Siva, one or other or all of whom, or their avatars or incarnations, Brahmanas of the post-Vedic times have come to regard as supreme. But their worship is largely directed to the wives of the deities, to heroes whom they have deified, to plants, to animals, to sculptured images, to shapeless pieces of wood or stone; also to the sun and moon and planets; and everywhere and amongst all classes, to spirits and snakes, and to the weapons or implements of their avocations; and their theological imaginations are as varied as their gods. Brahman has few shrines,—it is said only at Bithur; Siva only has one in the linga-shambala and Vishnu in the form of one or other of the avatars in which he is believed by them to have appeared on earth to save mankind, or to punish arrogance and vice. Saraswati, goddess of learning, the wife of Brahma, has escaped the oblivion into which her spouse has fallen. But Siva and his consort Parvati, and Vishnu, with Lakshmi his spouse, claim as worshippers the bulk of those whom Europeans call Hindus. In 1881, Hindus were returned as 139,343,820 in British India; but there was another body, 5,746,673, whose religion at the time of the census was not ascertained.

Castes.—The numbers of Hindu and their higher civilisation have secured for them a recognised superiority over the non-Aryan aborigines and over all fragmentary tribes. To these, Hindus apply the term m海外, which has the same significance as Gentile had to the Jew, as Barbarian had to the Greek, and as E has to the Chinese. But the whole of the idol-worshippers, alike Aryan and non-Aryan, are separated from each other into a multitude of sections, who neither eat together nor intermarry, but dwell apart in different sections of their towns. These sections, known to Europeans as castes, are designated by the people, Varna, colours, or Jat or Zat, race. Their Varna and Zat names indicate differences in race, or place of birth, or nationality, or avocation, or even simply of the customs they follow. The number of such separate castes in Bengal alone is not short of a thousand.

In Maharam Peshwa, Wilson enumerated 145 castes, 23 of whom were deemed unclean, and not permitted to dwell within the town walls. But, to Europeans, much of the action of the Hindu and caste purity seems strange. Ghi is a food article in use with every Hindu, and it is carried in great leather bottles; yet the bottle-maker is one of the unclean artisans. Many, perhaps most, of the servile races are broken up nations and tribes whom wars and revolutions in prehistoric times have reduced to their present standing. To Europeans it might even seem impossible, under these conditions, for society to exist; but they are held together by an ordinance of Menu, their lawgiver, who laid down the rule that every man is pure in his respective trade.

Prominent amongst the Hindu castes are the Brahmanas, though they, too, are separated into small sections by differences of religion, philosophy, and descent. Ages of intellectual culture have produced in them a race of recognised ability. For nearly 3000 years they have been in the ruling princes, all important executive and administrative; once only, and that in modern times, they attained to dominion under the title of Peshwa; but their power lasted barely about sixty years, and was destroyed in 1761, by their complete defeat at Panipat.

The Rajput is generally accepted as representing the ancient martial Khatriya. Clans of them hold villages in the N.W. Provinces and Oudh, where they were dominant till the 13th century; but they are still ruling in Rajputana and Gondwana, over aboriginal races, who instal their Rajput princes by making with their blood the tika mark of sovereignty.

The Vaisyas, a third caste, are at the present day admitted to embrace all the Hindu sections who are engaged in trade; but their physical appearance does not indicate the most diversified origin.

Sudra, the fourth class, includes all who are Hindus, other than the Brahman, the Khatriya, and the Vaisyas.

The Jat race, who followed and pushed the Rajputs farther into N.W. India, are eminently agricultural and pastoral; and, with the tall, robust Kat’hi, dominant in Kattyawar, are of a stock who still maintain many Scythic rites. There are two Jat sovereignties, Bhurtpur and Dholpur, and
BRITISH

several powerful Jat chiefs in the N.W. parts of India. The Jat in the N.W., the Tamil, Teleng, and Canarese in the south, and the Karen on the frontiers of Burma, have given the most numerous converts to Hinduism, as nations.

All the Hinduized aborigines of the Kolarian and Dravidian stocks have been admitted into the Sunda section. The major part of the Canarese, the Mahbrat, and the Telugu speaking races who are engaged in agricultural occupations, are of this division.

Castes.—It might be thought that one Brahman, or Banya, or Kshatriya family might eat or intermarry with any other Brahman, Banya, or Kshatriya household, or that any one Kunbi, or Karuni, or Pariah, or Dher might eat with or obtain a wife from others of their own caste; but differences in their tribal or clan descent, or in their occupations, keep them apart. In the many languages current, the names of identical trades and avocations necessarily vary, and even that forms a sufficient reason to keep apart the people following them. The respective castes exercise strict supervision over their members. Fines and penances are imposed on parties who deviate from recognised rules,—even excluding them from their caste. In ancient times, neglect of religious rites seems to have been a reason for depriving a person of caste. Menu says (x. 43, 44) the following Kshatriya tribes have gradually sunk into the state of Vrishala, from the extinction of sacred rites, and from having no communication with Brahmanas:—Paudraka, Odra, Dravida, Kamboja, Yavana, Saka, Parada, Pahlava, China, Kirata, Darada, Khasa.

At the present day, the penalty of exclusion from caste is inflicted on Hindus who have sailed to Europe, notwithstanding that the mercantile Rajputs of Cutch have been trading for centuries on the east coast of Africa, and Hindus are met with westwards through Central Asia to Russia in Europe. Also, Java and Bali, in the Archipelago, were conquered by a Hindu dynasty, and Hinduism is still Hindu; the Teleng and Tamil soildiers of the Madras Presidency, and the Sikh and Hindu soldiers of the Bengal army, have conquered in Burma, China, Persia, Aden, Egypt, and Abyssinia.

A peculiar feature of the Brahmanical supremacy has been the servile position which they have enforced on the non-Hinduized aboriginal tribes, few of whom have, or only partially, adopted Brahmanism. This is not confined to the semi-barbarous forest and mountain tribes, whose long seclusion has superinduced timidity in intercourse with their fellow-men; but outside the walls of every village throughout British India are families of the Pariah, the Dher, the Mah, the Mang, the Ramul, the Koli, Chamar, the Bil, the Dhor, the Blur, the Dom, the Mhaor, the Mina, who, since two or three thousand years, have been retained in feudsl slavery, who have recognised in succession the Hindu, Buddhists, Mahomedans, and Christians as their masters, and have been doing all the servile work, but have nevertheless adhered to their own fetish forms of worship, uninfluenced by their masters' creeds. Many of them are intellectual. They are brave, truthful, docile, and gentle; but the religion of their village authorities has never commended itself to them. There are small, homeless, broken tribes wandering through the country, as the Bazigar, Doomar, Korawa, Kunjar, Nuth, Sosannah, Yeruka, of whom little is known. They almost all are predatory; and pitch their reed mat or grass huts in lone parts of the outskirts of towns.

Sacred Books.—Hindus arrange the whole of their sacred and learned works under eighteen heads, and speak of them as embracing eighteen kinds of knowledge, viz. the four Vedas, the four Upanishads, the six Puranas, and the four Vyagras.

The Vedas of the ancient Aryans, styled the Rig, the Yajur, the Sama, and Atharva, are acknowledged by nearly all Hindu and Jain sects. They consist of collections of hymns, containing a ritual, in the Sanskrit language, and are supposed to have been composed about fifteen centuries B.C. The Sanhita of the Rig Veda is the earliest record of the eastern Aryans extant. The Sama Veda is a reproduction of parts of the Rig Veda. The Upanishads are books containing the doctrine of the Vedas explained and enlarged.

The Puranas, literally the old books, are eighteen in number, are of different ages, between the 8th and 9th or 14th and 15th centuries A.D. They are written in the Sanskrit language, in simple sloci metre, and each treat of five subjects, viz. (1) the creation of the universe, (2) its progress and the renovation of worlds, (3) the genealogy of gods and heroes, (4) mythological chronology, and (5) heroic history, containing the achievements of demigods and heroes. They superseded the Vedas, and are the proper religious books of the modern Hindus; they are practically polytheistic, and yet essentially pantheistic.

The Hindu systems of philosophy are six in number. They grew out of the Upanishads, and are sometimes called the six Sastra, or bodies of learning, sometimes the Shad Darsanas, or six Demonstrations. They are, (1) the Nyaya, founded by Gautama, which corresponds to the Peripatetic school; (2) the Vaisheshika, by Kanada, corresponding to the Ionic; (3) the Sankhya of Kapila, corresponding to the Italic school; (4) the Yoga, founded by Patanjali, resembles the Stoic philosophy; (5) the Manichaeans of Jaimini corresponds to the Platonic; and (6) the Vedanta of Vyasa or Badarayana, is likewise a Platonic philosophy.

Their philosophical speculations as to the nature of the soul and its relation to the Supreme, are derived mostly from three great apostles of the Vedantist schools, who flourished in Southern India, viz. Sankaracharya in the 9th century, his follower Anandagiri, author of the Sankara Vijnaya; Ramanuja, a Vaishnava, in the 12th century, and Madhavacharya, a Saiva, a little later, in the 14th century; and their several views have separated them into believers in the Adwaita philosophy of Sankara, the Dwaita of Tirthachari, and the Visishta-dwaita of Ramanuja.

Charvaka founded the materialistic school of the Hindus; he was the Pyrrho and Epicurus of India. The Hindu mind, particularly in such as are of Aryan descent, is pre-consciously speculative, always ready to go after truths that lie in the region of philosophy or religion. While the Arab, Turk, Moghul, and Persian races have been largely historical in their writings, the Hindu mind has revelled in myths, in poetry, and the drama. Their writings are clothed with images; much in them is beautiful and sublime, but so defective in all that relates to their history, that the dates even of their most famed events, the eras in which their celebrated personages have lived, cannot be
more than guessed at. When, and by whom, their great epic the Mahabhārata and Ramayana, or their sacred Vedas and Purānas, were written, has not been determined. The age in which Krishna lived is only surmised, and although he is now worshipped as an avatar of Viṣṇu, the date of his apothecosis is only supposed to have been about the 5th century of the Christian era. Neither as to the origin of the Śaiva and Viṣṇuva culture have they any information on which the historian can definitely rely. Amos v. 26 gives more information about the era of Śiva than all that the Hindu books contain.

What can be traced of the history of the country since the 8th century, discloses continuous religious movements amongst the people. Devout men, in all grades of Hindu society, have drawn followers around them, forming new sects of greater or less importance. The tendency of all of these has been to enjoin faith in the Supreme; and all the great leaders have founded their views on a belief in the brotherhood of man and the abolition of caste restrictions, but each in succession has become as exclusive as any of the Viṣṇuva sects from which they were separated.

Modern Hindus barely recognize or even know several of the gods of the Vedic times. Indra, the Vedic god of the air and of the heavens, the king of the gods, compared with ancient times, is now seldom alluded to. Varuna, god of the waters, with Pavana, god of the wind, Kama, god of love, and Kartakeya, of war, are in similar neglect. Agni, god of fire, with Surya, the sun, Soma, the moon, Kuvera, god of wealth, and Yama, god of the infernal regions and judge of the dead, are better known. But the prominent deities in their invocations and worship are, Brahma the creating principle, Viṣṇu the preserving and Śiva the destroying principles. Each of these has corresponding female divinities, who are mythologically regarded as their wives, but metaphysically as the active powers which develop the principle represented by each of these divinities. The names of these energies or sakta are respectively, Saraswati, the goddess of learning and eloquence, who continues to be invoked by the learned; Lakshmi, the goddess of plenty, who is worshipped in all households; and Parvati, who is largely worshipped, and is known also as Devi, Bhawani, and Durga. Ganesha is invoked at the commencement of all undertakings, as the remover of difficulties, and as such he presides over the entrances to all edifices.

Śiva is entitled Eswara, lord, or Mahadeva, great god. He has many temples under various names, and his usual emblem relates to their physiological idea of the cosmos.

Many of the deities now worshipped—Balaji, Kandoba, Vithoba—have been local deities in pre-Hindu times, whom the Brahman missionaries admitted into their mythology as incarnations of Viṣṇu and Śiva. There are many saiva sects:

Aghori; Akasamukhi; Avadhuta; Brahmacari; Dandi and Dasnami; Gudara; Janganna; Jogi or Yogi; Kara Lingi; Naga; Nakhi; Paramhansa; Rukhara; Sanyasi; Sivachari or Srisiva; Sukhara; Ukkara; Urdha Bahur.

The more important of the vaishnava sects are:

Charan-Dasi; Radha-Dasi; Ramanuja or Sri-Sampada; Durgavallabhi; Dhun Panthi; Hari Chandchi; Sadasiva Panthi; Khaki; Madhav; Madhuchand or Brahma Sampradaya; Maluk Dasi; Mira Bai; Naga; Radha-Vallabbi; Ramanandil or Ramawat.

Sakta sects are:

Dakshina or Bhakta; Kan Chulyia; Vami or Vamanachi; Karni.

The Tantras are the Sakta sacred books.

Reformers.—From time to time Hindu reformers have appeared, and at the present day Hindu missionaries are actively extending their faith amongst the forest tribes. The more noteworthy have been Kumariya Bhatta, about the middle of the eighth century, followed by his disciple Sankaracharya, the great apostle of Saivism in the middle of the 8th century, and his historian Anandagiri; Jayadeva, author of the Gita Govinda, lived about the 12th century; Ramanuja, in the middle of the 12th century; his follower, Ramanand of Benares, about the end of the 14th century; Kabir, a follower of Ramanand, about the end of the 14th and beginning of the 15th centuries (1380–1420); Chaitanya, in the latter part of the 15th century; Valabhacharya, in the beginning of the 16th century.

The tendency of all Hindu reformers has been towards monotheism; and the Sa'dh or Sa'dhna, the Siva Naryani, and the Brahmo Sanjih have been the prominent and important theistic movements of the 19th century. The last originated with Dwarkanath Thore, and was followed up by Keshab Chandra Sen. Separations early occurred amongst them, but they may be characterized as distinctively monotheists in belief, and philosophical rationalists.

Looking at the ordinary everyday life of the people, it may be said that all classes worship the Graha-devata or village gods, and Giriha-devata or tutelary divinities; and demons, the cobra snake, the sun; the spirits of the dead are recognised by all,—spirits of their own ancestors, of other Asiatists and of Europeans, of British and French officers, and ladies of Great Britain, to all of whom sacrifices are made, with offerings of flowers or fruits, or alcoholic fluids. When a pestilence breaks out, the malignant deity whom the pestilence is believed to represent, is conveyed in a procession beyond the bounds of the village with music and banners. This is the Bolwan, and is often a cause of violent quarrel with the villages to which the pestilence has been conveyed.

Religious Mendicants.—Byragi, Gosain, Jogi, and Sanyasi amongst the Hindus, all the Buddhist priests and the Qalandar fakir amongst Mahommedans, are ascetic mendicants, as also are the Man Bhao friars and nuns, and some of the followers of Chaitanya.

Mother-worship is adhered to by all the non-Aryans of the south, in the form of the Ai of the Mahratta, and the Amma or Amman of the Tamil people. It is founded on the physiological idea of development from the female principle, which
they have incorporated into all their cosmogonies, and into their saiva religion, Barth, writing as to one form of mother-worship, says (p. 202) the Vedas have a cultus very similar to that of the Tirso Devi, or the three goddesses. In the Mahabharata they are the mothers of Shaka, the god of war, and appear in the inscriptions of the Chalukya and the Kadamba, and are up to 120 in number in different parts of the country.

Spiritual and astral and mother worship, in one form or other, are visible amongst all the Aryan and non-Aryan races in India. With the non-Aryan, malignant demons, bhuta, vetala, pai or pinchala, preta, yaksha, vidyadhara, rakshasha, receive attention; with the Aryan Hindus, it is the manes of ancestors that are worshipped, are brought back to the house to be again released, and have offerings presented to them periodically.

Snake and sun worship are adhered to by all castes and classes professing Hinduism. That of the sun has been continued from Vedic times, is a daily duty, and with special rites at the summer and winter solstice and at the spring and autumn equinox; that of the cobra snake also daily and periodically.

Batha is the name of the chief deity of the Cachari or Bata. He is represented by the Euphorbia plant, which is grown in the courtyard of every Cachari house. The Euphorbia is also worshipped by tribes in Orissa and in Chutia Nagpur. The Bengali people suppose the Euphorbia ligularia to be sacred to Manasa, the goddess of snakes, and it is worshipped on certain days of June to September.

The tulai plant, Ocimum sanctum, is sacred to Vishnu; and a small plant of it, grown in every vaishnava courtyard, is worshipped every morning by the women of the house. The leaves and flowers of other trees are offered to their deities, — the Phyllanthus emblica, the Aegle marmelos, and others to Siva, the Ficus religiosa, Melia azadirachta, and others to Vishnu. It is also to Vishnu that the Salagram is sacred, and worshipped daily in every vaishnava home, although it is only an ordinary fossil ammonite from the Ganad river. Muruni of the Nepalese holds the Portax jugas (antelope) as sacred, Muruni being their name for that animal. The Santal believe that a wild goose from the great ocean alighted at Ahiri Pipri, and there laid two eggs, from which issued the two first parents of the Santal race. A heron is the emblem of the Baori tribe, and must not be eaten by them; and the dog also is sacred to them. The Oojal Bill reverence a white ram, and will not eat any white animal. The Oran tribes are named after plants and animals, and these are tabooed to the tribes bearing their names.

The gurus, or spiritual chiefs, may be men of any caste; indeed, Mira Bai, a woman, was a guru in the 16th century, Sahaji Bai in the 18th century, and the Karta-biha of Bengal had a female head. Tiru Valluvar, author of the Kural, was a Pariah. The Valluvars are the priests or pujari of the Parahs. Avvaiyar, author of many ethical works, was a Pariah; Valmiki, author of the Ramayana, is said to have been a Koli; Vyasa, author of the Mahabharata and the Puranas, was the illegitimate child of a Brahman and a girl of the fisher caste; Sankaracharya, the great advocate, of the Saiva doctrine, is said to have been of humble origin, but has come to be regarded as an incarnation of Siva. Kabir, also, is revered by his followers as an incarnation of the deity, who style him Jnanim, the seer, the one who has knowledge. He is supposed to have been a real personage, and to have lived about A.D. 1449. He left no writings, but his sayings have been preserved in verse, in which he opposes Hindu superstitions, ridicules the Shastras and Puranas, rejects caste and all idolatry, and demands moral purity.

A Hindu prays to avert evil. A Mahomedan prayer is a meditation on the power and majesty, the wisdom and the mercy of God; the Christian idea of a filial relation on the part of the worshipper to the Being whom he worships, which enables him to lay all his wants before God as before a father, is almost wanting in Islam. The religious services of the prayer ritual of the Mahomedans may be conducted in their mosques or in their homes. In India, the Waz or sermon is rarely given.

A large part of the landed property of the country is in the hands of religious corporations, and the religious duty of feeding and giving alms to Brahmins is said to be at least as onerous a tax as the liability to tithe. One of the best-intentioned measures of the British Government was the transfer of the funds of Hindu and Mahomedan religious bodies from the exchequer of the state to the custody of trustees elected by the worshippers. This was about the middle of the 19th century; but nothing done by the Government is said to have been more profoundly unpopular. In native opinion, not only are endowments just, but the proper protector of them is the Government. Mr. Hunter even asserts that the deepest grievance of the Indian Musalmans was the compulsion put upon them to elect their own Kazi, or ecclesiastical registrar. They said that his appointment could only be validly made by the Government; and though it was true that the Government was of another faith, such a government was better for these purposes than none at all.

Much has been done by Christian missionaries of all denominations. Nothing is known of the martyred St. Thomas, whose supposed remains are shown in a cathedral in the Madras suburbs, nor is anything certain of the early days of the Cochins and Travancore Christians, who have Sassani or metal title-deeds of early centuries of this era; but the great St. Xavier effected much permanent good around the shores of these countries, and in later times, Dubois, Carey, Ward, Marshman, Rottier, Rhenius, Wilson, Duff, have continued his benevolent labours. The influences of Christianity, spiritual, educational, and social, have been felt far and wide. The downtrodden Shanar and Choga, and the despised Pariah and Pulliar, have been raised from their state of demoralization, while many of the objectionable practices that obtained among the higher castes have either entirely disappeared or been greatly mitigated.

Arts, Manufactures, and Trade.—The artisans of India have been famed from the earliest times for excellence in the decorative and ornamental arts. Sir George Birdwood believes that the secret of their continuous success lies in the fact that the arts of India are indissolubly bound up with the popular institutions of the country, and in the patience, perseverance, and
BRITISH INDIA.

Their skill in architecture, displayed in the grandeur of their designs, their fresco paintings, their work in metals for ornamental jewellery and domestic use, the beauty of their woven fabrics, both silk and mixed, as seen in their Kinshah, Hembroo, and Mushroom, and the taste displayed in their arrangement of colours, have won the admiration of all nations. Most of these will be found under the respective headings, and reference also may be made to the articles on architecture, armour, arts, Boder ware, Bombay work, brass, carving, carpets, colours, enamel, inlaying, jewellery, lace, sculpture, shawls, silk.

Since the advent of Europeans, with ways and habits different from orientals, and displacement of the wealthier princes, the high art of Indian workmen has suffered, while the yearly value of the trade in the raw and special products of the country, and in the cheaper manufactures of Europe, has increased. Western Asia and Northern Africa have traded with India from prehistoric times; the land routes have changed with the rise and fall of empires, but Povindah caravans still successfully fight their way from India through Central Asia. Since the early part of the 19th century, the sea-borne trade has increased twenty-fold. Reference may be made to the headings cotton, gunny, hides, jute, leather, opium, pottery, silk.

The production of some of the articles of older trade—raw silk, shawls, sugar—has decreased; but the exports to foreign countries by land and sea have increased beyond the most sanguine expectations—in 1879-80 to the value of £67,212,363. These consist of wheat, rice, and other food-grains, oil-seeds, hides and skins, fibres of coir, cotton, jute, and wool, cinchona, coffee, tea, tobacco, and opium, with indigo and other vegetable dyes, and coal for internal consumption.

On the other hand, importing to the value (1879-80) of £41,166,003, chiefly of manufactured articles. Of the exports, the value of the opium sent abroad was £14,324,146, and of raw cotton £11,145,453; while the imported cotton piece goods, twist, yarn, thread, etc., and of woollens, was valued at £19,699,056; £20,097,511.

The cramping effect of the sewer or transit duties on traffic was early recognised, and in the early part of the 19th century they were entirely abolished, and a watch has been kept over the action of the municipalities, in their levy of octorol duties, to prevent the reintroduction of the sewer in another form.

The growth which, of late years, has taken place in the foreign trade of India, is due in a large measure to the extension of railway communication. The quantity of merchandise, exclusive of minerals, conveyed by railways, increased from 2,633,687 tons in 1870, when the mileage was 4,775, to 9,319,421 tons in 1880, when 9,325 miles were open. In the same period, the value of exports increased from £55,336,186 to £74,517,357, and of imports from £34,469,119 to £50,278,575. Wheat and other raw products from the distant Punjab, a thousand miles from the sea, are successfully competing in Britain with the products of America. Coal is mined in Bengal by upwards of 60 collieries, the total output being not far short of 1,000,000 tons per annum. Dye-works, tanneries, soap-works, sugar refineries, silk-works, and paper mills are in operation; the Indian breweries turn out 2,000,000 gallons of beer every year. The success of cotton spinning and weaving mills in Bombay led to an extension of this industry in other parts of India, where there is an abundant population from whom to draw for labour, and who are also the consumers of the manufactured fabrics. The jute mills in Bengal have eclipsed the special industry of Dundee.—Dundee capital and Dundee skill having been transferred from the banks of the Tay to the banks of the Hooghly; and the trade in seeds and cereals in India is sufficient to take off any extra quantity of jute bagging that may be produced. Up to 1882 there had been 58 cotton mills established in India, for mule yarn, mule twist, cotton twist, twist and yarn. (St. Tab. Br. Ind., 1882), 44 of them in the Bombay Presidency, where the enterprising Blattain and Parsee have been the leading races in all mercantile transactions; six of the cotton mills are in Bengal, and three in Madras.

Nothing in the history of commercial progress is more healthy than the course of the trade of India, both foreign and coasting, since the mutiny of 1857. The foreign commerce—and it partly feeds the coasting trade—has more than doubled in value since 1855-1856. The figures show the annual averages for quinquennial periods of both merchandise and treasure:

With the increasing imports and exports, the number and tonnage of the shipping engaged in the foreign trade has grown from 2189 vessels, aggregating 314,139 tons, entered and cleared in 1858-59, to 5083 ships of 555,220 tons in 1880-81. The size of the ships trading from Europe has been increased from 300 and 400 to 2000 and 3000 tons, but the trade to other foreign countries continues to be carried in small vessels, averaging 145 and 180 tons.

**Seasons.** In India generally there are three well-marked seasons, the hot, the cloudy, and the rainy. The cold season of the year corresponds with that of all northern latitudes, and lasts from the middle of December to the middle or end of February; and although it is only in the N.W. Provinces of Bengal or on the Neilgherry hills in the S., and occasionally on the table-lands of Central India, that the thermometer sinks below the freezing point, the dry winds which then blow over the plains and elevated tracts, cause a sensation of great cold. It is in this season that the thermometer has the greatest daily range, varying from 19° to 89°.

The hot season commences in March. By May the heat is intense everywhere but on the mountains. The rivers dry up, and the earth is scorched and fissured by the great heat. The country seems a desert; all nature is hushed; it is the stillness of the winter of the poles. This is succeeded by a few sultry days in the end of May, the forerunner of the rains of the S.W. monsoon; in June and July this monsoon has carried the rains to almost every part of India, reaching the different provinces according to their proximity to the southern oceans, or to the direction given by the mountains to the winds. The face of the country then becomes green with its natural vegetation and the crops of the cultivators, the rivers are all full, and particularly the great rivers flowing from the Himalayas. The valleys of Bengal, where in several places the ryots go to their fields on rafts. This monsoon is ushered in with great electric changes, and prevails till the end of September, when it disappears with thunder and lightning as it came; the occurrence of these electric phenomena marking the breaking up of the monsoon. The fall of rain, while this monsoon lasts, varies from 12 to 250 inches in the different provinces, but it is distributed to a greater or less extent over almost all India, the only part deprived of it being the Karnatic, where, so far N. as Ongole, only slight showers fall in July. The hot weather consequently continues in the Karnatic from April until November, when the winds change to the N.E., and bring the rains of that monsoon across the Bay of Bengal.

The N.E. monsoon rains, however, only last for six weeks or two months, and do not extend so far inland as those from the S.W. Indeed, at places in the Western Peninsula within a hundred miles of its Eastern Ghats, it is marked only by the occurrence of heavy showers. At Madras, on the Coromandel coast, the annual fall of rain is about 50 inches.

Besides these, in Northern India a well-marked season of winter rain also occurs, commencing about Christmas and extending to February.

The period and the amount of rain differ greatly in the several provinces of India. The fall is very heavy on the tracts offering a front to the S.W. monsoon, as on the Western Ghats, and on the tract between them and the sea, being as much as 70 to 100 inches at the sea level, and as much as 250 inches on the mountain face, particularly, along the Himalaya, Pen, and Arakan coasts, on the mountains of Assam, and along the foot and outer slopes of the Himalaya throughout its whole extent, reaching 100 inches or more.

The country may be classed generally into three regions,—the portion of India E. of the 80° meridian has a rainfall of more than 40 inches; the portion W. of the same meridian has less than 40 inches; and a third region, in which the fall
is less then 30 inches, includes almost the whole of the Panjub, a considerable part of the N.W. Provinces, a large part of Rajputana and Kattyanwar, as well as almost the whole plateau of the Dekhan and Mysore. In Sind, and in the southern portion of the Panjub and most western part of Rajputana, the rainfall is less than 15 inches, and is extremely small and irregular, and the country is either actually desert, or agriculture is only possible with the aid of artificial irrigation.

Wars have aggravated distress; but all Indian famines are caused by drought, and the districts most subject to droughts are the western and southern portions of the N.W. Provinces and that part of the Panjub territory which lies east of the Sutlej, also the western and northern states of Rajputana and of the central plateau which border on the N.W. Provinces; likewise the districts of Bombay above the Western Ghats, the western region of Hyderabad, all Mysore, and the districts of Madras above the Eastern Ghats, and those along the E. coast and at the extremity of the Peninsula. The region whose total rainfall is from 20 to 35 inches has frequently suffered from severe scarcity, and within it have occurred the great famines of 1837-38 in the N.W. Provinces, of 1868-69 in Rajputana, and of 1876-77 over nearly the whole of the Peninsula of Southern India. These were mainly due to the failure of the S.W. monsoon. The drought of 1855-56 and some of the earlier scarcities in the Madras Presidency arose from failures of the rain of the N.E. monsoon on the east coast, a failure which in that year extended into Western Bengal.

How varied are the amounts falling at different places, will be seen from the following list:

</table>

In 1861 the rainfall at Cherrapunji was 805 inches, of which 366 fell in July; 559 and 615 inches also have been measured.

The main agricultural operations of the country correspond with the principal seasons of rain, and their relative importance is in a great degree dependent on the local distribution of the rainfall at the various seasons of the year. Where the natural rains have alone to be relied on, only one crop is obtainable; but with an abundant water supply from irrigating channels or tanks, two or even three crops are had, the three harvests being spring (arit), monsoon, and winter. The fluctuations of the total rainfall from year to year in all parts of the country are very considerable, and scarcely a year passes free from anxiety as to some part or other of India suffering from scarcity of food, or actual famine, caused by drought.

Famines.—However great may be the injuries from Indian rivers, the area affected by an inundation, though large according to European notions, is really insignificant compared with that ruined by an endless hot season. Even the tidal wave which swept over Sandip in 1876, and Saugar island in 1833, and again in 1864, filling the tanks with brackish water, and sweeping away human beings and cattle, with houses and chattels, in the space of three or four minutes, never produced such intense suffering or left such traces as the famines of Orissa, of the N.W. Provinces, and of the Madras Presidency. In Mysore the famine of 1876-77 is calculated to have caused a loss of population of 1,550,000, another estimate being 2,130,987.

Since 1769, with the exception of Burma, the most eastern parts of Bengal and Sind, hardly any part of India has escaped the visitation of severe famines, and out of considerable portions acute distress has recurrently been felt in other regions. Twenty-three famines and scarcities recorded up to 1880 in any part of India, the proportion is 24 years of bad seasons to 85 years of good, or about two bad to seven good; in each case, on an average, one-twelfth of the population of the whole country—that is, about 20,000,000—may be approximately taken as the portion affected, so that the result might be said to be equivalent to a famine or scarcity over the whole country once in 54 years. Of these calamities eight may be classed as immense famines, nine as famines, and four as severe scarcities. Omitting severe scarcities, there have been 17 famines affecting 20 years, and occurring at an average interval of five years. Of the eight greater famines, affecting 11 years, 5 have occurred in the 19th century, and have affected 292,000,000 of people, so that each on an average has been felt by 40,000,000, or one-sixth of the population of India. In Bengal, during the 110 years over which the records extend, four droughts only have occurred, of which two were very severe. Previous to the Orissa famine in 1866, Bengal had enjoyed complete immunity from famine for 81 years; and on this occasion, as well as in 1873-74, only the western parts of the province were affected. In the N.W. Provinces nine droughts are recorded, of which two were intense and three very serious. The two greatest famines in this part of the country, those of 1783 and 1837-8, were separated by an interval of 53 years; but there was a frequent and highly irregular occurrence of less important droughts. In Bombay nine seasons of drought appear, of which two were extreme; and in Madras there were eight such seasons, of which two were excessive. Excluding Bengal, the average interval between the several recorded droughts, great and small, in any one province, is about 11 to 12 years, and between those of the severest type about 50 years. The Government of India endeavors to be prepared for the occurrence of scarcity, in some degree of severity, and in some part of the country, as often as two years out of every nine; and great famines may be anticipated at average intervals of twelve years. Seasons of drought do not occur simultaneously in Southern and Northern India, though some tendency is shown for a bad year in the north immediately to follow a bad year in the south. On the assumption that no famine is likely to be worse than that of 1876-8, which affected a population of 36,000,000, the Famine Commissioners were of opinion that the largest number likely to be severely affected by famine at one time may be put at 30,000,000, of which 16 per cent., or 4 millions, would probably be in receipt of relief in the worst months, and about seven or eight per cent., or from two to two and a half millions, continuously for the space of a year. It was considered by them that a loss of
harvest amounting to less than 50 per cent. of a full crop will not produce famine; but where the whole out-turn of the year is diminished to 25 per cent., it may be taken as certain that intense famine will prevail; whilst an estimated failure of even a third of the year's out-turn will always demand the utmost vigilance and preparedness on the part of the authorities, as relief measures may at any moment become necessary.

British India grows more grain for food than the people require. The Famine Commissioners in their report state that the Madras Presidency, during the terrible visitation of 1876-78, was able to draw on the surpluses of Bengal to the extent of two million tons of food-grain, almost all rice, which was not an extension of a pre-existing trade, but the sudden creation of a new one. The same Commissioners estimated the aggregate surpluses of all the provinces, available in case of need for the supply of each other's deficiencies, and for foreign export, at five million tons in a year free from drought, a condition which rarely exists in all the provinces at once. The following is an estimate of the grains under culture:

With augmenting means of intercommunication, it will daily become easier to deliver the food-grains used by man, but no amount of railway extension can possibly suffice to lay down in a famine district the forage needed by its cattle.

Political and Social Reforms.—Dr. Hunter has recorded the opinion that the modern history of the British in India, as benevolent administrators, may be said to begin with Lord William Bentinck. The inscription upon his statue at Calcutta, from the pen of Lord Macaulay, says: 'He abolished cruel rites; he effaced humiliating distinctions; he gave liberty to the expression of public opinion; his constant study was to elevate the intellectual and moral character of the nations committed to his charge.' His two most memorable acts are the abolition of sati, or widow-burning, and the suppression of the thugs.

Much has been done to promote civil and religious liberty. Up to 1882, about 1000 towns had been granted municipalities, a step towards self-government of the country generally. Liberty of conscience is assured to all classes. A Hindu can change his religion, and retain his property. A Hindu widow can re-marry. Courts of justice have been established, and appeals to the British throne permitted.

A code of criminal law has been introduced, and made applicable to all the people; and in civil law, the different races have had their own traditions applied to them.

In 1838, the British Government determined that a body of substantive law, criminal and civil, should be framed for India, and Mr. (afterwards Lord) Macaulay was appointed head of a commission for this purpose. A penal code was the first fruits of this. In 1853, a Legislative Council for all India was formed of Government officers; but in substitution of this, a supreme legislature was appointed in 1861 for all India, and from 1861 to 1871 a commission in London was engaged in preparing drafts of laws. Up to 1870 they submitted draft acts for civil and criminal procedure; succession, contract; evidence acts, negotiable securities, and transfer of property bills. A law of limitation has been passed.

The Presidencies of Madras and Bombay, and the Lieutenant-Governors of Bengal and of the North-Western Provinces, have each a High Court, supreme both in civil and criminal business, with an ultimate appeal to the Judicial Committee of the Privy Council in England. Of the minor provinces, the Punjab has a Chief Court, with three judges; the Central Provinces, Oudh and Mysore, have each a Judicial Commissioner, who sits alone; while in Assam and British Burma, the Chief Commissioner, or supreme executive officer, is also the highest judicial authority; and magistrates and judges, European and native, are in numbers in the districts, with Small Cause Courts in all the great towns.

The laws administered in the Indian courts consist mainly of the enactments of the Indian Legislative Councils (imperial and provincial), and of the bodies which preceded them; also statutes of the British Parliament which apply to India; likewise the Hindu and Mahomedan laws of inheritance, and their domestic law in causes affecting Hindus and Mahomedans; and the traditional customary law affecting particular castes and races.

The Hindu and Mahomedan codes of law are observed in all matters relating to marriage, inheritance, adoption, partition of property, testamentary disposition, management of religious institutions, and the like.

A system of police has been introduced throughout all British India, which has been largely imitated by Native States; and jails have been erected for criminals, in place of the mutilation, blindings, and other barbarous punishments. Hitherto, however, mortality in Indian jails has been far higher than that of the adult population.

Amongst the people, the annual death-rate has been 32.57 per 1000. In the native army, in 1877, it was 13.38 per 1000, and the mortality amongst the European troops was 12.71 per 1000, the lowest on record.

Total prisoners: 118,456, 135,227, 122,675

The police force in 1879 had 16,180 officers, and 126,189 men, armed in equal numbers with muskets or swords, or only batons.

The British have endeavoured to lighten the forms of the land tax, as they found it prevailing in the acquired provinces, and the ryotwari, the zamindari, and the village tenures now in force, have resulted from the changes made. The zamindari system resembles that of the estates of Great Britain. As before mentioned, it was introduced into Bengal by Lord Cornwallis in his Code of 1793; and by his permanently alienating districts for a rental far below the present value, there
has been lost to the general revenue millions yearly, while the cultivators have been rendered more dependent than in other parts of the dominion. How to remedy the error of 1793 is a constant thought to the rulers. Under Native rule, a simple order would have done it.

In the land laws enacted in 1859, the British Government have endeavoured to protect the cultivators of Bengal, by classing them into—

1. Tenants since 1793, whose rents the zamindars could not augment;
2. Tenants of twenty years’ standing, whose rents also could not be increased;
3. Tenants of twelve years’ holding, to whom occupancy rights were granted.

And, in 1873, a commission sat for further inquiry, and the twelve years’ tenancy was made into a joint proprietary.

Education.—The British Government has founded universities, with colleges, where classics, with the vernacular tongues, also the sciences, are taught. Under the princes of India, both Hindu and Mahomedan, the learned men had been training scholars, mostly private pupils, in all the branches of learning customary in the east, but there never had been more than one or two Mahomedan or Hindu collegiate institutions. Education has received a continuous attention from the British. Warren Hastings, in 1781, established in Calcutta a Madrasa for the Mahomedans; the Marquis Wellesley formed the College of Fort-William; and Lord Amherst, Sir Thomas Munro, and Lord William Bentinck aided in its advancement. In 1800 there were 71,435 colleges, technical, secondary, and primary schools, with 1,351,509 scholars. Of these institutions, 40,662 were aided by Government, and 14,286 unaided. The receipts were Rs. 1,82,07,188, and the expenditure Rs. 1,61,59,383.

The desire for education has been vastly stimulated by restricting admission into the employ of Government, to such as pass a successful examination. In Britain, any one may appear for the covenanted civil service or for a commissioned military appointment, but only those who attain the highest marks are accepted—about 16 per cent. Similarly, the great covenanted civil service of India is also open to all who are successful in a public examination; in all the services, age being the sole limit. In India, in the ten years 1871-1880, the results of the examinations in the lists of passed candidates were as under at the universities:

| University | Pass. | 1st Arts | Arts | M.A. | Law | M.L. | Med. | Civil Eng. | Arts | 1869 | 2402 | 2402 | 2402 | 2402 | 2402 |
|-----------|-------|----------|-----|------|-----|------|-----|-----------|-----|------|------|------|------|------|------|------|------|------|------|------|------|
| Calcutta  | 9842  | 2402     | 2402| 2402 | 2402| 2402 | 2402| 2402      | 2402| 2402 | 2402 | 2402 | 2402 | 2402 | 2402 | 2402 |
| Madras   | 7106  | 1553     | 12  | 88   | 37  | 18   |     |           |     |      |      |      |      |      |      |      |
| Bombay   | 205   | 508      | 29  | 57   | 229 | 243  |     |           |     |      |      |      |      |      |      |      |

From the earliest arrival of Christian missionaries, especially in the south of India, parents of all creeds, Christian, Hindu, and Mahomedan, have sent children to their schools, though the education they impart is openly and avowedly founded on a Christian basis. Since the middle of the 19th century, universities, with medical, engineering, and other colleges, have been established at all the great centres of government, where the highest branches of western learning are taught; and by grants of money in aid of private efforts of missionary and educational bodies, the masses have been reached. In 1857 the pupils were 200,000. In 1877 they numbered 1,700,000. Museums have been founded at Madras, Calcutta, Bangalore, Allahabad, Bombay, Trivancore, and Nagpur; libraries have been formed in many of the cities and towns; model farms have been opened to instruct in agriculture. Agri-horticultural and botanical societies are aiding in the introduction of economic plants. Great efforts have been made to gather and husband the water supply; to protect the trees by means of a forest department; to discover the causes of cattle murrain, through the agency of the veterinary officers; and a meteorological department has been established to aid in spreading information as to possible droughts.

The general and history of the country during Buddhist, Hindu, and Mahomedan times, are being traced by the Asiatic societies, which were originated in India by the British in the 18th century. Liberal grants have been annually made for marine, topographical, and trigonometrical surveys, for cadastral field survey, for a geological survey, also for a meteorological department, and for geographical and archaeological research.

It is amongst the non-Aryan races that Christian missionaries and Government officers have been most successful in their efforts to impart a higher civilisation. Xavier converted to Christianity many of the fisher races of the Indian and Malaccan Peninsulas; Augustus Cleveland, a civil servant, did good amongst the races of the jungle Terai of Rajmahal; General Sir James Outram, while yet a young officer, was able to make an impression amongst the Bhils; Colonel Dixon, amongst the Mahr races; the Rev. Dr. Mason and Mrs. Mason, among the Karen; and Bishop Caldwell, amongst the Maravar and Shauar.

In ancient times the Hindus had a really scientific acquaintance with the practice of therapeutics and surgery. They appear to have acquired their knowledge and skill from dissection and other methods similar to that of modern Europe; and it is to the rigid imposition of the shackles of caste, forbidding contact with dead or morbid matter, that the decline of this science is to be attributed. But since the early part of the 19th century, the Brahmanical races of Bengal have again taken to the study of medicine.

Private and official correspondence have been largely facilitated by the British. A letter under a tol (180 grains) is carried from one end of India to another for half an anna, equal to 0.75 of a penny. In 1871 the letters, etc., sent through the post-office were 85,689,823. In 1880 the number rose to 132,977,644; but above one-third of all the letters were registered. Improved postal services, with the introduction of telegraphic communication, the opening of roads, railroads, and canals, and the construction of bridges, have done much to extend the range of commerce, and of these the influence of railroads and the Suez Canal has been marked. The Suez Canal is 100 miles long, and ships of many thousand tons burden pass through it.

In 1857 there were 274 miles of railway open. In 1876 there were 6832 miles, and at the commencement of 1881 there were 9619 miles of railway open to traffic, and 646 under construction. During the year 1881, 318 were opened to traffic, and the commencement of 1482 miles was sanctioned. The total capital outlay on railways to the end of 1883 will be £138,907,000,
BRITISH INDIA.

The cultivation of the Punjab has been largely extended in recent years. The construction of canals about 300 miles in length. The Sardak canal leads from the Sutlej, The Agra canal from the Jumna, the Son canal from the Son, and the Oressa canals from the Mahanadi.

In Bundelkhand, canals have been led from the rivers Betwa and Dassan.

The Lower Sutlej and Chenab canals are 19 in number, and 418 miles in aggregate length. The four Upper Sutlej canals have 47 miles of length.

The Indus canals, 19 in number, have an aggregate length of 577 miles. They are all drawn from the right bank of the river in the Dehra Ghazi Khan district.

In the Shalahpur district there are 18 inundation canals. In Sind are the Sakhar and Shahdadpur perennial canals, and 8 inundation canals, the Sind, Ghar, Eastern and Western Nara, Bigari, Mirtan, Thar, Fallali.

On the Bombay side are the Jumna in Kandesh, the Krishnala, and the Ahmadnagar canals.

Forests.—It had long been acknowledged by all writers that trees have a great influence on the humidity of a climate, but it was not until the middle of the 19th century that any regular care was taken of the forests of India. The subject was brought by the editor to the notice of the Madras Government, and the Directors of the E. I. Company ordered the appointment of conservators of forests, but Act vii. of 1856 was the first Forest Act passed by the Government of the country. The continuous denudation of extensive tracts in such fine districts as Midnapur, Bankura, Birbhum, and Bardwan, without any corresponding development of agriculture, is said to have perceptibly decreased the rainfall and the power of the soil to store water. The forest reserves in 1879-80 were 15,344 square miles, as under:

In the ten years 1871 to 1880 the forest revenues amounted to £5,949,099, and the charges to £4,114,927. With every year the object has more and more been rather to preserve and restore than to profit by the sales. Indeed, the destruction has been so great in many places, that the state for many a year to come might expend all in replanting.

The coffee plant was not a gift of the British, though its cultivation has been much fostered. It is said to have been introduced into Mysore about the middle of the 17th century, by Bawa Budan, a Mahomedan fakir, and the cultivation extended into Ceylon, and, since the early part of the 19th century, largely into other parts of Mysore, Coorg, Travancore, and Cochin. In 1880 the number of plantations and plants and approximate yield were as under:
Cotton has been cultivated in India from pre-historic times; but in the early part of the 19th century, in the Peninsula, much outlay was incurred in efforts to improve the quality. In 1879-80 there were 10,708,031 acres under cotton cultivation, yielding 5,181,550 lbs. of cleaned cotton, or an average of 59 lbs. of cleaned cotton per acre. In the Central Provinces and in Mysore the yield was only 24 and 25 lbs. respectively; but in the Nizam's dominions, the Panjab, and British Burma, 68, 90, and 147 lbs. respectively were obtained.

Tea.—The introduction of tea-planting is wholly a British gift to India. The tea plant was discovered about the year 1825 growing wild in Assam, and it is now largely cultivated in several parts of British India.

Chinchona trees, another grand gift to India, were introduced in the middle of the 19th century (1860), by Mr. Clements Markham, C.B., who twice visited South America, and twice conveyed to India different species of chinchona, which he and his scientific assistants had obtained there. In 1880-81 the state of the plantations was as under:

<table>
<thead>
<tr>

The organic constituents of chinchona barks are quina, chinchona, aricina, quinida, quinia, chinconida, tannic acid, quinonic acid. The medicinal forms are quinina, quinidina, chinconine; chinconidine. Quinina is being steadily superseded in India by a chinchona farrugine manufactured in the country. It is now in general use in Government hospitals, and enters largely into private practice. Only 3964 lbs. of quinina were imported in 1880-81, as against 7409 lbs. in 1879-80.

Sati.—The efforts of the British to suppress barbarities and crimes have been continuous and successful. Animal sacrifices have decreased; slavery everywhere abolished, and devil-worship largely discouraged.

According to the Abbé Dubois (p. 198), a sati was extremely rare in the south of the Peninsula. During the rule of the Brahman Peshwas, they were of not unfrequent occurrence in the Mahratta territories; and, so late as the year 1855, on the death of Kurun Singh, raja of Ahmadnagar, his widow was forcibly made a sati, at midnight, in defiance of all the exertions of the Political Officer, Mr. Erskine, backed by a small body of troops, who were fired upon and their officer wounded. But now, sati, the voluntary, or at times forcible, immolation of the Hindu widow, has ceased; only rare instances occur of the samadh, or burying alive of lepers or others with incurable diseases; self-immolation beneath the wheels of the Jagannath car are rare; the ghat murders, at one time so common amongst the Hindus, are almost unheard of. Until the middle of the 19th century, human sacrifices occurred amongst the Kandh and the Gound; and instances do still occur, from time to time, amongst the semi-barbarous tribes on the north-eastern frontier, and even amongst fanatic Hindus of the saiva sect, but the criminals are readily detected and punished; the charkhu puja, or swinging festival, has been put down, though it has been rooted out, and dacoity is only heard of when scarcity prevails.

In the suppression of sati all the native princes have imitated the British.

In 1850 an Act was passed declaring that change of religion should not involve a loss of property or civil rights. In 1856 an Act legalized the remarriage of Hindu widows. In 1870 (Act viii. 18th March), infanticide was declared criminal.

All through the 19th century the British have striven to prevent infanticide. The sacrifice of children at Saugor was prohibited on the 20th August 1802, and the poisoning of infant girls has been largely checked, though still practised. The relative numbers of the sexes returned in the census of 1871 varied greatly. Excluding Rajputana, which did not furnish a sex return, generally, throughout India, there was an excess of males, in a population of 241,533,698, of 5,094,956. Considerably more than half of this disproportion appears on the face of the returns of the North-Western Provinces and the Punjab. In the North-Western Provinces, females were less than the males by 1,382,000, in a population of about 32½ millions; and in Oudh, in a population of nearly 11½ millions, the females were returned less by 314,000.

In the British districts of the Bombay Presidency, with about 14 millions of inhabitants, the females were 851,000 in excess; but in Sind and the Native States, with a population of 7 millions, the females were 218,000 fewer than the males. In Bengal the females, in a population of nearly 69 millions, were about 380,000 in excess. In Assam, in a population of something over 4½ millions, the females were less than the males by about 116,000. In Madras, with a population of nearly 31 millions, the females show a preponderance in numbers of 355,000. Several of the Rajput races have a disinclination to state the number of the female members of their families, and many are attracted to the great centres of trade, as to the presidency towns, or to new territories, as Assam or Burma; but infanticide and neglect of girls' healths are supposed to be the causes of these differences.

BRITTANT-PATTA. HIND. The record of a decision given by a panchayat.—Elliot.

BROA. HIND. Rhododendron arboreum.

BROACH. BHARNEH, or BAROACH, a populous commercial town on the right bank of the Nerbudda, 27 miles in direct distance from the bank. The Nerbudda is here two miles broad, and boats of 50 tons come up the channel. It gives its name to a district lying between lat. 21° 26' and 22° 17' N., and long. 72° 32' and 73° 11' E., with an area of 1458 sq. miles, and a population of 350,922 in 1872. The Hindus, 277,032 in number, are
BROADBILL. BROTHER.

divided into 142 distinct castes, and these again into numerous subdivisions, whose customs and modes of life are the same, but who are socially separate. The Mahomedans of the Borah (Vohara), Memon, and Khoja sects are numerous; and other conversions from Hinduism are the Molisilami (formerly Rajputs), Malik, Momina, and Shaikhdas, all but the Borah in a depressed condition. The cultivators are Borah, Kol, Kumbi, and Rajput; the last are a quiet agricultural race. The aboriginal races are Kol, Talavia, Talwada, and Bhil. Baroach town has 36,032 inhabitants. It has a Panjrapol, or hospital for animals. From ancient times it has been an important commercial site, known in the first century of the Christian era as Barugaza, a name said to be from the ege Bhrigu, who founded it, and named it Bhirupur. It has since been held by many dynasties, Rajput, Mahomedan, and, since November 1772, by the British. It was twice (1536, 1546) sacked by the Portuguese. Bombay has since attracted many of its people, and the Bhargao Brahmins claim descent from Bhrigu.—Imp. Gaz.

BROADBILL, birds of the genera psaromus and seriophilus and family cerylaimidae.

BROCADE, Kimkhab.

Brokade, ... DUT. Intalas; Kinxa, MALAY.
Brokal, ... Gen. Sandus.
Luppa; Kimkhab, HIND. Parsthesa, ... RUS.
Broceno, ... It. Brocado, Sp.

A fabric composed of satin, striped or purpled with gold or silver, manufactured at Surat, Benares, and Ahmadabad. The looms are very simple in their construction. The gold and silver pass through many hands before they are formed into thread. Brocades (Kimkhab), gold-woven scarves (dopatta), and silks are consigned from Benares, together with a kind of yellow silk shet called pitambar, and a dark-blue silk with white spots called band, also the silk sari or scarves, exclusively for women's wear, forming both a skirt and a scarf.—Faulkner, M'Culloch, Taylor.

BROCCOLI, a variety of the Brassica oleracea.

BROMELIACEAE, the pineapple tribe or bromel worts, a natural order of herbaceous plants, remarkable for the hardiness and dryness of their foliage. The pineapple, Ananas sativus, belongs to this; also the genera Bromelia, Billbergia, Pitcairnia, and Tillandsia.

BROMICOLLA ALEUTICA, a sea-weed of the Aleutian islands, used as food.

Stuckmetall, ... GER. Metal de Canones, ... Sp.
Bronzo, ... It.

An alloy of copper and tin much employed in the arts. See Alloys.

BRONZE LEATHER. Kimkhab, HIND.

BROOKE, Sir James, raja of Sarawak, was born in 1803 at Benares. At the age of sixteen he received a commission in the Bengal Infantry, and served in the first war against Burma, where he was severely wounded at the storming of a stockade. He lost his appointment by overstaying his home leave. On the death of his father, he succeeded to a handsome patrimony, and on the 27th of October 1838 his yacht 'The Royalist' quitied England for Sarawak. He found its ruler, Muda Hasan, engaged in the suppression of a rebellion, but with a few volleys from the European guns the insurgents surrendered, and Mr. Brooke was duly installed in the rank of raja of Sarawak, previously promised to him. The newly-acquired territory was swampy, and ill cultivated by the native Dyaks, who varied their occupations as tillers of the land by head-hunting excursions among neighbouring villages. He declared head-hunting a crime punishable by death to the offender, and he suppressed it and piracy. On revisiting Britain, the British Government recognised his position, ordered a man-of-war to take him to the seat of his new settlement, gave him the title of Governor of Labuan, with a salary of £1500 a year, with an extra £500 a year as a consular agent, and afforded him the services of a deputy governor, also on a good salary. He compiled a code of laws, declared trade to be free, all roads to be open, all property inviolable, instituted a current coinage, and rigorously suppressed head-hunting, and marauding expeditions gradually became extinct in the province. He died in 1868.

BROOME, Colonel Arthur, an officer of the Bengal Artillery, author of History of the Rise and Progress of the Bengal Artillery.

Articles for sweeping floors, walls, ceilings, etc. They get the name of broom, because first made in Europe from the small branches of the plant of that name. In India they are made of the strong grasses which abound. That in Southern India is the torampum pillo, broom grass; but vullakamar, the erkoo, bamboo branches, the midrib of date and of coconut and of the Phoenix sylvestris leaves, are also used, as likewise are the Fibex negundo and Ferreola buxifolia.—Ains. Mat. Med. 145.

BROONGA MALAGUM. TAM. See Oil.

BROH, HIND. Ulmus campestris.

BROSIMUM ALICASTRUM. SWZ. The Jamaica bread-nut tree and the B. utile, Eendl., the cow tree of the Caraccas, were both introduced into the Calcutta Garden. They have a tenacious gummy milk.—Voigt, 29. See Cow Tree.

BROTHER.

Akh, ... ARAB. Fratillo, ... It.
Frere, ... Fr. Bradar, ... Pers.
Bruder, ... GER. Hermano, ... Sp.
Bhai, ... HIND. Tambi, ... TAM.

In eastern countries, this term is applied to relatives not so designated in Europe, as to cousins, also to persons of the same faith, or town, or country, or avocation. These last are supplemented by a class of friends, styled munh-badh, 'so-called brothers,' common throughout British India. This eastern use of the designation brother has caused difficulties to readers of the Christian Bible. Jude in connection with James, though called (Matthew xiii. 55) the 'brethren of Jesus,' were really his cousins, it being common with the Jews to call the first cousins brethren. They were the sons of Mary, the sister of the mother of Jesus, the wife of Cleophas. In Britannia, at the present day, if two cousins-german be married, the son of one
of these cousins will address the other as 'ma
tante,' my aunt; he is her neveu à la mode de
Bretagne. Amongst all the Mongoloid people of
Asia, the Dravida of Southern India, the na
tions of the Malay family, and among the aborigines
of America, the descendants of a common ancestor,
if they are of the same generation, give one another
the name of brother and sister.—Milner's Seven
Chiefs."

BROTHER-MAKING. With the ancient
Greeks, two persons would vow to each other per-
manent hospitality and protection for themselves
and their descendants,—the Greek ἵδινς. It is the
German Gast-freund. This is practised amongst
the Bedouins, who take an oath before one or two
witnesses. Amongst the Rajput races of India,
the women adopt a brother by the gift of a
bracelet. The intrinsic value of such pledge is
never looked to, nor is it necessary that it should
be costly, though it varies with the means and
rank of the donor, and may be of flock silk and
spangles, or of gold chains and gems. The accept-
ance of the pledge is by the katchil or corset, of
simple silk, or satin, or gold brocade and pearls.
Colonel Tod was the Rakhi-band-bhai of the three
queens of Udaipur, Bundi, and Kotah, as also of
Chand-Bai, the maiden sister of the Rana, and of
many ladies of the chiefmans of rank. Though
the bracelet may be sent by maids, it is only on
occasions of urgent necessity and danger. The
adopted brother may hazard his life in his adopted
sister's cause, and yet never receive a mite in
reward, for he cannot even see the fair object
who, as brother of her adoption, has constituted
him her defender.

Hindus take a vow of friendship and mutual
support with certain forms, and even in a com-
munity little remarkable for faith, it is infamous
to break this oath. Part of the ceremony is divid-
ing a bel or wood-apple (Feronia elephantum),
half of which is kept by each party, and from
this the compact is called Bel Bandhar.

Amongst the Oraon girls, sworn friendships or
sister-making occur, called 'Gut,' between two
They each say,—'Tu aar main gui jumbi; amren
phul lagabi.' Then each plucks flowers and
arranges them neatly in the other's hair; they
exchange necklaces, embrace, and give a joint
feast. When two Karen wish to become brothers,
one kills a fowl, cutting off its beak, and rub-
binding the blood on the front of the other's legs,
sticking on them some of the feathers. The
augury of the fowl's bones is then consulted,
and if favourable, the ceremony is repeated by
the other party. If the omens be still aus-
picious, they say, 'We will be brothers (doh),
we will grow old together, we will visit each
other.' Brotherhood amongst the Burmese is
termed doh, also thway thok, blood - drinker,
because they mix a few drops of blood from the
arms of the contracting parties with water, and
drink it. The following forms were observed,
near the eastern frontier of the Akyab district,
on the occasion of the reconciliation of two clans
or villages of the Chin (or Khyeng) tribe, named
Bainbah and Mantin, between whom a blood-feud
had previously existed. At the foot of a Young
Bin, supposed to be the residence of a 'Nat,' a
pot of rice was placed half-buried in the earth.
In the orifice of the pot some fresh leaves of the
tree were placed, and through them, into the
liquor, were thrust two pipes to suck with, a
gun, a spear, a dah, alligators' teeth, tiger's tusks,
and some bamboo sticks with notches, ears, and
splits of a mystic character. This being ready,
one of the oldest of the Tomgunim (hill chief)
present killed a small pig, extracted its heart,
and, filling the pot with water, commenced a harangue
invoking the 'Nat' to pour down his wrath
on the two Mantins and Bainbah, the contents of
the pot, and cause their destruction by any of
the ways indicated by the different articles thrust
into the pot, if they bore each other ill-will, and
did not remain friends thereforth and for ever.
This invocation being over, the Mantin took up
the pig's heart, and, pressing a drop of blood from it
into the liquor, the two men exchanged words,
and commenced sucking up the liquor, adding
more water. After them, two other representatives
of the two villages had a suck, and then the differ-
ent implements, etc. were removed, and all
the other Chins present began drinking (by
suction) out of the same pot, and another one
supplied for general use. Some war dances were
performed, and the Chins then cooked the pig,
ate, drank, and were merry. The khoun pats
were filled with fermented rice, to which water
was added as required. The oath thus administered
is said to be most binding on Chin Heart, once
taken, and Bin is the Burmese for tree. Nyoung includes a large number of
the feasts tribe. Nat is the Burmese word used to
translate the Indian Deva. Originally it denotes
a local divinity, often a Hamadryad. Khoun is a
kind of rice-beer made and used by the hill
tribes all over Burma.

Mr. Burns thus related the ceremony of brother-
making among the Kyans.—Singingdung sent on
board to request me to become his brother accord-
ing to Kyan fashion. The ceremony is called by
the Kyans Ber-biang, by the Burmese Bur-
sahibah. I landed with our nakodah, and, after
some preliminary talk to allow the crowd to
assemble, the affair commenced; we sat in the
verandah of a long house, surrounded by some
hundreds of men, women, and children, all look-
ing eagerly at the white stranger who was about
to enter their tribe. Stripping my left arm, the
Kyans took a small strip of wood, sharpened like a knife
blade, and, slightly piercing the skin, brought
blood to the surface, which he carefully scraped off;
then nakodah Gadore drew blood in the same way
from Singudung's right arm, the one next me, and
a small cigarette being produced, the blood on
the wooden blades was spread on the tobacco,—
scarcely spread, for the quantity was as small as
could be imagined. A chief then rose, and, walk-
ing to a sort of window, looked full upon the
river, and invoked the spirits of good and evil
to be witness of this tie of brotherhood; the
cigarette was then lighted, and each of us took
several puffs, and the ceremony was over.

In Hindu marriages, one of the necessary forms
is for the bridgegroom to place the bride's foot
successively on seven lines drawn on rice in a
platter. From this has been adopted the practice
of any two persons pledging mutual friendship by
taking seven steps, Saptapathi, together; and
the term Saptapatherum has come to signify
friendship.—Elphin. p. 193; Tod's Travels; Jour.
Indian Archipelago, v. No. 12; Forbes, 290. See Sabat.

485
BROTO. Beng. A vow; a self-imposed devotional exercise.

BROUGHTON, GABRIEL, surgeon of the ship Hopewell, in 1636 was able to obtain thecession of Balasore to the East India Company. In that year he cured the daughter of the Emperor of India, who had been burned by her clothes taking fire, and in 1640 he successfully treated a lady of the emperor’s zenana. When asked to name his own reward, he replied that he wished nothing for himself, but begged that his countrymen might be allowed to have a maritime settlement in Bengal. Accordingly, in 1642, a land factory at Hugli, and a maritime settlement at Balasore, were formed. Balasore was at once fortified, and became the key to the position which the British have since acquired in India.—Imp. Gaz.

Morus papyrifera, Linn. | Papyrus Japonica, Linn.
Killa, | CELEBES. | Gluga, | JAV.
Che, | CHIN. |

This is a shrub or small tree, with soft, brittle, woolly branches, and large hairy rough leaves, either heart-shaped and undivided, or cut into deep irregular lobes. It is a native of the isles of the Southern Ocean, as well as of China and of Japan, but has been introduced into the Indian gardens. In Tahiti or Otaheite, and other islands, they make tapa cloth of its bark; and it is said that the finest and whitest cloth and mantles worn by the principal people at Otaheite and in the Sandwich Islands were made of the bark, and this when dyed red takes a good colour. For the purposes of making cloth it is not allowed to become higher than about 12 feet, and about one inch in diameter. The bark, taken off in as long strips as possible, is steeped in water, scraped with a chank shell, and then macerated. In this state it is placed on a log of wood, and beaten with a mallet, three sides of which have longitudinal grooves, and the fourth a plain surface. Two strips of tapa are always beaten into one, with the view of strengthening the fibres, an operation increasing the width of the cloth at the expense of its length. Most of the cloth worn in the islands is pure white, being bleached in the sun; but printed tapa is also, though not so frequently, seen, whilst that used for curtains is always coloured. The chief dye employed is the juice of Aleurites triloba.

In Japan, they are said to cultivate this plant much as osiers are cultivated in Europe. There, for paper, the young shoots, being cut down in December, after the leaves have fallen, are then cut into good long pieces, and are boiled until the separation of the bark displays the naked wood, from which it is then easily separable with the aid of a longitudinal incision. In order to make paper, dried bark is soaked for a few hours in water, after which the outer cuticle and the internal cellular layer are scraped off. The stronger and finer pieces are separated from the weaker shoots, which are of inferior quality. The selected bark is boiled in a ley of wood-ashes till the fibres can be separated by a touch of the finger. The pulp so produced is then agitated in water till it resembles tuffs of tow. If not sufficiently washed, the paper will be coarse, but strong; if too much boiled, it will be weaker, but white. It is then beaten on a table, with batons of hard wood, into a pulp. Muclage obtained from boiled rice, or from a plant called orni, is added to the pulp. These three are stirred with a clean reed till reduced into a homogeneous liquor, and when of a due consistence are ready for conversion into sheets of paper.—Dr. Seeman, Viti; Voigt.

BROWN BEAR, Ursus isabellinus. The white bear, Ursus arctos; Syrian bear, U. Syriacus; Himalayan bear, U. Tibetanus; Japanese bear, U. Japonicus; Malay bear, Ursus Malayanus; Sloth bear, Ursus labiatus.

BROWN BUG or Sealy Bug, Lecanium coffee. BROWN HEMP, the commercial name given in Bombay to the fibres of the Hibiscus cannabinus. It is the Ambarce or Mesta-pat of Bengal, and the Palungoo of Madras, and is also known as Indian hemp and ‘hemp.’ See Ambare.

BROWN JAWARI. ANGLO-HIND. Sorghum vulgare, var.

BROWN RAT, Mus decumanus. B'ROUKHTON, the language of the Afghan people about Kabul, Kundahar, Shorawak, and Fishian. See Afghan; India; Dr. Pakistan.

BRUCE (JAMES), Author of Travels to Discover the Source of the Nile in 1768-73.

BRUCEA ANTIDYSENTERICA is considered by the Woodginos of Abyssinia a most valuable remedy in dysentery and severe cases of diarrhoea. The false angustura bark was long supposed to be the produce of this Brucea, and its active principle was accordingly named Bruceine. It is now, however, established that the false angustura bark is that of the Strychnos nux vomica, the Kuchila tree of Bengal.—O'Sh. p. 626.

BRUCEA SUMATRANA. Roxb. Fl. t. i. 449.

Gnus amarissimus, Linn. 

Ampadoo Barrowing, MAL. | Lissa Raja, AMBOTNA.

A plant of Assam, Cochinn-China, Sumatra, and Moluccas, and has been successfully grown in the Botanic Garden of Calcutta. The leaves are intensely bitter, and possess the same medicinal properties as the Brucea antidysenteria.—Christison, Dispensatory; Don, Gardener's Dictionary; Eng. Cyc. p. 671; Voigt, 185; O'Sh. p. 226.

BRUCHUS. Two species of this genus of insects attack the poppy seed when stored.

BRUCK, COMMODORE, Indian navy. His report on the Persian Gulf enumerates as articles of trade,—silk, dried fruits, guns, dates, horses, pearls, and spices, to the amount of 60 or 80 lakhs annually. In 1820 he commenced the survey of the Persian Gulf, followed by Captain Haines, I.N., and by Lieuts. Constable and Stiffe in 1860.

BRUGGH. HIND. Echinops niveus. 

BRUGPA. See Dalai Lama; Hung-Kiao; Tibet.

BRUGUEIRA PARIJFLORA. W. and A. 

Rhizophora parijflora, B. | R. cylindrica, Rzoth.
Pyu, Boung, | BURM. | Uravada, Varavada, Tel.

This mangrove grows in the Moluccas, Sumatra, Cochinn-China, the Malay Islands, in both the Indian Peninsulas, the Khassya mountains, Nepal, Orissa, Jellasore. It has small green and scented flowers. Berries dye black.—Voigt; Elliot, Fl. Audhraica.

BRUGUEIRA RHEEDI. L. Hert.

B. gymnorrhiza, Linn. | Rhizophora gymnorrh., L.
Kanka, | Beng. | Pyu, Soung, | BURM.
This species of mangrove is abundant all along the eastern coast of the Bay of Bengal, and it furnishes a hard and durable yellowish timber. The tree is easily distinguished from its associates, for it drops no roots from its branches, but the trunk is divided into numerous roots for half its height, like a small bamboo pavilion. It grows in Cochín-China, the Moluccas, Java, Ternseerim, Penang, the Sunderbuns, and in Malabar. Burmese apply the names Pyu and Sonrug to B. Rheedi, B. cripatula, and R. parviflora.—*Mason; Vogt, 47.*

*BRUH* of Sumatra, species of Macacus, Bruh putik, Bruh sepotong, and Bruh-selapi, are Macacus nemestrinus, *Lim.*

*BRUM BRUM.* HIND. Hedera helix.

*BRUMER ISLAND.* The mode of salutation or expression of friendship amongst these islanders consists in first touching the nose with the forefinger and thumb of one hand, and then pinching the skin on each side of the navel with the other, calling out at the same time, Magasúda! This habit resembles on one hand that of rubbing second day, and on the third day can fly strongly.

*BRUSH KANGAROO* is Macrops cereulce. The tail and loins are the best for food.

*BRUSH TURKES* of Australia, the Talegalla Lathami, are of the Megapodiidea family, all of which hatch their eggs by the natural heat arising in a mound about 4 feet high, which they construct of vegetable materials, earth and sand. The male bird closely watches the temperature of the mound. The young bird leaves the nest on the second day, and on the third day can fly strongly.

*BRYACEE,* the moss tribe of plants, comprising many Indian genera, calyperses, dicranum, didymodon, gymnodium, orthotrichum, schlotheimia, syrrhopodon, and zygodon.

*BRYONIA, sp., bryony.*

Tien-hwa-fen, CHIN. Tien-kwa, CHIN. Peh-yoh, —

Grows in Kwang-si, Honan, and other places in China.—*Smith.*

*BRYONIA LACINIosa.* *Lim.*

Mala, — BENG. Nehoe-maka, Maleal. Garga-nara, HIND. Linga donda, — TEL.

A creeper growing all over India.—*Roxb.*

*BRYONIA UMBELLATA.* *Wild.*

Gsw kaki, HIND. Mohkri, — HIND.

Not uncommon in the N.W. Himalaya at from 2500 to 7500 feet. The fruit is eaten, and on the Sutlej the root is said to be given for spermatorrhoea.—*Dr. J. L. Stewart,* M.D.

*BRYOPHYLLUM CALYCNUM.*

Yew kya pen pouk, — BURM.

This curious flowering plant, with a leaf like the house-leek, was introduced into India by Lady Clive from the Moluccas, and has been so naturalized on the Tenasserim coast, that it may be sometimes seen growing around old pagodas like wild plants. The leaves readily produce buds upon their margins, capable of propagating the plant when laid upon damp soil. This marginal production of leaf-buds has been considered analogous to the development of seed-buds (ovules), which in plants generally are also normally marginal, being developed upon the margin of specially modified leaves (carpels).—*Mason.*

*B'STAN-HGYUR* is a compilation in Tibetan of all sorts of literary works, about 3900 in number, in 225 volumes, written mostly by ancient Indian pandits and some learned Tibetans in the first centuries after the introduction of Buddhism into Tibet. The Rgyul portion is on religions rituals and ceremonies, and the Mdo part on science and literature.—*Csoma Krosi in As. Res.; Weber, 209.*

*BTSOD.* Tin. Madhier.

BUA or Buah. MALAY. Fruit. Bua angru, the grape; Bua dulima, pomegranate; Bua lontar, palmrya fruit; Bua minyak, olive oil; Bua nanka, jack-fruit; Bua pala, nutmeg, the Myristica moschata; Bua-rucom, Carissa spinarum; Bua-rucom (?), a plant of the same family, which reaches a height of thirty feet, and when covered with its branches of deep red-coloured fruit, it presents a beautiful appearance; the fruit is milky, has an agreeable flavour, and some resemblance to the Sawo fruit.

*BU-ALI-SINA, or Aviceena, a celebrated physician; his name was Abu Ali-ul-Husain, ibn Abul Ullah iba Sina, q.v.*

*BUBAK,* a small town in the Kurachee district, of 5703 inhabitants. The Mahomedan sections are Korichaki, Janot, and Machi.—*Imp. Gaz.*

*BUBALUS, H. Smith,* a genus of mammals of sub-family Bovine; the horns are large, attached to the highest line of the frontals, inclining upwards and backwards; ribs, 13 pairs.

*BUBALUS ARNI,* the wild buffalo.

Bos arni, Kerr. Shaw. B. bubalus, Blyth. Arna (male), Arni (fem.), — BUBALUS, var. B. bubalis, — HIND. Mun of. — BHAGUER,* — GORD. Mangi bhyus, —

The wild buffalo is found in Assam, in the swampy Terai at the foot of the hills from Bultan to Oudh, also in the plains of Lower Bengal as far west as Tirhub, but increasing in numbers to the eastwards, on the Brahmaputra and in the Bengal swamps. It also occurs here and there through the eastern portions of the table-land of Central India, from Midnapur to Raipur, and thence extending south nearly to the Godavery: a few are found in the north and north-east of Ceylon. They adhere to the most swampy sites, and never ascend the mountains. Length, 10½ feet and upwards from snout to root of tail; height at shoulder, 6½ feet; tail short. The horns are of two kinds, the one very long, nearly straight, well thrown back, var. Macoerucus of Hodgson, the other much shorter and well curved, more directed upwards, Spirocus, Hodg, the horn reaching in length. It lives in large herds; but in the rutting season in autumn the most lusty males lead off a few females and form small herds for the time. It gestates 10 months. The bull is of such power and vigour, as by its charge frequently to prostrate a well-sized elephant. They are uniformly in high condition, while the domestic buffalo is lean and angular.—*Jerdon, Mammals,* p. 308.
BUCKETLANDIA.

BUCHE-MARA.

BUCH-MARA. CAN. Calophyllum calabara. 
BUCHIANNA. See Simhilli.
BUCHLE. SIND. Acacia farnesiana.
BUBO, a genus of birds of the tribe Nocturnae, family Strigidae, order Raptore, or birds of prey. They are arranged in the sub-fam. Buboniue, viz. Nyctea, Bubo, Asio, Scops, Ketupa. Bubo maximus is the 'eagle owl' of Europe, Siberia, China, Asia Minor, Babylonia, Barbary, Himalaya? See Birds.
BUBUK, MALAY. Wormwood.
BUCINDE, a family of recent and fossil molluscs comprising many genera and sub-genera.
BUCHEPHALIA, a town built by Alexander, supposed to have been on the site now occupied by the town of Jhelum. It was named after his horse, which was killed in battle here. See Poras.
BUCEROTID, the hornbill family of birds, distinguished by the enormous size of their bills, and many with a casque or protuberance at the base of the bill on the culmen. The genera and species in S.E. Asia are—

Buch. Beng. Zingiber zermamb; Duk., sweet flag, Acorus calamus.
BUCHANAKA. SANSK. Arachis hypogea.
BUCHEAN, DR. FRANCOIS, a medical officer of the East India Company, who afterwards added the surname of Hamilton. In 1800 and 1801, made a 'journey from Madras through the countries of Mysore, Canara, and Malabar,' under the orders of the Marquis of Wellesley, investigating the state of agriculture, arts, and commerce, and his report was printed. He introduced into his Commentary upon Rhode's Hortus Malabaricus, published in the Linnean Society's Transactions, vols. xii., xiv., and xv., descriptions of several new peninsular species. His writings are—An Account of Nepal, Edinburgh, 1819, 1 vol.; Travels through Mysore, Canara, and Malabar, Lond. 1807, 3 vols.; Geographical and Statistical Description of Dinapore, Calcutta, 1853, 1 vol.; Fishes of the Ganges, Edin. 1822; On a Map of Burma in the Journal. 
For his Mysore journey he set out on the 23d of April 1800, and completed it on the 6th July 1801. The first edition appeared in 1807. It is an almost unique encyclopaedia, and how one man, however indefatigable, could have produced, in so short a space of time, such a mass of reliable information about a country in which he was a stranger, is indeed astonishing. His survey of the north-eastern districts of Bengal, 1807-1813, are still in the India Office. Mr. Montgomery Martin, in 1838, printed them from three volumes of History, Antiquities, Topography of Eastern India.—Baist's Civil ; Imp. Gaz.

Pai, char meunjhi, HIND. 
Charanji, Charoli, ... 

This is a straight-growing, handsome, large forest tree, with fragrant flowers, common for some distance west of the Jumna, in the lower hills. It grows in Ajmir, Panjab, and Garhwal. In the Bombay Presidency, is found more inland than in the coast jungles. In Canara and Sunda it is most frequent above the gaths, particularly north of Dandelle, and the wood is rather strong and tough, but seldom squaring above four inches, The tree abounds in Mysore and Cuddapah; in Cuttack is worked up generally into furniture, house doors, windows, presses, tables, etc. It requires to be polished, otherwise it stains of a burnt-sienna colour any cloth brought into contact with it. Brandis says that in Bruma it is a soft, light wood, and not used. The fruit, when ripe, in May is gathered, then soaked in water to soften the outer pulp, when it is washed and rubbed off by the hands; the little nut is then dried in the sun, and afterwards broken between a common chuckee or stone hand-mill, such as is used for grinding wheat; the kernels are then shifted and winnowed, and much used in native confectionery, roasted and eaten with milk, and considered a great delicacy. They abound in a straw-coloured, sweet-tasted and limpid oil, which is seldom extracted. Its bark is used by tanners. In Hindu poetry, its handsome white flower furnishes a simile for pretty eyes, and is held to be sacred to Vishnu.—Madras Exhibition ; Eng. Cyc.; Drs. Roxb., Gibson, Voigt, Brandis, Irvine, Mason; Cal. Cat. of 1862. Useful Plants; Flor. Andh.; Powell, p. 570; Mr. Thomson; Beddome. 
BUCHEBAN, VaRIMATTA, the Kaichnar of Chutia Nnau, a tree with hard, whitish yellow timber.—Cal. Cat. Ex. 1862.
Buchgoti, a Rajput tribe in Junpur and Gorakpur, formerly notorious for turbulence; part of them became Mahomedans prior to Sikaner Lodi's rule. The Bilk-huria, the Rajvar, the Rajkumar, are offshoots from the Buchgoti.—Elliot.

BUCK. HIND. Fleabane; Canna sp.
BUCKHAN. See Clothing.
BUCKINGHAM, JAMES SILK, editor of a newspaper in Calcutta. He urged freedom for the press, but was ultimately deported from India, and travelled in Western Asia. He published his travels.

BUCKLANDIA POPULNEA. R. Brown, a beautiful evergreen of the Sikkim Himalaya. One seen by Dr. Hooker had a trunk 211 feet in girth, and was unbranched for forty feet. Ferns and the beautiful air-plant Caelogyne Wallichi,
BUCKLAT-UL-MALIK.

with other orchids, grew on its branches, while 
clematis and Saintonria clung to the trunk. Its 
wood is brown, and not valuable as timber. It is 
also interesting in a physiological point of view, 
from the woolly fibre being studded with these 
curiously microscopic discs so characteristic of pines, 
and which, when occurring on fossil wood, are 
considered conclusive as to the natural family to which 
such woods belong. The whole natural order to 
which Bucklandia belongs, possesses this character, 
as well as several species of Magnoliaceaee found 
in India, Australia, Borneo, and South America. B. 
populnea, R. Brown, is a large tree of the Khassya 
mountains from Cherrapunji to Sarureem. Flowers small and greenish.—Hooker, Journ. ii. p. 
185; Voigt, 53.

BUCKLAT-ul-MALIK. Arab. Fumaria officinale, funitary. Bucklat-ul-Mubarak, Por-
tulaca quadrifida.

BUCKTHORN or Rhamnaceae order of plants, 
comprising the genera, zizyphus, berhenia, 
sageretia, ventiliago, rhamnus, scutia, hovenia, 
colubrina, vitmannia, and gosmania. The dried 
red crushed drupes, both of rhamnus and zizyphus, 
are sold in the shops of China, under the name of 
Tsai-pi and Xao. That part of the Southwold 
province of Chinese rhamnus, is purgative and 
diuretic. The kernels of R. sopheria are 
separate. The bark of a species of rhamnus is 
brought from Cheh-kiang, and is used to form a 
beautiful green dye.—Smith.

BUCKUM. Hind. Pterocarpus santalinus.

Fagopyrum emarginatum, Meeza, and F. escu-
 lentum, Manch, both known as buckweat, are 
cultivated abundantly in Central Asia and the 
Himalaya, at about 6000 feet on the Jhelum, 
5500 feet on the Chenab, and on the Ravi 
8000 to 9000. Dr. Thomson saw it at 13,000 
feet in Zanskar, and Drs. Stewart and Caley at 
13,000 and 14,000 feet in Ladakh. Beers are more 
found of this than when growing than of any other food; 
the leaves are much used in Lahul as a pot-herb. 
In the hills, the buckweat grain is considered 
inferior to millet, but much is taken to the plains, 
where it is used by the Hindus on their 'barr or 
fast days, it being then 'phalahar,' or lawful. 
In the neighbourhood of Hankow in China, the crop of 
F. esculentum is much depended on; its small 
grain is very sweet and oily, and makes very 
nourishing food and pastry. The crop is cut 
before the frost. It is believed to be a native of 
Central Asia, and is supposed to have been first 
brought to Europe in the early part of the twelfth 
century, at the time of the crusades for the recovery 
of Syria from the Saracens. The fruit of the S. 
species, in America, 30 to 60. Bushels per acre are not 
unfrequently produced. The quantity of seed 
sown is 5 to 8 pecks the acre.—Simmonds, p. 259; 
Dr. J. L. Stewart; M’Culloch; Smith, p. 44.

BUD. Pers., Hind. Existence. Bud-0-bash, 

BUDDHA.

BUDAON or Budda, an ancient city on the 
bank of the river Sat, in the N.W. Provinces of 
India, in lat. 28° 2' 30" N., and long. 79° 9' 45" 
E. The Budon district is bounded on the west 
by the Ganges, has an area of 2004 square miles, 
and a population of 953,458. Besides Hindu castes, 
the Ahir graziers on the Bhur tract are 81,522; 
Chamar landless cultivators, 133,528; Kayasth, 
9726; Kurmi, 6143. The Bantu, ostensibly beg-
gars, are a predatory thriving tribe moving in 
gangs; the Hubarah, also in thieving gangs. 
The Sansa are vagrants professing Mahomedanism; 
they cross over from the Doab and steal children. 
The district was Ahir a territory; from the 11th to 
the 19th century it was under the Mahomedan 
dynasties of Dehli and Oudh, and since 1801 it 
passed to the British.—Imp. Gaz.

BUDDERI. SANSK. Ziziphus jujuba.

BUDHIA. This title is usually employed to 
designate the eminent religious teacher, from whose 
doctrines have sprung up the forms of the Budh-
ist religion which are found prevailing in Ceylon, 
Nepal, Tibet, Tartary, Mongolia, Burma, Siam, 
Anam, Cambodia, China, Japan, Formose, and 
Corea. Its votaries, it is supposed, outnumber those 
of all other creeds, except the Christian. The Rev. 
Mr. Hardy quotes a German estimate of the Bud-
ghists at 369 millions; Major Cunningham has 222 
and, even 500 millions have been estimated.

Buddha in Sanskrit means wisdom, supreme 
intelligence, and the words of nearly similar 
sound are mere varieties, in different parts of 
the East Indies, in orthography and pronunciation. 
The Chinese having no B or D in their alphabet, and 
their language being monosyllabic, they have 
father softened this term into Fo, Fo-o, or Fo-
Hi; they also call him Sa-ka, a variation of 
Saky, his brother.

Taking the term in the simple sense of a religious 
teacher, it is generally admitted that there had 
been several Buddha prior to the advent of 
Sakya Sihna, to whom the term is now restricted 
by the people of Europe. Sakya Sihna declares 
he was the twenty-fifth Buddha, and says of 
another, 'Bhagava Metteyo is yet to come.'
Colonel Tod is of opinion (i. p. 90) that there had been four distinguished Buddha or wise men, teachers in India of a monotheism which they brought from Central Asia, with their science and the arrow or nail-headed written character. The first Buddha he considers was Budh, the parent of the Lunar race, b.c. 2250. The second (twenty-second of the Jains), Naimnath, b.c. 1120. The third (twenty-third of the Jains), Parswanath, b.c. 650. The fourth (twenty-fourth of the Jains), Mahavira, b.c. 533.

Sakya Sruha was born in the 5th or 6th century b.c., at Kapilavastu, in the Gorakhpur district, in the reign of Bimbisara, the fifth of the Sisunaga dynasty of Magadha or Behar. He was the only son of raja Suddhodana, the chief of a tribe called Sakya, whose country lay among the spurs of the Himalaya, along the banks of the Rohini, or modern Kohana. Suddhodana was indeed one of the last representatives of the pure Aryan or Solar dynasties who held sway in Ayo- diya, the modern Oudh, and were deposed by the Lunar dynasties of the mixed Aryan and Turanian races, and reduced to mere chieftains of tribes, who still maintained a precarious independence under the protecting shadows of the Himilaya. The Rohini divided the Sakya from the Koliyan on the opposite bank, and in times of famine the river was often the object of fighting between them. But during the rule of Suddhodana there was peace between the clans on either side of the Rohini, and Suddhodana had married two of the daughters of the Koliyan chief. Both continued childless, until, in her 45th year, the elder sister professed the mendicant's life, and with her, the prince Gautama Siddhartha. Buddhist legends describe the great rejoicing at the unexpected event; that Buddhas from afar came to worship the new-born babe, and aver that his incarnation was voluntary, and his conception immaculate.

At 19 years old he was married to his cousin Yasodhara, the daughter of the Koliyan raja; and in the Pali scriptures we hear nothing more of him, until in his 29th year it is related that, one day, driving beyond his pleasure-grounds, he met an old man, and on another a paralytic, and again one suffering from the pest, and after that a corpse. These sights stirred the prince to new thoughts. About this time Yasodhara gave birth to a son, her only child. On hearing of it, Gautama only said, 'This is another strong tie I have to break.' That evening the nautch girls came as usual to dance before him, but he paid no attention to them, and gradually fell asleep. On waking again at midnight, and seeing them lying about in the ante-room in inelegant postures, an overpowering loathing filled his soul, and he called at once to his charioteer, Channa, to get ready for his departure. He then went to Yasodhara's room, hoping to embrace his new-born boy while she slept, but, fearing that should she awake he would be moved from his resolution, he tore himself from the threshold of her door; and on the night of the full moon of the month of July, b.c. 594, the young Rajput prince went forth into the forests of Magadha, resolved never to return to his father's house, and to his wife and child, until he could come back to them as a teacher. This, in the Buddhist scriptures, is styled 'The Great Renunciation of Gautama Buddha.' He first went to Rajagriha, the capital of Magadha, the residence of king Bimbisara, where he attached himself to a Brahman named Alara, and afterwards to another named Adraka, by whom he was initiated into all the mysteries of the Hindu religion and philosophy. But not being satisfied, he retired to the jungle of Uruvela, on the north of the Vindhya range, where for six years, attended by five faithful disciples, he gave himself up to the severest asceticism, till his fame filled the whole of Malwa, or Central India, 'like the sound of a great bell hung in the canopy of the skies.' At last one day he fainted from extreme exhaustion, when, recovering, and seeing the folly of such useless self-denial, he thenceforward began to take food regularly, on which his five disciples deserted him and went to Benares. On the very day that they left him, he wandered forth, meditating painfully on their desertion just at the time when he most needed human sympathy, until at last he came to a village on the banks of the Nairanjara, where Sujata, the daughter of one of the villagers, compassionately brought him food as he sat under the Bodhi tree, Uro stigma religio sum, or sacred fig-tree. He was greatly moved by the compassion of Sujata, and sat meditating under the tree through all the day and all the following night. First he was strongly tempted to give up his missionary life, and return to wife and child, wealth and power, but as the sun set the religious side of his great nature triumphed. His mind was made up to the belief that penances, self-tortures, and sacrifices were not the way of life and peace, but a pure heart; and that the only freedom from doubt and heresy was through overcoming impurity, envy, and hatred. The first encumbrance that must be conquered is sensuality, and the last, self-righteousness; and the crown of purity, faith, and justice, without which all these are no more than self-righteousness, is 'universal charity.' As these truths flashed on his mind, he felt that he had become the Buddha, the Enlightened One, and he arose to proclaim his new-found joy to all the world around him. He first sought out his old teachers, Alara and Adraka, but they were dead. Then he went to his former five disciples at Uruvela, who were now living in the Deer Forest at Benares. As he approached, they determined not to receive him, but Gautama was a man of commanding presence and noble countenance, and had a rich, deep, thrilling voice, and as he drew near and addressed them, all their self-righteous resolutions failed, and in the end they followed him as their true teacher and master. Another of his converts in the Deer Forest was a rich young man named Yasa, who came to him by night out of fear of his resolutions, and afterwards succeeded in bringing many of his friends and companions into the new religion. He then returned to Uruvela, where he converted three fire-worshippers, one of whom was called Kasypa, and other hermits who were living there, accompanied by whom he proceeded again to the court of king Bimbisara at Magadha. There great numbers joined him, including Sariputta and Moggallana, who afterwards became famous leaders of the new religion. At last, after seven years' absence, Buddha started for Kapilavastu. He entered the city with his mendicant's bowl in his hand, begging through the streets. The old raja Suddhodana was scandalized; but Gautama replied, 'My father, the customs of the Diarna (Law, or
Kingdom, of righteousness) are good, both for this world and the world which is to come. My father, when a man has found a treasure, it is his duty to offer the most precious of the jewels to his father first. Do not delay, let me share with you the treasure I have found.' Yasodhara did not go forth to welcome him. 'I will wait and see,' she said; 'perhaps I am still of some value in his eyes; he may ask for me, and I can better welcome him here.' Gautama, who had not seen her since the night of his renunciation, noticed her absence, and observing that doubtless the princess, knowing that a reclusion could not be touched by a woman, had kept away, added, 'She may exit and stand by the wayside under a tree. Unwilling sorrow be allowed to take its course, her heart will break.' Then he went in to Yasodhara, who, when she saw him whom she had known as a prince standing before her as a yellow-robed hermit, and though she knew it before, for the first time then realized the impassable gulf between them, she fell upon him, and held him by the feet and wept bitterly. Buddha praised her great virtue, and, when she afterwards entered into the new religion, she became the head of the first Buddhist nunery of female recluses. For 45 years Gautama prosecuted his mission in Hindu- sthan, attended by his cousin Ananda. He also converted another cousin, Devadatta, who, in envy, incited king Ajatasatru, who had suc- ceeded king Bimbisara in Magadha, against him. But in the end Ajatasatru was also converted. The common people, whose levelling instincts rebelled against the hereditary priesthood and crushing caste system of the Brahmans, joined him in multitudes. He died at the age of 80, B.C. 543. He was journeying towards Kasina- gara, 80 miles east of Kapilavastu, and had rested in a grove at Pawa, presented to the new society by a goldsmith named Chunda. Chunda here prepared for him a meal of rice and pork, of which he ate incautiously, and was soon afterwards taken ill. Finding that Chunda was likely to be reproached for his mortal fit of indigestion, he quietly remarked to Ananda, 'After I am gone, tell Chunda he will receive in a future birth a very great reward; for, having eaten of his pork, I am about to pass into Nirvana. These are the gifts which will be blest above all others, namely, Sujata's gift before I attained wisdom under the Bodhi tree, and this gift of Chunda before I enter into the rest of Nirvana.' Afterwards, observing Ananda weeping, he said, 'O Ananda, do not weep. This body of ours contains within itself the powers which renew its strength for a time, but also the seed of its destruction. Is there anything put together which shall not dissolve?' Then, turning to his disciples, he said, 'When I am passed away, and am no longer with you, do not think the Buddha has left you, and is not still in your midst. You have my words, my explanations, my laws, the Buddha has not left you.' And again, 'Beloved disciples, if you love my memory, love one another.' And after another pause he said, 'Beloved, that which causes life causes also decay and death. Never forget this. I called you to tell you this.' These were the last words of Gautama Buddha, as he stretched himself out and died under the great sal tree, the Shoren robusta, at Kasinagara. His body was burnt with great reverence by the local rajas of Malwa, and his charred bones were distributed over the whole country, and in after times gave rise to the stupas, tope, or relic mounds which have been discovered in so many parts of India, from the valley of the Kabul river to the banks of the Kistna. For gradually the new religion grew mightily. The Sisunaga dynasty, which reigned at Magadha from B.C. 691 to B.C. 325, was followed by the Maurya dynasty, which reigned to B.C. 118. It is the most brilliant and best known of all the dynasties of ancient India. In the anarchy which followed the invasion by Alexander the Great, B.C. 330 (Heracl) to 326, the last of the Sisunagas was murdered in revenge by a learned Brahman named Chandragupta, who was born as a prince, and established the Maurya dynasty, established Buddhism as the state religion in India, B.C. 250. He was the first to raise stone architecture in India, the art of which was probably derived through the Greek invasion. He engraved his edicts on rocks and on pillars; and the Sanchi tope, and the tope of Bharhut, are probably remains of the 84,000 tope or stupas he is said to have erected in honour of Gautama Buddha and his most distinguished first disciples. Only eight of these mounds were shrines of actual relics of Sakya Muni himself, and these are distingulished by the name of dhagobas,—being derived from dhatu, a relic, and garbha, the womb,—that is, a relic-shrine.' The legends relate that on his attaining perfect knowledge while resting under the pipal tree near Gaya, he celebrated the event with the stanzas :

'Through various transmigrations
Have I passed, (without discovering)
The builder I seek of the abode (of the passions).
Painful are repeated births !
O house builder ! I have seen (thee).
No house shalt thou again build me ;
Thy rafters are broken,
Thy ridge-pole is shattered ;
My mind is freed (from outward objects),
I have attained the extinction of desires.'

According to tradition, a likeness of this great reformer was carved in sandal-wood from the life, and this became the model for such representations as exist. He appears in them as a smiling, smooth-faced, feminine-looking person, with long hair parted like a woman's, and formed into a knot at the top of the head. In early Buddhist belief, however, statues were not erected to him. There are none belonging to the eastern caves, nor any found at Buddha Gaya, Bharhut, or Sanchi. There are none erected as early as the Christian era. His statue in the facade at Karli and in the western caves are insertions of the 4th or 5th centuries, or later.

Before the end of his career, he saw his principles zealously and successfully promulgated by his Brahman disciples, Sariputra, Mahalaya, Ananda, and Kasappa, as well as by the Vaisya Katyayan, and the Sudra Upali. At his death in B.C. 543, his doctrines had been firmly established, and eager claims were preferred by kings and rulers for relics of their teacher. His ashes were distributed amongst eight cities, and the charcoal from the funeral pile was given to a ninth; but the spread of his influence is more clearly shown by the mention of the numerous cities where he lived and preached. Amongst these are Champ

491
BUDDH.

and Rajagriha on the east, Sravasti and Kausambi on the west. In the short space of forty-five years, this wonderful man succeeded in establishing his doctrines over the fairest districts of the Ganges, from the neighbourhood of Agra and Cawnpur to the Delta. This success was perhaps as much due to the corrupt state of Brahmanism, as to the greater purity and more practical wisdom of his own system. His success was also partly due to the political admission of women. To most of them the words of Buddha preached comfort in this life, and hope in the next.

To the young widow, the neglected wife, and the cast-off mistress, the Buddhist teachers offered an honourable career as nuns. Instead of the daily indignities to which they were subjected by grasping relatives, treacherous husbands, and faithless lords, the most miserable of the sex could now share, although still in a humble way, with the general respect accorded to all who had taken the vows. The Bhikshuni were indebted to Ananda's intercession with Sakya for their admission into the ranks of the Buddhist community, and (Cosima's Analysis of the Dulva, Res. As. Soc. Bengal, xx. p. 90; also Fo-kwe-ki, chap. xvi. p. 101), in token of their gratitude, the Pi-khieu-ni, or Bhikshuni, at Mathura, paid their devotions chiefly to the statue of Anan (Ananda), because he had besought Buddha that he would grant to women the liberty of embracing ascetic life. The observances required from the nuns are given in note 23, chap. xvi. of the Fo-kwe-ki. Though thus enrolled, their position was still humble. The female ascetic, even of a hundred years of age, was bound to respect a monk even in the first year of his ordination.

Sakya has become a saint in the Roman Catholic Church, under the name of St. Josaphat.

In Burma, his statues or images appear in Buddhist temples, sometimes seated cross-legged, in the attitude of teaching, sometimes resting on his right side supporting his head on his right hand. He is represented in those of India seated on the Sinhasana, or lion's throne, at first alone, but, under the Mahayana heresy, with other beings near, often with standing figures holding fly-flags; or seated on a throne, the corners of which are upheld by two lions, with his feet on a lotus blossom, and his hands in front of his breast, the little finger of his left hand held between the thumb and forefinger of the right. This is the attitude of teaching, and is known as Dharma Chakra Mudra. Buddha and the Jaina Tirthankaras are also represented squatting with their legs doubled under them, and the hands laid one on the other over the feet, with the palms turned upwards. This is the reflective or meditative attitude, Jnan Mudra or Dhyan Mudra. A third attitude is called Vajrasana, also Bhumisparsa Mudra, when the left hand lies on the upturned soles of the feet, and the right, resting over the knee, points to the earth. He is also figured standing, with the right hand upheld in the attitude of blessing, or with the alms-bowl of the Bhikshu or mendicant. Also resting on his right side, with his head to the north, the attitude he took at his death.

Sakya Sinha, according to Tibetan books, died near the town of Kusula in Kamrup, beneath the shade of two sal trees on the southern bank of the Brahmaputra river, then called Hiranyo. The Pali books of Burma and Ceylon say B.C. 544; General Cunningham has B.C. 478, at the age of 80. In the middle of the 19th century, Professor Kern of Leyden, in a dissertation on Buddha, gives B.C. 388 as the date of his death; and Professor Weber, in the Literisches Central Blatt of 1874, adopted the view taken by Professor Kern. Mr. Fergusson gives as under the dates of events:—

Buddha born at Kapilavasta, B.C. 560.

" became an ascetic, 381.

" died, 481.

First Buddhist council, 247 B.C.

Second Buddhist council, held in the 10th year of the reign of Kala Varidham, 283.

Vrijadratha, 150.

He is known to the various races by various names and titles. He was called Sakya and Sakya Sinha from his clan; Sādhu-dani, as the son of Suddodana; and from his mother Maya-Devi he got the name of Maya-Devi-Suta; Gautama was from his got or ancestral descent, and hence the Burmese Gaudama; Arka-Bandhu, or Kinsman of the Sun, from his descent as a Kshatriya of the Solar Line; Bhagava or Bhagavat, meaning saintly; Sakya Muni, or Sakya the hermit; Tathā-gata, he who has gone away; Sramana, the priest; Mahā-Sramana, the great priest. He is the Buddas and the Sarmanes of the Greeks; the Mercurius Mayas of the Roman Horace; Bud or Wud of the pagan Arabs; Toth of the Egyptians; Woden of the Scandinavians. His clan name of Sakya became the Xu-Ka of the Chinese and Japanese, and the Shakhout of Tonquin; and the Chinese, having no b or d in their monosyllabic language, style him Po, Fo-e, Fo-Hi, and Fo-to; in Tibet he is Pot or Po-ti; also in Siam, Chom-dan-das, Sungs-gyas, and Somme-no-Kodam.—Ferg. and Berg. Cave Temples of India, 24, 178.

BUDDHA-PRIYA, the compiler of the Rupasiddhi, the oldest Pali grammar, now lost. It was compiled from the more ancient work of Kaichhyayana.

BUDDHA-SARA. Sansk. The essence of the Buddha philosophy.

BUDDH GAYA or Budh Gaya, a village, lat. 24° 41' 45'' N., long. 85° 24' E., about 6 miles from the town of Gaya in Bengal. Sakya Muni, in the 6th century B.C., resided here for four years under a pipal tree (Urostigma religiosus), sitting
BUDDHISM.

with his legs crossed in mental abstraction. That celebrated tree, the Bodhi-drum, or tree of wisdom, still exists, but in a very decayed state. The rajasthan, or palace, was the residence of the Buddhist king Asoka and his successors on the throne of Magadha. In front of the tree are the ruins of an ancient Buddhist temple, restored A.D. 1958-1960 by a Buddhist ruler, but only the mazaric shrines remain. It is largely visited by pilgrims, who deposit their offerings at the foot of the pipal tree. One inscription on a stone in Sankrit, dated Samvat 1005 (A.D. 948), is said by Dr. Wilkins to import the temple of Buddha at Buddh Gaya was built by Amara Deva, the author of the Amara Kosh; but it may mean restored, as it was seen before Amara Deva's time by Fa hian (v. p. 189). Another Pali inscription, of date 1305, in Baranasee, says the chaitya or temple was first built by Asoka, 218 years after Buddha, or B.C. 325; often restored, and finally restored by the Burmese Emveys, A.D. 1306-1309 (v. p. 157). The vaulted cavern or Nagarjuna has other inscriptions, all short, and in every variety of the Deva Nagari. — Beng. As. Soc. Journ. vi. p. 671; Tr. of a Hindu; Ferguson's Buddhist Architectural Remains; Hardy's Eastern Monachism, p. 434; Buddhagaya, the Hermitage of Sakyu Mani, by Rennadrala Mahat. L. I. in Sinhalese. —BUDDHISM. Sansk. Perfect knowledge, the acquirement of which, with the Buddhists, frees from further transmigrations.

BUDDHISM is a religion which had its origin in the teaching of Sakyu Sinha. In the year 281, the population of the world was estimated at 1,500,000,000, of whom 470,000,000 were supposed to be Buddhists. Some circumstances, of which we are uninformed, must have prepared these regions for the reception of his ascetic doctrines. From its rise in the 6th century B.C., it gradually spread from the valley of the Ganges over the whole of India; it extended into Kabul, into Bamiyan in ancient Bactria, a district of Persia under Darius; traces of it early appear through Mongolia and Tibet; it was introduced into China by 500 Kashmirian missionaries in A.D. 65; through Hindustan it extended into the Peninsula and to Ceylon, into Nepal, Burma, Assam, Siam, Cochin China, the islands of Formosa and Japan; and, except in India, where it arose, and in Kabul, Bactria, Bamiyan, and Kashmir, it still flourishes in the countries named, and in Sikkim, Ladakh, Zanskar, Dras, Suru, Purik, Spiti, Nubra, Rong, Janskar, Hanle, and Rupshu. Buddhist made a start in the time of king Asoka, and religious Buddhist counsellors assembled at Pataliputra with Asoka. After nine months' consultation, they sent out nine teachers, viz. one to Kashmir and Peshawur, a second to the country of the Nahrinda, a third to Mewar and Burd, a fourth to Northern Sind, a fifth to the Mahatta country, a sixth to the Greek province of Kabul, Arachosia, a seventh to the country of the Himalaya, the eighth to Avn or Siam, that is, the 'golden land,' the aurea regio or the aurea chersonesus, and the ninth to Laina or Ceylon.

It is known that Buddhism was introduced at the court of Mughals, the emperors of China, in A.D. 65; into Java in A.D. 24 to 57; into Koali (Corea) in A.D. 372; into Po-tsi, in Corea, in A.D. 384; into Tibet, under Hla-ta To-ri, in A.D. 407; into Sin lo or Sinra (in Corea), A.D. 528; in 552 into Japan; and in 632, under Srong dzam gampu, Buddhism was introduced into Tibet generally.

About 450 A.D., missionaries from Ceylon permanently established their religion in Burma. The Burmese, however, allege that just after the Patao council, B.C. 297 and 244, missionaries came to Tun-ton, between the Sitong and Salwin estuaries.

In Turkestan, Buddhism was still prevailing in A.D. 1419, in the cities of Turfan and Kamin, while Shah Rukh's ambassadors passed through; and Tagalaq Timur was the first Mahomedan sovereign of Kashgar of the lineage of Chengiz. There are now many Buddhist priests at the capital of Khotan; but Mahomedanism had been extensively prevalent in East Turkestan for centuries prior to its conquest by the Chinese in A.D. 1757, and the Buddhist priests and temples may have been since introduced.

In the first 500 years there were several assemblies of its eminent men, to discuss its condition and prospects. At the council held B.C. 543, when 500 of Buddha's discipes were assembled in a cave near Raja-grh, to gather together his sayings, they criticized the lessons of their master, in three great divisions — (1) the words of Buddha (his discipes; (2) his code of discipline; and (3) his discourses to the people. There are the three collections, Pitaka, or baskets of Buddha's teaching; and Sangiti, the word for a Buddhist council, means literally a singing together.

Even before the decease of Sakyu Sinha, however, schisms had arisen amongst his followers. Ananda had been with him from the first, and to him Buddha had referred his discipes as the depository of what he himself had said. Nevertheless, so rapidly had the views of Buddha been departed from, that Ananda was excluded from the deliberations of the first Buddhist council as an unbeliever, and only re-admitted when he had submitted to their views (Bunsen, God in Hist. i. 341). A century afterwards, B.C. 443, 381? in the reign of Kala Yrhdhana, a second council of 700 was held at Vaisali, to settle disputes between the more and the less strict followers of Buddhism; it condemned a system of Ten Indulgences which had grown up, but it led to the separation of the Buddhists into two hostile parties, who afterwards split into 18 sects (Imp. Gaz. p. 248). Eighteen heresies are deplored in the Mahawanso, within two centuries of Sakyu's death; and four distinct sects, each rejoicing in the name of Buddhists, are still to be traced amongst the remnants of his followers. Not reckoning the doctrines cherished among the Jaina of Gujerat and Rajputana, its mysteries, as administered by the Lamas of Tibet, are distinct from the metaphysical abstractions propounded by the monks of Nepal, or the philosophies of the Burmans. Its observances in Japan have undergone a still more striking alteration from their vicinity to the Sintu sect; and in China they have been similarly modified in their contact with the rationalism of Lao-tse, and the social demonology or spirit-worship of the Confucians (Ten. Ceyl. p. 527).

The third council, B.C. 246, was assembled by Asoka, and the fourth and last council was held under King Kanishka, and it was at this fourth council that Nagarjuna introduced the Mahayana doctrine. — Ferri.; Imp. Gaz. Both
these rulers made Buddhism a state religion. Asoka had inscriptions recorded on rocks and columns, enjoying its doctrines, and some of these still remain. His son Mahendra, B.C. 243, carried to Ceylon Asoka's version of the Buddhist scriptures in the Magadhi language. He took with him a band of missionaries; and soon after, his sister, the princess Sanghamitta, who had entered the order, followed with a company of nuns. In the inscriptions, Buddhism appears as a system of pure abstract morality, no trace being exhibited of the worship either of Buddha himself, or of the serpent or tree. Kanishka, of Kashmir and N.W. India, about A.D. 10–40, but his sway extended to both sides of the Himalaya, from Yarkand and Khokand to Agra and Sind. The assembly convoked by him consisted of 700 members. They drew up their commentaries on the Buddhist faith, which supplied in part materials for the Tibetan or Northern Canon.

The prominent sects are known as the Hinayana and Mahayana, the Lesser Vehicle and the Greater Vehicle. The original puritans belong to the Hinayana. They practised morality, with a few simple ceremonial observances. The Mahayana school was founded by the 13th patriarch, Nagarjuna, a native of Berar, about 500 or 400 years after Buddha. It taught an abstract mystical theology, in which Buddha was pushed into the background by female personifications of Dharma or the Fruita Parmatha, and other goddesses, by Jnanat Maka Buddhās, or forms of the senses (Ferg. and Burg. Caves Temples of India, 182). The Mahayana includes many later corruptions or developments of the faith, as originally embodied by Asoka in the Lesser Vehicle or Canon of the southern Buddhists, B.C. 244. The Buddhist Canon of China is a branch of the Greater Vehicle, and was arranged between A.D. 67 and 1285. It includes 1440 distinct works, comprising 5586 books; and the Buddhism of China and Japan is a grossly idolatrous religious system.

Kanishka and his council became in some degree to the northern or Tibeto-Chinese Buddhists what Asoka and his Patna council (244 B.C.) had been to Buddhists of Ceylon and the south. But the ultimate divergence between the canons is great, both as to the historical aspects of Buddha's life and as to his teaching.—Imp. Gaz.

The rails of the dagobas at Buddha Gaya, Bharhut, with the eastern caves, give a complete history of Buddhism as it existed in India during the Mauryan dynasty (B.C. 325 to 188). At Sanchi and the western caves is given a complete representation of the character it assumed from the 1st century before the Christian era till the third or fourth of it. At Amravati and the N.W. monasteries in Feshawar, are shown the modifications introduced before and during the 4th century; and from Ajanta and later caves are to be traced its history till it became almost Jain, and then altogether faded away.—Pergusson, p. 206.

The gateway of the Sanchi tope belong to the first half of the 1st century of the Christian era, and, though subsequent to the Naga revelation, the sculptures scarcely indicate its existence. Buddha does not appear on the Sanchi sculptures as an object of worship. The serpent is there, but rare. The dagoba, or depository of the relics of saints, is there, as also are the tree, the wheel, and other emblems, and, on the whole, the sculptures on the Sanchi tope may illustrate the Hinayana school of Buddhism, at the period when other doctrines were about to be introduced.

The Amravati sculptures, again, belong to a period 300 years later than that of Sanchi, and in them the new school of Mahayana Buddhism may be studied. In these, Buddha is an object of worship, but the serpent is his co-equal. The dagoba, tree, and wheel are reverenced, and the sculptures contain all the legends of the later books, though, in a purer form. Hindus, Dasyus, and other men, women, and animals, especially monkeys, appear in the sculptures worshipping the serpent and other gods. The serpents are all divine, five and seven headed; and representations are numerous of the Naga angelic orders,—the female Naga with one serpent only springing from the back, the male Naga with three. In the Amravati sculptures are tonsured priests, and other signs of a clerical order segregated from the laity, and of an established ritual. Sanchi is illustrative of the Hinayana Buddhist philosophy, 500 years before the oldest Buddhist book; and Amravati illustrates the Mahayana philosophy 600 years after its promulgation.

The frescoes of the caves of Ajunta illustrate a period 300 years later than the Amravati tope, and belong to the time immediately preceding the decline of Buddhism in India. In No. 19 chaitya cave, Ajunta, he is the object of worship, and occupies a position in front of the dagoba itself, surmounted by the triple umbrella. A pure theism has become changed into an overwhelming idolatry.—Pergusson, p. 124.

Seemingly the symbols or idols first sculptured were the chakra, or wheel of the law, the Bodhi Tree, and the daghoba (Dhatugarbha), a cupola-shaped structure intended to contain relics, and which, in the ancient sanctuaries, occupies exactly the place of the altar in churches of the Romish and episcopal forms. About the 4th century it was replaced generally by images of Buddha, and representations of him have been found on the coins of Kanishka, and his images were worshipped in the domed chaitya.—Barth, p. 129.

In Tibet Buddhism, relics-worship is not expressed either in their architecture or their religious forms. But it is a nation of priests; their monasteries are innumerable, some with 2000 or 3000 lamas; and, according to M. Huc, up to 15,000, at Sera, near Lhasa, where are long streets of cells, mostly surrounding courtyards, generally with a shrine or altar in its centre. That of Bouddha La is where the Delai Lama resides, outside of Lhasa. In its centre is a four-storied building, with a dome covered with plates of gold.—Pergusson, p. 312.

Buddhism prevailed in different parts of India partially for 1800 years. During this long period, Buddhism was swept from many provinces by great revivals of the Brahmanical creeds, generally brought about by migrations of Brahmans from Northern India, under whose teachings, and often with violence, Buddhism in British India became extinct. It had, however, triumphed throughout India from the time of Asoka, B.C. 255, up till the 5th century A.D., trampling upon the whole ceremonial of Brahmanism, with all its sacrifices, penances, and castes, and asserting the
BUDDHISM.

paramount necessity for purity of mind and body, and a more elevated moral rule. Sacrifices of all kinds were especially excluded from the Buddhist ritual, the offerings of flowers to Buddhas being alone permitted. In A.D. 400, when Fa Hien visited India, Buddhism was still the dominant religion, but the Vaishnava sect were already rising into consequence. In the middle of the 7th century, although the pilgrim Hiuen Thang found numerous temples of the Saiva sect, whose doctrines had been embraced by Iskandar Gagh and the greater part of Pataliputra, yet Buddhism was still the prevailing religion of the people. But the faith of Sakya was evidently on the decline; and though it lingered about the holy cities of Benares and Gaya for two or three centuries later, it was no longer the honoured religion of kings and princes, protected by the strong arm of power, but the persecuted heresy of a weaker party, who were forced to hide their images under ground, and were ultimately expelled from their monasteries by fire. In 1835, Major Cunningham excavated numerous Buddhist images at Sarnath, near Benares, all of which had evidently been purposely hidden under ground. He found quantities of ashes also, and there could be no doubt that the buildings had been destroyed by fire; and Major Kittoo, who subsequently made further excavations, was of the same opinion. General Cunningham also dug up a colossal statue of Sakya in the Kosamba Kuti temple at Sravasti.

It was about the year A.D. 800 that there were the great Brahmanical revival, which has prevailed in India up to the present day, but Buddhism left its influence: the great sacrifices of antiquity have never been revived; the Homas and Piyassa, or ghi and food sacrifices, are exclusively offered by the Vaishnava sectarians, even by most of the Saiva; and the sacrificing of buffaloes, goats, and fowls is chiefly practised amongst the uneducated Sudra and non-Aryan races, to Durga, Kali, or the earth, under the form of the various local deities. The Vaishnava, who look for the coming of a tenth avatar, had been inclined to regard Sakya as the prophesied incarnation; but when Buddhism was seated on the throne of Magadha, and the old Vaishnava sect was persecuted, they fell away from Buddhism, and have ever since been apart, even more tender of animal life than any Buddhist, but in other doctrines dissimilar.

Amongst the Singhalesse Buddhists, the term Buddha is understood to indicate beings who appear in the world at intervals, and are able to teach men the way to attain nirvana (Hardy), and they recognise Anomadasssa as a Buddha prior to Gautama.—Hardy, p. 433.

In Ceylon, this faith has not been subjected to much persecution. In the 16th century, the Tamil invaders made every effort to destroy the Buddhist books; but the priests subsequently sent a mission to Siam, and properly ordained priests were imported from Amarapura in Burma. By the 18th century, Buddhism had regained its ascendency. In the 19th century, the priests have been actively diffusing a knowledge of their creed. They have printing presses, from which tracts, pamphlets, and serials issue in great numbers. They present some new arguments and inferences; but the defiant and blasphemous expressions which they contain against the sacred name of Jehovah, are probably the most awful ever framed in human language. In Ceylon, on Adam's Peak, is a footprint which has been the object of pilgrimage for ages, which Buddhists ascribe to Buddha, but Mahomedans to Adam. There are models of feet in different parts of the island.—Yule, ii. 359, 368. The tooth of Buddha, Dalada, SINGH., Dahata Dhata, HIND., is greatly reverenced. There are, in Ceylon, statues of Buddha of great height. One near Mehtintal is 70 feet high, and one of Gautama Kaja at Carcula is 38 feet. At Anurapura, in Ceylon, are several Buddhist dagobas or dagobhas, the heights of which vary. They were built at from n.c. 367 to A.D. 276. A shoot from the pipal tree at Buddha Gaya, known as the Bo Tree, has been cherished at Anurapura for twenty centuries; and in the courtyard of every vihara and temple of Ceylon, pipal trees are preserved as objects of veneration. A system of caste was introduced by king Vijiao amongst the Ceylon Buddhists, which still prevails there, though directly opposed to Buddhist doctrines, and not existing in any similar form in other Buddhist countries.

Buddhism has been examined by Prinsep, Hodgson, A. Cunningham, Yule, Caoma Korosi, Rajendra Lala, Sykes, and Bird in India; by Pallas, Schmidt, Burnouf, Muller, Bunsen, Barth, Fergusson, St. Hilaire, Benfey, E. Edkins, Stanisla Julien, Lassen, Abel Remusat, Tenent, Wilson, and Wassiljew of Europe; by Turnour, Gogerly, and Spence Hardy of Ceylon; by Phayre, Mason, Lowe, Bigandet, and Bastian of Burma; and by Logan of China, and there has been much discussion as to the nature of the doctrines which Sakya preached. There is no doubt that he was an ascetic, for he left his wife and family, and preached and inculcated asceticism; and however greatly his followers may now vary in their belief, it is a fundamental doctrine with all of them, that existence is an evil, for birth originates sorrow, pain, decay, and death. Whether he believed in a Supreme Being is questioned. Mr. Hodgson describes his belief as 'monastic asceticism in morals, and philosophical scepticism in religion.' Bunsen considers that Sakya, the ascetic, of all founders of religions, at once stands the nearest to, and the farthest from, Jesus of Nazareth, the Christ. The farthest, inasmuch as he renounces in despair the actual world which Jesus purposes to raise to Godlike purity; but the nearest, by virtue of the width and humanity of his conceptions of God, and the wide diffusion which they have obtained. But this view was not held by many of his own day, who styled him An-Iswara, the loriless one, meaning that he taught an absolutely atheistic nihilism; and Burnouf considered the doctrine of Buddha to be atheistic and materialistic in his teaching that existence is a burden, and that annihilation is the highest happiness which the soul can strive after. Barth says (p. 110) Buddha's doctrine is absolutely atheistic. The great truth of the Fatherhood of God is lacking in Buddha's teaching. According to Bunsen (God inINST. p. 345), his creed introduced or revived civilization, and softened manners amongst millions. At present the Buddhists are in two great sects, those of the Mahayana, and those of the Hinayana. The Mahayana is represented in the literature of the northern Buddhists of Tibet, Nepal, China, and Japan; and the Hinayana in that of Ceylon, Burma, Siam,
and Cambodia, and Anam? The Buddhism of Mongolia is an offshoot from Tibet, and that of Corea, Japan, and Cochinchina is from China. In China and Mongolia, according to M.M. Huc and Gasoin, there are the Buddhists, who acknowledge an Adi-Buddha, or eternal Buddha, whom they consider to be God over all.—**Yule**, i. 242.

Sakyu Muni disconntenuised the philosophic views of the Brahmanas, but did not deny the authority of the Vedas. But he was not followed in this by subsequent professing Buddhists.—**T.**

Three marches from Jeyapore, on the road to Delhi, the town of Babra has one of the edicts of Asoka on a block of stone or rock on a hill, in old Pali, and of date B.C. 309. It is in the oldest Lat character. It differs somewhat in style and language from the pillar and rock edicts. The subject is the Buddhist commandment, forbidding the sacrifice of four-footed animals. The Vedas are alluded to, but though not named, are conveyed as 'true and false in their doctrine, and not to be obeyed.' The scriptures of the Muni (which must be the Vedas) are spoken of as directing blood-offerings and the sacrifice of animals. Priests and priestesses, religious men and religious women, amongst the Buddhists, are commanded to obey the edict, and bear it in their hearts (vol. ix. p. 617).

The sacred canon of the Buddhists now extant is called the Tripitaka, i.e. the three baskets. The first basket contains all that has reference to Vinaya, or morality or discipline; the second contains the Sutra, or discourses of Buddha; the third, Abhidharma, includes all works treating of dogmatic philosophy or metaphysics. The first and second each contain five separate works. The second is generally known by the name of Dharma, or law; and it has become usual to apply to the third basket, which contains seven separate works, the term Abhidharma or by-law. The Sutras are ascribed to Sakyu Muni; they consist of ethical and philosophical dialogues by Sakyu; and a writer in the Calculata Review states they make mention of the gods Narayan, Jounardhan, Shib, Braham, Petomah, Borun (Vorn), and Songkar. Other names are Kabir, Sokr or Vasob, and Vissoo Kormo.—**Cat. Rec.**

Professor Max Muller, in 1881, translated the Dhammapada, a collection of verses; the Sutta Nipata, a collection of discourses, was translated by V. Fransboi; and Rhys Davids issued the Buddhist Sutras.

Buddhist writings have been preserved in two comparatively original redactions, but neither of the two types of dialects, the primitive language of their creed. The Buddhists of Nepal, Tibet, and China have their books in Sanskrit, or have translations immediately from the Sanskrit. The Sanskrit writings were made known about 1840, by Mr. B. H. Hodgson.

The literature of the Buddhists of Ceylon, Burma, and Siam, is in Pali; and the Dipavansan contains a history of Buddhism in that island, which breaks off with the death of Mahasena, A.D. 302. The Mahavansa was compiled by Mahawana, who lived about A.D. 500; it has been brought down to the 18th century by successive writers, and was translated by the Honourable G. Turnour of the Ceylon Civil Service.

Their relative age and authority is not yet decided, though that of the Pali has been known since the 5th century by the commentators of Buddha ghosa.

Analyses of this literature have been made in Spence Hardy's Eastern Monachism; Childers's Pali Dictionary; Rhys David's Buddhism; B. H. Hodgson's Memoirs in Asiatic Researches and the reprint of his Collected Essays, Csona of Koros in Bengal As. Soc. Journal and Asiatic Researches.

The Chinese collection has been described in Beal's Buddhist Tripitaka as it is known in China and Japan, and W. Wassiljew's Der Buddhismus.

Up to the present time, all that has been found of the Abhidharma is in extracts and fragments.

Some of the Sutras have been translated by E. Burnouf, Max Muller, and Cecil Bendlall, and in the Journal of the R. As. Society. The Vinaya Pitakam in the Pali has been published by H. Oldenberg, the Mahavagga in 1879, and the Cullavagga in 1881.—**Barth. Rel. of India**.

Mahendra, son of Asoka, is supposed to have brought the Aththa-katta, ancient commentaries in Pali, to Ceylon, and to have translated them into Singhalese, which Buddha ghosa, about A.D. 430, re-translated into Pali. According to another account, the doctrines were first reduced to writing by the Ceylon priests during the reign of king Vartagnami, 88-76 B.C., and by a synod assembled 10-40 A.D., by the Turushka king Kanishka. For the former the language used was the vernacular, from which in the 5th century it was translated into Pali; for the latter, Sanskrit.

The Buddhist religious works of Tibet brought to notice by Alexander Csona de Koros, are the Tanjur, which consists in its different editions of 100, 102, and 108 folio volumes, and comprises 1050 distinct works. The Tanjur consists of 225 volumes, each weighing from 4 to 5 lbs., in the edition of Pekin; but editions have also been published at Lhasa, and other places. Of these, De Koros gave an analysis in the 20th volume of the Asiatic Researches, and died soon after.

In the Tibetan creed, the doctrine of transmigration is shown, and final absorption into Buddha, as the reward of a virtuous life. It therefore follows that Buddha, with the Tibetans, is the divine Being who created all, and to whom all return, and that for the good there is no separate existence in a future world. There has been some misapprehension regarding the Buddhhas and Budhhaswats of the Tibetans, the regeneration of the Grand Lama being considered as an exceptional ease of a Buddha returning amongst mankind. Mr. Hodgson (pp. 107, 138) truly calls the Lamas of Tibet, 'Archantes;' but he believes 'that a very gross superstition has wormed the just notion of the character to its own use,' and so created the 'immortal mortals, or present palpable divinities of Tibet.' In the Nouv. Jour. Asiat. t. xiv. p. 408, ii., Fra Orazio says that 'Lama sempre sara coll istessa anima del medesimo Ciang-c'ib, oppure in altri corp.' Remusat was not aware of this fact when he stated, 'Les Lamos du Tibet se considérent euxmêmes comme autant de divinités (Boudhhas) incarnées pour le salut des hommes.' But the explanation which Major Cunningham received in Ladakh, which is the same as that obtained by Fra Orazio in Lassa, is simple and convincing. The Grand Lama is only a regenerated Budhhaswata, who refrains from
BUDDHISM.

accepting Buddhahood, that he may continue to be born again and again for the benefit of mankind. For a Buddha cannot possibly be regenerated, and hence the famous epithets of Sattagatha, 'thus gone,' and Sugata, 'well gone,' or 'gone forever.' The valley of Le or Ladakh proper, Zanskar, Hemahas or Dras, Sura, Purik, Spiti, Nubra, Janske, and Rong, are all Buddhists (The \textit{Bhia Topes}, by Major Cunningham, pp. 1-67).

In Tibet, the Buddhist practical creed is thus briefly stated by Csona de Koros:—1st. To take refuge only with Buddh. 2d. To form in the mind the resolution to aim at the highest degree of perfection, and so to be united with the Supreme Intelligence. 3d. To humble oneself before Buddh, and to adore him. 4th. To make offerings of things pleasing to the six senses. 5th. To glorify Buddh by music, and by hymns, and by praise of his person, doctrine, and love of mankind, of his perfections or attributes, and of his acts for the benefit of animated beings. 6th. To confess one's sins with a contrite heart, to ask forgiveness of them, and to repent truly, with a resolution not to commit such afterwards. 7th. To rejoice in the moral merit and perfection of animated beings, and to wish that they may obtain beatitude. 8th. To pray and exhort existing holy men to turn the wheel of religion, that the world may long benefit by their teaching (Prinsep's \textit{Tibet}, Tartary, and Mongolia, p. 167).

One of the established points in Tibetan Buddhism is the belief in metempsychosis, or the migration of the souls of animated beings; and the Tibetans believe in six forms in which a living being may be re-born, viz. lha, Tin.; deva, Sans.; spirits or gods; ni, or mother earth, or evil spirits; jowo, or jholangs, brute beasts; yidaga, imaginary monsters; and inmates of nyalba, or narakas, or hells.

To cease to exist is the prevailing hope with all Buddhists. The Buddhist longing for annihilation is an exaggeration of the craving for rest which has been felt by many races, and by the followers of many creeds. The universal cry of the overworked and suffering children of men has ever been that of the lotus-enters:

There is no joy but calm.

The universal refrain of humanity is one implying trouble, anxiety, and never-ceasing toil, and its aspiration is that of repose. A holiday is a cessation of labour; and the highest hope of many Christians has ever been, to reach that bourne where the wicked cease from troubling, and the weary are at rest. Nirvana is as a blown-out candle. It is essentially in theory a non-active faith—a faith of negatives. Their ten commandments, according to Max Muller, are:—Do not kill; do not steal; do not commit adultery; do not lie; do not get intoxicated; abstain from unsuitable words; abstain from public spectacles; abstain from excess in dress; do not have a large bed; do not receive silver or gold. Ten obligations or precepts, dass sil, are repeated when a Burmese enters a kyaung as a novice (Fyfece, ii. 192).

In carrying out the ascetic views of Sakya Muni, pious Buddhists of all these countries, both men and women, have, from the first enunciation of his doctrines, been accustomed to withdraw from public life into monasteries and convents. We have distinct evidence of the existence of institutions of this kind established at dates long antecedent to the Christian era. They were in the form of vilara, or cells and caves, or buildings erected for the convenience of those who sought so to spiritualize themselves by separation from the world. Only the ruins of such buildings exist in peninsular India, but in Tibet and Tartary they still are like those left by the Indian Brahmanis or Lamas, ten and twenty centuries anterior to the present, and varying very little from what is reported of the monasteries of the earlier Christians; there are also, according to M. Hile, both to Koon-boom and in Tibet, the types of devotees who practised penances, and sat as pillars, like Siva and Saktis. To a Burmese Buddha lad, for a period, must enter a monastery.

Pythagorean institutions are described as very monastic in their character, in that respect resembling closely the vilara of the Buddhists of India. The doctrines of Pythagoras were widely spread over Greece, over Italy and Asia Minor, for centuries after his decease, and under the name of Mithnach the teachings of Buddha had also a wide extension (Prinsep's \textit{Tibet}, pp. 140, 161).

To a Buddhist ascetic, continence is essential to purity, but even contact is unlawful. Nevertheless convenants for women are very characteristically Buddhist institutions; they existed in the Burman empire till of late years, and are still to be met with in Nepal, Tibet, and China (Tog Cart, p. 142).

\textit{Burm.}—Dr. Mason says the philosophy of Buddhism, in Burma, is the religion of Buddhism. To be a Buddhist is to believe in the philosophy of Being. The Burmese Buddhist, in Burma, exercises the power of law, and all things are unreal, and on it all their philosophy is based. Some Buddhists recognise idols, a few wholly reject the worship of idols; but these are equally Buddhists, who believe that true happiness is not found in any state of body or mind; that existence is a calamity; and that the only desirable object is the extinction of being, or nirvana, where there is deliverance from ideas and consciousness.

To be a pious Buddhist is to remain unaffected by surrounding objects, to deny oneself of everything beyond the bare necessities of life, and to cry out, day and night, all things are transitory, productive of unhappiness, and unreal. A change of heart and implicit faith are essentials of salvation. Burmese Buddhists believe in good and evil spirits, and in the scheme of transmigration, and, for the good, final absorption; and the Burmese Buddhist prays that he may, in his transmigrations, meet with a Buddha to convert him to humble position in Burmese Buddhism, and she longs to become a man in her next transmigration. Their views as to the desirableness for release from this life are evincive in modes painful to European feelings. The Rev. Mr. Marks, when in Moumein, had a sick pupil whom he went to see. On entering the house, and inquiring for the lad, the mother in a glad manner repeated he was well, and jauntily led to another room, where he was pained to find the young boy lying dead, and still more pained by the mother continuing to repeat that he was well.

In Burma, in some temples, four past terrestrial Buddhas occupy the four sides of the temples (Yule, \textit{Cathay}, i. 242).

In Burma, there is a great belief in spirits, both good and bad,—amongst others, the nat and the
BUDDHISM.

In umbrellas, theness. At Soolay not individual or monastery, a" movement of the mind and the objects of faith. They condemned the lax practices of this degenerate age, such as priests wearing sandals, carrying umbrellas, and visiting religious theatrical shows.

At the bottom of their reforms, insignificant as they appear, there was doubtless much puritan earnestness. They called themselves "Soolay Gande," meaning the great spirit to whom the pagoda in the centre of Rangoon is dedicated. The Buddhists of Burma are liberal almsgivers; but the act of making the offering is the final individual merit, and the utilization of the gift is not regarded.

In Burma, the Buddhist priesthood is open to every orthodox believer. All that it enjoins is a life of purity, temperance, and truth. The h'poongeey is the priest. Every Burman boy becomes a pious똥 and during the most receptive years of his life, remains under the discipline and control of the village h'poongeey, to whom the family authority is temporarily delegated. He is housed, clothed, and fed in the kyung or monastery, and the parents are put to no trouble or expense throughout the whole period of his tuition. The h'poongeey is the master. As a rule, he is strict and peremptory, yet sufficiently attentive to the moral and physical well-being of his pupils as to earn their continuous attachment and esteem. His teaching has a strong religious tinge, but it teaches discipline, diligence, and habits of punctual attendance. The h'poongeey have ceased to be propagandists, and have undertaken the work of national instruction, and have all the elementary education in their tuition.

Tibet.—The Buddhist priests or Lamas of Tibet, Mongolia, and Manchuria acknowledge the Grand Lama of Tibet as their spiritual head. He is the spiritual and political ruler of Tibet, and is subordinate to the Emperor of China only. The Lama are chosen from all classes of society; and in Mongolia, when there are two or three sons in a family, one of them must be dedicated to the service of Lamaism. They reside in monasteries, and are celibates, shave their heads, and wear a yellow robe. Their religious services resemble those of the Christian cathedrals. A human thigh-bone is hollowed out, and made into a musical pipe. The Lamas in the towns of Lama-nian and Ye-hole are about 10,000 in number. Many of them are wanderers on the vast plains of Mongolia. The Lama temples are very imposing (Gray, p. 134).

Siam.—Between the Buddhists of Siam and Ceylon there has been much intercourse, and it is probable that almost identical doctrines are held in the two countries. During the efforts made by the Buddhist monks of Ceylon in the defence of their religion, and in their attacks on Christianity and on Jehovah, the king of Siam and one of the native chiefs of Kandy contributed largely towards the publication of the numerous tracts, pamphlets, and serials that were sent forth from the Buddhist printing presses of Ceylon. When Siam was visited by Sir John Bowring, a king was reigning, who in early life, when a late king had usurped the throne, had withdrawn from political squabbles to the safety and sanctity of the religious profession, and was residing in a Buddhist temple, whence he was brought forth to occupy the throne, after the seclusion of a quarter of a century. In Cambodia.—It is stated by a writer in the Journal of the Indian Archipelago (No. xi. Nov. 1852, p. 606), that in Cambodia, Buddha is not regarded as the first cause, the creator of all things; but there prevails amongst them a pantheism, in which all nature is deified, but above all they place Buddha, and worship him daily.

Laos.—Similarly, for instance, De Carne relates (p. 113) that Buddhists of Laos offer parts of their bodies at the image of Buddha, in the pagoda at Phnom in Upper Laos. The interpreter to the French mission made an offering of his forefinger up to the half of the upper joint. It was chopped off with a chopper by the attendants of the pagoda.

In China, monks try themselves with great severity. Buddhism has never taken a high place amongst the philosophies and religions of the country, though recognised as a state religion from A.D. 65, under the emperor Ming-ti. Buddhist missionaries had entered China in the third century before Christ. A missionary is mentioned in the Chinese annals, in the year 271 B.C.; and about the year 120 B.C., a Chinese general, after rebelling the barbarous tribes north of the desert of Gobi, brought back as a trophy a golden statue of Buddha (Miller's Lectures, p. 139).

There was much intercourse between the Buddhists of India and China for some centuries after the introduction of Buddhism into China; but in the 10th century, after A.D. 975, the religious visitors to China became greatly more numerous. Chinese pilgrims also had passed years in India studying their religion, and they wrote narratives of their travels. Of these, there have been published the travels of Fa Hian, A.D. 399-414; of Hiwen Tsang, A.D. 628-645; and of Hoi Singh, who set out A.D. 518. A later traveller, Khi-Nie, who journeyed A.D. 964-976, was sent by the emperor of China, at the head of 300 monks, to seek relics of Buddha, and to collect palm books. Such pilgrimages continue; and Colonel Yule met men at Hardwar who had crossed the Himalaya from Mal-Chin, to visit the holy flame at Jawalakshmi in the Panjab (Yule, ii. 411). The Chinese Buddhist invocation is, Oh me to Fo! Oh me to Fo! In China and Mongolia, according to MM. Hue and Gabet, theistic Buddhists acknowledge an Ahi-Buddha, or eternal Buddha, whom they consider to be God over all. In Ceylon and Indo-Chinese countries there is no such belief (Yule, i. 242). Chinese Buddhists are in different sects or schools, on account of different points of doctrine or matters of philosophy. But though the religion is one of the recognised State creeds, Buddhists are not allowed to hold office.

Amongst the Japanese, the religion of Buddha and the Sintu religion have equal precedence. Their Buddhist priests use the Chinese language in their worship, except in their poetry, which is in Japanese. Bishop Smith of Victoria says there were in Japan, at his visit, eight sects or orders of Buddhist priests,—Tendai, Shinmogon, Zen, Oobaku, Jiodo, Hokki, Ikko,—whose priests are allowed to marry, and Nichiren. Shiu, Shu, or Ju is placed after the proper name, designating each

498
BUDDHIST ARCHITECTURAL REMAINS.

Buddhist architectural remains are the only vestiges of the prevalence in British India of the doctrines taught by Sakyamuni and his disciples, but they afford valuable illustrations of the alterations introduced into that great teacher's doctrines. It is known that the final disappearance of Buddhism from continental and peninsular India was violent—their priests were slain and their temples burned—and there can be no doubt that the Brahmanical priesthood were the immediate actors in the scenes, but whether these were of the Vaishnava or Saiva sect there is no information. The Buddhist remains now existing may be divided into four distinct classes: First, cave temples, containing topees, sculptures, paintings, and numerous inscriptions. Second, viharas or monasteries. Third, inscriptions on rocks and pillars. Fourth, topees, or religious edifices.

The vihara or monasteries are of two kinds: First, cave viharas, of which several magnificent specimens have been published by Mr. Ferguson; and second, structural viharas, of which some specimens still remain at Sanchi, but in a very ruinous condition.

(a) The cave vihara consists of (1) natural caverns slightly improved by art. These are the most ancient, and are found appropriated to religious purposes in Behar and Cuttack. The next kind have (2) a verandah opening behind

sect. At Dyboots, in Japan, is a bronze figure of Buddha, 53 feet high.

The Loo-Choo islands Buddhism is less perfect than that of the Japanese.

The Korean Buddhists and Buddhism were made known to Mexico by Chinese priests in the 5th century A.D., and had followers in that country until the 13th century, when the conquering Aztecs put an end to it.

Perhaps no religion equals the Buddhist in its injunctions as to tenderness for animal life; yet the Chinese, amongst whom are many Buddhists, and the Burmese, all of whom are Buddhists, are, as races, amongst the least merciful of mankind; are cruel, revengeful, and remorseless shedders of the blood of their fellow-man. The Burman Buddhist will not kill a quadruped animal for food, but he eats with readiness all animals that have died of disease, or that have been killed by others; and fish and the shrimp tribe, which their rivers and seas produce, are eaten in quantities greater than by any other known race.

Much of the costume of Buddhist priests and of the ritual has a similarity to those of Christians of the Romish and Greek forms; and De Guignes, D.C. Gama, Clavijo, Anthony Jenkinson, all notice statements regarding the Greek Church, the Chinese, and the Burmans, indicative of a belief in the identity of the form of worship. When Dr. Richardson and Captain MacLeod, in their exploration of the countries east of Burma, fell in with Chinese traders, these generally claimed them as of their own religion. In the Chinese temples are a number of images not unlike the Christian representations of Mary and of some of the saints. lamps and wax lights are on the Buddhist altars, the Buddhist priests are robed in the sacred vestments called pluvials in Christian ritual books, processions of suppliants occur as with Christians, and chanting is in a style almost exactly like the Gregorian chants of Christian churches. Early Christian missionaries to China believed these to have been introduced among them by the devil clumsily imitating holy things, and grasping at the honours due to God (Yule, ii. 551).

In India, Buddhist caves exist in Kattyawar, in a hill near Setana; in another near Khadia, south of Junagarh; at Hinglaj near Pattnan, between the villages of Khaditi Khan and Khamardand, in the Bardas; in the Salenal hill, North Bhakra; at Mewaria in the hill of Kakanda; at Diveawar in the hill of Mandaya, near Chotila; at Devagarhi, near the village of Bhardi, south of Palayd; at Bhogarh, N.E. of Jassan; in the Jogi near Kanamata village; in the Poliana hill; and at Dwarka. There are Buddhist caves also in Orissa.

The caves of Junnar, Bhaja, Bedesa, Talaua hill, Sanchi, are remarkably Decorative of figure sculpture or imagery. In that respect they are best with Ajanta, Ellora, Karla, the second and last few caves at Nasik, and many in Salsete. At Ajanta and other places are images of Buddha, in the sanctuaries and on the façades. They are entirely absent at Bhaja, and in the older and middle series of about ten caves at Nasik, and at Junnar. The Talua Lena group of caves in a hill about 1½ miles west from Junnar, are so named because one of them has been appropriated to Talua Devi by the modern Brahmins.

Nädana indicates twelve conditions of existence, viz. ignorance, karmam or acts, consciousness, individuality, sensibility, objects of sense, sensation, desire or thirst, clinging to existence, birth, old age, and death.

The Buddhist triad or tri-ratna (three jewels) consist of Buddha, Dharma, and Sangha.

The Buddhist wheel is a prominent object in the Buddhist sculptures of India. It is supposed to be an emblem of the perpetual succession and eternity of matter; and it has served likewise another purpose in the corruptions of Buddhism. Prayers were poured on it by the priests, who then put the wheel into rapid rotation. Each turn had the efficacy of an oral repetition; and the faster it revolved, the more rapidly was the devotee approaching the ultimate bliss of nirvana.

Buddha-Pusaka is a Buddhist salutation. It means worshipper of Buddha. Upasaka is another salutation.—Prof. Max Muller's Lectures, p. 139, and Chief Sec. Yule's Researches in Buddhism, p. 23. Poasan's God in History, i. pp. 341, 211; Wheeler's History of India, p. 150; Tenent's Ceylon, i. pp. 343, 527, ii. p. 614; Tenent's Christianity in Ceylon, pp. 206, 207, 264; Hardy's Eastern Monachism; Calcutta Review; Frazier's Magazine, June 1868; Rangoon Times; Saturday Review; Bengal As. Soc. Journ.; Journ. Ind. Arch.; Browing's Siam, i. p. 50; Prinsep's Antiquities, by Thomas, p. 150; Prinsep's Tibet, Tartary, and Mongolia, pp. 140, 162; Coleman's Mythology, p. 205; Rev. W. Hodgson; De Carne; Bishop Smith; Colonel Pyle; Barth's Religion and Customs of India; Bishop Bigandet; Ferguson's Rock-cut Temples of India; Ferguson and Burgess, Cave Temples of India; Hunter's Imp. Gaz.
BUDDHIST ARCHITECTURAL REMAINS.

into cells for the abode of priests, as in Cuttack and in the oldest vihara at Ajanta. The third (3) has an arch and hall supported on pillars. The most splendid of these are at Ajanta; though the Dherwara at Ellora is also fine, and there are some good specimens at Salsette and Junnar.

(i) Buddhist chaitya caves form the second class. These are the temples or churches of the series, and one or more of them is attached to every set of caves in Western India, though none exist on the eastern side. Unlike the vihara, all these caves have the same plan and arrangement. All consist of an external porch or music gallery, an internal gallery over the entrance, a central aisle, which may be called a nave, roofed by a plain waggan vault, and a semi-dome terminating the nave, under the centre of which always stands a daghopa or chaitya. In the oldest temples, the daghopa consists of a plain central drum, surmounted by a hemispherical dome crowned by a tee, which supported the umbrella of state, of wood or stone. These two classes comprehend all the Buddhist caves in India.

The third class of religious architectural remains in India consists of Brahmanical caves, properly so called. The finest specimens are at Ellora and Elephant, though some good ones exist also on the island of Salsette and at Mahabalisur. In form many of them are copies of, and a good deal resemble, the Buddhist vihara. But they have not been appropriated from the Buddhists, as the arrangement of the pillars and position of the sanctuary are different. They are never surrounded by cells, as all viharas are, and their walls are invariably covered or meant to be covered with scantily and variously decorated by paintings, except the sanctuary. The subjects of the sculpture of course always set the question at rest.

The fourth class consists of rock-cut models of structural Brahmanical temples. To this class belong the far-famed Kailas at Ellora; the Saivite temple at Dhnmar, and the Raths at Mahabalisur. The last are cut out of isolated blocks of granite, but the rest stand in pits. The Indra Subba group at Ellora should perhaps form a fifth, but whether they are Brahmanical or Jaina is undecided.

The fifth or true Jaina caves occur at Khandagiri in Cuttack and in the southern parts of India, but are few and insignificant. In the rock of Gwalior fort, there are cut in the rock a number of rude colossal Jaina figures some 30 to 40 feet high; all the viharas are almost as invariably decorated by paintings, except the sanctuary. The subjects of the sculpture of course always set the question at rest.

The Behar caves are in the neighbourhood of Rajagriha. The Milkmaid's cave and Brahman Girl's cave have inscriptions in the Lath character. They date about 200 B.C., and are the most ancient caves of India. The Nagarjuna cave and Haft Khanah or Satghar group are situated in the southern arm of the hill, at some little distance from the Brahman Girl and Milkmaid's cave. Another group is the neighbouring Karn Chapa and Lomas Rishi caves.

The caves of Udyagiri and Khandagiri hills, about 20 miles from Cuttack and five from Boban Esbarr, are next in antiquity to those of Behar. They are built on the hills of Udyagiri and Khandagiri; the former are Buddhists and the older, the latter probably Jaina. Many of the inscriptions are in the Lath character, and this gives their age as anterior to the Christian era. The frieze sculpture in the Ganesghopa is superior to any in India, and resembles that of the Sanchi tope at Bhisala. In it there are no gods, no figures of different sizes, nor any extravagance. In the Buddhist caves here, there are no figures of Budhha, nor any images. In a Jaina cave near, on Khandagiri, the 24 thirtankara with their female energies are sculptured.

The Ajanta are the most complete series of Buddhist caves in India, without any mixture of Brahmanism, and contain types of all the rest. They are in a ravine or narrow valley in the ghat south of the Tapti.

At Daun, in a ravine or small valley in the ghat on the north side of the valley of the Tapti, are three ancient Buddhist caves.

The Karli caves are close to the high road from Poona to Bombay, about half-way down on the right-hand side of the valley as you proceed towards the sea. They are not so extensive as those of Ajanta, but they are purely Buddhist. The largest and most splendid chaitya cave temple in India which could be selected for reproduction by art, is the principal excavation at Karli, and it is also interesting as the oldest Indian work of the kind known to exist. Karli has numerous inscriptions in the caves in the Pall language.

The Salsette or Kenheri caves, in the island of Salsette, are purely Buddhist, but inferior to those of Ajanta or Karli. They are excavated in a hill in the midst of an immense tract of forest country, and Mr. Ferguson supposes their date to be about the 9th or 10th century of the Christian era.

Dhnmar, about 40 miles S.E. from Nommhe, but close to Chumdivass, contains Buddhist caves, with a Brahmanical rock temple behind. Those of Dhnmar, like the caves of Ellora, contain a strong admixture of Brahmanism.

The Ellora caves are excavated in a porphyritic greenstone, and are largely Brahmanical. They are in the face of the mountain overlooking the valley of the Godavery, close to Roza, the burial-place of Dowlatabad, and where Aurangzeb, Alamgir I., is interred.

Those of Elephant are entirely Brahmanical, though perhaps of the same age as those of Ellora. The caves of Elephant overlook the harbour of Bombay. They are cut in a harder rock than those at Ellora. These caves are in the island of Gharpuri, called by Europeans Elephant, an island in Bombay harbour. Among the hundreds of figures there sculptured, every principal deity is found. Buddha is evidently, from his size and situation, a principal personage there.

Mahabalisur, or the Seven Pagodas, between Covelong and Sadras, south of Madras, has been described by Dr. Babbington in vol. ii. Trans. R. A. S., p. 258; and by Messrs. Chambers and Goldingham in A. R. vol. i. p. 145, and v. p. 63; and by Mr. Charles Gubins in Bengal As. Soc. Journal. The Mahabalisur caves are entirely Brahmanical, and have been excavated after all the other series were formed (Ferguson's Rock-cut Temples of India).

The inscriptions of King Asoka consist of edicts and proclamations. King Asoka carved his edicts on the rocks at Dhauli in Cuttack, also at Girmar in Gujerat, at Kapuragiri, near Pesh-
war, and on pillars erected in different parts of the country. In the thirteenth edict of the rock-cut inscriptions, he mentions having, about B.C. 265, formed treaties of alliance with Tholeng Philadelphos, Antiochus Theos, Antigonus Gonatas, Magas of Cyrene, and Alexander, the king of Epirus and Macedonia, mentioned by Justin, for the protection or aid of his co-religionists in their dominions. They have been deciphered successively by J. Prissep, Norris, Dowson; and elucidated by the works of Burnouf, Lassen, Wilson, Kern, Buhler, General A. Cunningham, Corpus Inscriptionum, and E. Senart in Journal Asiatique.

BUDGEROW. ANGLO-HIND. A boat in use on the Ganges. See Boat.

BUDH, in Hindu astronomy, the planet Mercury, and Hindus deem it fortunate to be born under this planet. Budh presides over Wednesday, Budhwar, dies Mercurii. In one of the zodiacs, he is represented seated on a carpet, holding in his hand a sceptre and a lotus; in another he is shown riding on an eagle; and elsewhere he is described as sitting in a car drawn by lions. In the West, he is called Mercurius.

BUDH, an ancestor of a branch of the great Hindu people of a time prior to authentic history. He is traced by them up to Brahma, from whom he descends through Atri, Samudra, Chandra, or Soma, and Vrishiipati. Budh is said to have married Ila, daughter of Ikshwaku; and the descendants of this union were, in succession, Pururava, Ayu or You, Nohas or Nohus, and Yayat. Ayu or You is claimed by the Tartar and Chinese genealogists as their great progenitor; and from Yayat sprang three great lines, the Yadu, Puru, and Oora or Oorvasa, from each of whom came many dynasties ruling on the Indus, in Hindustan, Assam, Ava, and China. The great Hya was a branch of the Yadu; and five members of it formed Panchalika or Panchaldeesa, and the seed of Bajaswa occupied all the countries on the Indus. Of the three lines, the Yadu, Puru, and Oora, the Yadu became the most illustrious. The descendants of Budh and Ila, who were known as the Chandravansa, Somavansa, or Induvansa, all of these meaning the Lunar race; but the fame of the Yadu eclipsed the prior designations, and throughout India the Lunar race came to be styled Yaduvansa. The Yadu held territories in Hindustan about Allahabad, but seemingly in small republican states, some of which were staked and lost at play. The relatives then fought for dominion, for eighteen days, on the field of Kur Khet. There was no battle of armies, but a series of single combats, with treacherous, cruel surprises, during which nearly all the Yadu fell, and at the close, several of those remaining emigrated, amongst whom Krishna was one. The story is told in the Mahabharata. After the combats, the Yadu seem to have left the Ganges, and to have been expelled to Darwica, to have crossed the Indus, passed Zabalistan, and was founded on a bank, but to have swept back on the Indus into Gujerat and the Indian desert, from which they expelled the Langha, Johya, Mohila, etc., and founded successfully Tannote, Derrawal, and Jeyshmir. They are now known as the Bhatti of Jeyshmir, the Jharjiah of Cutch Bhoj, the tribes occupying Kerrockwe and Subhburgh on the Chambal, and the Sumoteca on the Chambal. The great Tuar tribe are also said to have have of Yadu origin. The Hya also was a branch of the Yadu, some of whom formed Panchalika or Panchaldeesa, and the seed of Bajaswa that one time occupied all the countries on the Indus. The Bhatti and Jhariaj thus trace their descent from Budh and Krishna, and they may be said to occupy the Indian desert from the Sutlej to the ocean. Budh seems to have been the first emigrant from Saka-wipa or Scythia, into Hindustan, viz. about B.C. 2100. Between Budh and Krishna was a period of 1200 years. But his descendants had defied Budh; and in Hindu mythology he is described as the son of Soma or Chandra or Indu, the moon, by Rohini. The date of the apothecosis of Budh is not known. Prior to the deification of Krishna, Budh was worshipped by all the Yadu as the great ancestor (Pitrismara) of the Lunar race. The principal shrine of Budh was at Dwariacs, where he still receives adoration as Budha Trivikrama. But by the deification of Krishna, whose emblem was the eagle, Krishna's mysteries were embodied in a simpler worship, of which he is the symbol of Bal, or the shining one, in the nath, and of the moon as that of Budh, seem to have co-existed, and an amalgamation had occurred, as the serpent was made to twine round the lingam, as at the shrine of Eklinga. Colonel Tod is of opinion that the original worship of Budh was monotheistic, and that prior to the rise of Vishnuswam, the three idolatrons classes of Hindustan were the adorers of Surya and the descendants of Budh, who preserved the serpent sign of their race, and Krishna's followers, who adopted the eagle. There seem to have been 56 clans of the Indu, who were distinguished by names of animals,—lakh, the serpent; aswa, the horse; sasnu, the hare; lorni or nomri, the fox, etc. etc. Tod's Rajasthan, i. pp. 533-536.

BUDHA-BASARA. SANSK. Budha-kakara, Tel. Cardioesperum halacabum. Popular superstition asserts that by eating its seeds, the understanding is enlightened, and memory rendered more acute.—Ell. Fl. Ind. Asia.

BUDHIA DAS, father of Upatissi, who built hospitals for cripples, for pregnant women, for the blind and diseased.

BUDHIA GANGLA, also Burha Gang, the old bed of the Ganges, from which the stream has shifted. It is traceable below Hastinapur, and also below Saron and Kumpil. The change of bed seems to have occurred since the time of Akbar.—Elliot.

BUDHIA GHOSHA or Budha.Ghosa, a Brahman, a native of Buddha Gaya, who became a convert to Buddhism. He lived in the early part of the 5th century A.D., nearly 1000 years after Sakya Muni (ob. B.C. 543). He went to Ceylon A.D. 450, and there compiled his great work, the Visuddhi Magga, or Path of Holiness, a cyclopaedia of Buddhist doctrine. He was subsequently employed by the Pali, to Pali, in Pali, to the other languages, which had been handed down in Singhalese, by Mahendra, son of Asoka, is supposed to have brought the Attha Katta, ancient commentaries in Pali, to Ceylon, and to have translated them into Singhalese, which Budha Ghosa, about A.D. 450, re-translated into Pali. His great eloquence obtained for him his titular name, meaning Voice of Buddha.—Hardy's Eastern Monachism.
BUDHA GUPTA.

BUDHA GUPTA, a king who governed the country between the Jumna and the Narbada, about the eighth century.

BUDHI-ASHTAMI. Sansk. A Hindu holiday, from Budha, Mercury, and Ashtami, the eighth lunar day.

BUDHAYANA, a Hindu philosopher, who lived in Ilavratu, the country which surrounds Sumeru. He taught that God alone is unchangeable. He is said to have been the author of a law treatise, and to have arranged some parts of the Vedas into chapters.—Warid, iv. p. 30.

BUDH'S BEGGING POT, the Kaogal-i-Ali, is a circular bowl, 4 feet wide and 2 feet deep in the centre; the sides are 4 inches thick. It is of black porphyry. It is in a corner of the enclosure of the tomb of Sultan Wais, at Kandahar.

BUDHWAR, Wednesday, sacred to Budh, and named after him. Amongst Hindus it is a day propitious to any new undertaking.

BUDI. Hind. Among Hindus, the period of the month from full to new moon, called the dark half of the month.—Elliot.

BUDI-BUDAKI. Can. A class of religious mendicants in Mysore.

BUDIDE. Tel. Ashes.

Budide Chatla, Heliotropium coronandulianum. Budide Gummadi, Benincasa cerfera, Sar, referring to the white powder covering the fruit. Budide Fanni, a fee for permission to bury a corpse.

BUDIL. Hind. Picea Wobhiana, P. Pindrow.

BUDKES. Hind. Cordisal Gauviana.

BUDLA, or Buddali. KARN. A leather bottle.

BUDLEYUN. Greek. The moon of the Abanians and Googal of India, names of Bidlium, also of the Comiphrina Madagascarensis tree.

BUDRANJA BOYA. Hind. A small species of Melissa, found about Ajmir, where it is considered heating, and is used to cleanse the blood; one seer sells for two rupees.—Gen. Med. Top.

BUDRI. Beng. Zizyphus jujuba.

BUDSHUK. Hind. Ephedra Gerardiana.

BUDU. Hind. Viscum attenutum.

BUDUMURU. Tel. Sponia orientalis, Planck.

BUFF. Peau passées en buffles, Fr. Bufalo; Cujo di peau de buffle; Bufal, ... Ir. Buffelhante.

A kind of leather prepared from the skins of thick-hided animals, buffaloes, oxen, and the deer tribe.—M'Culloch; Faulkner.

BUFFALO.

Bubalus Buffaloes, Blum. | Bos bubalus, Briss.

Blains (male), ... | Hind. Karbo; Karbon, Malay.

Mhains (female), ... | Moonding, ... Sundan.

The buffalo inhabits Tibet, but is domesticated in India, the Indian Archipelago, and southern Europe. It is the only indigenous ruminant of Ceylon. They are frequently albino, with pink eyes. The finest of the domesticated buffaloes of India are reared in the Hyderabad Dominions, west of Nirmul. Some naturalists are inclined to the opinion that there are two species. They are large, ungainly-looking animals, with great horns; but a domesticated breed, to the west of Nirmul, are of enormous size, almost like small elephants, and give a great quantity of milk. They are kept as milk kine, but are also employed as beasts of burden and draft; also to carry sacks on their backs, to plough with, to drag carts.

They have little or no hair, and their hides look like polished leather. They require to be in a moist climate, or to be immersed in water daily. They love to wallow in water or slily mud, and often roll themselves to get a coating of it. A large male buffalo is more than a match for a tiger. It has large flat horns, some curved and some long (spirocerus and macrourus). Its ribs are large, flat, and white. It is the buffalo, baffle, and buffel of the French and Germans. In the Himalayagotte country, in Ceylon, the villagers are much annoyed by the wild ones, that mingle with the tame when sent out to the woods to pasture, and it constantly happens that the herd, placing himself at the head of the tame herd, resists the attempts of the owners to drive them homewards at sunset. Being an animal to which water birds are accustomed, the Singhalese train the buffalo to sport, and, concealed behind the animal, browsing listlessly along, they guide it by ropes attached to its horns, and thus creep undiscovered within shot of the flock. In the northern parts of India, they are similarly trained to assist the sportsman in approaching deer. One of these sporting buffaloes sells for a considerable sum. Between 1851 and 1855, Liverpool imported from India, annually, about 30,000 of its hides and 600 tons of horns. The male buffalo is frequently sacrificed by non-Aryan races, sometimes in considerable numbers; and only in 1859, the Government of Madras ordered the magistrate of the Krishna Division to forbid the cruel rite of Annamavur, wherein bullocks are impaled alive to appease the goddess Devi, and avert cholera. On that occasion, in a small village, from twelve to twenty-four bullocks were sacrificed, as also several hundred sheep, and the heads of the sacrificed buffaloes were carried in procession on the heads of the men. There are two generally recognised wild species of buffaloes in Africa,—the Cape buffalo (B. caffer), and the short-horned buffalo (Bos brachyceros).—Bikmore, Travels; Stat. of Commerce; Tennent’s Ceylon.

BUFFALO THORN, Acacia latroonum.

BUFFONIA, a section of the 2d sub-class of reptiles, Batrachia, and order Batrachia salientia. The section Buffonia includes the families Rhinodermatidae and Bufonidae. Duro scabra, the Bengal and Java toad, abounds in the marshes of the Lachen valley, adjoining Tibet. This is a remarkable instance of wide geographical distribution for a batrachian, which is common at the level of the sea under the tropics.—Hooker, Jour.

BUG, an insect belonging to the family Hemiptera, several genera of which occur in India. Amongst others are Cantu ocellatus, Leptoscelis marginalis, Callidea Stockerius, etc. etc. Of the aquatic species, the gigantic Belostoma Indicum attains a size of nearly three inches. Some of them are most attractive in colour; a green one is often seen on leaves, and is quite inoffensive if un molested, but if irritated exhales an offensive odour.—Tennent’s Ceylon.

BUG. Insects known as coffee bugs have, in recent years, occasioned anxiety and losses to the coffee planters. In Ceylon, the first regularly worked estate was opened in 1825, but the bug became so prevalent, that some of them in large quantities till 1845, when, however, it began to spread with such rapidity, that in 1847 a very general alarm was taken by the planters, about the same time.
that the potato, vine, and olive diseases began to create alarm in Europe. The coffee bug seems, however, to be indigenous in Ceylon, for the white bug has been found on orange, guava, and other trees, as also on beet-root and other vegetables, and the brown bug attacks the guava, hibiscus, ixora, justicia, and orange trees—indeed, every plant and tree, and even the weeds, on a coffee estate, particularly such as are in gardens.

When a coffee tree is attacked by the bug, it is deprived of its sap and its nourishment, whilst the fruit, which never fails to attend on the bug, prevents restoration by closing the stomates through which the tree breathes and respirates. Bug, Mr. Nietner tells us, existed on the estates to an incalculable extent; none were believed to be quite free from it. Whole estates are seen black with bugs, i.e. with the fungus; and he asks, 'Am I wrong in saying that if there was no bug in Ceylon, it would at a rough guess produce 50,000 cwt. of coffee more than it actually does?'

The value of this quantity on the spot being about £125,000, this sum represents the aggregate of the annual loss by bug sustained by the Ceylon planters.

Mr. Nietner's observations had been more particularly confined to the group of districts around Peacock Hill, but his list of the enemies of the coffee tree holds good in general for the entire coffee region of Ceylon. He tells us, however, that the brown and white bug and the black and white grub are the only universal and important enemies of the coffee tree, and that the destruction caused by arbines, limacodes, zeuzera, phymatea, strachia, and the coffee rat, appear to be of a more local and occasional nature, and are therefore of less importance. There are three pests which are chief,—the white bug, the brown bug, and the black bug.

The appearance and disappearance of the coffee bug, he tells us, is most capricious. It comes and goes,—now rapidly spreading over a whole estate, now confining itself to a single tree amongst thousands; here leaving an estate in the course of a twelvemonth, there remaining permanently. Sometimes spreading over a whole estate, sometimes attacking a single field, then leaving it for another and another. But the white bug prefers dry, and the brown, damp localities, the latter being found more plentiful in close ravines and amongst heavy rotted timbers than on open hillsides, and it is probably to this predilection that the shifting of the insect is attributable. The bug of course seeks out the softest and most sheltered parts of the tree, the young shoots, the under sides of the leaves, and the clusters of berries. The injury done by the white bug seems more severe than that from the brown, but, not being so plentiful as the latter, it is of less general importance. The white bug is especially fond of congregating amongst the clusters of berries, which drop off from the injury they receive, and trees often lose their entire crop in this manner. The injury produced by the brown bug is the weakening of the tree, and is thus more general, but the crop does not drop off altogether nor so suddenly. With white bugs on an estate, the crop can hardly be estimated; with brown bugs it can.

The White or Mealy Bug is the Pseudococcus adonidum. The male insect is of a dirty brownish colour, and slightly hairy. It is very minute (very much smaller than the female, only about half a line long), and resembles certain small Ephemerdidae or May-flies. The female is oval, brownish-purple, covered with a white mealy powder, which forms a stiff fringe at the margin and at the extremity of the abdomen two setae. The larvae and pupae are active, and move about. The insects, in all stages of development, are found in Ceylon all the year round, chiefly in dry and hot localities, on the branches of trees, and on the roots to one foot under ground. Mr. Nietner says the近年 is very common in the interior of the conservatories of Europe. It is preyed upon by the scymnus rotundatus, a minute beetle of the ladybird tribe, of the size of a pin's head, black and pubescent; also, the yellow-coloured and common eucyrus Nietneri and the black-coloured scarce chartococcus musciformis, two minute hymenoptera (wasps), only ½" long, and the minute whithsal mite, acarus tracheolus. Of the members of this family of insects, the coccide, some, as the cochinical and lac insects, are of great economical importance, but others, as the sugar-cane blight of the mauritius, the spilidiotus, and the coffee bug, are excessively baneful to the gardener and agriculturist.

The male of the Brown or Sealy Bug, Lecanium coffeae, is of a clear light pinkish-brown colour, slightly hairy, and very pretty. It is more delicate than the male pseudococcus. The females when young are yellowish, marked with grey or light brown, and with the males as light brown, with a dark margin. It affects cold, damp, and close localities 3000 feet in height, and the propagation, as in the white bug, is continuous. The brown bug is much infected with parasites, amongst which the most common are eight minute hymenoptera (wasps) with brilliant colours; but a mite, the acarus tracheolus, and the larva of the chilocorus circumdatus, a kind of ladybird, also feed on the bug. In the larva state, the male and female brown bug are not distinguishable. The number of eggs produced by a female brown bug is about 700. Those of the white bug are not so numerous, but their propagation in Ceylon is continuous throughout the year, and this explains their great abundance compared with cold countries, where the produce is one generation of young annually. The brown bug, particularly the full-grown female, is dreadfully infested with parasites, which thus greatly help the planter. Indeed, it is a question whether coffee-planting could be carried on without their aid in the destruction of the bug.

The Black Bug is Lecanium nigrum, but the female only is known. In colour it is from yellowish-grey to deep brown, and almost black in age, and of a shield-like shape. It occurs alone, but also intermixed with the brown bug, but it is much less abundant, and therefore not demanding the planter's attention. Its occupation of a coffee or any other tree gives rise to the appearance of a glutinous saccharine substance, which has received the name of honey-dew. This is either a secretion of the bug, or the extravasated sap which flows from the wounded tree, or probably a combination of both. A fungus, or two fungi, the synalchium nietneri and triplosporum gardneri, seem to depend on this for vegetation, as the honey-dew and the fungus disappear with the bug.

503
Another bug, the Strachia geometrica, of a yellowish colour, but marked with grey and orange on the upper side, was found at Badulla. It feeds upon the juice of the young berries, three per cent. or more of which were said to have suffered from it. It is allied to the green or fistful bug; but though it may occasionally cause destruction, there is no fear of it ever becoming a serious nuisance.

One of the Aphidæ, Aphis coffeeæ, the coffee louse, is found in small communities, on the young shoots and on the under side of the leaves of the coconut tree, but the injuries it occasions are insignificant.

Several caterpillars, the Aloe lacteina, the Orgya Ceylanica, Euprocis virguteula, the Trichia exigua, Naressa conspersa, the Limacodes gecisa, and a species of Drepana, are found on the coffee trees, but they do not cause much injury. Another caterpillar, however, though fortunately not abundant, the Zeuzera coffeeæ, destroys many trees, both young and old, by eating out the heart. It resembles the caterpillar of the goat-moth of England, and is as thick as a goose quill. It generally enters the tree 6" or 12" from the ground, ascending upwards. The sickly drooping of the tree marks its presence.

Black Grub.—The larva of the moth called Agrostis conter, is very destructive black grub. This pest is about an inch long, and is most abundant from August to October. The caterpillar lives in the ground, but comes out at night to feed, and is very common and injurious. They attack not only coffee trees, but all sorts of vegetables and flowers, and are very destructive to gardens and in the field, as they eat everything that is artificially raised, despising grass and weeds. They generally appear only on certain fields, and will not go over an estate. The insect is not confined to Ceylon; its ravages are well known in India, at the Cape of Good Hope, and in Europe, where it injures the grain and beet-root crops. In Ceylon it only attacks young coffee trees, gnawing off the bark round the stem just above the ground. Where the trees are very small, they are bitten right off, and the tops sometimes partially dragged under the ground, where the grubs may easily be discovered and dislodged. The damage which they inflict on plantations may be estimated, when it is mentioned that Mr. Nietner lost through them in one season, in certain fields, as many as 25 per cent. of the young trees he had put down.

The larva of a little moth, the Galleriomorpha lichenoides, and three caterpillars of the Boarmia leucostigmaticæ, B. Ceylanica, and Empithecæ coffearia, are found on coffee trees and other plants from September to December.

The larva of the Gracillaria coiffoliiæ mires the coffee leaves; it is very common, but of no importance to the planter.

The ravages of the large, well-known, beautiful locust, the Phyllophaga punctata, with its scarlet abdomen and yellow and bronze above, are not continuous in the coffee tree, but are occasionally very annoying. A swarm settled on a field of one-year-old coffee and gnawed the bark off the stems, causing them to throw out many shoots, and permanently disfigured five per cent. of the trees. They do not touch the Illuk grass, Sascharum Konigii, Retz, but seem only to attack cultivated plants and trees. At Tangalle they destroyed tobacco plantations, and at Matullee in Kandy the native grain crops were injured by these locusts. The larvae and pupæ are as destructive as the perfect insects; but this seems, fortunately, the only species of locust that does any real injury in Ceylon, and this injury is in importance not to be compared with that done by other species in other countries.

White Grub.—Under this name are included the larvae of various Melolonthæ, the cockchafers of Ceylon, which do much harm to coffee plantations, young and old, by eating the roots of the trees. Mr. J. L. Gordon of Rambodde considers the white grub to be by far the greatest enemy of the coffee trees which the planter has to contend with, as he never knew a single tree recover after their attack; and he adds that they had destroyed, at Rambodde, in two years, between eight and ten thousand fine old coffee trees. Mr. Gordon used to dig up the soil at the foot of the trees, and take out such grubs as he could find.

Weevils.—The family of the weevils is one of the most extensive amongst the beetles; and in Ceylon, as in Europe, many of its members do much injury to agricultural produce. Mr. Nietner had seen nearly the whole sweet potato (Bataca dulcis) crop of the Negombo district destroyed by one of them, the Cyclus supercinnam. The common rice weevil Sitophylus oryzae, is another instance; and one of the coconut tree destroyers of the Ceylon low country, the Sphenophorus planipennis, belongs also to this family. The Arhines destructor, a beautiful green weevil, Mr. Nietner had not found do any injury to coffee trees; but Mr. J. Rose of Maturattée, writing to him, says, 'The mischief they do is plentiful, and if they were as plentiful as the bug, they would be the planter's worst enemies.' Five or six acres were completely covered with them, and they consumed almost every leaf. Year after year they appeared upon the same place. One year they appeared upon a neighbouring estate in great force, and ran over at least forty acres. The same thing occurred on three other estates.

The Acarna coffee, or coffee mite, is so small as to be hardly perceptible to the naked eye. It is closely allied to the red spider of the hothouses of Europe. Nearly all the year round, but chiefly from November to April, it feeds on the upper side of the coffee leaves, giving them a brownish sunburnt appearance. Individual trees suffer from its attacks, but the aggregate damage from it is not great.

The coffee rat of Ceylon, the Colunda Elliotti, occasionally commits much damage, seemingly to get the bark, for they do not seem to eat the berries. With their long sharp incisors they bite off with great smoothness the smaller and younger branches, generally an inch from the stem; and should the plants be quite young, just taken from the nursery, they bite them right off a few inches from the ground, and carry them, as if they were eggs, to the nests in hollow trees. They appear irregularly at intervals from the jungles, and there is hardly an estate that does not now and then receive a visit from them. The natives of Ceylon say that their food in the jungles is a species of Strobilanthus, called Nil in Singhalese, and that the rats only issue from their forest residence and attack the coffee estates when their forest food fails.
The injuries from other animals are not serious. A squirrel, the Sciurus Layardi, which eats the coffee berries, is common on estates; the pulp alone is digestible, and the coffee beans are dropped on logs of wood and on the ground. Jackals and monkeys occasionally do the same; this is called parchment coffee. A deer will now and then come from the forest and nibble the tops of the young trees.

Mantis tricolor, Nieter, the Mantis of the coffee tree, is green, lower wings reddish, with large blackish spot at the posterior margin. The female is 1 inch long, with 1/2 inch of an expanse of wings. The male is considerably smaller. The eggs are deposited upon coffee leaves, in cocoon-like masses of 1/2 of an inch in length, but drawn out further at each end. As to the remedies to all these plagues, Mr. Nieter tells us that several means of checking the extension of the bug have been proposed and tried. Amongst these, the introduction of the red ant; but their bites are so fierce and painful, that the coolies refuse to go amongst the trees while the ants are there. Rubbing off the bug by hand has been tried, but it can only be attempted upon young trees without crop; Mr. Nieter, although allowing that an immense quantity of bug is thus destroyed, is opposed to the idea of opinion that the effect is but trifling. He thinks that the application of tar to the roots is a good suggestion, although he is obliged to admit that hitherto no important results have been achieved by it. He adds that high cultivation seems to have the effect of throwing it off. But as the bug seems to depend on locality, Mr. Nieter does not look for any beneficial result so long as the physical aspect is unchanged. He thinks that if the open, warm, airy pattenas were cultivated, which the experiments on a large scale, tried at Passalawa, show that they can be, the brown bug, which is the great destroyer, would not find the conditions favourable to its existence; or perhaps, if estates as a rule were made smaller than they generally are, if the reduction in acreage were counterbalanced by a higher system of cultivation, universally carried out, the bug would not be so numerous as it now is (Mr. Nieter). In the Peninsula of India, borer is a name given to the larva of certain coccinopterous beetles, which injure coffee trees. There are two, the white and red borer, and the chief of these is the Xylotrechus quadripes of Chevalot. The large and rapid introduction of coffee-growing into Ceylon and India has shown that the plant is liable to be attacked by many enemies, and ignorance of that has been the cause of much loss. Coffee trees in Coorg have also been injured by the rot, a disease resulting from improper pruning. The rot attacks and decays the centre of the stem. In Coorg, when the tree is attacked by the borer, the leaves become yellow and droop. The insects are generally about the diameter of a small quill, are always confined to the wood, and never enter the bark until the larva has done its work, passed through the pupa stage, and is about to escape in the form of a beetle. The eggs are deposited by the females near the root of the tree, and the pupa borers tunnel up the heart of the plant.—Nieter; Dr. Bidie on Coffee Planting. See Coffee.

BUG of Miana. See Argas.

BUGGLECONDA, a steep basaltic hill rising about 1200 feet above the plain near Innamoola, in the Guntur collectorate of the Madras Presidency, and remarkable for the frequent earthquakes which occur at it. No crater has been observed, but it has three peaks, the central one being the highest. The name, meaning the charcoal hill, has been given to it from the black colour of its rocks. About the year 1800 earthquakes occurred several times in some months; large stones rolled from the hill to the plains. Heynrichs (Tracts, pp. 108-117) the Chicota hill has frequent earthquakes, and that the Ongole hill seemed to affect the compass.

BUGYLEE-PHYOO. Bum. Clecordon vicosum, Vent.

BUGIO, in Japan, a civil officer who exercises controlling powers over collectors, interpreters, and other inferior officers. See Japan.

BUGIS or Bugi, a bold, self-reliant, maritime people of Celebes, of which they occupy the northern part, and are known, in consequence, as Macassar men. The Bugis, originally from the same stock as the Malay, are superior to all other natives of the Archipelago in their spirit of adventure. They are a brave, active, haughty, fierce, and vigorous race. They love justice, and are faithful to their bonds, but seldom forgive injuries. In the name of Macassars, they form the flower of the coastal troops in the Dutch service. Macassar was the most notorious place in the Eastern Archipelago for the Bugis people to run amok. On the average, one or two occurred in the month. It was in fact the national mode of committing suicide amongst the natives of Celebes, and was therefore the fashionable mode of escaping difficulties. Ten or twenty persons were sometimes killed and wounded at one of the amok. Stabbing and killing at all he meets, the amok runner is at last overpowered, and dies in all the excitement of battle. It is a delirious intoxication, a temporary madness, absorbing every thought and action (Wallace, i. p. 171). Although they bear some personal resemblance to the Malas, arising probably from a common origin, in every quality but courage they are essentially different. Exposed to the same temptations, and most skilful and adventurous navigators, they have never adopted the ancient of piracy, but abhor and resist it, and defend themselves against the Malay prahuns with the most heroic and desperate valour whenever they are attacked, proceeding, if overpowered, to blow up their vessels rather than submit. The poorness of these hardy islanders is as impatient of a blow as a European gentleman; and it is permitted to any one to avenge an affront by the death of the person who offers it. A more than Spartan training is bestowed on children. The males at the age of five or six are removed from their parents, lest they should be made effeminate by indulgence, and they are not restored to their family until they are of an age to marry. They are the Phoenicians of the Indian Archipelago; and there is not a coast, from the northern shores of the Australian continent to the Malay Peninsula, where their ships are not habitually seen. They leave their country in the beginning of the eastern monsoon on a trading voyage, and proceed westward until they reach Singapore. With vessels of peculiar build, of from forty to fifty tons burden, they conduct almost the whole carrying trade of the
Archipelago. They own at least 1000 ships, the outward cargoes consisting of cotton cloths, gold dust, edible birds' nests, tortoise-shell, trepang or sea-slugs for Chinese epicures, scented woods, coffee, and rice; and in spite of the jealous and restrictive policy of the Dutch, they have greatly contributed to diffuse British manufactures throughout the islands of the eastern seas.

In the beginning of the western monsoon, they go in great numbers to the Aru islands, which is the principal rendezvous for the people of Ceram, Goram, the Ki islands, Tenimer, Bahia, and the adjacent coast of New Guinea, a distance from Macassar of upwards of 1000 miles. They carry English calicoes, cotton goods of their own manufacture, Chinese gongs, and arrack; and the return cargoes are tortoise-shell, mother-of-pearl shell, pearls, birds of paradise, and trepang, the Malay term for all the kinds of holothuriae or sea-cucumbers. Of trepang alone about 14,000 pikuls are yearly shipped from Macassar, of a value of 600,000 dollars, or £150,000. It is estimated that the annual value of goods carried by the Bugis to the Aru islands from Macassar alone is 80,000 dollars, or 200,000 guilders; and of those taken to the Aru group from other places, 20,000 dollars, or 50,000 guilders. Bugis are subdivided into many national units; however, by the common use of similar language and similar institutions. There is but one of their tribes distinguished for maritime enterprise and commercial spirit, the Wajo or Tu-wajo people. Their original site is in the interior of Celebes, on the northern banks of an extensive fresh-water lake, 24 miles in breadth, from which a river issues, to fall into the Gulf of Boni. Their voyages extend from Siam to N. Guinea, and from Manilla to Acheen. They are the great carriers of the Archipelago. In the year 1829 they had 786 trading prahus. Amongst the Bugis traders to the east, Kilwara is their metropolis. It is a mere sandbank, lying between Ceram Lant and Kissa, and offers good anchorage in both monsoons. Horses are bought at Gorontoro in Celebes.—Quarterly Review, No. 222, p. 502; Bidmore, 101; Oriental Herald, viii, p. 140.

BUGLAR. A tree of Churia Nagpur; its bark, powdered, is used as a substitute for glue.

BUGLI. HIND. Spirea Lindleyana.

BUGO, of the Philippines, Chavica scribou, Miq.

BUGRA. HIND. Gynandropsis peptaphylla.

BUGRI. HIND. Cleome ruta.

BUGTI, a wild Baluch tribe on the western bank of the Indus, near Shikarpur, in the hills east of Lehlat. They are one of the great Rhind tribes. Some of them are serving in the Punjab cavalry, and many were in the Sind service. They are subject to the khans of Kalat. The Bugti and Marrar occupy the mountain district which extends eastward to the south of Sind and Kutchi.

BUG-TRORA. MAHR. Tecoma undulata.

BUHRA. BENG. Terminalia rubra.

BURI. BENG. Compsis myxa, C. latifolia, Terminalia bellerica, T. Moluccana.

BUHOW, a tribe lying south of Kashmir, little reclaimed from barbarism.

BUI, HIND, seemingly from Bham, land, uncultivated land. The name of several plants,—the Crotalaria buria; Agathotes, sp.; Francea curcus; Ballota limbata; Plectranthus rugosus; Ærura bovi; Panderia pilosa.

Bui Champa, Kæmpferia rotunda.

Bui-Choti, Anabasis muliflora.

Bui Madarin, Achillea millifolium, Artemisia Indica, Artem. vestita, Wal.

Bui-Mung, and Bui-Singh, Arachis hypogea.

Bui Aonlah, Phyllanthus niruri.

Bui Kaviti, Feronia elephantum.

BUILDING MATERIALS. In the Peninsula of India, all the most ancient buildings are of stone, while the edifices of the past five hundred years, comprising some of the most stupendous piles, are of brick. The great religious institutions of Sri Saim in Cuddapah, at Conjeeveram, Chellambaram, Srinangan, the temples at Tanjore, Gangondaram, and Tribhuvanam, the ruins at Bijanagan, Bijapur, Gogi, and Kulekura, the pagoda at Leepichi in the Bellary, and that at Tarpatri in the Cuddapah district, monuments of ancient Hindu and Mahomedan art, are of stone. Those connected with architecture, sculpture, and painting, called into being by the exigencies of religion, always the best stimulus to works of design, have suffered more from sectarian zeal than the ravages of time, and they are widely scattered over the length and breadth of the land. Sculptured stones, fortifications, temples, and works of irrigation are found in every direction, and not only impart a knowledge of the state of science and civilization at various periods, but throw a valuable light on other subjects of inquiry. The recent advent of the British nation into India, the efforts needed to obtain a standing-place, and the duty devolving on them of introducing useful public works, have all hitherto prevented them from engaging in ornamental architecture. The cupola of the Presbyterian church at Madras, built by Colonel de Hauland, is good, and there are a few ornamental buildings in Calcutta and Bombay. But works such as the Ganges Canal, the Southern Coast Canals, already extending almost from the Brahmaputra and the Ganges to the western coast, the great dams across the Godavery and the Kistna, the tunnelling of the Ganges and Indus, the roads everywhere, from Cape Comorin to Tibet, the railroads with their stupendous bridges, and the irrigation canals, already in vastness and in public usefulness, surpass all that Aryan, Hindu, Buddhist, Pathan, Moghol, or Arab rulers had done during their previous 3000 years of occupation. The Moghul dynasties of India, besides palaces and tombs, porticos and mosques, left a few useful sarai and bridges, but many of these were erected by private persons.

In the northern part of the Peninsula, from the Central Provinces to the Godavery, is a great greenstone area, the trap flowing over and covering sedimentary rocks; and in the east, in the province of Hyderabad, is a vast Plutonic outburst of granite. On the south of this granite and volcanic rock there had been an estuary, extending from north of Madras to the Kistna, and from the Bank of Bengal to the western coast of Penman; in the source of the Godavari and Malabar, and it is now filled with distorted, broken, upraised limestone, blue slate, and sandstones, from near Curcumbarry, through Tarpuri, Cuddapah, Kurnool, to Kaladgi and Belgam. To the south of that narrow gulf is the great granite tract of Bellary and Mysore, succeeded further south, about Trichinopoly and Madura, with other.
BUILDING MATERIALS.

limestone beds, both fossiliferous and non-fossiliferous; and from these volcanic, metamorphic, and aqueous-formed rocks, building stones are drawn.

Laterite rock is a clay iron ore peculiar to India; it is widely diffused, and has been largely used in India. The Arcade Inquisition at Goa is built of it; also St. Mary's Church, Madras, and the old fortress at Mahéca.

Trap-Tuffa, sometimes white, sometimes greenish or purple, resembles laterite in the quality of being easily cut when raised, afterwards hardening on exposure to the air. It is used as a building stone, and suited well for basins, troughs, and conduits; it is not very extensively employed.

Littoral Concrete is invariably found close by the sea-shore, and is so named from its resemblance to the artificial stone formed by the cementation of sand, gravel, or other coarse material, by lime or mortar. It is composed of the material prevailing on the shores,—of shells, sand, gravel, and pebbles,—and varies in its character with the rocks in the neighbourhood, being micaceous towards Cochin and Tellicherry, from the quantity of sand and other nodules from the granite and gneiss; gravelly to the north of Bombay; and around it, composed almost entirely of fragments of shells. Along the shores of Sind, Arabia, and the Red Sea, though the material composing it is abundant in a position similar to that in which it exists on the Malabar coast, but it is nowhere cemented into stone. Even in Bombay the cementation is far from invariable. The principal quarries are at Vem, about twenty miles to the north of Bombay, where the shore is sheltered by a vast dyke of basalt, formerly submerged.

The sand is first removed, and the rock is smoothed on the surface. A space about twelve feet each way is next divided into slabs one foot square, the grooves between them being cut with a light, flat-pointed, single-bladed pick. These are raised successively by a tool something between an adze and a mattock, a single stroke of which is in general sufficient for the detachment of each from its bed. The blocks thus cut out and raised being laid aside, the bed is once more smoothed, and the operation resumed, till the pit reaches the depth of six or eight feet. This variety of building material is brought in vast quantities to Bombay, where a large portion of the native houses are built of it. It is not very strong, but, with the admirable cement employed, it makes a good and economical wall.

In the Dekhan, the most massive structures are raised and carved on trap with delicacy and correctness. The favourite material for the over-ground Mahomedan tombstone is basalt, and, after many hundred years, the Arabic letters, carved in relief, are as sharp as on the day they were first cut. The vaults and domes of tombs and temples are commonly bored with iron from top to bottom; and in many cases, instead of scaffolding, the structure is surrounded with a rough wall, ten or twenty feet off, the interval between being filled up with earth; a long inclined plane serves for raising the stones. A magnificent structure of this sort, the tomb of one of the Gwallor princes, has stood half-finished near Poona since the early part of the 19th century, and here native architecture may be seen in perfection in all stages of advancement.

The only other building material at the Bombay Presidency consists of a fine-grained variety of nummulite, like Bath oolite, called, from the name of the place whence it comes, Porebunder stone. All over India, bricks, laterite, and clay are largely used; in the Mauritius, stone and slabs of coral rock. In many parts of Bengal, wattle-work is in use for houses.

Since Indian railroads were commenced, with their great spanning bridges, the rocks of all their neighbourhoods have been largely utilized; and buildings formed of the greenstones, granites, limestones, clayslates, laterite, and flagstones are everywhere to be seen. Throughout the great volcanic district of the Dekhan, the various kinds of greenstone are largely used. On the blue slate formation, along the valleys of the Kistna and Tumbudra, and on the compact limestone formation on each side of these rivers, houses have ever been formed from these materials; but the favourite rock for ornamental purposes in the Buddhist and Hindu temples of peninsular India, is the dark basaltic greenstone, often, from its high polish, called black marble. In an ancient underground temple at Bijapur this basalt is alone employed. The Brahmanical and Buddhist caves of Ellora and Ajanta, and the smaller caves at Mominabad, are excavated out of the greenstone and greenstone amygdaloid. At Ellora they are about twenty in number, in the face of the mountain, almost scarped as it falls into the valley of the Godavery; a similar number are at Ajanta, in a ravine near the scarped ghats overlooking Kandes. Those on the Iravadi near Prapat look on the river. In Madras and Calcutta, and in Indian towns generally, brick is the ordinary building material. In the whole of Burma and the Tenasserim Provinces, the houses are on posts, and built of wooden planks with shingled roofs.

Of the rocks of aqueous origin, the sandstones, slates, and limestones, the whole of the valley of the Kistna, and great parts of the valleys of its affluents, the Gutpurba, Malpurba, Bhima, Tunga, Bhudra, and Tumbudra, and much of the valley of the Godavery and of the valleys of its northern affluents, have limestone, clayslate, and sandstone rocks, and the houses and more extensive buildings are all built of these. The compact limestone of Kurnool, westward to the Bhima, is an excellent building material.

The whole of the Kymore range in Shahabad is described as of mountain limestone, which also shows itself in the valley of the river Son; so far at least as Mungeswar peak in Mirzapur: and it crops up at Rhotas, forming a sloping base to the precipitous sandstone rock. Below the mountain limestone is one of a plush grey colour, mixed with occasional crystals of calc spar; this, like the Kurnool stone, is admirably suited for lithography. Below the latter, in Kymore, is a limestone of a hard, tenacious, almost indestructible composition, admirably suited for building.

The sandstones of the Kymore range have a high commercial value at Chumar and Mirzapur, being used as flagstones and for ornamental purposes, the proximity of the Ganges affording an easy river carriage; otherwise they are the worst and most destructible description of stone in the range. The millstones of Chynepore, Sussaram, and Tilouthoo (perhaps also Akbarpur), are famous, but must always be dear in a distant
market, for want of river carriage. The Sone causeway and the Koylwan railway bridge are built of the dense sandstone of Sussaram; little quantities are found in the higher portions of the range towards Rihotias. The best stone, while easily workable, is almost as hard as granite, and may be had in any colour, with crystalline, blue, grey and all shades to a dark red.

Flexible sandstone is found at Ulwar, Jhend, and Jubulpur.

At the Panjab Exhibition held at Lahore, there was a good collection of building materials from Sahi Balaghgar in the Dehli district, including the red, the spotted, and the light-coloured sandstone so much used in the large buildings of Upper Hindustan; and from the same place were polished blocks of white marble, and a pretty dappled grey marble, called Narnaul marble, from the Hissar district. From the Kangra district there was sent grey limestone, sandstone of two sorts, both good for building, and granite. Some nice workable sandstone sent from Madhopore must come from the hills above that place. From Kashmir there was sent black marble, and some polished slabs of serpentine, which is found at Tashgna in Little Tibet. The Salt Range, Jhelum, and Shaipur districts possess good building stones, sandstone, and calcareous sandstone; from Jhelum were specimens of marble which might become useful for building, with gypsum or alabaster of the same hills. See Architecture.

He accepted employ under the Government of India at Allahabad, but became ill, and returned to Caledula, where he died. He was one of the most distinguished students of physical science in India, and one of the veterans of the Indian press.—Dr. Buist's Catalogue.

BUJI BABBAR. HIND. Eriophorum comosum.

BUJ. HIND. Ores erosis lanceolosa.

BUJOOR. BENG. Corypha elata.

BUJIRA. HIND. Ceyome ruta.

BUJRA. HIND. Ceorni, commodious, but generally cumbrous and sluggish boats, having more pretensions to comfort than speed, used for journeys up the Ganges. See Boat.

BUK or Buka. BENG. Agati grandiflora.

BUK. HIND. Land recovered by the recession of a river. Bukar, land left by a river, but rendered useless by a covering of sand.

BUKALAMUN. ARAB. Chameleon.

BUKAN. HIND. Eclipta erecta, Lippia nodiflora.

BUKAYUN. PERS. Melia sempervirens.

BUKBUR. ARAB. Fruit of Cassis fistula.

BUKCHI. HIND. Conzyza anthemitica.

BUKEPHAL. A city built on the scene of Alexander's battle with Porus. Strabo says it was on the left bank, where Alexander had crossed; Plutarch says it was near the Hydaspes, where Bucephalus, Alexander's horse, which was killed here, was buried; Arrian, Diodorus, Curtius, and Justin say it was opposite to Nikãa. According as we follow Strabo or Arrian, it was at Dilawar or at Jalalpur, each of them 6 miles from Mong, the battlefield of Nikãa.—Cunningham, p. 177.

BUKHARA, the capital of a khanate in Central Asia, the chief point of Central Asiatic trade. Its name has been supposed to be derived from Vihara, a Buddhist monastery, but Mahomedan authors say that Bokhur meant Majma-i-ilm, i.e. a place for the collection of knowledge, that is, a college or school. Turks pronounce the word Bukhara, while the Persians say Bokhur.—Vernberg, Bokhara, p. 14.

BUKHARIA, also called Little Bukharia, also Eastern Turkestan, bounded on the north by Mongolia, on the east by the Shami or Kobi desert, on the west by Kokhand and Badakshan, and on the south by the Tsung Lung or Kora-konran range of hills, which separates Little Bukharia from Little Tibet. The inhabitants of Little Bukharia speak Turki, and profess the Mahomedan religion. The Uigour Hoei-hou, called simply Hoé-hœi, under the Mongol dynasty of Yuan, were Mahomeds, and this name is applied by the Chinese to all those of the same religion. The inhabitants of the towns of Little Bukharia are in part descendants of the ancient Uigour or Hoéi-hou, and consequently Turk; in part Sart or Bokharians, who are scattered as merchants all over Central Asia, and who are Turks. There are many of them at Pekin, Hoang-ou-fou, Canton, and other commercial cities of China. Their mother tongue is Persian; but they also speak the oriental Turki, which is the general language of Turkestan, and the most diffused in Little Bukharia. The Uigour writing character was the original source of those still used by the Mongol and Manchu, and was itself almost certainly derived from the old Syriac character through the Nestorians. The modern Tartar characters are written (and, it is presumed, read) in vertical lines from top to bottom of the page, the lines succeeding each other from left to right. What Uigour meant with Mongol authors is doubt-
BUKH.

...ful, but the people and language so called by the western Asians were Turk. Captain Valkkanoff speaks of the language now in use at Kishgar as being Ugour, but it is not clear whether he means that this term is known to the natives.—Russoans in Central Asia, p. 67; Yule, Cathay, i. p. 206; Timkovski's Journey to Pekin, i. pp. 6, 675-79.

BUJ, the Karen priest and physician.

BUKHUR, ARAB. Incense or immigration.

BUKHL. Arranged.

BUKHT, ARAB. Incense or immigration.

BUKHU, the Jind, a locality in the Malacca district occupied by the Jangk race.

BUKIYAN, an industrious cultivating tribe of Mahomedans in the Multan division of the Punjab. They were Chauhan Rajputs, and about the 16th century became converts to Islam.

BUKKAPU. Tel. Casalpinia sappan.

BUKKAR-ul-WASH. ARAB. The wild cow.

BUKKUR, a fortified island in the Indus river. It is in the centre of the stream, nearly opposite the town of Rori; and on the western bank is a part of the Indus. Bukkur is in lat. 27° 42' 45" N., and long. 68° 56' 30" E. It is the limestone rock 2400 feet long, 900 broad, and 25 in height. On its north is the holy islet of Khaja Khizr or Jind Pir, and on its south is that of Sadi Bela. It has been held successively by the 14th century by the Summa Rajputs, the Dehli, Kahi, and Talpur, and Talpur rulers, and was ceded to the British in 1856.—Barton; Postans; Imp. Gaz. See Bakkar.

BUL. SANSK. Force, strength; pronounced Bal, also Bil.—Ell.

Bul-Arati, a name of India as the destroyer of the giants.

Bul-Bhog. HIND. Taking forcible possession of property; from Bul, force, and Bhog, wealth.

Bul-Kut, rent taken in advance.—Elliot, Glossary. See Bal.

BUJA. BENG. Parition tortuosum.

BUJAHUR, HIND., also Buladur, from bulana, to call; a village servant in Allahabad district serving as a guide or messenger.—Ell.

BULAK, said by Niebuhr (p. 63) to be the Lapolos of the ancient Greeks. Bulak has been for centuries the river port of Cairo, although originally a mile distant from it, and it has now become incorporated with that city. The Museum of Egyptian Antiquities, a magnificent collection, entirely unrivalled of its kind, was established at Boulaq by Ismail, Khedive of Egypt.

BULANDSHAHR, a town often called Baran, in the N.W. Provinces, on the west side of the Kali Nadi. It gives its name to a district in the Doab between the Ganges and the Jumna, between lat. 28° 3' 30" and 28° 42' 45" N., and long. 77° 20' and 78° 31' 45" E.; area, 1910 square miles, and population, 936,667. It is said to have formed part of the great Pandava kingdom ruled over from Hastinapur, a city which was cut away by the Ganges. Bulandshahr was approached by Mahmud A.D. 1018, and its people embraced Mahomedanism. A.D. 1193, Kutub ud Din captured it from the Door raja by the treachery of his cousin Ajaypal, who accepted Mahomedanism, and whose descendants still hold lands there. Rajputs since, for a time, occupied the district, expelling the Meo. It has been under the Dehi and Mahratta rule, and in 1808 became British territory. During the mutiny the Gujar and others held the district from the 21st May to the 4th October. The people are Hindus, Rajputs, Mahomedans, with Chamar, 146,149; Jat, 56,453; Lodha, 51,513; Gujar, 48,786; Khakrob, 29,501. Coins of Alexander the Great and of the Indo-Bactrian kings are being found at Baran to the present day.

BULAQ. HIND. A jewel worn in the septum cartilaginum of the nose.

BULAT. BENG. Phaselus mungo, Linn.

BULAT-WIEL. SINGH. Chovica seribbo.

BULBASSI, a Kurd race, composed of—1. Kabaz, the reigning family; 2. Manoos; 3. Mansoo; 4. Piran; 5. Ramook; 6. Sinn and Taafah, who together make one tribe. They are all predatory. The chiefs of tribes are called Muzzin. The price of blood among the Bulbassi is 22 oxen; but it may be made up in other effects, to which often a nominal value is attached, more than twice the real amount, when the affair is to be compounded amicably. The crimes punished with death are adultery, seduction, and such like. The Bulbassi are endogamous. They have courtship among them, and carrying off a girl by the lover is common. When a chief dies, if his eldest son is incapable, the best of the brothers succeeds. In their own country the Bulbassi do not willingly acknowledge any superior, either Turkish or Persian, but when they descend into the regions of Karatchoo they pay a tribute of sheep to the Bey. Most of the principal people among them possess a complete suit of mail. For curing wounds they sew the wounded man in the skin of a bullock fresh stripped off the animal, leaving only his head out.—Rich, Kuristan, i. p. 133.

BULBUL. PERS. A term employed among the various Mahomedan nations of Southern Asia, to designate birds belonging to several generic divisions of a natural family. The Persian bulbul is a species of true nightingale; it is the Luscinia major (or Sylvia philomela of Temminck), and is known as the Bulbul-i-bostan in India, where it is frequently imported as a cage-bird. In Persia it is often called the Bulbul-i-hazar dastan, the bulbul of a thousand notes; and its genus, Luscinia, is very closely allied to the small thrushes of America. The Persians delight to speak of this favourite song-bird, which Moore has made widely known:

'There's a bower of roses by Bendemeer's stream,
And the nightingale sings round it all the day long:
In the time of my childhood 'twas a sweet dream.
To sit in the roses and hear the birds' song.
That bower and its music I never forget;
But oft, when alone in the bloom of the year,
I think, Is the nightingale singing there yet?
Are the roses still bright by the calm Bendemeer?'

It is migratory there, making its appearance with the roses in April, and disappearing with the rose at the end of summer. According to Zakary bin Mahomed-al-Kaswini, the Persians say the bulbul has a passion for the rose, and laments and cries when he sees it pulled. The English nightingale, Luscinia philomela (Philomela luscinia), is migratory through Europe, N. Africa, and Asia Minor, but is not known in India or Persia. Indeed, there is no true nightingale, wild, in British India; but the shama, Cisticola marmoratus, undoubtedly the finest song-bird of British India, is not unfrequently designated the

509
Indian nightingale. It is common to India and the Malay countries; and there is a second species (C. luzoniensis) in the Philippines, and a third (C. erythropus) in Africa. The esteemed Indian songster is the merle tricolor de longue queue of Levallaint (Oiseaux d'Afrique, pl. 114). We may remark that the Orocetes cinclorhynchus is also termed shama in the Madras Presidency. The bulbul of Southern India is not uncommonly seen in the hill-trails, the term being applied to the Bulbul-l-i-gul-dum, Hamatornis eacer, which is a common cage-bird, and, like quails and cockers, trained to fight; and when pitted against an antagonist, it will sink from exhaustion rather than release its hold. The Hurasini bulbul, also called the Shah bulbul, is of another sub-family, the Myagrinæ, and is known also as the Paradise fly-catcher. It is of a chestnut colour for many months, but becomes white in the breeding season. It is a very graceful bird, with very long tail feathers, and it is a pretty sight to see it flying from tree to tree. How the birds prevent the long tail feathers from becoming entangled in the thorny trees, is very curious. In Ceylon, the chestnut bulbul is called the fire thief, and the white bird the cotton thief. Its cheerful notes, Yelling bulbul, and its movements in flight graceful. Mr. Layard has often watched them, when seeking their insect prey, turn suddenly on their perch and whisk their long tails with a jerk over the bough, as if to protect the feathers from injury.

In the Madras Presidency, the three-coloured thrush, Geocichla cyanota, is sometimes called a bulbul; and the hill bulbul of Matheran is the Otocompsa jocosæ. It has crimson ear-tufts.

—Jordan, Birds of India; Layard's Nat. Hist. of Ceylon; Cal. Rev. See Birds.

BULBUL CHASM. PEWS. Literally, bulbul eye. A pattern produced in weaving.

BULCHA, a pass in Kamaon, in lat. 30° 28' N. and long. 88° 14' E., over a high ridge, extending E. and W.

BULDANA. BULD. HIND, Horned cattle. Buldena, a cowherd.—Fili.

BUL-DAN. Amongst the ancient Hindus, the sacrifice of a bull to Balnath, the lord Bal, the sun. Balnath was the deity worshipped by the Saura races in Gujerat, and was identical with the Syrian Bal. That ancient sacrifice has long ceased. Four altars were erected for offering the flesh to the four gods, Lakshmi-Narayana, Uma-Maheswar, Brinda, and Ananta. The nine planets, and Pritru, or the earth, with her ten guardian deities, were worshipped. Five Vilwa, five Khudiru, fire Pulashu, and five Udmurbun posts had to be erected, and a bull was tied to each post. Clarified butter was burnt on the altar, and pieces of the flesh of the slaughtered animals placed thereon. Another description says that a covered altar had to be prepared. Sixteen posts had to be erected of various woods; a golden image of a man, and an iron one of a goat, with golden images of Vishnu and Lakshmi, a silver one of Siva, with a golden bull, and a silver one of Garuda, the eagle, were placed upon the altar. Animals, as goats, sheep, etc., were tied to the posts; and to one post, made of the wood of the mimosa, was to be tied the human victim. Fire was to be kindled by means of a burning-glass. The sacrificing priest, hota, strewn the grass called d'hul, or immortal, round the sacred fire. Then followed the burnt sacrifice to the ten guardian deities of the earth,—to the nine planets and the Hindu triad, to each of whom clarified butter was poured on the sacred fire one thousand times. Another burnt-sacrifice, to the 64 inferior gods, followed, which was succeeded by the sacrifice and offering of all the other animals tied to the posts. The human sacrifice concluded, and the sacrificing priest offered pieces of the flesh of the victim to each god as he circumambulated the altar.

At the present day the bull is often desired by Hindus to the gods, on the 11th day of mourning or a near death as a live. In this manner, marriage ceremonies are performed, called brikhotsarg, or abandoning of a bull. Brik means a bull, and also the zodiacal sign Taurus. The brikhotsarg marriage ceremony is performed in the name of the bull, after which the animal is set free to roam; and in some Hindu towns of India these devoted cattle infest the streets and roads, and are very numerous and very troublesome. In several Mahatta towns they were often let loose. In Benares they are still in numbers; and whatever they may do or wherever they may lie down, they may be patted, spoken to, or even shot at, but never struck. They are called Bijar, Saur, Brahman bull. A similar marriage ceremony is performed with a well and orchard.—Ward on the Religion of the Hindus, ii. p. 289; Elliot, 260. See Bantotsarg; Bull; Jalotsarg.

BULDANA, a small walled town on a plateau in the Berar Assigned Territories. It is the chief town of a district of 2807 square miles, and a population of 404,042 souls, three-fourths Hindus, composed of several plateaux, with small fertile valleys intervening. Since 1318 it has been under Mahomedan rulers; but prior to that a Jaina dynasty seems to have held sway, and remains of their temples are to be seen at Deolghat, on the Penganth, at Mehkar, at Sindkhed, Pimpalgaon, and at Lona. Besides the Mahomedans, in 1867—
BULL.

BULDEO, in Vrij, is a shrine of Buldeo, who is supposed to be the Hercules of the east and west, his club ploughshare, and his covering in bull skin. The complex of Buldeo is depicted white, and that of Krishna black or azure. See Baldeo.

BUL-DHOON, the valley of Sockeytmuni in the Kohistan of Jullundur, but also called Kangra Bhawan, also Pallam Pattiar. Natives of the Bul-dhoon and Kulu have sallow complexities, and seem of the same race as the natives of Bushair. The men are tall and strong, but few of them are handsome. Many of the young women are pretty, but at the age of 20 or 25 they become coarse and stout. It was the practice for the women, gaily dressed, to assemble and greet a stranger with songs as he entered each village, for which honour he was expected to give a rupee to each knot. The men and women dress almost similarly.—Masson's Journeys.

BULESUR, a subdivision of the Gujar race.

BULGAR. Hind. Boletus ignarius.

BULGARIAN. The wild people who dwelt or wandered in the plains of Russia, Lithuania, and Poland, in the age of Justinian, being reduced under the two great families of the Bulgar and Selavonian. Those of the former nation, who touched the Euxine Sea and the Maeotis, derived from the Huns their name or descent. The evidence of language attests the descent of the Bulgarian from the original stock of the Selavonian, or more properly Slavonian race; and the kindred bands of Servian, Bosnian, Rascian, Croatian, Wallachian, etc., followed the standard or example of the leading tribe. The first king of Bulgaria, in its present extent, was in a.d. 640, and their empire continued until 1017, when they were ruled by a lieutenant of the Greek empire.—Chatfield's Hindustan, p. 289.

BULGHAR, a town in Russia, where Russian leather is made; also Russian leather, corrupted into Bulkhali or Bhukhalh. In Persia, a kind of bottle, to hold nearly three quarts, is made of bulghar, to be used by horsemen travelling. It has a wooden stopper, and hams from the saddle or girth, and swings under the horse. It is called matalhrah or mellarah.—Ouseley's Travels, i. p. 247; Fraser's Khorasan, p. 69.

BULL. Beng., Hind. Sterculia urena, Rozb.

BULJ-A-WANLU. Tel. A Sudra race of Telingana. See Balja.

BULKOKRA. Beng. Adalia castancarpa.

BULL.

The bull has always held a prominent place in the religious systems of Asia. The sacred bull of the Assyrians, the Apis of the Egyptians, and the bull Nandi of the Hindus, are evidently identical types. The golden calf of the Israelites will not be forgotten. And for the use of the figure of the bull as a sacred ornament by the Jews, the brazen sea in the temple of Solomon may be cited (1 Kings vii. 25; 2 Chron. iv. 4, 5; and Jeremiah iii. 20). In Assyria, Baal, or the supreme deity, was worshipped under the form of a bull or heifer, as may be inferred from Tobit i. 5: 'Now all the tribes which together revolted, and the house of my father Naphthali, sacrificed unto the heifer Baal;' but the reading is doubtful.

In the English Scriptures, the word 'bull' is the translation of several Hebrew words, e.g. a cow, a heifer, a bullock, a calf, a heifer, a bull; abhira, tor. A calf was in Hebrew ogel, in Arabic, ajel. Jeremiah xxxiv. 18 and 19 tells of a sacrificial rite of splitting a calf in two, and men passing between the parts; and bull-worship is noted in 1 Kings xii. 28, 29, 30, the images being of gold. In ancient Western Asia, Bal and the brazen calf were specially worshipped on the fifteenth of the month (see 1 Kings xii. 32); and at present, in India, the sacred day of Bal-Eswar, with his Vahan bull Nandi, is the amovaas, the moonless fifteenth day of the month. The bull was offered to Mithras by the Persians; and, opposed as it now appears to Hindu faith, he formerly bled on the altar of the sun-god, on which not only the Bullian offering of the bull was made, but human sacrifices.—Layard, Nineveh, ii. pp. 474-5. See Bul-dan.

Apis, the sacred bull of Egypt, was chosen by the priests of Memphis for its black and white spots; and Mnevis, the sacred bull of Helipolis, had nearly the same marks; but the Hebrews, in preparing their water of purification, were ordered (in Numbers xix. 2) to kill a red heifer without a spot. Amongst the Egyptians, the solemnities at the burial of Apis were entirely Bacchic. The priests did not wear the nebris or deer skin, but they wore the panther skin, and carried thyrsus staves. The brazen calf mentioned in Scripture as an object of worship by the Hebrews, is still worshipped by Hindus in India, frequently of brass, but oftener of stone. Some of the Hindu images of the bull are of colossal size. One, supposed to be the largest in the south of India, is to be seen at the Charmandi hill in Mysore. It is carved out of a solid rock at the side of the hill, and is approached by ascending 600 stone steps. There is also a magnificent temple of Siva at Mayore, with a great bull in front. Siva, under the name of Mahadeva or Esvarra, is the tutelary divinity of the Rajputs in Mewar; and, from the early annals of the dynasty, he appears to have been, with his consort Isani, the sole object of the Gehlot Rajput's adoration. Esvarra is there adored under the epithet of Ekinga, and is either worshipped in his monolithic symbol, or as Esvarra Chao-mukhi, the quadriform divinity, represented by a bust with four faces. The sacred bull Nandi has his altar attached to all the shrines of Esvarra in India, as was that of Mneves or Apis to those of the Egyptian Osiris. Nandi has occasionally his separate shrines, and there is one in the valley of Udaipur which has the reputation of being oracular as regards the seasons. The bull was the steed of Eswara, and carried him in battle; he is often represented upon it, with his consort Isa, at full speed. To Cleonymus, to every herd of cattle there is a sacred bull, who is supposed to exert an influence over the prosperity of the flocks; his horns are ornamented with tufts of feathers, and
frequently with small bells, and he invariably leads the great herd to pasture. On starting in the early morning from the cattle kraal, the natives address the bull, telling him 'to watch over the herd'; to keep the cows from straying, and to lead them to the sweetest pastures, so that they shall give abundance of milk,' etc.—Bunsen, 1. p. 432; Tod's Rajasthan, i. pp. 222, 514; Tennent's Ceylon; Vossius de Idololatry; Bryant, Analysis; Hancorrelle, Recherches sur les Arts de la Grèce; Ouseley's Travels, i. 280; Ward's View, ii. 143. See Bal-dan.

BUNN, John. Terminalia bellerica. SANSK., Pavonia odorata.

BULLA, the polo game of the Dard.

BULLAIN-LENA. HIND. A ceremony amongst Mahomedan and Hindu women in India, in which the woman sweeps her hands down from the head to the feet, and then raises them to her own head, supposed to take off the other's evils on herself.

BURLUSHES, Typhaeae.

Jono, . . . . Fr. | Pan, . . . . . . . . . . SIND.
Goma, . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Tr. | Junco, . . . . . . . . . . . . . . . . . . . . SIND.

Burlishes, so conspicuous in the marshes of Europe, extend to similar situations in most parts of India. The leaves are in some parts of Europe employed in making mats and winter coverings for plants, as well as for stuffing chairs, putting between the staves of barrels. The leaves of putera and riri (Typha elephantina and T. angustifolia) are employed in making mats in North-West India. In Sind the former is called pun, and its leaves employed for making mats and baskets. The pollen, like that of Lycopus, is inflammable, and used as a substitute for it in Europe. It is also collected in Sind, and there called booree. Elephants are fond of T. elephantina. It is a valuable sand-binding plant, and it is tied into bundles as a swimming float.—Royl. Fl. Pl. p. 35.

BULSUN. A Native State, originally a foudary of Sirmoor, but a separate summons was granted to it in September 1815. Its tribute payment is Rs. 1080. Its chief is of Rajput origin. Thakur Jograj was created a rani in 1858, for services rendered during the mutiny. The revenue of the state is Rs. 6000, and the population 4892.

BULTI extends from the confines of Ladakh westward to the great bend of the Indus. It has Dras and Hasora on its south, and the Koun Lun or Mustagh on the north. The bed of the Indus at Tolit is 7500 feet; at Iskardo, the capital, 7000; at Rondhu, 6200; and at the great bend, about 5000.—H. f. et T. 224, 225.

BUL TUL, or Shur-jil, a pass leading to Kashmir, in lat. 34° 10' N., long. 78° 10' E. The crest is 10,800 feet.

BULUH. MALAY. A bamboo. Buluh perindu, the primitive bamboo, also called Buluh-ribat, the storm-bamboo. In the forests of the Malay Peninsula, Sumatra, and Java, the natives make holes in the forest bamboo, and plantain squares issue when the wind blows. It is a sort of Aeloa pipe. See Bamboo.

BULUN. SINDI. The water hog, a porpoise in the rivers Indus, Ganges, Irawadi.

BULUNG. JAV. Pilocaria candida, Nees Eucnema spinosa; Agar-agar; Garcillaria tenax.

BULTUG TAGH is that part of the Koun Lun chain which is east of Sunarccd and south of Khoobul. Bul Tagh means the cloud mountain; but the Koun Lun chain is also called the Belur Tagh, which, according to Cunningham, is synonymous with the Balti mountain. Other names for the chain are Mustagh, Kararakam, Hind Kush, and Taung Lung or Onion mountains, from the prevalence on it of a species of Alitum. It continues for the Pamir range west of Yarkand. The Koun Lun chain is not less elevated than the Himalaya, and is covered throughout a great part of its length with perpetual snow. Its axis has not been crossed by any traveller, but has been reached by Dr. Thomson, who visited the Kararakam pass, elevated 18,300 feet. In the Western Tibet, the axis of the chain is in general distant about 150 miles from the Himalaya, and the country between the two consists of a complication of ranges of lofty and rugged mountains, separated from one another by stormy valleys, which at the higher parts of the courses of the rivers expand at intervals into alluvial plains.—H. f. et Th.

BUMAY-ZA. BURM. Albizzia stipulata.

BUMBA, a race inhabiting the hills westward from Kashmir to the Indus.

BUM BUKLEISR. See Hot Springs.

BUMBUL. HIND. Rubus biflorus.

BUMEE. SINGH. Tetranthera Roxburghii.

BUMMALO, a small fish, salted and dried, also called Bombay duck, but found on all the coasts of Southern Asia. See Bombay Duck.

BUMELE, name of a Rajput tribe on the eastern parts of the Central Doab.—Ell.

BUN or Boon. ARAB. Coffee, coffee berries.

BUNA of Kaghan. Albizzia odoratissima.

BUNA. HIND. Edwardsia mollis, Platanus orientalis.

BUNAFUR, a tribe of Yadubansi Rajputs in Oudh. Allimabad, Benares, Gurra Mundia, and Bundelkhand.—Ell.

BUNHOOAY. BURM. Careya arborea.

BUNCHONG BULU, a red dye-wood of the Celebes.

BUNCOGA. SINGH. Urostigma Mysorensis.

BUND. HIND., PERS. (Bund.) A slip of an account. Band-bheli, also Band-phantah, a statement of a village account; an embankment, a dam.—Ell.

BUND, Boond. HIND. A dark blue silk with many spots, largely made at Benares. Bundummi, a kind of stiff waxed spotted silk.

BUNDA. HIND. A sort of earring (pandela) or a ring used by ear-borers.

BUNDAISH, or Original Creation, a sacred book of the Parsees; it is in the Pehlevi. It gives the Parsee cosmogony; and one version was written about A.D. 880.

BUNDALA, or Boondala, an agricultural race in the Maiker district.

BUNDARE, a Kandh village in the Madras district of Visagapatam. Until 1849, three human beings were here annually sacrificed, two to the
sun in the east and west of the village, and one in the centre. The head was left attached to the sacrificial post till devoured by birds.—Imp. Gaz.

BUNDELA, a tribe who claim to be Rajputs. They give a name to the province of Bundelkhand (corruptly Bunceulcund). They are descended from the Garhwar of Kantit and Khairagarh, and first settled in Bundelkhand in the 13th or 14th century. There are few genuine Bundelas in the British portion of the province, except in the pargana of Panwar. The province of Bundelkhand is a mountainous hilly tract of country lying between lat. 23° 52' to 26° 26' N., and long. 77° 53' to 81° 39' E., between the rivers Jumna and the Chambal on the N. and N.W., the Jumulpur and Sauqar divisions on the south, and Rewa and Baghelcund and the Mirzapur hills on the S. and E. Within these bounds are five British districts; it encloses the three Treaty States of Orcha or Tehri, Datia, and Samthar, and the states of 26 chiefs who have sannud or Ikrrnamah from the British Government. Iron and copper are obtained, and diamonds from Panna. It seems to have been occupied successively by Gonds and Rajputs; and to the latter are due the forts of Ajyegarh and Kalinjar, the temples at Kajuraka and Mahoba, and the Hamirpur irrigation works. A vast portion of Bundelkhand is hilly and unproductive, forming the northern slope of the Vindhaya, and the province of Bundelkhand has, in the past three centuries, been fifteen times desolated by famine. The Bundela became dominant in the 14th century. Towards the middle of the 18th century, the aid of the Mahattas was called in against the Dehli forces. On the fall of the Peshwa in 1818, all his sovereign rights were ceded to the British. Under the Bundelkhand Agency are Sohawal, Jignee, Ajyegarh, Baonee, Beronda, Bijswar, Chikrak, Chutterpore, Dutia, Kotee, Myhere, Nagode, Orcha, Punna, Rewa, and Sumpthur. Of the principal states, Gwalior, Indore, Bhopal, Dhar, Dewas, Bhopal, and Jowra are under Mahomedan rulers, and the rest Mahatta. The petty states hold under the immediate guarantee of the British Government, but have feudal relations with one or other of the larger states, and occasionally with more than one.—Imp. Gaz.; Treaties, etc., iv. p. 195.

BUNDELI, or Bandar. Pers. A sea-port; prefixed to many sea-ports along the coasts of the Arabian Sea. Shah-Bunder is a harbour-master, a governor; the British sailors' market boat is the Bunder boat.

BUNDER ABBAS, formerly called Gambroon, in lat. 27° 10' N., at the entrance of the Persian Gulf, is 5 miles north of Kishm island. It is in the south of the province of Kirman, and is about eighteen days' march from the town of Kirman.—Horsburgh.

BUNDESH, a religious book of the Parsee Zoroastrians. See Bandahish.

BUNDI, a tributary state in Rajputana, lying between lat. 24° 58' and 25° 55' N., and long. 75° 23' and 76° 30' E. Population in 1875 was 224,000, paying a tribute of one lath of rupees. The ruling family belong to the Hara tribe of Rajputs. Omoha Raja gave most efficient assistance to Colonel Monson's army in its retreat before Holkar; he died in 1804, after a rule of upwards of fifty years, and was succeeded by his infant son, Bishen Singh. During the Mahatta supremacy, this state suffered much at the hands of Sindia and Holkar, who virtually assumed the management of the revenues. The territory of Bundi was so situated as to be of great importance during the war in 1817 in cutting off the flight of the Pindari. Maha Rao Bishen Singh early accepted the British alliance, and a treaty was concluded with him on 10th February 1818. By this, the tribute paid to Holkar and the lands in Bundi held by Holkar were relinquished to the raja, who engaged to pay to the British Government the share of tribute he had hitherto paid to Sindia. In its earlier fortunes, this state became so connected with the imperial court of Dehli, that, like Jeyapore, the princes adopted several court customs. The Purthau, or premier, was entitled Diwan and Moossahib; and he had the entire management of the territory and finances. The Foujdar or Killadar is the governor of the castle, the Maire de Palais, who at Bundi is never a Rajput, but some Dha-bhae or foster-brother identified with the family, who likewise heads the feudal quotas or the mercenaries, and has lands assigned for their support. The Bakhshi controls generally all accounts; the Rassala those of the household expenditure. Bundi has a beautiful palace. During the mutiny and rebellion of 1857, the raja fled forward. Its military force is 700 horse, 1750 infantry, and 80 guns.—Todd's Rajasthan, ii. p. 504; Treaties, Engagements, and Sounds, iv. p. 63.

BUNDI. HIND. A kind of sweetmeat, in grains or drops. Bund, a drop.

BUND-i-Kaisar, a dyke or bund near the town of Shuster in Southern Persia, thrown across the river Keren. Sir Henry Rawlinson says that it was constructed by Ardeshir Babekan or his son Shaipur; and the canal constructed is called Nahr-i-Dariyan, which waters the fields to the south in the Mianab.—De Bode.

BUNDU MALLIJI. Tel. Jassuminium sambac, At. BUNER, a democratic State between Afghanistan and India, N.W. from Peshawur, beyond the Juddoo country on the north-west. It is a rugged country, extending from the lower range of the Hindoo Kooeh downwards to hills which command the Chumla valley and the central plain of Yosufzai. On its western frontier, again, lies the Swat territory. The Buner people could muster a force of some thousands. They have generally abstained from molesting British subjects. Near them are the Swat, Rankai, and Lower Osman Khel tribes, the two latter being subordinate to the former.

BUNGA, PUKHTO. Ransom.

BUNGA, a temple of the Akali sect of the Sikhs.

BUNGA-BUAPALA. MALAY. Also Bunga pala, nace. Bunga Chanki, also Bunga-lawang, clove; Caryophillus aromaticus. Bunga pukul ampat, Mirabilis jalapa. Bunga chappa, Blumea balsamifera.

BUNGARI. HIND. Vangueria spinosa.

BUNGAROO, Tel. Gold.

BUNGARUS CÆRULEUS, B. tropidonotus, B. Ceylonicus, are three poisonous serpents of Burma and Ceylon, of the family Elapidae. B. caeruleus occurs in most parts of India and in Burma; B. fasciatus, common in Burma, is rare on the eastern coast of the Peninsula; B. semifasciata occurs in China. These snakes are from 4 to 6 feet long.
BUNGA SURSON. Hind. Siapis junea.

BUNGA SURSON. Hind. Corchorus olloritus.

BUNGKA, Hind., also called Kutooa, an aquatic beetle which eats rice plants. It is said to make a leaf boat, which it paddles from plant to plant.—Ell.

BUNGAL. Hind. Bungalow, a one-storeyed house.

BUNG-MAI-ZA. BURN. Inga bijemina, Willde.

BUNGOMA, ? Emyda granaon.

BUNGRAH. Hind. Acorus calamus aromaticus.

BUNGREE. Hind. Glass bracelets.

BUNG-TA-LAI. CHIN.

Tung-tai-hai. . . CHIN. Yang-kwo, . . . CHIN.

Ta-hai-tsz, . . . " Boa-tai pai jin, . . . "

Pung-ta-rai, . . . "

A tree of Siian; its fruit makes good jelly.—Smith, p. 44.

BUNGUSH, a Pathan tribe who inhabit the enclosed plain of Meranzai, and also the Kurum valley within the Afghan limits. In the Kohat district, the principal tribe is the Bungush. They can muster 15,000 fighting men, and are fairly good soldiers. In 1851 they petitioned the British to include them in Kohat. This request was acceded to. They offered to guard the Kothul; and while arrangements were progressing, the Gullee Afridi suddenly attacked the Bungush people on the Kothul, and seized that post. Several Bungush chiefs were killed in the encounter, and Major Coke, who was present, was slightly wounded. Upon this check, the Bungush people obtained the alliance of two small though warlike tribes, named Buzotz and Sipah. These were independent, and dwelt in the hills near the pass.

BUNI. Hind. A muslin made at Dacca.

BUNJI, the Thug designation of a victim.

BUNJ. ARAK. Hyoscyamus sniper.

BUNJAR or Banjar. Hind. Waste land, land lying fallow; also indifferent soil.

BUNJIN. Hind. A weed which grows in the kharif crops; much sought after by fakirs who practise alchemy.—Elliott. Qt. ban jain, Wild Man.

BUNKITA BARRING, obtained from an undescribed plant in Borneo, produces a dark purple or black dye.

BUNNAS, a river which rises in a cluster of summits in the Aravalli range, lat. 24° 47' N., long. 73° 28' E., south-west into Runn of Cutch by several small channels. Length, 180 miles. About 17,000 square miles drained.

BUNNI. Hind. Payment in kind; hence Bunnihaar, a ploughman paid in kind.

BUNNI, a timber of Julundur; resembles the 'Ban,' except that it is smaller, and the wood is of a white colour, but it is applied to the same purposes as the 'Ban.'—Comr. Julie.

BUNNU, a district in the Derajat division of the Panjab, situated S.W. of the Kala or Salt Range, with its centre in lat. 22° 40' N., and long. 70° 30' E. Its population, 288,000. The Bunnu valley is south of and is accessible by the Sirduk and the Koonh-i-gao passes. The lands are chiefly rich and fertile, intersected by the Kuram, and irrigated by water-cuts. The only uncultivated portion is the 'thul,' or pasture ground at the base of the hills. During the winter months the Waziris pasture their flocks and herds, and erect patriarchal huts of skins with wooden framework. In the summer months they retire to the cool mountain heights, taking their cattle and dwellings with them. The Bunnuchi are mixed races, who dwell in walled villages. They are undersized and sallow-skinned. They are quiet, orderly, and not in troublous matters, but immortal, capable of reckless perjury and deliberate assassination. They cultivate with some industry. Iron is imported in quantities from the Waziri hills, and is worked up at Kalabagh into agricultural implements, caldrons, cooking utensils, grates and fire-irons, ladles, pugs, locks, horse-shoes and chains. The Waziri bring it down on bullocks and mules chiefly through the Kurum pass to the Bunnu fair, where it is bought up by carriers from Kalabagh. The trade in use in Bunnu, called in Fushu 'erm,' is very peculiar. Tobacco is imported in large quantities from the Waziri hills. Much cattle is brought to the Bunnu fair from Dour and the Waziri hills; also numbers of goats and sheep. The Doomba is much prized, and is reared in the district as well as beyond the border.—Records of the Govt. of India. No. 11.

BUNNUR, an Afghan tribe adjoining the Peshawur district.

BUN-OTSURG. Hind. Also written Ban-otsarg, from Ban, a forest, Ootsarg, abandoning. A Hindu marriage ceremony performed in honour of a newly planted orchard, without which it is not proper to partake of its fruit. A man holding a Saligramma personates the bridegroom. Another, holding the sacred tulsi, personates the bride. After a homa or fire sacrifice, the officiating Brahman puts the usual questions to the couple. The bride then makes three circuits of a spot in the orchard, moving from the south to the west, followed by the bridegroom holding an end of the personating bride's garment. The bridegroom then takes precedence, and circumambulates similarly.—Elliott.

BUNSEN, KARL CHRISTIAN, born 1791, at Corbach in Waldeck. He was the son of a soldier; was long employed in Italy and England as ambassador; and was the author of Egypt's Place in Universal History; Description of Rome; Hippolytus and his Times; Signs of the Times; Church of the Future; God in History.—Fraser's Magazine, June 1868.

BUNT are the chief people in Canara.—C. 134.

BUNT. HIND. Smut balls, or pepper brand. The fungus which occasions this disease, Uredo caries, Dec., U. fontida, Bauer, has hitherto been met with only in the grains of wheat, when its presence is readily recognised by the peculiarly disgusting odour of the infected ear. When this disease prevails, it greatly deteriorates the value of the sample; and from imparting its disgusting odour to the flour, makes it less fit for bread.—Russell.

BUNT. Hind. Uptide pulse of Cicer arietinum.

BUNTA-JAMUDU. Tel. The Euphorbia antiquorum.

BUNTAKI. HIND. Solanum melongena.

BUNTING. Several species of these birds occur in India. The grey-capped bunting is Emberiza caniceps. The black-throated bunting is E. cicoles. The grey-capped bunting is E. Stewarti.

BUNTARIA, a class of wood-rangers in the northern parts of Gorakhpur. They are now cultivators.—Ell.

BUNUCH. BENG. Morinda exserta, Roeb.

BUNUGA-GASS. S1NGH. Urostigma myso- rense, Mig.
BURAYA.

BUNUN. HIND. Fragaria vesca.

BUNYA-BUNYA, a tree, Araucaria Bidwellii, of Australia, with cones as large as a child’s head. It grows from 100 to 150 feet high, with a remarkably stout trunk, which scarcely tapers for one-half of its height from the base. The unripe seed is greedily eaten raw by the natives at all times, and when ripe, roasted and pounded into cakes. Each tribe of aborigines has its own group of trees; and of these each family has a certain number allotted, which pass from generation to generation, and is the only hereditary property which any of the aborigines are known to possess.—Mr. Bidwell; Dr. Bemat, Australasia.

BUZU. See Bom-za.

BUPLEURUM MARGINATUM. Wall. Kali Zewari, HIND. [Zira, Sipal, HIND.]

This and allied species are abundant in many parts of the Punjab Himalaya from 2500 to 11,500 feet. In Kanawar the root is stated to be eaten raw, and the seeds to be exported as Zira.—J. L. Stewart, M.D. See Carum.

BUPLEURUM OCTORADIATUM. Smith. Tex-hu, CHIN. [Tai-hu, CHIN.]

This plant is said to grow in Yen-nan-fu and in Shen-si, its root is employed in thoracic and abdominal inflammations.—Smith, p. 45.

BUPRESTIS, a genus of beetles with bright wing-covers, largely used in the arts. See Beetles; Coleoptera; Insects.

BUQ. PERS. A goat’s horn. Buq-i-Hamam, the horn summoning to the bath.

BUQR-EED, or Eed oos Zoha, held on the 9th day of the twelfth month Bag-ree. On this occasion, Mahomedans of India proceed to the Eed-gah in great state, when the kohboh is placed in the name of the ruling sovereign.

BUR, also Buri or Boratu. SIND. The pollen of the Typha elephantina, Roxzh, made up with water into cakes, and much eaten. It is inflam- mable like that of Lycopus, and is used as a substitute for it in SIND.—Royce, p. 35.

BUR, a wandering tribe in the N.W. Provinces.

BUR. HIND. Tamarix orientalis, Oreoesseris lanuginosa, Cymbopogon iver,vancusca.

BUR, Buri, Burha, Budha. HIND. Old. Many towns, rivers, etc., are so designated.

BURA. HIND. Chopped straw.

BURA-AL. HIND. Morinda citrifolia.

BURA-BUHOARI. BEN. Cordia latifolia.

BURABUR hills are isolated rocks of sienitic granite rising abruptly from the plain about 15 miles north of the city of Gaya, by the left bank of the Phulgo or Mahnandi. The highest is called Burabur, also Sidheswar, from a temple to Mahadeva that once crowned its heights. The next in height is the Kowa Dol, which is near a mile to the south-west. A third is called Nagar-juni, and is the easternmost of the great cluster. A fourth, and the smallest, called Durhawut, is at the northern extremity; others also have names, but the above alone contain objects of notice. The Kowa Dol is an almost entirely bare rock, having nearly a perpendicular scarp on its northern face, and sloping at an angle of 45° more or less on the opposite or southern side; east and west, it is disjointed and inaccessible; huge stratified masses are piled one over the other, decreasing in length at each end. The whole is surrounded by single blocks like pillars, the centre one of which towers above the rest, and is conical. It is said that formerly there was a huge block balanced on the top of this cone, which, from its being moved by birds alighting on it, obtained the name of Kowa Dol, or crow-moved, or the crow swing; about the eighteenth century, this rock block fell down to where it may still be seen. The caves of Burabur are both in number,—four in one hill, three in another; but the name Satgarha, commonly understood to mean seven chambers, is applied to two only.

In the hollow or recess on the east side are the remains of a once splendid Buddhist temple, of which many pillars are still standing; also a gigantic figure of Buddha seated. The Sinhasan or throne is very handsome: there are the usual supporters, the Sinha or lions rampant, trampling on elephants couchant, and ridden by amazons armed with shields and swords. 60 or 80 figures are rudely cut in the huge detached masses of rock at the foot of the hill. There is one block hewn into the shape of a small temple, with niches and images on the four sides. First niche, from proper right, male figure erect with a spear; 2d, female figure, Pulnavati or Maya devi; 3d, Buddha seated; 4th, Mahadeva and Parvati, the latter only called Gouri Sunkur. Parvati seated on Mahadeva’s knee, with the bull Nandi at his feet, and the Sinha or lion at her side; 5th, male figure erect with four arms; 6th, male figure carried on the shoulders of another; 7th, the Lingam and Yoni; 8th, male half figure, Aruna? 9th, Mahadeva and Parvati repeated; 10th, male figure erect holding a lotus in each hand, probably Surya; 11th, Ganesha; 12th, female figure with four arms, attended by Nandi and Sinha; 13th, male figure standing on a prostrate figure. After these, nine niches have what appears to be Durga slaying Mahesh-Asur with her trident; she has one foot on the buffalo’s neck, and holds it by the hind leg. This subject is repeated on many detached rocks. The Linga is of as frequent occurrence. There is one very large four-faced Linga, called the Chounwari Mahadeva, such as may be seen in the caves of Ellora; it is of common occurrence in this district. The inscriptions are in Palli, the old Pali character.—Capt. Kittoe, Beng. As. Soc. Jo., clxxviii., 1847.

BURA-GHOOLI. HIND. Villasria Indica.

BURAD. HIND. Filings, raspings, chips.

BURAGA. Tel. The gum and wood obtained from Bombax Malabaricum.

BURA-JANWAR. HIND. The hog; literally, bad beast.

BURAK and Sarmu rivers run in valleys of the Assam chain. The Naga, Mikir, Cachari, Garo, and Kasya are the five races in whose possession chiefly are the broad highlands of that chain, extending from the N.E. near the head of the Kynduayn and Namrup, on one side along the valley of the Brahmaputra to its southern bend round the western extremity of the chain, and on the other side south-westernly along the valley of the Burak and Sarmu.

BURAK, steel on which Mahomed rode to the seven heavens. The angel Gabriel seated him on it.

BURAT. HIND. Assignment. ABAR, the night of record, a Mahomedan ritual.

BURATY or Pulati, a Mongol nomade tribe near the Biakal lake.

BURAYA. HIND. Rucervus durvancelli.
BURIAL.

BURIAL sp. but Symplocos in author of Notes on the Bedouins, 1831, and W. habis; also of Travels in Arabia, 1829, and Travels in Syria, 1822. He visited Mecca a.d. 1814, under the name Shaikh Ibrahim. He is buried near Cairo, in the large cemetery outside the Bab-un-Naâr.—Plutarch; Burton's Pilgrimage to Mecca, i. p. 186.

BURDA is one of the five northern districts of Kattyawars; buried hills end in the south in the Alak range and in the Oahum.

BURDEH. Arab. A thick stripped woolen stuff, in use by the Arabs as a cloak or blanket. Akhda-burdeh is a grey or brown, and Almar-burdeh a red one. That of Mahomed was 7½ feet long and 4½ feet broad.

BURDEH. Arab. A thick stripped woolen stuff, in use by the Arabs as a cloak or blanket. Akhda-burdeh is a grey or brown, and Almar-burdeh a red one. That of Mahomed was 7½ feet long and 4½ feet broad.

BURDEWAL, a lofty tower in Jaganath, about 180 feet in height and about 28 feet square inside, in which the idol and his brother and sister Subahdra are lodged. See Jaganath.

BURDÍ, a wild Baluch tribe on the western banks of the Indus, near Shikarpur.

BURDU GUMADU. Tel. Cucurbita hispida. BURDUR. —? a tree of Cuttack, an excellent wood for carriage poles, shafts, and wheels, and in all mechanics' work; sp. gr. 1:00.—Cat. Cat. Ex. 1862.

BURENDA, also written Borenda, properly Bruang, a pass in the Himalaya, in lat. 31° 23' N., long. 79° 12' E.; the length of the crest is 50 paces, and the crest is 15,171 feet above the level of the sea. The most elevated part is a narrow glen, very steep. The pass leads from Kunwarar through the outer Himalaya, and is the easiest and most frequented in the neighbourhood. It is open for seven or eight months; during the rainy season almost all the snow dissolves.

BURGEE, a Hindu race in Woon.

BURGH. HIND. Phytolacca decandra. BURGHÉR, in Ceylon, is applicable only to white persons of pure Dutch descent, of whom there are now but very few in Ceylon; but the nature of the caste, by courtesy, been given to all those who in India are styled Indo-Britons, Eurasians, East Indians, Anglo-Indians, or more commonly 'half castes,' namely, the descendants of Europeans by native women. In the Maluccas, also, the term is applied to the Christian descendants of the Dutch. The Amboya burghers, who usually crowd the jetty spending their time in angling for small fish, will refuse to carry even a light burden; but this kind of manual labour is the peculiar province of slaves, and the Vrij Burghers, poor enough as they usually are, but priding themselves in professing the same religion with the Europeans, will not lower themselves by performing a description of labour which even Chinese and free Mahomedans would disdain.

BURGHÉR, a name given by Europeans to the Baluga or Marves race on the Neighhury Hills.

BURGUNDY PITCH is a product probably of the Abies excelsa; it is of light yellow colour, often adulterated with dammar or ganda baroza.

BURHA or Budha. HIND. Lit an old man; in the Kamaon Himalaya, the superintendent or headman of a village, or of a set of villages. The term is equivalent to Kumin, Syana, and Thokdar, and is chiefly used in the eastern parganas of Kamaon. The tenure connected with it is called Burha Chari and Kumin Chari.

BURGA GANGA, an old bed of the Ganges, traceable below Hastinapur, and Soron and Kampil.

BURHAL. HIND. A light yellowish-coloured wood, not strong; plentiful in the Santal jungles. Used for doors, venetians, furniture, etc., by the natives.—Cat. Engineer's Journal, 1860.

BURHAPATRA, BURDETTO. BURDEH. BURDA.

BURHANPUR, town in lat. 21° 18' N., and long. 76° 16' 20' E., is on the N. bank of the river Tapti, and distant 41 miles S. by W. from Khambat, the headquarters of Nimer. Population in 1872 was 29,206. It was founded about a.d. 1400 by Nasir Khan, the first independent prince of the Faruki dynasty of Kandesh, and called by him after the famous Shaikh, Burhan-ud-Din of Dowlatabad. It was held by eleven princes of this dynasty for two hundred years, till a.d. 1600, when the kingdom of the Faruki was annexed by the emperor Akbar. In 1614, Sir Thomas Roe, ambassador from James I. of England to the Great Moghul, describes his visit here to Prince Parviz, son of Jahangir. Tavernier passed through Burhanpur (or, as he wrote it, Brampourt) in 1641, and again in 1658. It was plundered in a.d. 1685, by the Marhattas. It was taken by General Wellesley on the 13th October 1803.

BURHAPATRA, a pargana in the Gonda district, in Uttar Pradesh, 727 square miles or 49,688 acres, and population in 1865 was 20,451. The Ahir and Chamar are the most numerous castes. The aboriginal Bhar here are following a kind of Kumeri cultivation, wandering from jungle to jungle.

BURHA PENN, a deity of the Kandh race.

BURHEL, Ovis nauraha. See Bovide.

BURHOLIA, HIND., a branch of the Bhrigubansi Rajputs settled at Burhoul, near Benares.—Ell.

BURI or Buli, a Philippine palm; probably Corypha gebanga, the gabang of the Malays and Javanese. The Philippine islanders from the leaves make mats, from the sap both sugar and a distilled spirit, from the pith a sago, from the seeds rosaries, and the spines, boiled in water, yield a thread from which a coarse cloth is woven, called sycopang.—Crawford, Dict. p. 276.

BURI. HIND. Vitis Indica; Symplocos spicata.

BURIAL CUSTOMS. In the south and east of Asia, the modes of disposing of their dead are almost as varied as are the races themselves. It has been remarked that the mode of disposing of the dead has from the earliest times been symbolical of the opinions as to the worth of the deceased while he was amongst them, or indicative of their views as to the future condition of the departed. In general there has been little display over the remains of women; but whether with men or women, the prevailing habit has been to convey the remains to some quiet resting-place with a decorous solemnity, and there erect some lasting memorial over them. With some races, however, even to the present day, the departure of a friend or relative is regarded joyfully, and the procession to the place of final disposal is quite joyous; while other races even cast out their dead, and allow the remains to be treated with indignity. But the anxiety of the generality of nations has been to perpetuate the memory of the departed; and everywhere are to be seen sepulchral monuments raised with that object. Many of these exist from prehistoric times, and often form the sole remaining history of the races who erected them. At the present day, monuments erected
with brick or stone, and in the form of pillars or upright or horizontal slabs of stone, or cupsulas, or domes, or sarcophagi, beneath which the remains are laid, are usual modes of marking the deceased's resting-place. But in more primitive times, the cairn or heap of stones, the monolith, the cromlech, the circle, the heaped-up barrow of the Celtic tribes, the tumulus, as the Romans called it, were usually resorted to, and many of these are to be seen in the south and east of Asia.

The cairn was formed of stones gathered from the vicinity, and set round about the resting-place of the dead and piled over them; and this is all that is given to the Mahomedan pilgrim who falls in the desert. The monolith or single stone was usually placed perpendicularly near the spot. The cromlech, consisting of two, three, or more upright stones, with a flat stone placed over them, formed a sepulchral chamber, and was the earliest approach to the cupula or dome. The circle, or enclosure of upright stones set singly at varying spaces apart, are found surrounding the cromlech or cairn. The barrow, or tumulus, often raised to a considerable height, and covering a large area, is the most noble, and has been the most enduring; and with these the bodies of the departed were not interred in graves sunk below the surface, but were placed on the surface of the ground, and then the earth was heaped up. The barrows, many of which have been opened, are found sometimes to contain skeletons, in other cases urns only, while occasionally both urns and skeletons, or urns and ashes, appear together. The urns are often found to contain burnt bones and relics; but in the earliest barrows are war weapons, such as stone hatchets and hammers, celts of the same material, both arrow-heads and spear-heads of flint, with beads of various substances, and torques and armlets of gold or bronze. Somewhat later, the celts and weapons are of bronze, and the sword is found to have been broken, indicative that the warrior's race had been run. The ornaments remain the same, and coins are found.

The methods adopted for the disposal of the dead from the most ancient times have been interment, burning, embalming, launching into rivers, and exposure. Of all these the first seems to have been the most general and primitive. Cremation is undoubtedly very ancient, for king Saul was burnt, and his bones afterwards buried; and Asa was burnt in the bed which he made for himself, filled with sweet odours and various kinds of spices. In Egypt the practice of embalming obtained from their earliest history, but the practice was confined to that country, and arose from its people holding it unlawful to expose the remains to fire or animals, or to place them beneath the earth. The vast catacombs still remaining on the banks of the Nile were the common receptacle for the general population who could not afford a separate tomb.

Over the ruins at Nimrud, Mr. Layard discovered ancient tombs, of a race unknown, and of which he could not assign any date. Many of the vases, necklaces, and ornaments obtained there have a resemblance to those of the Egyptian tombs. Two or three purely Assyrian cylinders were also discovered in the tombs. Mr. Layard considers that the mode of burial which is there evidenced, more nearly resembles that adopted by the early Persians. Cyrus and Darius were buried in sarcophagi in troughs. The Egyptian alabaster πνεκά, or tub, in which Darius was buried, is mentioned by Theophrastus. The Assyrians, like the early Persians, may have buried their dead entire, and preserved the bodies in honey or wax (Herod. lib. i. c. 140, Arian de Bello, Alex. Theop. de Lapid. c. xxv). According to Eliaen, when Xerxes opened the tomb of Belus, he found the body in a coffin filled nearly to the brim with oil. Mr. Layard infers that these tombs belonged to an intermediate people or race who occupied Assyria after the building of the most ancient palaces, and before the foundation of the most recent.

In British India, and in all the south and east of Asia, interment, cremation, and exposure are all practised by one or other of the races occupying it. In Java, in the Archipelago, seems to have been people from the funeral cairns of the same race, and these people have three modes of disposing of the body of a deceased person. By fire, termed obong; by water, termed larung; or by exposing it upright against a tree in a forest, where it is left to decay, termed setra. When the body of a chief or person of consequence is burnt, it is usual to preserve the ashes, and to deposit them in a chandi or tomb.

The Ninevites, in all their various monuments, have left us no trace of their ideas concerning the dead, while the sepulchral urns obtained in Babylonia contain the remains of the dead, with jars and utensils for food and water made of baked clay, and with remains of date stones, the head of the dead reverently laid on a sun-dried brick as a pillow. Amongst the urns found on the plain of Buxireh each had a pointed end, and at its mouth a bowl or basin without bottom; not united to the main part by means of agglutination, but very closely fitted, and supported in its place by the general bed of earth. These urns lay horizontally, not parallel with each other, but on a straight line, and in the direction of east and west. In one urn was a quantity of sand, with the bones of a full-grown person, completely filled, and very heavy. The skull was placed about the middle or widest part, not in the basin, which contained only sand. Of this urn the greatest circumference was 2 feet 9 inches, its length 3 feet 4 inches, including the bowl or basin, which separately was nearly 8 inches. The urns, made of clay, are about 1-3d of an inch thick, and solid at the pointed end, but the bowls without bottoms. The insides had evidently been coated with some bituminous substance; but the urns nowhere exhibited inscriptions nor any other mark by which their degrees of antiquity might be ascertained. The sepulchral urns of the Chaldaens were of clay, some of them shaped like a dish cover, the head being placed on a pillow of sun-dried brick, and jars and utensils for food and water. There were also jar coffins, and they seem to have been interred in artificial mounds.

Their ancient tombs, rare in Assyria and Upper Babylonia, are chiefly in Chaldea proper; and the Rev. G. Rawlinson (i. 107) suggests that the dead may have been conveyed to the sacred land of Chaldea, similarly as the Persians even now send their dead to Karbila and Meshid Ali, and as the Hindus from remote India send the bones, or the entire bodies, to the Ganges at
BURIAL CUSTOMS.

Benares. There, Chagla or Challakada, near Sookagar, is an abyss said to have been made by the chariot wheel of Bhagirath. The place is a great Golgotha, where the dead and dying are brought from a great way off to be burnt and consigned to the Ganges. The deceased is seldom conveys by any of his relations, unless from a short distance. Poor people generally send forward their dead for incineration in charge of bearers, who never betray the trust reposed in them.

The Romans generally burned, but they sometimes buried their dead; and children who died in infancy were interred in the immediate neighborhood of their former homes. Their sepulchral urns, with the ashes of the dead, were commonly buried about two feet below the surface, and their memorial stones were often inscribed. They used the sarcoephagus, or massive stone-coffin, and also the tumulus or barrow. They bore their dead with much lamentation to the funeral pile, on which, after being lighted, they cast the robes and arms of the deceased, as well as the slaughtered bodies of their favourite animals.

The ancient Greeks, in laying out their dead, always placed an obulus or Greek coin in the mouth, to pay Charon's fare across the rivers Styx and Achelon, and a cake made of flour and honey to appease Cerberus. Amongst them men cut off their hair when they attained the age of puberty, and dedicated it to some deity. These is said to have repaired to Delphi to perform this ceremony, and to have consecrated his shorn locks to Apollo. After this it was again allowed to grow long, and only cut off as a sign of mourning. Thus at the funeral of Patroclus (IIiad, xxiii.) the friends of Achilles cut off their hair, and

'On the corse their scattered locks they throw.'

In some parts of Greece, however, it was customary to wear the hair short, and to allow it (Cassandr. 973) to grow long when in mourning.

'Neglected hair shall now luxurious grow,
And by its length their bitter passion show.'

In Luristan, the female relatives, on the death of their male relatives, cut off their hair, and hang the locks around the tomb. The young women and young men of the island of Delos cut off a lock of hair before marriage, and place it near the tomb of the virgins from the Hyperboreans.

Barrows or mounds of earth have been largely used by the nations of Central Asia, from the Mediterranean to the Pacific Ocean, both in ancient times and now. The king of Ai, slain by Joshua (Josh. vii. 26, viii. 29), was placed at the entrance of the city, and over his body was raised a great heap of stones. Herodotus mentions that the barrow of Alyattes, king of Lydia, was 1300 feet broad, and nearly a mile in circumference, and it has been identified by modern travellers. Barrows were the favourite memorial of the Teutonic race, some of them very large; but the Saxons used also cists or stone coffins. The custom of raising tumuli over the remains of the mighty dead, seems to have been prevalent in the Central Asiatic region from the most ancient times and been taken into Scandinavia. Ezekiel, xxvii. 27, describes the practice of slaying persons and interring them with their dead chief. Herodotus also describes the barrow burial of the Scythians; and to the present day, in the region of the Kar Karella, and in many other parts of the steppe occupied by the Kirghiz, are to be seen numerous tumuli of great size. Herodotus tells us that when a king died, his corpse, embalmed and covered with wax, was conveyed in a chariot in solemn state to the place of sepulture; a large quadrangular pit was dug; in this they placed the royal corpse on a mattress of straw; on each side of this they planted spears, and covered it with wood, and roofed it over with hurdles of willow. In the remaining part of the pit they interred one of the late king's women, strangled for the purpose, together with his cupbearer, his cook, his groom, his minister, his courier, his horses, as well as some articles of every kind, including several goblets of gold, that he might be supposed to need in his journey to the other world. This done, the people eagerly contended with each other in the work of heaping over the whole a mound of earth as vast as possible. The proceedings did not here terminate; for the year following, fifty of the late king's confidential attendants, and fifty of his horses, were slain, and placed, the men on the horses, around his sepulchre.—Melp. 71, 72. When Chengiz Khan died, his remains were covered with a lofty mound, and extensive forests were planted to exclude the footsteps of man. Colonel Tod tells us that the tumulus, the cairn, or the pillar, are still raised over the Rajput who falls in battle; and throughout Rajwara sacrificial monuments are found, on which are seen, carved in relief, the warrior on his steed, armed at all points; his faithful wife (sati) beside him, denoting a sacrifice; and the sun and moon on either side, emblematic of the dying fame.—Tod's Rajasthan, i. p. 74. In Saurashtra, also amidst the Cadi, Comani, Balla, and others of Scythian descent, numbers of palia or joojar (sacrificial pillars) are conspicuous under the walls of every town, in lines, irregular groups, and circles. On each is displayed in rude relief the warrior, with the manner of his death, lance in hand, generally on horseback, though sometimes in his car; and on the coast the pirates of Buddha are depicted boarding from the shores.

In the Punjab, near Bambian, in Afghanistan, and near Kabul, the sepulchral monuments remaining of ancient times are topses. They consist of a mound, on which is erected a cupula, supported by walls of masonry, more or less in a Grecian style of architecture. One near Manikya is 80 feet high and 320 feet in circumference. In its centre were found vessels of gold, silver, and copper, with coins of Rome and the Bactrian Greeks. In a chamber 60 feet deep was a copper box containing animal remains. It is one of many topses or stupas.

Many cairns are found in different parts of Southern India, and, prior to the stupas or topses, this seems to have been a common mode of covering the dead. Indeed, as Colonel Cunningham marks, the tope is only a cairn regularly built. On the Neilgherry hills are found remains of cairns, cromlechs, kistvaens, and circles of upright loose stones, which are nearly identical with those found in Europe in the ancient seats of the Celts. In these cairns are found vases, cinerary urns, and other vessels of glazed pottery, which sometimes contain human bones, more or less charred, and mixed with ashes; sometimes a little
animal charcoal alone. They are met with in various districts in the Presidency of Bombay, in almost every part of the Dekhan and peninsular India, from Nagpur to Madura, in immense numbers on the Anamally hills, a range on the south side of the great Coimbatore gap, which forms the commencement and northern face of the Southern Ghats, those on the Anamally being of a more advanced order and a better condition than the Neighgerry tombs. Similar remains are found in Circassia and Russia, and circles of stones surrounding ancient graves are found on the south Arabian coast and in the Somali country in Africa. Major Congreve directed much attention to those on the Neighgerry Hills; and Captain Meadows Taylor discovered and examined a large number of these remains at Rajaun Kooloor, in Surpurr, and also at Sivari, near Firozabad, on the Bhima, and devoted much attention to the comparison of them with similar remains found in England. He calls them Scytho-Celtic or Scytho-Druuidical. Neither the hill people, the Toda and Kurubas, nor any Hindu, knows anything about the race to which these sepulchral remains belonged; and neither in Sanskrit literature nor in that of the Dravidian languages is there any tradition on the subject. The Tamul people generally call these cairns Pandu-kuri. Kuri means a pit or grave, and Pandu may refer to the Pandu or Pandava brothers, to whom so much of Hindu mythology relates. The race who raised these cairns were probably dwellers in the country prior to the advent of the present Dravidian occupants, and were expelled by or ultimately became absorbed in the latter; or they may have been a nomad shepherd race, who had wandered into India after it was peopled and settled, and then wandered out again, or became absorbed amongst the people of the country. But the remarkable fact connected with the people whose religious rites and usages of sepulture gave rise to these cairns, is that they have everywhere disappeared from Southern India, and not even a tradition of their existence survives.

In the centre of peninsular India, around Hyderabad, in the Dekhan, and at Bolanur, and at Secunderabad, there are many burial-places of that race, of whose existence nothing is known; and about 20 miles S.E. of Secunderabad is one great resting-place of the dead, a vast burial-ground extending over miles, which must have been the place of interment of a huge number of people, or used through many centuries. The mode of interment in all these has been to select a large stone, beneath which a winding tunnel or way had been excavated; and the remains of bones and urns, with weapons, are found deposited in a central cavity, a circle of large loose stones being drawn around, the circumference of some of these circles being between one and two hundred yards. The people whose tombs are thus represented were undoubtedly nomades dwelling in tents, for not far off are the remains of a great nomade city, consisting solely of walls, within which the tents must have been erected, for no stone nor earth heap nor mound remains within the same enclosure to indicate the former existence within of any building. The remains found within these cairns also leave the impression that, as with the barrow burials, the wives and servants were slain and interred along with the chief person; and the Hindu and Rajput practice of suttée (ato) would therefore seem to be merely a continuation of the ancient Scythic sepulchral rite of immolating the favourite wife, the servant, and the horse to accompany their master and serve him in the next world.

The Christian treatment of the dead is various; and in Europe, to this day, the indifference, not to say levity, of the Italians, in all relating to their dead, contrasts strangely with the tenderness and sentiment of the Germans, both Romanist and Protestant, as displayed in their cemeteries. In Naples, where are two cemeteries, with a pit for each day of the year, the humbler dead are stripped, and after a priest has read prayers over the bodies, they are all thrown into a hole by the cemetery assistants, amidst oaths and jocularity and laughter. The richer dead are stripped, placed in dry sand to be shrivelled up, and when dry they are dressed in their usual clothes, ticketed, and placed in a glass case. The German, for his part, the other hand, conveniently dispose of their dead, and preserve in neatness the grounds and tombs of their cemetery, which they call Gott's Aker, God's field, but after a few years the ground is re-ploughed to be refilled.

In Ceylon, formerly, after burning the bodies of the deceased kings of Kandy, their ashes were carried by a man in a black mask to the Mahawelli Ganga, where he embarked in a canoe. At the deepest part of the river he clove the vase with a sword, scattered the ashes on the stream, and, plunging headlong after them, dived, arose near the opposite bank, whence he fled to the forest, and was presumed to be never more seen. The canoe was allowed to drift away, the horse and elephants that accompanied the procession were set at liberty in the woods, and the women who had strewed rice over the remains were transported across the river and forbidden to return.

Several of the Hindu customs resemble practices mentioned in the Old Testament, as Jeremiah iv. 6: 'Now the lamentation men lamented for them, nor cut themselves.' For the Hindus, on the death of a relation, express their grief by loud lamentations, and not unfrequently, in an agony of grief, bruise themselves with whatever they can lay hold of. Ezekiel xlv. 25: 'They shall come at no dead person to defile themselves,' and touching the dead defiles a Hindu, who must bathe to become clean again. Job xxvii. 19: 'The rich man shall lie down, but shall not be gathered,' i.e., his soul shall be left in a wandering state; and Hindus believe that persons for whom funeral rites have not been performed, wander as ghosts and find no rest. Jeremiah xxxiv. 5: 'So shall they burn their dead, their sorrows for thee.' Scented wood and other odiferous substances are placed upon the funeral pile of a rich Hindu, and burnt with the body. Matthew ii. 18: 'Rachel weeping for her children, and would not be comforted, because they are not.' The lamentations of a Hindu mother over her child are very loud and piercing; it is, indeed, almost impossible to conceive of a scene more truly heartrending than that of a whole town of such mothers wailing over their massacred children.

In Roma there was there a voice heard, lamentation, and weeping, and great mourning.

Rajendra Lal Mitra, writing on the funeral ceremonies of the ancient Hindus, says the first ceremony was the removal of the dead from the
house to the burning ground, and this was done on a cart, drawn by two bullocks, or by aged slaves. The procession was headed by the eldest of the party, and included an old black cow. The animal was sacrificed at the burning ground, and its fat, flesh, and organs were placed on the corpse, which was subsequently enveloped in the raw hide of the animal. The wife of the dead was made to lie by the corpse, and was thence removed by a younger brother, a fellow-disciple, or a servant of the dead, who offered to marry her. The ceremony of burying the bones was performed on the 3d, 5th, or 7th day; and on the 10th day the mourners assembled together, and, after certain oblations, offerings, and prayers, raised a circle of stones, and then retired to the house of the chief mourner to feast on kid's flesh and barley.

As a rule now, the dead of Vaishnava Hindus are burned. As death draws near, a lamp is lit at the bed-head, and a 'homa' sacrifice performed with camphor and coconut; and as life dies out, the five elements of the cow are dropped into the mouth of the moribund from a tuli leaf. Within two or three hours the body is lifted, and this is done early, as none of the household nor any of the neighbours can partake of food until the remains be disposed of. The pile of wood or cow-dung cakes used is about two feet high, and on it are placed some tuli leaves, a little sandalwood, and the deceased is laid with his feet to the north. When laid on the pile, a cloth is placed over the face, and raw rice is placed on it over the mouth. The heir of the deceased places a charred bit of sandal-wood or a tuli branch at each corner of the pile, and a Vityan sets fire to the mat, using fire taken from the sacred fire lit at the bedside of the dying man. On the following day the heir and friends visit the pile, remove the skull and the bones, on which he and all with him pour water and wash them,—wash them with the siki, anoint them with oil and honey, and clean them with milk, and place them all on plantain leaves anointed with butter. A young coconut shoot is then placed on the skull, and the whole put into an unburned earthen pot, and taken or sent to a river—7th day—and the person who conveyed it returning to the temple, where he pronounces aloud the deceased's name, and adds, 'Pray for him.' Often they are sent to a holy river, even to the Ganges at Benares. The men relatives shave. The hair of the Brahman widow's head is shaved. The body is not always carried through the doorway of the house. If it be an inauspicious day, or if the house door be so placed that the courtyard has to be crossed, then the remains are carried through an opening broken in the wall. Captain Butler, writing of the Hindus of Assam (Travels, p. 228), says if a man die inside a house, no Hindu can eat in it afterwards, or reside in it, as it has become impure; it is generally pulled down and burned, and a new house erected on the same spot. All Assamese, who are carried by the current are brought out to die in the open air on the bare ground, that building may be preserved, and also to ensure the happier liberation of the spirit from the body. The remains of Hindus are unclothed for the last rites.

Children under eight years of age and unmarried girls are buried, as also are all who die of smallpox, as the belief is that this ailment is a manifestation of the presence of the goddess Ammun, Mariatha, Mariammam, or Kali, and the anger of the goddess would revert on the family if burned. The dead from cholera are similarly buried.

In the mode of disposing of the dead, the wish expressed by the deceased is attended to. Vedantists all bury; also all the Gosi, all the Lingaat or Vira Saiva, the five artisan castes, the Kansala, goldsmith, carpenter, ironsmith, brazier, and stone-cutter, all the Byragi and Sanshanks, and the guests of the sects, the Pandarams, and the Kashi, likewise all the non-Aryan races and tribes not admitted into Hinduism. The dead of the Vedantist sect, and those of the Lingaat and artisans, are placed seated, the last in a grave five feet square, with a ledge on the south.

As the artisan's life becomes extinct, the body is made to assume the attitude to be preserved in the procession and in the grave. It is placed against a wall, the legs are crossed underneath in the usual sitting attitude, and the head is fastened to a nail driven into the wall, and so retained till rigidity ensue. They are borne to the grave in a car, on the shoulders of relatives or friends. On reaching the burial-place, the Oodwan reads prayers, and the body is seated on the side ledge with its face looking northwards; salt and ashes of cow-dung are placed on the head.

Amongst the Aryan Hindus, the great bulk believe in spirits and worship them; their worship of ancestors, 'piti,' is continuous; they also believe in demons and evil spirits; transmigration through clean and unclean animals is a point of faith, and a great majority regard the soul as an emanation from the Deity, and look to re-absorption and annihilation as the point of attainment for the good. Many of these are Buddhist views.

Hindus of Sind are not allowed to die in bed, otherwise one of the males of the family who has attended upon the deceased becomes in a state of impurity, and must visit some well-known place of pilgrimage, as the Dhara Tirth, the Narayan-Sar in Kutch, etc. When near death, the sick person is placed on a spot smeared with cow-dung (Chanko, Lepan, or Foto), and when in the last agony, the five sacred elements are poured into the dying person's mouth.

The Mahomedan, when about to die, has his spirit calmed by the 'Yasin' chapter of the Koran being read to him, and is either washed (Ghassal) at his own house, or taken, within a few hours, to a Ghassalkhana, especially built for the purpose, near the cemetery, and where men or women washers perform the duty, and then put on burial clothes and apply camphor and antimony. The body is conveyed in a box with much solemnity, with wreaths of flowers and perfumes laid over the covering; the coffin is carried on men's shoulders, and from time to time is heard the Tyeb part of the Mahomedan creed: 'There is no deity but God, and Mahomed is the prophet of God;' and on reaching the grave, funeral service is read, consisting of the four portions of their deity (Takbeer), and a blessing (Dua) is asked, which all present repeat. After the Fatih, the body is lifted from the coffin and gently lowered into the grave, laid with the head to the north and feet to the south, and turned on its side with the face towards Mecca. Each person then takes a little earth, and, repeating the words in chap. 112 of the Koran, 'We created you of earth and
we return to earth, and we shall raise you out of the earth on the day of resurrection," he puts the earth gently into the grave. The body is then protected with wood and covered in. The Fattha is again repeated, and again at the door of the cemetery, and at this juncture two angels, Moonkir and Nikir, approach the dead, make him sit up, and inquire who his God and prophet are, and what his religion is. If he has been a good man, his pleasures are satisfied, and odours from paradise are diffused around the departed; but if bad, he is bewildered, and these angels torture him. They believe that the dead continue in a conscious state, and dogs and horses or other polluting animals are not allowed within the cemetery; women, also, do not enter, lest the repose of the dead be disturbed. Mahomedans do not speak of a person as dead,—they say he has passed away, has taken his departure; and the living all believe in, and hope for, resurrection in a future state: 'They who believe and do that which is right, shall enjoy blessedness, and partake of a happy resurrection. . . . Paradise. . . . is watered by rivers; its food is perpetual, and its shade also; this shall be the reward of those who fear God' (Koran, ch. xiii.). 'Therein are rivers of uncorruptible water; the rivers of milk, the taste whereof changeth not; and rivers of wine pleasant unto those who drink; and rivers of clarified honey; and therein shall they have plenty of all kinds of fruits, and pardon from their Lord' (ch. xlvii.). 'There shall be gardens with shady trees; with fountains flowing, couches of silk interwoven with gold; beauteous damsels with black eyes lying on green cushions, and beautiful carpets, fruits, palm trees and pomegranates' (ch. lv.)

The monuments over Mahomedan tombs have usually been of earth, or of unbaked brick; but every material, and of the most enduring kind, is employed, and the names are sometimes engraved on the tombstones. The tombstone of a man is distinguished by a raised part in the centre, and that of a woman by a depression. In Turkey, a pillar with the carved figure of a turban distingushes the grave of a man. The prevalent form in India of Mahomedan tombstones of the rich is a dark or black tombstone, with verses of the Koran engraved on it, and covered by a cupola. Some of these domes are very magnificent. Those of the Adal of Phul dynasty at Bijapur and Gogi have attracted much attention, as also have those of the Bahmani dynasty at Bulbulagama and Kutub Shahi dynasty at Golconda. The cupolas at Roza where Aurangzeb is buried have not any display, and that of Aurangzeb is the least ostentations. His daughter's tomb at Aurangabad is large, and many of the tombs at Delhi and Agra are great structures. That of Mumtaz Begum, known as the Taj Mahal, is particularly remarkable. Reformers amongst the Mahomedans consider that unbaked brick or earth should alone be used.

The Christian doctrine that man, in all that he can do of good, is still without merit, is not shared in by any of the Mahomedan, Buddhist, or Hindu sects, who all consider that a personal merit is gained by their good doing; and a Mahomedan passing a funeral of a Mahomedan, turns with it a short way, and lends his shoulder to convey the body to the grave, to bring a merit on himself.

The Parsee or Zoroastrian race are to be found scattered from Hong-Kong in the east to Great Britain in the west, a small but intellectual remnant of the once great Median nation. A considerable body of them dwell in Bombay, in Gujerat, and the western towns of India. Their sick are never allowed to expire on a bed. When the moment of passing away is near, the sick person is removed to the ground, and bathed and washed. The reasons alleged for his removal are various; but the one ordinarily accepted amongst them is that a dead body is an unclean thing, necessitating that all who touch it shall destroy their clothes, and whatever is touched by it must be destroyed. For these reasons, the dead, in Bombay, are carried by a class of Parsees called 'Nessus salar,'—Nessus meaning unclean (Najis, Pers.). These men, clothed in white, carry the remains to the Dokhma, or tower of silence, and lay the body on its raised upper floor. The Dokhma is without any roof covering; is open to the sky, so that birds of prey, vultures, kites, have the freest approach. The raised floor has a deep well, surrounded by a raised platform, with channels converging to a well. The corpse is laid on a partition of the platform, and the decomposing matters flow along the channels into the well. When the well is full, the bones are removed and buried outside the Dokhma. The fire-priests are paid to pray for the dead, monthly, for a year, and throughout the first anniversary of the demise. After the demise, and before the removal of the body, a dog is brought near to gaze on the departed. This is the 'Sag-did' or dog-gaze, and, by one account, is said to be had recourse to with the object of ascertaining, from the dog's movements, the state of the soul of the departed; by another account, it is practised from the belief that the dog is a naturally chaste animal, and the view of the chaste dog falling on the dead will expedite the translation of the soul to heaven across the Chigvan bridge. See Bridge.

The non-Aryan and non-Hindu races of British India are estimated at about 20 million souls, but, except the great Gond nation, and the Kol, the Bihil, and the southern Shanars, most of them are in small tribes, and many are occupying forests and mountain fastnesses, or are dwelling on the outskirts of towns. They in general bury their dead.

The Sourah of the hill ranges of the Circars, mostly those hills near Chicaene, near Kalahanda, and southwards as far as Bradachellum, bury their dead with their weapons.

The Chenchwarc race, farther south, in the forests of the Nalla-Mallai, bury their dead and sometimes burn, and, like the Tartar races, they carry the deceased's weapons to the grave.

The Kuki race of Assam, up to the middle of the 19th century, continued to make inroads on the plains, not for plunder, but to secure heads, and they have been known to carry off fifty heads in a night. On the death of a chief, the body is smoke-dried, and kept for two months with the family. If a raja fall in battle, they immediately proceed on a head-hunting expedition, and bring in the heads of those they kill, hold feastsings and dancings, and, after cutting the heads into pieces, send a portion to each village. This is considered in the light of a sacrifice to the manes of the deceased.

The Khansya hill race, 4000 to 6000 feet above
BURIAL CUSTOMS.

the level of the sea, inter their dead on the un-
dulay eminences of the country. These are
dotted with groups of huge unpainted squared
pillars and tabular slabs, supported on three or
four rude piers. Menhir are there; one of them
was seen 50 feet out of the ground, 6 feet broad,
and 24 feet thick, and in front of each is a dolmen
or cromlech of proportionately gigantic pieces of
rock.

In Tibet there are four modes of disposing of
the dead, viz. incineration, throwing into the
rivers and lakes, exposure on the summits,
and cutting the dead bodies and giving them
to the dogs to eat, which is the most flattering
of all. The dogs of the environs devour the poor,
but for the rich there are establishments with dogs

In Tibet, the sovereign Lamas are deposited
entire in shrines prepared for their remains, which
are ever afterwards regarded as sacred, and visited
with religious awe. The bodies of the inferior
Lamas are usually burnt, and their ashes preserved
in little metallic idols, to which places are assigned
in their sacred cabinets. Ordinary persons are
treated with less ceremony. Some are carried to
lofty eminences, where they are left to be devoured
by ravens, kites, and other carnivorous animals.
But they also have places surrounded by walls
where the dead are placed.

*Mongols* sometimes bury their dead; often
they leave them exposed in their coffins, or cover them
with stones, paying regard to the sign under which
the deceased was born, his age, the day and hour
of his death, which determine the mode in which
he is to be interred. For this purpose they con-
sult some books, which are explained to them by
the Lamas. Sometimes they burn the corpse, or
leave it exposed to the birds and wild beasts.
Children who die suddenly are left by their
parents on the road.—Tůmkow's *Pekin*, ii. p. 312.

In Spiti, in the N.W. Himalaya, when a person
dies, the body is sometimes buried, or burnt, or
thrown into the river, or cut into small pieces and
burnt. Admonitions are made over the body to the
departed spirit, such as, 'Do not trouble yourself,
you cannot enter it (meaning the dead body); in
summer it quickly becomes corrupt, in winter it
freezes and is too cold for you.'

Amongst the Buddhist Burmese, whose religion
teaches them to look on death as a release from
the cares and troubles of the world, as a possible
cessation of transmigrations and the longed-for
arrival of annihilation, the cremation of the remains
of friends, relatives, and teachers, is not seasons
of grief; the spectators are often able to look on
with joy. The Rev. Mr. Marks went to see a sick
pupil, whose mother met him at the door.
To Mr. Marks' inquiry as to her child's state, she
replied, 'He is well, he is well,' and skipping, half
joyfully, half hysterically, before him, led him to
an inner room, where the pupil lay dead, but the
bereaved mother, full of faith, was still able to
say, 'He is well.' The remains of holy men, the
phoungye, are not soon removed. Their bodies
are placed in honey, sometimes for a year or more.
One at a phoungye house in Kommendine, adjoining
the Vivian, which was kept in honey for a year, and then removed.

In the process of embalming, the body is placed in honey for
a few weeks, the intestines are then removed, and
replaced by spices, and the body is encased in a
sheathing of wax, which is coated with lac, and
this gilded with gold-leaf. The body is then left
to dry on a staging, under a white umbrella, and
finally the coffin is placed on a model of a kneeling
elephant, made of wood and paper. On the day
appointed for the funeral of the priest, a great
crowd assembled, and, with two ropes attached to
the car, one part of the multitude pulled it towards
the place of cremation, another pulled against
them, and, with shouting and laughter, drumming
and uproar, the remains at length reached the
burning place and were burned. Looking quietly
at the opposing multitudes, their antagonism seemed
a representation of some ancient idea of good and
bad spirits as fighting for the dead. But the object
of this struggling to draw the car onwards and to
retard it is unknown.

In September 1870, the remains of the queen-
mother of Burma were burned between the inner
and outer walls of the palace, to the north of the
main entrance. A large space was enclosed by a
fence or yazamat, in the centre of which the
burning took place. Inside and outside of this,
numerous temporary sheds were run up for the
princes, queens, ministers, etc. Above, where
the fire was to be placed, a lofty structure
of bamboo was erected; this was covered
with white cloth. The body of the late queen-
mother was laid out in state in one of the pavilions
to the south side of the palace, the gardens being
for the time open to all. The troops were under
arms in the great square and other parts of the palace
open to the public, a large space in front of the
enclosure being kept clear for the king and his
retinue. About 10 A.M., the first of the procession
accompanying the coffin appeared at the inner
gate of the palace, and slowly marched towards
the pyre, all taking up their respective positions
with order and regularity. Save the troops, all
taking part were in white; but the numerous
muffled palanquins, gold umbrellas, together with
the splendid bier, with the white umbrellas joined
to the green coats, red and gilt headpieces of the
troops, with the numerous elephants, gaudily
trapped, placed here and there, made the scene
barbarously splendid. Following or preceding
the bier were the princes and princesses, the
queens with the Pakan Meng, the late king. He and
the first queen, whose mother the deceased was,
waked in front of the bier. About a quarter to
eleven the great inner gates were again thrown
open for the exit of the king and retinue. The
king was seated in a large gilded palanquin,
borne on the shoulders of some 40 or 50 men,
and was accompanied by four of his daughters
and one son, all young. He, like all the others,
was dressed entirely in white. Advancing up to
about ten yards from the front of the enclosure,
the palanquin was halted, the retinue and guards
filing off right and left, and forming a large hollow
square. Prayers were said by several phoungye,
the king gave directions as to the exact minute at
which the cremation was to commence, the bearers
turned round, the procession was re-formed, and
moved inside the great gates, which were again
partially closed, while drums, tom-toms, and
cymbals were beaten, and trumpets (?) sounded.

The retinue, the princes, Pakan Meng, etc. etc.
returned to the palace, shortly after the cremation
was completed, in the same order as they came out. The coffin was
overlaid with gold to the extent of 75 viss, which was afterwards distributed among the priests; or to be applied to the building of a pagoda. Charcoal was employed at the burning of the body, and was kept at a red heat by numerous bellows placed all round. The whole of the body with the exception of a small part of the back of the skull was reduced to ashes, or at least consumed on the fire. This small piece, little bigger than a rupee, was placed in a gold cup closed by a lid studded with rubies, while the remains of the charcoal and ashes were placed in earthenware vessels to be carried to the river. The gold cup was confided to an official, who took his place in the hearse. Having arrived at the river bank, those deputies for the purpose entered two gilded boats lashed together, but a little apart, which were rowed out into the centre of the stream. Here a halt was made. The bearer of the gold cup, with it rolled up in his putzoe, jumped into the water, and while he was underneath let it go. At the same time the jars of ashes had their contents poured into the stream, the man was picked up, and there was an end of the ceremony.

On the death of a Burmese, the body is washed, the two thumbs are tied together, a piece of gold or silver money is put in the mouth, as Kadoakah or ferry toll, and after a day or two placed in a coffin. The body is then taken to the burying-ground, halting from time to time to sing and dance, keeping time to the song. The tsandala or grave diggers place the coffin on the funeral pile. Persons dying of cholera, smallpox, and the young under 15 years of age are buried; 7 days after the funeral, the lep-bya or soul of the deceased is released from the house by the house Nat.

Karen relatives, after burying the body, collect the bones, and, at an annual festival, the bones of all who have died are carried and interred in a consecrated Agoi Tongh or hill of bones.

In Siam, the poor are buried or exposed to beasts of prey; if above the lowest class, the deceased, after the bowels have been extracted, is laid in a wooden coffin, externally heaved and gilt, and this is placed for some days on a high table. In the meantime the priests light up tapers, burn perfumes under the coffin, and chant funeral hymns at night. A procession of relatives and friends dressed in white and covered with white veils follow the corpse. Beside it are borne figures of various animals or singularly-shaped monsters carved out of bamboo, and the accompanying talapoons exclaim, ‘We must all die, we are all mortal.’ The mourners attest their sorrow by their tears, and often hire women for the express purpose. The body is then taken from the coffin and placed naked on the pile, which is set fire to, and the remains are scorched. The body is then replaced in the coffin and deposited under one of the pyramids erected about the temple. Graves are held sacred among the Siamese, and their violation is considered a heinous offence. They refuse the honour of burning to persons killed by accident, by lightning, to the still-born, to those who die in childbirth or from smallpox, and to suicides. The remains of such are either thrown into the water, or exposed to beasts of prey.

With the Chinese, when life has departed, the dead body is arrayed in robes of state, or in most costly apparel; ablutions are not performed, nor any unnecessary handling of the body suffered. White is the sign of mourning. The Chinese worship the spirits of the dead, and, amongst that nation, the desire to have a good coffin is universal. Many purchase for themselves that last tenement, and keep it by them, and it is usually substantial, of metal or wood. In Burma, where many Chinese are settled, the best block of teak is selected, and the upper portion being cut off to form a lid, the block is hallowed and ornamented. These may be seen in Moulmein in every carpenter’s shop.

In China, the coffin-makers’ shops have a very gay instead of a lugubrious appearance, as the coffins are usually painted red, or some equally bright colour, and the more expensive ones are decorated profusely with gilding; these coffins are placed on shelves one above the other, and the prices vary from one dollar up to four or five hundred. The funeral customs of China vary in the different districts. In Fo-Kien, the body is placed in a coffin soon after death, a fan is placed in the hand, a piece of silver in the mouth, and an opening is sometimes made in the roof for the spirit to effect its exit. The tombs are on the hillsides, where lucky spots are chosen by geomancers. Paper images of clothes, horses, and other luxuries are cast into the grave, and a sacrifice of cooked provisions is offered on the day of the funeral. Every year, in the month of April, the whole population enters into the tomb, the company of ancestors, sacrifice at the tombs of their relatives, weeping near the graves, and burning fictitious paper money, making offerings of meat, fruit, cakes. Sackcloth is the material for mourning.

Most of the Chinese cemeteries have a sacrificial temple, to which are attached extensive suites of rooms for the reception of the coffins of the richer members, pending transmission to their native districts, for Chinamen prize the privilege of being interred near their forefathers. The Chinese coffin is of good wood, and ponderous. The lid is morticed on, and carefully closed, all joints cemented so as to prevent all entrance or exit of air. Only a small aperture is drilled through the lid over the face, so as to allow the entrance or exit of the spirit at its option. Sometimes a humble family will keep the coffin for many months in their house till able to purchase a tomb, but the very poor are buried in mass within enclosed buildings. The rite of respectful burial is however so revered, that burial clubs exist in all the large cities. The monumental tombs are small raised truncated cylinders. The tombs of opulent Chinese are decorated with statues of men and horses. They run into excess in mourning for the death of near relations. Every part of the ceremonial is exactly regulated; even the period, manner, and degree of the mourners’ grief being duly prescribed. The corpse being dressed in warm clothes, and deposited in a substantial coffin, is kept for several days above ground, whilst the survivors express their measured grief by gesture, dishevelled hair, sackcloth, and mournful silence. When a lucky spot has been selected for the grave, the corpse is consigned to the earth. Building a tomb in the form of a horse-shoe, they inscribe thereon the name of the deceased, erect a tablet to his memory in the hall of his ancestors, and repair annually to the grave, in order to prostrate themselves before the mummies.
BURMA.

Comparative Grammar; The Koran; Madras Journal of Literature and Science; Timkovski’s Journey to Pekin, ii. p. 212; Burton’s Scinde; Butler’s Travels; Forbes, 277; Rawlinson.

BURIGOPAN.  Beng. Dipteracanthus decius.

BURI MAE.  Hind. Tamarix Indica.

BURJ.  Pers. A bastion, a fort. Buruj, the plural, is applied to the signs of the zodiac, in order, as Masudi says, to mark the position of the stars with reference to these fixed objects. The word burj is widely diffused. In Gothic Bairgan, and Saxon Beorgan, to fortify; Thracian Bria, a city (Strabo, viii.); German Burg, a city; and English Borough, Burgh, and Burty, so frequently the affix of the names of towns. All places in Britain that in the old time had the name of Bouroughs, were places one way or other fenced or fortified. The Greek Purg-oas is evidently the same word, signifying a tower, and hence applied also to a dice-box.—Mitteret in pyrgum tales (Hor. Sat. ii. 7, 17). It enters commonly into the name of fortified towns,—one in Myisia (Anabasis, vii. 8, 8); in Thrace (Herod. vii. 112).—Eliot, Supplemental Glossary; Restitution of Decayed Intelligence, ch. vii.

BURJA.  Tel. Hymenocytium excelsum.

BURKA.  Arab. A veil, a woman’s face veil; also a door curtain, and the curtain which is suspended over the entrance of the Kaba.

BURKUK, Khubani, Mishmish, Bakur-Khanee, Hind., vars. of Armeniaca vulgaris; the apicot.

BURMA, as now known to Europe, was formerly the site of four kingdoms, viz. Arakan, Tha-hun, Martaban, and Pegu. It is still subject to two dominions, being partly a British province and partly under a Burmese ruler, the two portions being designated respectively British Burma and Independent Burma.

British Burma comprises territories conquered in the two wars of 1824–26 and 1852–55. The features of the country are of a varied character. The Yoma mountains and the Tenasserim range stand prominently to the view. On the Arakan coast is the Naf estuary; and there also are the Mru and Koladvyn or Arakan rivers. In the Pegu district are the Irawadi, the Hlaing or Rangoon rivers, the Pegu, Sittang, and Bihlen; in Tenasserim the Salwin and the river of Tavoy.

The British portion consists of the long strip of land lying between lat. 9° 55’ and 20° 50’ N., and long. 92° and 99° E., an area of 88,556 square miles, with a population in 1881 of 3,707,646. Arakan.—Males, 384,045; females, 257,963; total, 562,008, against a total of 484,363 in 1872, thus showing an increase of 77,645, or 16 per cent. Pegu.—Males, 1,249,346; females, 1,081,061; total, 2,330,407, against as 1,602,658 in 1872, or an increase of 688,349, or 42° 2 per cent. Tenasserim.—Males, 431,270; females, 380,548; total, 811,818, as against 600,727 in 1872, or an increase of 211,091, or 34° per cent. The totals for the entire province are—males, 1,984,661; females, 1,719,572; total, 3,707,606, as against 2,747,148 in 1872, showing an increase of 957,085, or 34° 8 per cent. Rangoon in 1872 contained a population of 98,745; it now contains 132,004, showing an increase of 33,259, or 36° 6 per cent. In 1872 the population of Moulmein was returned at 46,472.
In 1881 it was returned at 53,080, an increase of 14 per cent.

A treaty is said to have been entered into in 1757 between the Indian and Burmese Governments, and in 1755 Captain Michael Synes was sent as envoy to Ava; but from 1797 disputes regarding Arakan began, and fugitives into Chittagong were in 1780 dismembered from the British. On this Colonel Synes returned to Rangoon, where he was not treated with ordinary civility by the governor, and he left for Bengal in January 1803. After this, Captain Canning was sent on several occasions, the latter in 1809. On the first he was treated discourteously, but on the second with civility. In 1811 the Arakanese rebelled, and invaded Burmese territory; and in 1811 Captain Canning was again sent to mediate. Subsequently to that year the Burmese officers in Arakan more than once made demands for the surrender of Arakanese refugees, and even made pretensions to the sovereignty of Bengal as far as the city of Murshidabad, as territory pertaining to the kingdom of Arakan. In 1819 they interfered in Assam, and in 1824 they invaded Cachar. War was declared against Burma on the 5th March 1824, and, after two campaigns under Sir A. Campbell, a treaty of peace was signed at Yandabo on the 24th April 1825, on occasion parts of Assam, Arakan, and Tenasserim were ceded to the British. Subsequently, in 1851, in consequence of the Burmese refusing redress to a British shipowner whom they had injured at Rangoon, war was again declared, and was conducted successfully by General Godwin. Rangoon fell to a combined naval and military force on the 14th April 1852, and when peace was declared, all Pegu and Arakan were retained by the British.

British Burma may be geographically divided into five portions, viz., (1) Arakan, stretching from the Naf estuary, which separates the province from Chittagong, to Cape Negrais, and consisting of a comparatively narrow strip of country between the sea and a high mountain chain; (2) Pegu, the valley of the Irawadi, which, divided from the Sittang valley by the Pegu Yoma range, unites with it in its southern portion; to the northward is the chain of hills which forms the watershed between the Sittang and the Salwin rivers, and on the west the Anouk-pek-toung-nyeung, literally, the high western range of mountains, sometimes called the Arakan Yoma range; (3) the valley of the Salwin; and (4) Tenasserim, a narrow strip, like Arakan, reaching down to the Pakhan stream in 9° 2' N. lat., and separated from Siam by a lofty chain of hills running from north to south nearly parallel to the coast, at a distance of from 30 to 40 miles inland, but approaching nearer to the sea at its southern extremity; (5) The numerous islands off the Tenasserim coast, known as the Mergui Archipelago.

For administrative functions it is arranged as the Commissionerships of Arakan, Pegu, and Tenasserim, all under a Chief Commissioner since the 31st January 1862. The principal towns are — Rangoon, Mon, Mawlamyine, Prome, Basay, Akyab, Henzada, and Tavoy, with the military cantonments of Thayat-nyo and Toungoo. Some of the districts have a very scanty population; in 1872 only 6 to the square mile in the Mergui and Salwin districts, 7 in that of Ramree, 10, 14, 15, and 16 in those of Tavoy, Toungoo, Sanyaw, and Amherst respectively, and in Myan Onug, the most populous, 115. Of the entire population, 2,447,831 were of the Buddhist religion, 99,816 Mahomedans, 62,299 Christians, and 36,658 Hindus.

The country has long been known to the people of India as one of the Savarna Bhumis, which Europeans render the Golden Chersonese, and applied to the delta of the Irawadi. The Irawadi and Sitang valleys unite towards their mouth to form an extensive plain, stretching from Cape Negrais to Martaban. It is annually inundated, but is the most productive part of the whole province, and a canal connects the Pegu and Sitang rivers. The Irawadi is navigable for river steamers as far as Bhamo, 600 miles from the coast. The Hlaing or Rangoon river rises close to Prome, and, when passing Rangoon, it is joined by the Pegu and the Pu-zwon-doung rivers coming from the N.E. and the E. The two latter rivers rise close together in the Yoma range, about 58 miles above the town of Pegu, and they communicate by several channels with the principal delta branch of the Irawadi. The Salwin is a great river, but, owing to numerous rapids and rocks, it is navigable only by small boats 100 miles from its two mouths. Between Talifu and Mon, 600 miles due north of its mouth, it flows a rolling current in a shingle bed 140 yards wide. The Sitang river rises far north of British territory, and in the dry season is with difficulty navigated by any boats. Below Shwe-gyeng it receives the river of that name, and finally disembogues into the Gulf of Martaban.

The more prominent and dominant races have been the Mya-gna or Burmese, the Ra-kheng or Arakanese, and the Mon, Mun, or Taleng. The native name, Ma-ran-ma, Man-ma, whence the softened modern M'yan-ma, M'ya-ma, is the source of the European corruption Burma. The Arakan people are of the same race as the Burmese, and the territory was long under the Burmese rule. In the 16th century, Arakanese dominion extended to Chittagong and the Megna river, and the 17th century saw several adventurers from Europe. Sebastian Gonzares established himself at Sandiva (Sawdweep), and was for years a terror to the country, till crushed with the help of the Dutch. The Ramana or Ramanji territory was held by the Mon, Mun, or Taleng, whose districts were Tha-htun, Pegu, and Martaban. It was founded several hundred years B.C. by emigrants from Coromandel. Tha-htun is now ten miles from the sea-shore. It was the Soba Empire of Ptolemy. Pegu city was founded by emigrants from Tha-htun, A.D. 573, and Martaban three years later.

In Arakan and in the basin of the Irawadi are other tribes of the same stock with the Burman, and their languages are in their present form so much akin to it, that they may be almost considered as forming, with Burman, dialects of one tongue. The Burman is monosyllabic, and has no letter corresponding to f or v, and no hissing s. The Burmese language is spoken in Arakan, in the valleys of the Irawadi and Sitang, and in Tenasserim to the south of Tavoy.

The Burman people occupy the lower part of the basin of the Irawadi above Pegu, with the southern parts of the upper basin and the valley
the river beyond, as far as Ba-no. They are also found in the delta, but their progress there has been comparatively recent, and the prior inhabitants still form the greater majority.

Burma has the Tai or Shan on the east, the Malay on the south, Hindu and Mahomedan races on the west, and the Tartar and Chinese on the north. Within these boundaries are many tribes, with several synonyms, but nearly all may be referred to four great families,—the Mon or Talaiung, the Burman, the Karen, and the Shan.

A. Mon.

B. Burman, viz. Burman, Bakhui, Mug, Ksyanan, Tounguere, Tavoyer, Yau or Yo, Yebain, Pyu, Kado, Danu.

C. Karen—

a. Sgau tribes, viz. Sgau, Manu-nga-pha, Paku, We-ua.

c. Pwo tribes, viz. Pwo, Shong, Ka or Kay, Ta-ru or Ku-ta, Mo-pha, Ha-shwee, Toung-thu, Kyhin.

d. Shan Karen, viz. Yen or Yelm, Yen-seik, Ying-baw, Pandung, Toung-yo, Black Karen.

e. Miscellaneous tribes, viz. Ka-khyen or Kay-ku, Ka-mi or Ku-mi, Kyau, Kun, Sak, Mru, Shendu, Selung.

D. Shan Tribes, viz. Shan or Tai, Lao or Lau, Po or Wa, Paloung or Palco, and Phwon or Mwoon.

There are numerous Shan states far to the north-east, but they generally owe fealty to the Burmese monarch.

Burmans march on the north with rude tribes of their own family, collectively termed Singpho, who occupy the Upper Irawaddy. On the extreme north, the linguistic boundaries of the Singpho are unknown.

Lau, a wild tribe only known under the generic Lau, termed Kha-nung, occupy the mountains to the north-east of the Kham-ti, apparently in the upper part of the Mi-li or Nan-Kiu. They are interspersed between the Kham-ti and the Meng-fan, the latter appearing to belong to the Tibetan family (Singpho-Kham-pa). The Kha-nung may form a link between the Kham-pa and the Singpho or Burman families.

Shendu, Shindu or Shandu, occupy all the country watered by the Koladyn and Mee, as far down as the Sulla Kheoung, but north of the Sulla Kheoung they are not tributary to the British.

Kham villages are spread from below the Sulla Kheoung to Teinway; their villages are few, and they also pay no tribute to the British.

Kumi or Khiwa-mi occupy all the country watered by the Koladyn as far down as the Koladyn Thannah, also both banks of the Mee and Samee Kheoung, and both banks of the Pee and the Yeo as far as Khoong-choo, east and northeast of Koladyn, and the country watered by the Pee and Yeo west of the Koladyn. Mru villages are from Koladyn Thannah as far as Ralla, and eastward to Mahamone and Old Arakan south-east, and both banks of Myoo from Rasonong northwards. They do not exclusively occupy the whole of that tract of country, their villages being interspersed with those of the Arakannese: they are, correctly speaking, wild people rather than hill-people. Some families live with the Kumi on the lower part of the Mee and Pee streams, and also on the Yeo. They also inhabit the hills on both banks of the Myoo river in the western part of the district from Rasonong northwards to Sugarloaf hill. In this extreme north-west part of the district, there are some wild people called Mroony, living among the Mru, but there is no appreciable difference in their manners, customs, and appearance, from those of the Mru.

The Mroony live on the upper basin of the Mayu, and towards the hill frontier of Chittagong, are a colony imported from the Bodo country by the kings of Arakan, at the period when their conquests extended far up Eastern Bengal.

Kyen occupy the whole of the large hilly tract of country east of the river Semru, in fact, all the hills east of the district, and dividing it from Independent Burma and Khyouk Phyoo. They are the most numerous of the hill tribes. Some of their nearer villages pay tribute, but those more remote are independent. All the Kyen women tattoo their faces.

Anoe is a small hill tribe of four villages, living on the Paroon Kheoung, a little above Tulukmee. They differ little from the Kumi. All the tribes have separate clans, at constant warfare with each other.

Burma, Siam, and Tonkin received their first culture from India, along with Buddhism; and their ancient buildings all bear the stamp of Indian origin and Indian taste of a post-Christian age. Siam has in recent times added Chinese methods of improvement to the Indian ones, and Tonkin owes mainly from China.

About five-sixths of the population are Buddhists, the remainder Christians, Mahomedans, Hindus. Every Buddhist Burmese must once in his life enter a kyoung or monastery, even if only for a few days, as a monk. The procession to the monastery is gay, and he there undertakes the ten negation commandments, not to kill or steal or indulge in unlawful passion, nor speak falsely, nor drink intoxicating liquors, nor eat after midday, dance, sing, or play instrument, paint the face, stand in high places, or touch gold or silver.

The Burmese are of the Himayana sect of the followers of Buddha, whom they call Godama, and they have great figures of Godama in every pagoda. They believe in the presence of a spirit ’La’ in every animal, plant, or thing, and they adhere to a Lent, Wa, from the full moon (watao) of July to that of (tha-ding-ynot) October, and they have a rosary of 108 beads. The Leipa-lya, literally ‘butterfly,’ is the soul, the psyche of the Greeks, the life, the perceptive principle. They have spirits of kinds called Nat, and demons called Beloo; have witch-finders; and believe in astrology, the evil eye, and philtres.

Every Mon village has a Nat; and a Burmese king dying is said to ascend to the Nat village (Nat yna-than-thee). With all the dead, a piece of gold is put into the mouth as ferry toll, ka-do-ak. The great Shin-Dagong-Pa-yah pagoda was erected B.C. 585. Its height is 372 feet.

Besides the Wa or Lent, their religious annual festivals are the Ko-daw-la, or Beg-pardoun day; the Ta-wa-dein-tha, relating to the life of Buddha; and the Water Festival, Shin-oopa-ga, when little saucer-shaped lamps are consigned to the river at night. Their favourite religious story is the Way-than-da-ra, on the former existence of Buddha. Their everyday amusements are the poopy drama, the puppet or marionettes, 2 to 3 feet high, music,
boat, and horse racing, football, boxing, wrestling, gambling, cock-fighting. The country is wealthy, and their aversion to regular labour is extreme. Notwithstanding this, the total trade in 1870 amounted to £10,263,000, increased in 1880 to £22,222,000. The incidence of taxation on the population of 3,736,771 is Rs. 63 per head. So little is this felt, that every family in Burma on the average spends £12 yearly on jewellery and imported luxuries. Bullion to the extent of a million and a half annually is absorbed in the province, in addition to the great amount spent in charity and amusements.

Their courting time is after 9 p.m., and is called Loo-byo-tay, thee-achyrin, the time for young men to go about. Polygamy is legal, but is only practised by the wealthy. Living as man and wife, or eating out of the same dish, is a legal marriage. The bridegroom provides a dower. The king has four legitimate wives. Few women have had education. They can hold property, and can divorce themselves from their husbands. The Burman woman’s lower garment, Ta-mien, is a narrow cloth of various colours of a pleasing contrast, which descends generally from the waist or from below the arm to the feet. It is made to overlap, and in front is tucked in, but it is so narrow that as the wearer walks the thigh is more or less shown at each step. Women transact the most important business. The filagree work necklace ‘Bayet’ is a great ornament with the Burmese women. As in Buddhist countries, Burmese women are more nearly the companions and not the slaves of the men. But the Tibeto-Burmans and the cognate Indonic tribes permit great licence to both sexes prior to marriage, when chastity is not required.

The Burmese tattoo themselves, and, after certain Turks, are perhaps the most civilised men and women who do so. They tattoo their bodies with figures of lions, tigers, beloo or demons, and dragons, also red squares, cabalistic signs or words on their breasts, arms, or backs. The Burmese, Mon, or Ta-laiung also tattoo from below the navel to below the knee; the Shan from the navel to the ankle. The Karen-ns have a rising sun on their back as a mark of manhood. The Kyen tattoo the whole of the face of their women. The inflammation is severe, and death occasionally follows the operations.

The Burmese have no surname. Their single name is prefixed with Mung, meaning brother, or Nga, Koh, and Poh. They and the Karen have the custom of brother-making, called by them Doh, also Thway-thouk. In salutation, the Burmese bend the head three times to the ground, but the Karen, the Shan, and wild tribes of Arakan snuff their relatives. Burmese are skilled workers in metals. A bell at Mengoong is 12 feet high. At Amarapura is a sitting figure of Gaudama, 12 feet high. It was formerly the tutelary saint of Arakan, and was carried off A.D. 1784 by the king of Burma. Amongst the Karen, the Kyee-zoe, a large one-headed metal drum, is the standard of wealth. They use as bellows the double-formed forcing air-pump of the Malays. Ha-pet, or plucked to a profusion from the leaves of the Eleodendron Perseaum, forms a part of every Burman ceremony. They brew a rice beer called ‘koung.’

The Karen races continue the destructive form of temporary clearings for cultivation, called Young-ya, meaning hill clearing or hill garden. Rats, at long intervals of 40 or 50 years, invade the Karen lands in myriads, crossing streams, so that the water is black with them, and devouring every edible thing. From 1870 to 1874 the hill country east of the Sitang was devastated by them, and Government expended £10,000 in relieving the Karens.

The adult dead are burned; those under 15, also such as have died of cholera or small-pox, are buried. Leip-byu, or spirit or soul of the deceased, is believed to dwell in the house until released on the seventh day from the house by the house Nat. The Karen, after cremation, and at an annual festival, collect the unburnt bones, and carry them to the consecrated Ayo-toung, or hill of bones. This is a practice of other tribes.

Independent Burma has the British districts of Assam, Arakan, and Pegu, with the Tipera and Manipur states on the N. and W. and S., with Chinese territory and the Shan states on the E. It extends from lat. 18° 30’ to 28° 15’ N., and from long. 93° 2’ to 100° 40’ E., and its area has been estimated at 192,000 square miles; this includes the tributary Shan states. Its rivers are the Irrawaddy, Kyemyin-daw, which unites in lat. 21° 50’ N., the Sittang or Pongla-laung (Pongloun), the Salwin, and the Myit-nge. Crawford estimated its population to 22 at the square mile, which would give about 3,000,000; Colonel Yule’s estimate in 1855 was 1,200,000; Count Bethlen in 1874, excluding the Shan tribes, reduced it to 700,000; Dr. Hunter in the Imperial Gazetteer, including the Shan, supposed the number to be 4,000,000.

The Burmese seem to have been an intruding race, conquering from north to south, and the boundaries of their kingdom have greatly varied. On their first advance from Arakan, they appear to have conquered the northern part of the ancient kingdom of the Mon, for their capital was for 395 years at Prome. In the era of their greatest stability and prosperity, their capital was at Pagan (probably the place of that name above Ava), from the second to the middle of the 14th century. It was founded in A.D. 1283, and was the 15th century a.d. that they succeeded in annexing Pegu. But in the middle of the 18th the Mon threw off the yoke, and in their turn subjugated all Burma for a short period. The Burma capital had moved up the river from Prome to Pegu, from Pegu to Panya, from Panya to Ava, from Ava to Amarapura, and thence, in 1822, to Mandalay, where it now is.

In the Burmese chronological table translated in Crawford’s Embassy, are the following events:

B.C.

691 Sacred Epoch.—The grand epoch established by An-ja-na, the grandfather of Gautama.

628 Gautama born; 603 began to reign.

589 Gautama became a Buddha.

544 Gautama died, and obtained Nibhan (immortality).

543 1 The sacred epoch established by king Ajatasat.

94 450 The communications of Gautama reduced to writing in Ceylon.

A.D.

76 1 The Prome epoch established by king Sumundi.

639 1 The Vulgar epoch established by Poppa Chan-ra-han.

1364 726 Uch-cha-na-praung, in Chitkang. But this year Sa-tong-bya founded
Angwa (Ava), and began to reign; and Chikhaing and Panya were de-
denied.

1732 1114 Alauung b’hura (Alompra) began to reign at Mut-chho-bo (Monchabo).

1781 1143 His cousin Paang - ka-chha, commonly called Mang-mang, son of U-pa-ra-
ja at Ava, succeeded the same year by his uncle Pa-de-mang, or Man-ta-
ri-kri, son of Alauung-b’hura, and found-
er of Ama-ra-pura.

1822 1184 Ava re-built and made the capital.

Independent Burma is ruled by a king, with a chief council, the Hlut-dan, composed of four
Meng-gyi, four At-ween-wun, and four Wan-da-lay.

Burmans differ from the Anamese in being stouter and
darker, and in the head being Daya-Poly-
nesian or Turanian oval, and not obtusely ovoid.
The head varies greatly, and the coarser forms
show a tendency to the Binua contraction of the
forehead, rendering the lateral expansion of the
forehead very marked. The normal or non-
Indianized Burman head appears in many respects
in a much smaller square, the jaws and eyebrow,
and Polynesian. This softened Turanian type is
decidedly allied to the oblong square and oval
Chinese type, and not to the ovoid and orbicular
type of the Tibetan, some of the Himalaya-
ganetic, the Angho, and the Celebesian tribes.
The Burmans on the west more often resemble
the handsome Asiatic tribes found in Borneo,
some parts of East Indies, and Polynesia.

Burmans and Malays are somewhat stouter than
the Siamese, the average height being probably
about 5 feet 2 inches.

The royal family have customs partly Scythic,
partly Aryan. They claim descent from the Solar
king of Kapilavastu (which was the capital of Sud-
dodana), and one of the royal titles is ‘Ne dwet
bhu-yeng,’ sun-descended monarch. A peacock is
borne on the royal standard, and the figures of
a peacock and a hare are painted on the king’s
throne. The Aebit thiek or Water Litation
is offered on the accession of a new sovereign.

In the royal family, the custom is continued of
marriage between brothers. Sir and sisters, and
the king’s eldest daughter remains unmarried.

Burma has a rich soil, producing in abundance
cereals, millets, pulses, and oil-seeds, valuable
timbers, fibres, cotton, indigo, catechu,
lae, caoutchouc, tea, coffee, tobacco, mustard,
sugars from the cane, palmry, betel, yam, sweet
potato, and the potato. A tea plant also, supposed
to be the Elaeodendron Persicum, which furnishes
the chief ingredient in the Hla-pet or pickled
tea. Amongst its mineral products may be named
silver, gold, silver, tin, lead, antimony, copper,
bismuth. Quaries of marble are worked near
Amatapura. Coal has been discovered in the Ira-
wadi. Ruby mines are very productive; sapphires
occur, and garnets; earth-oil is largely obtained
from wells. A bisoxide of tin occurs in abun-
cdance in the streams of the Tavoy and Mergui
districts. Lignite, bead stone, but they have
been found to fine away. Once-washed stream
tin yields 70 per cent., and twice-washed 75 per
cent., of pure metal. The mercantile products
are rice, timber, silk, lacquer ware; and the
people are famed for their gold and silver work,
and for their wood-carving; rice, of which the
yearly product is a million tons, employs,
with other articles of produce, 1,200,000 tons of
shipping, of which 1,000,000 tons are British.
Of teak wood, 150,000 tons are exported in the
year,—86,000 tons to India, and 64,000 tons to
Europe, chiefly to Britain. The approximate
value of the whole is £1,000,000 sterling. Rice
cultivation is chiefly in the valleys and the delta.
The amount of the rainfall varies greatly,—in
Prome about 43 inches, and at Sandoway
280 inches.

Cautchouc trees are abundant in the Bhamo
and Mogoung districts, estimated at nearly half
a million. The galena of Bandwex and Tonghoo
mountains is highly argenteous; precious ser-
pentine also occurs, and the gems of Capelan
(Kyat Pen) are famed. The larger wild animals
are, elephants, rhinoceros, unicorn and bicornis,
hog, tiger, leopard, bear, deer, bovide, por-
poises.—Forbes’ Burmah; Mason’s Burmah; Cra-
ford; Yule’s Embassy; Oldham in do., p. 335;
Prinsep’s Antiquities; Peschel; Aitchison’s Treasures;
Bishop Bigandet; Imp. Gaz.

BURMA.

BURNS.

BURNELL, A. C., of the Madras civil service,
who devoted much labour to the elucidation
of the history of ancient India; an eminent Sanskrit
scholar, a voluminous writer on Hindu law and
Sanskrit literature. The Strasburg University
honoured him with the title of Doctor.

BURNS. Three brothers of this name served
together in India. Sir Alexander Burns wrote
Travels in Bokhara and History of Cabul, at
which place, along with their youngest brother
Charles, he fell on the 2d November 1841. They
were natives of Montrose in Scotland, sons of
James Burns, provost of the town, and relatives
of the poet Burns.

Sir Alexander entered the Bombay army in
1822; travelled from Bombay through Sind, the
BURNOUF, EUGENE.

Panjub, and Bokhara to the Caspian Sea, returning by the Persian Gulf, betwixt 1831 and 1833; was despatched on a mission to Kabul in 1837; Assistant to the Envoy from 1838 to 1842; Author of Notice of Hospital for Animals at Surat, Jl. 1. p. 96; On the Colossal Images in Baman, Ml. As. Trans. 1853, ii. p. 563; Travels into Bokhara, London, 3 vols.; On the Infantilc Incidence in Cutch, Lond. A. S. Trans. 1834, i. p. 193; Cabool, 1837 and 1838, Lond. 1842, 1 vol.; Notice of Siud, Lond. G. S. Trans. 1837, vii. p. 2; Observations on the Maritime Communications of India, as carried on by the Natives, ibid. 1836, vi. p. 2; On the Ruins of Puttan Sonmath, Lond. A. S. Trans. v. p. 104; Account of the Reg Rawan; On the Descendants of Alexander in the Valley of the Oxus; On a Fair for the Indus Trade; On Herat and the Surrounding Countries; Coal Localities near the Indus; Navigation of the Indus; On the State of Turkostan. He also wrote articles on Commerce in Sind and Afghanistan; On the Persian Faction in Kabul; On the Political Power of the Sikhs; On the Political State of Kabul in 1837; On Russia in Central Asia; On the Siah Posh; On the Wool of Kabul and Bokhara. A memoir of his life appeared in the Bombay Times, December 1841, As. Jl. 1842. James Burns, K.H., the elder brother, a medical officer of the Bombay Army, author of A Visit to the Court of Sind.—Dr. Buist's Narrative of Afghanistan, Bombay, 1843.

BURNOUF, EUGENE, a learned native of France, who devoted much of his life to oriental investigations. As a Sanskrit scholar, in 1840-47 he edited and translated part of the Bhagavata Purana. He published in 1844 his Introduction à l'Histoire du Budhisme. He died in 1851. He was Professor of Sanskrit in the College de France in 1826, in conjunction with Lassen. He wrote the Essai sur le Pali. He did for Zend and Achaemenian Persian what Jacob Grimm had done for the Teutonic languages. His labours have been continued by Lassen, Hang, Spiegel, Jasti, and others. He published a memoir on the eunuch inscriptions of Hamadan.—Oriental Linguistic Studies, p. 176; Sayce, i. p. 52.

BURNUS, Art., also written Burnoo, a hooded cloak, generally made of white woollen stuff, and mostly worn by the people of northern Africa.

BURO. BENG. In Hindi, Bara, large.

Buro-bel, Jasminum plumum.
Buro-bet, Calanusa fasciculatus.
Buro-buhooari, Cordia latifolia.
Buro-chali, Guatteria suberosa.
Buro-chi-coneula, Cympus iris.
Buro-chuna, Vicia sativa.
Buro-elachi, Annonum graia paradisi.
Buro-gach, Ficus religiosa.
Buro-goebosti, Mariscus cereus.
Buro-hulkusa, Leucas cephalotes.
Buro-jalgantee, Punicum setigerum.
Buro-jhauji, Utricularia stellaris.
Buro-jovan, Psychotria ajowan.
Buro-jubanee, Trichitis miliaris.
Buro-kanoor, Cinnum toxicarium.
Buro-keru, Euphorbia hirta.
Buro-keshuriya, Hymenochete grossa.
Buro-keshuti, Adenosetum biocarpum.
Buro-koshimi, Marsiscus rostochiensis.
Buro-kooindo, Jasminum arborescens.
Buro-kookoor-chita, Tetranthera monopetala.
Buro-kulpa, Trichodesma Zeylanicum.
Buro-kung, Abutilon gravoless.
Buro kut, Sagittaria obtusifolia.
BURSINOPETALUM ARBOREUM.

of tcamahaca, are afforded by plants of this tribe.

BURSINOPETALUM ARBOREUM, Wight, var. macrophyllum. A large tree of the forests of the Central Provinces of Ceylon, growing at an elevation of 4000 to 7000 feet. B. tetradrum, Wight, is another large tree of Ceylon.—Thu. Zeyl. p. 42.

BURZAL. HIND. The leaves of Bertera Konigi, used medicinally.

BURTON, R. F., an officer of the Bombay army, in which he rose to the rank of captain, one of the most valued linguists of his day. In 1843, under the name of Haji Abdullah, he visited Medina and Mecca. He led an expedition into Central Africa, and discovered Lake Tanganyika. He visited the Mororns at the Salt Lake. He entered the civil service of Great Britain, and was successively consul of Damascus, at British Guiana, at Cape Coast, and at Trieste. He went on a mission to the king of Dahomey. He made an examination of the land of Midian. He wrote—Goa and the Blue Mountains; Description of Sind, or the Unhappy Valley; Sind and the Races that inhabit the Valley of the Indus; Journey to Mecca; Travels in the Somali Country; The City of the Saints; The Nile Basin; Aboekuta, Zanzibar; Unexylored Syria; The Highlands of Brazil; Battlefields of Paraguay; Ultima Thule; Two Trips to Gorilla Land: Mission to Dahomey.

BURU, a large island in the Eastern Archipelago, being about 200 miles in circumference. The bulk of the inhabitants are a comparatively fair people, very closely resembling the natives of Ambonya, and the only tribe that is likely to be Papuan, is a small community which resides in the neighbourhood of a mountain lake near the centre of the island. This lake was visited by parties from the garrison in 1669, and again in 1710, and their observations are recorded at some length by Valentyn, in his Beschryvinge Van Oost India.—Earl's Papuans, p. 185.

BURUCH. SINGH. Chloroxylon Swietenia. BURUD. MAIRE. A caste whose occupation is mat-making, some times enumerated among the village servants.

BURUGA. Tel. Eriodendron anfractusum. BURUNG. MALAY. Any bird.

BURUNGE. DEXI. Siphonanthus indica; HIND., Quercus flexuosa.

BURUT are distinguished from the Kalmuk only by their language. The Mongol, the Kal- muk, and the Burut are a very phlegmatic, good- humoured people; they have all accepted Buddhism, but practise many shaman rites.

BURYA. PERS. Mats.

BURZAL. HIND. Betula bhojputra.

BURZUD. PERS. Galbanum.

BUSA-KARELLA. HIND. Monomorica char- antia.

BUSHAN, of Upper Chenab, Salix alba.

BUSHA, a town in the Himalaya, with horses, yaks, sheep, provisions, etc. The people, half nomadic Tartars, inhabit caves fitted up like houses in the cold season, and dwell in tents during the rest of the year. The height of Bushan is 9290.—Rep. Proceed. Mag. Sura. India, p. 3.

BUSHIRE or Abu-Shahir, in lat. 29° 0' 15" N., and long. 50° 51' 30" E., a port on the coast of the Persian province of Fars, 295 miles W.S.W. of Shiraz. It is situated at the N. extremity of a low sandy peninsula, about 11 miles long and 3/4 broad. It has a population of about 12,000 souls. Treaties were made with the king of Persia in 1763 and 1841, and the British have a Resident there. The value of the trade amounts to about a million sterling. Its population are mixed Arabs and Persians, with about 100 Armenian merchants. The tribes around Bushire are the bravest on the Persian seaboard, and opposed the British in the war with Persia in 1856. It was captured by the British on the 10th December 1856. Bushire is probably the result of the siting up of a still more ancient harbour about 6 miles from it, where bricks with cuneiform inscriptions are found. The coast of the plain near Bushire many cases have been taken, formed of ill-baked clay, and filled with seeds of the tulah plant or mallows, which soon decay when affected by the fresh air. Earthen urns, containing the remains of human bodies, are said to abound on the plain of Bushire.

—MacGregor, pp. 80-102; Ouseley's Travels, i. p. 216; Treaties, vii. 99, 137.

BUSH-KURD district is looked upon by the natives as a part of the Kohistan, and the Kurds who inhabit it are never spoken of by the term Makrani, or people of Makran; but it is south of the Kohistan, and unquestionably in Makran. It is one uninterrupted and rugged mass of mountains, that afford pasturage for the cattle of the Kurd Baluchi, who depend on the lower countries for grain and other supplies. These people are a tribe of Kurds that have advanced out of Luristan.

—Pottinger's Travels, pp. 305-6.

BUSV QUALI. LOWA. HIND. Quails of the genus Perdicula.

BUSI. TEL. Vitex arborea.

BUSSAHIR or Bashahr, a hill state in the upper course of the Sutlej river, recognised 6th November 1815, at the close of the Nepal war, and in 1862 granted the right of adoption. The inhabitants suffer from goitre, but not so much as in the valleys of the Pabur and Tons; the people in the higher valleys do not suffer so much as those in low situations. The natives of Bushahir, Sookeyt Mundee, and Kooloo have sallow complexion, and seem all of the same race.

BUSSI KHEI, a tribe on the N.W. borders of British India. The Afridi lie between Peshawur and Kohat; they are fierce, factious, and strong, and, with the Bugburgh, the Jewaki, Bari, Bussi Khel, and Busti Khel, as also the Sipah and Buzooti, are more or less independent.

BUSSO. JAP. A Buddhist priest or talaparn.

BUSSY, an eminent commander of the French in India, from a.d. 1751. He threw all his influence in support of the Nizam of the Dakhhan, was present at the battle of Ambur, which the French gained and Anwar-ul-Din fell, and he attacked Gingee successfully. He was attached to Muzzaffar Jung, but after his death he appointed Salabat Jung to be subahdar of the Dakhhan, and accompanied him to Aurangabad. He subsequently defeated the Peshwa, and was able to obtain for Dupleix the title of Nawab of the Carnatic. He subsequently obtained the cession of four provinces near Aurangabad, then of the four Circars. He was afterwards dismissed the Hydroabat service. He then returned to the Dakhhan, and joined Lally at Arcot, and was taken prisoner at the battle of Wandiwash.—Malleson, French in India.

BUSTAR, a district and dependency in Central
BUSTARD.

India, surrounded by the Teling in the south, Khond and Mari Gound on the east, and Hindus to the north. It lies westward of the state of Jeyapore, and has the Goslavry for its southern boundary. In length it is about 170 miles, and in breadth about 120, with an area of 18,000 square miles. It is a country of plains and plateaux, lofty mountains and fertile valleys, rivers and forests, with a population of about 200,000.

The raja claims to be a Rajput, and the family adds Singh to their name. The chief town is Jugtlupur. Till past the middle of the 19th century, human sacrifices to Decteshwari Devi were of frequent occurrence, and at certain festivals as many as a thousand sheep and buffaloes would be sacrificed to two goddesses. The races consist of the hunting and fishing Tungara or Parja, who will eat anything, from beef and mutton down to rats and snakes. The Gudera, who subsist by cultivation chiefly, seem much given to dancing and amusement. On holidays, men and women join in dancing to the music of a fife and drum. A ring is formed by all joining hands; the company circles round and round, relieved now and then by mighty hopes to the centre or back. This finished, a man steps forward, sings out one or other sex, and banters her about her ugliness, and so forth, and the woman retorts. The Sowderl deal extensively in mahwa arrack. The Maria are numerous; inhabit the densest jungles, avoid all contact with strangers, and are so timid that they flee to the hills on the least alarm. They are strong and agile, very expert in the use of the bow, and are a cheerful, light-hearted race. The women tattoo themselves from head to foot. The clothing of the Maria decreases in quantity in direct proportion to the increase of the distance of their abodes from civilisation. They are very inquisitive, sharp observers, apt to learn, and remarkable for their truthfulness and honesty. The savage race in the Beila hills have leaf sapons.

BUSTARD. European and Indian bustard.

Beet-miaka, CAN. Tel. Ositarde, Osarade, Houtar, Bistars, Fr. Trapp, Trappe, Trapp, Traps, gans, GER. Ackentrappe, A. Der Grosse Trappe, A.

It is the Otis tarsis, the great bustard of Europe, to which the English name bustard is usually given; but in the classifications of zoologists the family Otididae has three genera, the Houtbara, Eupololitis, and Syphoetides, some species of the last being usually termed florikin.

Eupololitis Edwardsi, gray. Indian bustard. Otis nigriceps, Vig. [Otis lucionensis, Vieill.]

Tokdar, Burra, HIND. Gurrayin of Hurriana. Sohan Guggah, Bati myaka, TEL.

This noble bird is 45 to 5 feet long, and extend 8 feet. It weighs 26 to 28 lbs. It is not known in Bengal, Behar, or the Malabar coast, but seeks the open grassy plains of India. It is becoming very scarce in the cultivated country, but is said to be still abundant in Nalaputana. Their usual food are insects, but they eat reptiles and fruits. They are polygamous, and at the breeding season the male struts about on some eminence, puffing out the feathers of the neck and throat.

O. lucionensis of China may be a distinct species.

Other species are E. mbara, Rappell; E. Ludwigi, Rapp.; E. Cafrara, Light; E. Denhami, Children; E. Arabs, L.; and E. Kori, Burchell. A species very closely allied to E. Ewardisi is the Otis Australia, Gray, the wild turkey of Australia.

Houbara Macqueenni, Gray, Houbara bustard. Otis marmorata, Gray.

Dugdoor, AFGH. Tilbor, HIND. Hurriana florikin, ENG. Obhara, W. PAS.

This bird has a beautifully crested head, is 25 to 30 inches long, and extended is 4 feet. It weighs 44 to 54 lbs. It is supposed that both the male and the female assumes white plumage in the breeding season. It is found throughout the plains of the Punjab and Upper Sind, where it is much hawked with the cherrug falcon, Falco sacer. It also occurs from Delhi to Afghanistan, in Mesopotamia, in Europe, and England. It occasionally baffles the hawk by ejecting on it a horribly stinking fluid, which bemears and soils the hawk's plumage. Houbara undulata occurs in N. Africa and Arabia, and visits Spain.

Syphoetides Bengalensis, Gmelin.

The Bengal florik in is about 24 to 27 inches long, and 44 to 47 inches extended. In the breeding dress of the male, the whole head, which is crested, also the neck, breast, and lower parts, with the thigh coverts, are deep glossy black. It is found from Lower Bengal to all along the foot of the Himalaya. The sexes live apart, at no great distance from each other. They eat insects and sprouts of plants. It is shy and wary.

Syphoetides auritus, Latham, lesser florikin.

Otas fulva, Sykes.

Khar tit of Bhils. Likh, HIND. Kan-noul, CAN. Tan-mohr, MAHR. Charas, charaz, DUKH. Warragol Koli, TAM. Chulla charas, Nila-nilmili, TEL.

The Canarese, Mahbratta, and Telugu names mean ground peafowl. In breeding plumage, the male, in head, neck, ear-tufts, medial wing covers, and the whole lower plumage, is deep glossy black; the thighs are white. It is 18 or 19 inches long, and weighs 16 or 18 oz. Dr. Jordon considers the black and common grey florik in to be identical, but in the plumage of different seasons; it is found throughout India, from the Himalaya to the south. It eats insects and beetles. It is hawked by the bax, the laggar, the shahin, and wokhab.

Otis tetra, L., the Tetrax campestris, the small bustard of Europe, is said to have been found in the Peshawur valley, and occurs in Central and Western Asia and North Africa.

The following are bustards of Africa, some of which spread into Arabia, viz. O. riaid, Shaw; O. curruccens, Vieill.; O. scolopacea, Tenon; O. afris, L.; O. afroies, S.; O. Seuagelensis, Vieill.; O. melagonaster, Rapp.

The Australian bustard is the O. Australis; in the pairing season, the courtship dancing of the male is extremely singular.—Ainslie, Mat. Med.; Eng. Cynec. Jerven, Birds. See Birds.

BUSTI KHELI, an Afghan tribe. See Bussi.

BUT, a manner of pronouncing and writing the name of Buddha, also the Biot or Bot race.

BUT. PERS. An idol. In the Hindi and 531.
several Indian tongues, Bu or But is a spirit, generally an evil spirit.

But-Khana, a temple, an idol-house; by some supposed to be the origin of the English word pagoda, also supposed to be from pai-guda.

But, also Butkalay. Beng. Cicer arrietinum.

Buta. Hind. Head of the Indian corn, the Zea mays. Buta-dar, a diaper fabric. Also any shrub or plant; Crotalaria burhia; Cheti-buta, Abelia triflora. Buta kara-mee, Tel., Naucela parvifolia.

Butani, a clan of the Baluch Maghazhi tribe, which has been located in Kachi for a long time. The Maghazhi are subdivided into four principal families or clans, of which the Butani of Jell are the most illustrious, and give the chief or sirdar to the whole. They boast of being able to muster 2000 fighting men, and between them and the Rind a blood-feud long existed. The Maghazhi and Rind are alike addicted to the use of ardent spirits, opium, and bhang. The Butani dwelling in the Dehra Ismail Khan district, were a robber tribe until they became British subjects.

Butasha. Hind. Sugar cakes.

Buchter island, 32 miles from the shore in Bombay harbor. Its Hindu name is Depa-devi, or the island of the gods, Holy Island.

Erythrina monosperma, Lam.

Moott, Chhuhl, Can. Poras maram, Tam.

Pulas, Eng. Moduga chettu, Tel.

Paras; Dhak, Hind. Kinsukam, Sank.

This tree grows in most parts of British India and Ceylon. It covered the battlefield on which Clive defeated Suraj-ud-Dowlah, which in history is known as the battle of Plassey. When left to nature it attains a good size, but it is much cut for firewood, and its roots cut for fibre to make ropes with, and it is generally seen gathered and bushy. In April its large clusters of deep orange-coloured flowers, called teso, also kiau, attract attention. An infusion of the flowers of this and also of B. superba, dye cotton, previously prepared with alum, a bright yellow, which may be changed by an alkali into deep reddish orange. The lice insect is frequently found on the smaller branches. Its wood resembles teak in appearance, and is used for gunpowder charcoal, well curbs, and for building purposes. The leaves are sold to shopkeepers in the bazaars for the purpose of wrapping small articles in them instead of paper. From the bark of the root a very strong fibre is prepared. The root is cut into lengths of from two to four feet, and the bark peeled off, dried, and beaten by handfuls with a wooden mallet. It is used for caulking boats, and making ropes and cables for anchoring boats. The flowers are offered by the Ho to their goddess Desauli Bonga. Its gum, of a deep red colour, is known in commerce as the Butea kino and Indian kino, the Paigs gond or Dhak ka gond.

Butea Superba. Roxb. iii. 267.

Tige moduga, Tel. | Baranki chettu, Tel.

Tivva modugu, ".

An immense creeper with flowers resembling those of B. frondosa. It grows on the mountains of Coromandel, in the Circars, the Kheri jungle, and in the Dehra Doon, and is not uncommon in the provinces of Tavoy and Mergui. It yields the same kind of gum as B. frondosa.

Buteonine, the buzzard sub-family of birds of the order Raptoria, or birds of prey, comprises Archibuteo hemiptilopus of Tibet and the Himalaya; Buteo pycnnaeum of Tenasserim; B. rufinus of India and N. Africa, and B. vulgaris, the common buzzard of Europe, N. Africa, Asia Minor, higher mountains of India, common in the W Himalaya; B. sublimus, the Nimbiricis; and replaced on the plains by B. canescens; rare, and to the northward and far west only, in America; mostly migratory in Scandinavia. B. Bacha, Franklin, and B. Melanotis, Jerd., are synonyms of Spilornis cheela. Sank.

Butyhusufer, Linn., the great black scorpion of Ceylon; is as large as a little crayfish; its sting occasions a little inflammation.

Buti. Hind. A vegetable; flower.

Butia, a name comprising the Little Tibetans, the natives of Ladakh, the Tibetans of Tibet proper, and the people of Bhutan. See Bhot Bhutan; Bulti; Ladakh; Tibet.

Butocera Rubus, the Curumings of the Singhalase. A beetle which penetrates the trunk of the cocoanut tree near the ground, and there deposits its eggs; and its grubs, when hatched, eat their way upwards through the centre of the tree to the top, where they pierce the young leaf-buds and do incredible damage. — Tenent's Ceylon.

Butomus, a genus of plants of the ord. Butomaceae. Roxburgh (ii. 315) describes B. lanceolatus of India. B. umbellatus, the Kii-tau of the Chinese, is a waterside plant of China and Tibet. Its rhizomes, formerly eaten, are now used medicinally.

BUTTER.

Bitter is one of the components of milk, the others being curd or casein, a kind of sugar, and certain salts. The lighter matters suspended in milk, when it is allowed to stand, separate in the form of cream, which can be further separated, by churning, into butter and butter milk. The yield of cream is increased by dropping into the milk a small piece of zinc. Butter is naturally of a yellow colour, which is deepened when the cows feed in rich pastures, but it is often artificially heightened by arnottto and safflower. Karra, or fresh butter, is seldom used by the natives of India. It is generally kept till it turns rancid, and then clarified by repeated boiling. This is called roughgan in Persia, and ghi in India. The ordinary drink of the Tartars is kumys, a spirit made of mare's milk. They pour the milk into a large leather vessel, and, when they have got a considerable quantity, beat it till it begins to ferment like new wine. When it becomes quite sour, they beat it again violently, and then draw off the butter part. The fermented whey makes a brisk sort of liquor, with an agreeable almond flavour, very intoxicating to those not much accustomed to it. The Tartars also make from goats' milk a kind of butter, which they boil and keep for winter use in goats' skins, and though they put no salt in it, it never spoils. It is a simply ghi. After they have taken off the butter, they boil the curd again to make cheese, which they dry in the sun, and which is as hard as iron. These cheeses they put into sacks for the winter store, and when the supply of milk becomes scanty, they put this hard, sour curd into a leathern vessel, pour hot water upon it, and beat it till it liquefies; and with this acid drink they have to content themselves during the time of year so severely felt by pastoral nations. The Tartars live chiefly on their flocks and the produce of the chase. In China the milk of every domesticated animal has been employed for making cream and butter. The milk from the wild cow is said to be the best. Ghi, or clarified butter, is called Ti-hüi. — Smith, 45; Huc's Christianity, i. p. 209; Tomk. i McCull.

BUTTERFLY.

Let-pya,  BURM.  Parwana,  HIND.  Papillon,  FR.  Farfallas,  IT.  Schmetterling,  GERM.  Mariposa,  SP.

Butterflies are very numerous in the S. and E. of Asia, and many of them very beautiful. They are classed by entomologists in the insect order Lepidoptera. The largest and most gaudy of Ceylon is the great black and yellow butterfly, the Ornithoptera darsius, Gray. Its upper wings, which often measure six inches across, are of a deep velvet black. Its caterpillar feeds on the Aristolochia and betel leaf, but the butterfly on the heliotrope. Papilio polymnestor, the black and blue butterfly, feeds on the ruddy flowers of the hibiscus or the dark-green foliage of the citrus. Papilio Hector has crimson spots on the black velvet of the inferior wings. When examining the Lachen valley, Dr. Hooker found the caterpillar of the swallow-tail butterfly (Papilio maachau) common, feeding on unbeliellurous plants, as in England; and a sphynx (like S. euphorbiae) was devouring the euphorbias; the English Cynthia cardui (painted-lady butterfly) is uncommon, as were saffuras, marlinae, Papilio (whites), blues, and Thecla, of British aspect but foreign species. Amongst these, tropical forms were rare, except one fine black swallow-tail. Kallima inachis of India and K. paralekta of the Malay Archipelago furnish wonderful examples of protective resemblance to dead or decaying leaves, every one of them being some shade of ash or brown or ochre. The Ornithoptera paeonae of the Anu Islands, is the bird-winged butterfly. In the western districts of Java are the calliper butterfly, Charaxes kademi; of birds, the elegant green and yellow trogon, Harpitaces Reinwardt; the gorgeous little minivet fly-catcher, Pericrocotus mininus, which looks like a flame of fire among the bushes; and the rare black and crimson oriole, Analaeus sanguiolentus. The Papilio arjuna has its wings covered with grains of golden green. — Wallace, p. 118.

BUTTER MILK.

Dhal,  HIND.  Salla, also Majiga,  TEL.  Moz,  TAM.

Butter milk forms an ingredient in many native recipes; it is used by chocklers for softening leather. — Rohde, M.S.

BUTTER-NUTS.  See Caryocar.

BUTTERS, VEGETABLE.  This name is given to the concrete oil of certain vegetables, from its resemblance to the butter obtained from the milk of animals. The term is also occasionally, but improperly, applied to some vegetable products which are entirely of a waxy nature, such as the wax of Myrica cerifera. The name is likewise bestowed in Siberia on certain alge, species of the genus Nostoc, such as N. pruiforme. The most important vegetable butters are produced by species of Bassia and certain palms.

Butter of Cacao, from Theobroma cacao. 1000 parts of the seed yield 300 parts of a concrete oil or butter, of a most agreeable flavour.

Butter of Cinnamon, from Cinnamomum verum, or C. Zeylanicum. By strong decoction the fruit yields a concrete oil, also called cinnamon wax, used for candles, and which exalates while burning a most fragrant odour.

Butter of Nutmeg, from Myristica moschata, is brought from the Moluccas, of two kinds, and is obtained by bruising the nutmegs into a paste, which is compressed in bags between hot metallic plates.

Butter of Coconut, from the Cocos nucifera, is prepared by rasping the pulp of fresh ripe coconut, adding a little hot water, squeezing and boiling the milky juice until the water has evaporated, and filtering through paper. This oil separates into two portions, the one fluid and limpid, the other a solid concrete substance of a pure white
colour, which, in the shade, remains unliquidated at all temperatures.

Butter of Pahu-oil, from Eleis Guineensis, a native of Africa and America. It is much esteemed in Europe for enlarging, and has been lately recommended for culinary purposes.

Butter of Tapal Tree, the Pentadesma butyracea, B.c., of Sierra Leone, is so named from the yellow, greasy juice which copiously flows from it when cut. It is mixed by the Negroes with their food.

Kawan Solid Oil, of Java and Singapore, is obtained from an undetermined species of Bassia. Shea Butter is from the seeds of Bassia Parkii, Don, growing in W. Africa; likely to become valuable for the manufacture of candles and soap.

Galam Butter, from Bassia butyracea, Fulwa or Phulwara, also Choorie, of Nepal, Alморa, and Kamaon in Northern India. In the province of Dotee this is so abundant, that the oil is cheaper than, and is used to adulterate, ghi. It is white and solid, fusible at 120°, and exhibits little tendency to become rancid when kept.

Bassia latifolia Oil separates into two portions, one on the surface, fluid, and of a pistacio green colour; the other of a brownish green, and almost solid.

Bassia longifolia or Illupn Oil. One sample separated into two portions,—the upper, fluid, of a pale oil-green in colour, and the lower greenish white, and of the consistence of ghi. Another separated into three portions, the uppermost a golden yellow, and fluid; the middle, yellowish white, solid, and floating in the upper; and the lowest, solid, and brown in colour. A third was of the consistence of ordinary ghi. A specimen, almost solid, from Tanjore, was of a light golden-yellow colour.

Chinese Vegetable Butter from Stillilina sebifera is much in use in China. The number of these trees in the province of Che-kiang is immense.

Indian Vegetable Butter, Piney Butter, or Doo-пада Solid Oil, is from the Vateria Indica of the western coast of India. It is white or yellowish white, of the consistence of hard salt butter, and in the shade remains always solid. It is used for lamps principally, but is very suitable for soaps and candles. It is prepared by cleaning the seeds, then roasting and grinding them into a mass. To five seers of seed add twelve seers of water, and boil until the oil rise to the surface. Remove the oil, stir the contents of the vessel, and allow it to stand until the following day, when more oil will be observed on the surface, which may be collected, and the process repeated.

Caram or Carab Vegetable Butter, from Carapa Guineensis, a large tree in Trinidad and British Guiana.

Butter of the Great Macaw Tree, from Acercomia fusiformis.

Japanese Wax is from Rhus succedaneum.

Almond Butter, from Amygdalus communis.

Cocum Butter, from Garcinia purpurea seeds, which produce solid oil.

Gamboe Butter, Mukke Tylum, Tam., Arasana Ghoorghy yennai, Can., is a product of the Garcinia pictoria, Roxb., which grows abundantly in Mysore and the western jungles. Gamboe butters are solid, and of a deep leek-green colour. The oil is procured by pounding the seed in a stone mortar, and boiling the mass until the butter or oil rise to the surface. 24 measures of seed yield one seer of butter; it is sold at the rate of 1/2 annas per seer of Rs. 24, in the Nuggur division of Mysore, and is used as a lamp oil and as ghi.

Sterculia foetida Oil, Coordin yennai, or Coordin pusjan yennai, Tam., is thick at all seasons of the year, and is obtainable probably in large quantities in the Nalla Mallas and Yella Mallas forests of the Peninsula of India.

Butter of Laurel, Laurus nobilis.

Solid Oils are obtained from some Dipterocarpi in the Indian Archipelago.

Solid Oil of the Horse-eyes and Cacoons of Jamaica, Fevillea scandens, is white and hard.

Mijo or Japan Butter, from Doliches soja.

Solid Oil, from Myristica (Virola) sebifera of British Guinea.

Solid Oil from the Demanara butter tree, Snouari, Pekea tobeculosa.

Solid Oil of Bombay, from Salvadoria Persica, or Vernonia abbreviata?

Croonga Malagum Oil, of Masulipatam, separates into three portions,—the uppermost, fluid, resembling brown sherry; the middle, of the consistence of ghi, and brownish yellow; and the lowest almost solid, and of a hair-brown colour.

Moorogana Butter, of Canara, is used for medicinal purposes, and as an ointment for the wounds of cattle injured by tigers. It is said to be produced from a forest tree growing in the Canara jungles. It is dark brown, and is the most solid of the solid oils.

Odur or Adul Oil, of Travancore, separates into two portions,—the upper, fluid, of the colour of golden sherry; the lower, reddish white, of the consistence of ordinary hard salt butter.

Shacotty Oil, of Canara, used for cutaneous eruptions, separates into two portions,—the upper, yellowish fluid, and the lower brownish-red, and of the consistence of hard ghi.

Hibavania, a solid oil of Canara, from the Sampaoyj district, of a clove-brown colour.

Camujuy Tree Oil; a small bottle, priced Rs. 24, from the same district, was a dark gelatinous mass, of the consistence of blanc-mange.

Oil of Hydnocarpus inebrians, the thortay oil of Canara, used for sores, is a very valuable vegetable solid oil, of the consistence of ordinary hard salt butter.

Terminalia bellerica, Tani-kai yennai, separates into two portions,—the one fluid, of a pale oil-green colour, and the other white, floccular, and of the consistence of ghi.—Madras Museum Report, Simmonds, pp. 510-514.

BUTTON.

Bottoni, ....................... IT. Battan, ....................... TAM.

Bahr, .......................... MALAY. Buttasalu, ....................... TEL.

Buttons are made from every possible material. Those of metal are often gilt; and five grains of gold, and sometimes 24 grains, are made to cover 144 one-inch buttons, so great is the divisibility of that precious metal. A round ball or button is used in China to mark the rank of their weavers. The members of the first rank, or highest order, wear on the apex of their caps a dark-red corn ball or button; the second class have one of a
light red; third class, light blue; fourth, dark blue; fifth class has a crystal ball; and the sixth class a ball of mother-of-pearl. Members of the seventh and eighth class have a golden ball, and the ninth and lowest rank, one of silver. Each officer may be further distinguished by the decoration of a peacock's feather. This is attached to the base of the ball or button on the apex of his hat, and slopes downwards; it is worn at the back.

**BUTTOO-PASSALEI KIRAI.** TAM. Basella cordifolia, Lam., B. alba, Linn.

**BUTUM.** Arah. Pistacia terebinthus, turpentine.

**BUTUNT.** A name given to the Tartars by the people of Lower Kunnawar. They also call the Tartars Zhal, also Bhotia, and their country is called Bhot and Bootunt. These Tartars differ greatly in appearance from the people of Lower Kunnawar.

**BUVUSHIRUM.** Sansk. Phyllanthus niruri.

**BUWAYA.** Malay. Crocodile.

**BUXAR,** a town, lat. 25°32' N., long. 84° E. It gives its name to a district which is a subdivision of Shahabad. The town is built on the bank of the Ganges, and is largely inhabited by Mahomedans. A battle fought and won here by the British, 22d October 1764, under Sir Hector Munro, against Mir Kasim, the last independent Nawab of Murshidabad, placed Bengal and Behar in their possession.

**BUXUS,** a genus of plants, the species of which afford the valuable boxwood. S. sempervirens is the common box, and forms a large evergreen bush or small tree, common all over the S. of Europe, from Spain to the N. of Persia and into the N.W. Himalaya. The Himalaya boxwood is known as Pabur Lakri. Mr. Dunlop saw a jungle of this plant at Sem Kharrak, beyond Ramoo, the trees as tall as English firs, and some of them as thick round as a man's body. The chief supply of boxwood for Europe is derived from the southern parts of Europe, and from Asia Minor. European boxwood is more curly, softer, and paler than the Turkey. The Karens furnished Dr. Mason with specimens of a wood not light, but scarcely to be distinguished from the boxwood of Europe. Dr. Wallich found Nauclea cordifolia on the banks of the Irawadi, with wood coloured like that of the box tree, but much lighter, and at the same time very close-grained. One Tavoy tree, he says, has a strong, tough wood, in grain like box. B. Chinensis, Lam., is the Chinese box tree. Buxus emarginatus, Wallich, was introduced into Britain from the Himalaya. The wood is found to be softer than the common kinds, though like them in other respects. Woodcuts have been engraved upon this wood, which has the advantage of being of considerable size and thickness.—*Eng. Cyc.;* *Royce, Hist. Bot.* p. 327; *Mason;* *Voigt.*

**BUXUS SEMPEPVIRENS.** Linn.

**BYAT.**

This grows in northern Persia, also in China in the provinces of Kiung-Chau-fu, Hainan island, and in Tung-jin-fu in the Kwei Chau province; it is abundant near Manikaran in the N.W. Himalaya. From being lopped, it is generally seen as a shrub, but at times grows to a tree of some girth, locally only, on the Sutlej and Bass, upon the Rattan Pir, near Panch, above Rawli Pindi, in the Salt Range, and Trans-Indus. The wood is carried to Umbiraur and other places in the plains to be made into combs, but the supply is probably getting exhausted. This is found in the Sutlej valley between Rampur and Sungnum at an elevation of 6000 feet. Wood hard, heavy, and nearly as compact as the boxwoods of Europe. Used in the schools of art throughout India for woodcutting, and used under the same name for rifle bullets. The leaves of the box are poisonous to the camel. —*Cleghorn, Panjub Report,* p. 63; *Powell's Handbook;* *Dr. J. L. Stewart,* M.D.

**BUYO,** thePhilippines, betel leaf, the sirih of the Malays, and Piper betel of botanists.

**BUZ.** Pers. A kind of antelope, or long-horned mountain goat, called Tish by the Arabs.

**BUZA.** Hind. Hordeum hexastichum.

**BUZGUND.** Hind. Gutpista; Pistacia nut.

**BUZLI.** Hind. Orostechium lanuginosum.

**BUZORO-BUTU,** of Bombay, Cynca circinalis.

**BUZOTI** and Siph are small but very brave Pathan tribes, the Buzoti numbering 500, and the Siph 300 fighting men. They live in tolerably close connection with their more powerful neighbours the Afridi, and manage to hold their own. After the British acquisition of the Panjab, they acted up to their engagements in regard to the Khasias, and generally behaved well.

**BUZRUJK.** Arab. Limsaid.

**Buz-kaluna, Plantago ispaghula.**

**Buz-ul-Bunj-Ahmar, seeds of Cleome visciosa.**

**Buz-ul-Bljub-Ahmar, dill seeds.**

**BWAI-JIN.** Eng. Careya arborea, Roxb.

**BWA-JIN.** Burm. Bauhinia anguina; B. racemosa.

**BYA-JAINTI.** Hind. Sesbania Egyptia. See.

**BYA-KED,** also Bokyool. Benc. Indian nightshade, Solanum indicum.

**BYANA** or Byara, Kalm. A piece of pasture land attached to a village, and assigned as a perquisite to the headman, who let it out for the grazing of cattle at a charge per head. —*W.*

**BYANS,** a pass in Garhwal, in which are 9 villages and 184 houses. The people who occupy four of the Garhwal passes are Bhot; those in the Darma pass are said to be Mongols left by Timur. The Bhotia in Byans speak a dialect of Hindi.

**BYANS RISHI** is a mythical holy man, who is supposed by the people of Byans in the N.W. Himalaya to be dwelling on the top of the Kelifong mountain. He appears to be the rishi Vyasa.

**BYAT.** A powerful tribe which came originally from Tartary with Chengiz Khan. They were long settled in Asia Minor; and a number of them fought in the army of Bajazet against Timur. After his defeat, many of the families of this tribe were sent by the conqueror to the province of Dairbekir, but, having quarrelled with its ruler, they went to the territories of Baghdad, where they lived till the time of Shah Tamsap, who brought them into Persia. One half was settled at Souj Bulagh, a district of Teheran, and the remainder at Ashraf, in Mazenderan. They remained on these lands till Abbas II. transplanted a number of them to Khurasan. The
Byat are still more numerous in Turkey than in Persia; but in the latter country, in the reign of the Saffawan monarchs, they were registered at forty thousand families.—Malcolm's Persia, ii. p. 218.

BY-IT-ZIN. BURM. Antidesma paniculata.

BYL.T.E of Ptolemy, are the Baltic people of Little Tibet. They have on the east the Khor country, which is inhabited by a people supposed to be the Chaurundi Seytanes of Ptolemy.—Cuaningham.

BYNNE AIRACK is from Caryota urens. 

BYNSA, one of the seven branches of the Byrana race.

BYRAGI. ANGLO- HIND. For Viragi (vi, privative, raga, passion), Hindu Vaishnava ascetics. The followers of Ramandan and Kabir form their principal subdivisions. The Byraga, or Zafaratia, is a small crooked stick or piece of iron which the Byragi devotee places under his armpit, to lean upon as he sees. See Vairagi.

BYRD, amongst the Rajput races, the blessing of a bard to a ruler. Whenever a Suktawat chief enters the court of his sovereign, or takes his seat among his brother chiefs, the bards still salute him with the dying words of Ballo—The bard, jealous of so sweeping a byrd, complained that nothing was left for him, when the master bard replied, he was 'Kewar-ka-Aggul,' the bar which secures the door, 'Kewar.'—Told's Rajasthan, i. p. 308.

BYSSUS, a long, delicate, lustrous, and silky fuscillus of filaments, by which some of the conchiferal mollusces, for example the Mytilaceae, mussels, and Mallicheae, hammer oysters, are moored to rocks, etc. It is an assemblage of muscular fibres, sereed up in one part of their extent, but still contractile and in a living state at their origin. The tendinous foot of Byssacea and Tridacna seems to be a step towards the organization of a true byssus. The byssus of the great Pinna of the Mediterranean is in a fleshy sac or sheath at the base of the foot, which is attached towards the middle of the abdominal mass of the animal. In Italy it is manufactured into various articles; and there are few museums without a glove or a stocking woven out of this substance. The pearl oyster, by a byssus, secures itself to the rocks. The animal's foot is composed of muscular fibres, and is 2½ inches long when distended. On the lower side there is a groove lined by a secrerting membrane, which is an exact mould for the formation of the byssus. When the animal desires to attach itself to the rock, its foot is protruded and, after seeking out a suitable spot with the tip for some minutes, is again retracted into the shell. A strong fibre, of the form of the groove in the foot, is thus left, attached to the base of the foot at one end, and to the rock at the other. The process is again and again repeated, until a strong cable is formed; and it was one of the

most important results of the careful investigations of Dr. Kelaart in Ceylon, that the power of the animal to cast off its byssus at pleasure was ascertained. It leaves it behind to make another in a more convenient place. From this ability to shift its berth, it follows that the pearl oyster might safely be taken from its native beds and made to colonize other parts of the sea, and also that it would move of its own accord if the surrounding water should become impure or sandy, or when there is an influx of fresh water. The animal can reform the byssus at pleasure, if in good health and condition.

BYTNIERNACE.E, the Byttneria tribe of plants, by some botanists considered a distinct natural order, by others reduced to a section of Sterculiaceae.

BYTURNI river rises near Lohardugga, in lat. 23° 29' N., long. 84° 55' E., runs S., S.W., S.E., E., into the Bay of Bengal, by Dhunrah river; length, 345 miles. It receives the Sunk, 95 miles. About 26,000 square miles are drained by the Brahminy and Byturni. It is the Styx of Hindu mythology, and is sacred, more especially at its source. There is a legend that Rama, when marching to Ceylon to rescue his wife Sita from her captor Ravana, halted at the river-side, on the borders of Keunjahr, and numbers of Hindus visit the river every January. It is also written Baitaranj.

BYZANTIUM of Ptolemy is supposed to be the Balabhi of Gujerat.

C

C, in the English alphabet, has no power of its own, but takes that of k before a and u, and of s before e and i. Its use for foreign words is therefore apt to mislead; for instance, in the Persian and Urdu word circar, a government, an authority, and in common use, there is one letter for two sounds, and two sounds for one letter,—a breach of all system. Even the form of ch has two sounds, as in character and charter. To get rid of this inconsistency, the tendency has been growing amongst scientific men, to substitute ka and ku for ca and en, and to write Cabul and Cashmir as Kabul and Kashmir, and Ouch and Cudapah as Kach and Kadapah, and also to use k for the hard ch. The Italians have the soft English ch in cio and ce; and the French and Germans use the letters tch and tsch to meet the equivalent letters in all the cultivated languages of Southern India in which the sounds produced by the English compounds of ch, as in child, have single letters with corresponding powers in all those tongues, and, in all but Tamil, ch h also has equivalents modified in compound letters, but there is no letter which has two sounds of ch, as in character, child. With entirely similar sounds for ca, en, and ku, some duplication is unavoidable. See CH.

CABA. ARAB. A quadrangular building in Mecca, towards which all Mahomedans turn in prayer; the Black Stone, Hajar-us-siah, is built into its wall. It was a lingam of the god Mahadeva or Siva.

CABAB-CHINI. HIND. Cabeba.

CABAN, in the Philippine Islands, a measure of capacity.
Cabbage, Brassica oleracea.

Peh-tai, CHIN. | Kohl, HIND.
Chou, FR. | Cavoletto, IT. | Kohl, GER.

The word is derived from the Latin, capit, a head, through the French cabas. The opinion is generally entertained by naturalists, that the white and red cabbage, savoy, borecoles, cauliflower, and broccoli have all originally sprung from the wild cabbage of the sea-coast. The cabbage, horse-radish, cress, mustard, turnip, etc., all belong to the natural order of Cruciferae. The varieties cultivated are, red, rose, and white; also the hundred-leaved cabbage. Cabbage is largely eaten by the Chinese. From the seeds of a variety cultivated on the continent of Europe, the colza oil used in lampa is expressed.

Cabbage, a term applied to the new leafshoots at the tops of palm trees; they are cooked and eaten as vegetables. That of the Alshephila excelsa of Flinders island, Australia, is in substance like a Swedish turnip, but is too astringent in taste to be agreeable, and it is not much improved by cooking.

Cabinets of silver are worn by all the Jan-gam sect of Hindus, each containing the conical emblem of Siva, the lingun of the Hindus, the phalus of the Greeks, and the priapus of the Romans. The tabernacle of Moloch, mentioned in Acts vii. 43, was doubtless a cabinet in which the object was enclosed; and the shrines of Diana were most probably of the same construction, and for the same purpose. In a medal, with a figure of Diana's shrine, shows pointed cones and a semi-lune. Bacchus brought his thyrsus from the east when he returned from his Indian expedition. It was said to have been surmounted by a fir cone or pine, but a recent writer in the Edinburgh Review thinks it was the date. This fruit, according to Pliny, was consecrated to the worship of almost every heathen divinity. The date palm is the scriptural emblem of all that is dignified, beautiful, and good, and entered largely into the ornamentation of temples.—Edinburgh Review; Miller's Seven Churches of Asia, p. 130.

Cable.

Tan, Ankeratau, GER. | Tal-i-sawu, MALAY.
Langkeri rasi, HIND. | Amar, TEL.
Gomena, IT.

In Southern Asia some cables for ships are made of coir, the requisite quantity being laid out at full length along the beach or other convenient spot; they are made upon strands, and twisted in a very simple machine, viz. a strong wooden frame in a strong board, across which three or four pins are placed, and turned, like the screws of a carpenter's bench, by as many men; the further end of the cable is fixed to a large revolving pin, which is turned round in a similar manner. As the strands are twisted, the horse in which this is fixed is drawn nearer to the other. It is evident that cable strands thus laid are very unequally strained, the outer lines being tight, while the inner ones are slack. By laying the strand and twisting it as each yarn leaves its separate reel, a strand is formed of which each yarn bears its due proportion of the strain. Hubbard's patent rope was laid on this principle; the necessary apparatus for winding off the yarn might be readily made. Cables for the Shakespeare bridges were formed of the country rattan. In the Red Sea, cables formed of the coating of the branches of the date tree are used; and the same material, with a proportion of fibre of the Kalderu bush, the Pandanus odoratissimus, is used by fishermen in forming drag ropes for their nets at Oopada. In the Eastern Archipelago rattan cables are largely used.—Mr. Rohde, MISS.

Cabo Negro, Spanish, of the Philippines, is obtained from the gomuti palm, Arenga saccharifera, and resembles black horse-hair. It is found between the trunk and branches, in a matted form, interwoven with interlaced twigs. When separated from the latter, it is manufactured into a cheap and durable cordage, chiefly used for cables and standing rigging. A single palm in its lifetime yields two crops of this material, each amounting to about 9 lbs. The twigs are used as writing pens, and also as arrows. Under the hair-like material a soft substance is besides collected, used as okum for caulking, and as such exported to China.—Walton's State, p. 119. See Gomuto.

Cabook. SINGH. Lateritious deposit, said to be the product of decomposed gues.

Caboool. See Kabul.

Cbral. Alvarez Cabral, the Portuguese commander in the second expedition sent to India by the Portuguese. It consisted of 13 ships and 1200 soldiers, and sailed from the Tagus in March 1500. In his route he discovered Brazil, A.D. 1500, and took possession of it, and then sailed to Calicut. He lost four ships, in one of which Bartholomew Diaz perished. He entered into treaties with the kings of Cochin, Cannanore, Onore (Honoire or Honawar), and Quilon, and built fortresses at their principal towns. The Zamorin at first was cordial, but, being instigated by the Mahomedans, attacked their fort, and killed all the Europeans. Cabral retaliated by destroying ten Mahomedan ships, and then returned to Lisbon in July 1501.

Cacailia Coccinnea, a flowering plant, mostly found in waste places.

Cecilia Kleinia, Wight. Hart's ear.

Lisan ul saur, ARAB. | Yenna putu nalikil, TEL.
Gao zaban, PERS. | Jimmuddu, Ermina-Kullie, TAM.

The leaves resemble the tongue of the buffalo; the stalks are prickly, and covered with white spots. While fresh, the leaves have a strong smell like hemlock; they are given in decoction in rhumatism, syphilis, and lepra. For the class of cases in which sarsaparilla is usually employed by European practitioners, they seem to be highly esteemed by Mahomedan and Hindu practitioners. A water distilled from the leaves is kept for use.—O'Sh. p. 420; Houyberger, p. 246.

Cacalia sonchifolia, Linn.

Emilia sonchifolia, D. C. | E. purpurea, Cass.
Shudimudi, BENG. | Udram panum, Sansk.
Pella camudi, MALAY.

A decoction of this plant is deemed antifebrile on the Malabar coast.—O'Sh. p. 420.

Caca-Mullu. TAM. Pedalium murex. Cacapa, Legularia vulgaris.

Cacatina or Cocato, a sub-family of birds of the family Psittacidae, of the order Scansores. See Birds.

Cacay tree is the greatest ornament of the woods of Karnataka. The foliage is a fine shining green; and the pendulous strings of flowers surpass those of the laburnum, not only in beauty,
but in length and number. In the cool of the morning they diffuse a most agreeable perfume.
The plant is sacred to Ganesh, the god addressed by all Hindus about to commence any undertaking.
The people worship him under the form of his favourite tree. The cultivators of every village place a stake of the Cacay on the ground, level a circular place round it, and purify this area with cow-dung. On this spot they assemble before the commencement of seed-time; burn some incense before the stake, make offerings of rice, milk, and the like, and pray for the success of their crops. The ceremony concludes with a rural feast. It seems to be the Cathartocarpus fistula.

CACHALOT, the Physeter macrocephalus, or sperm whale. The male ranges in length from 58 to 76 feet, is about 60 feet in the average. The female does not exceed 30 or 35 feet. The cachalot is without symmetry, of a prevailing dull black colour, occasionally marked with white, especially on the abdomen and tail. They propel themselves round by striking and pulling against the water with the flashes of their tails. The lower jaw is diminutive, slender, and in form not unlike the mandible of a bird; the teeth of the upper jaw, wholly ivory, in aged males are of great solidity, and weigh from 2 to 4 lbs. each. It spouts a thick watery mist from its nostrils at intervals of ten or fifteen minutes. The valuable sperm is chiefly situated in the head. It is a solid mass of soft, yellow fat, weighing between 2 and 3 tons, in a hollow of the head, bared on the upper jaw, and forming the lower part of the snout. The cavity, called case, is situated to the right and beneath the spouting canal, and corresponds to nearly the entire length of that tube. It is filled with a very delicate well of cellular tissue, containing in large cells the limpid and oily fluid, which is liberated on the slightest force. The quantity, chiefly spermacei, contained in this singular receptacle is often very considerable, and nearly 500 gallons have been obtained from the case of one whale. It has been noticed in the Mediterranean, and a strag individual in the Thames.—Hartweg.

CACHAR, a district in Assam, in the upper portion of the valley of the Barak, extending from lat. 24° 13' to 25° 30' N., and from long. 92° 26' to 93° 29' E. Its area, 3750 square miles. Its population in 1872 was 275,027, in the area of 1285 square miles, to which the census was confined. They consist of Manipuri, Cachari, Lushai or Kuki, Naga, Mikir, and Khassa. The Burmese invaded it, but were again expelled during the first Burmese war, when the legitimate raja, Govind Chandra, was restored by a treaty. On the southern frontier of Cachar lies the territory of the Lushai or Kuki, a most warlike tribe, who in 1848-49 drove up the Kuki from the south into Cachar; but Colonel Lister, by a judicious employment of the Kuki as soldiers, exerted a salutary influence over the Lushai. The Lushai, however, have in their turn been pressed up northwards by another tribe still more powerful than themselves, called the Poi, who approached from the south-east. The lonely tract lying between Cachar and Chittagong is inhabited by the Lushai, who claim and hold all the tract of country to the south of the parallel of the latitude of Chattergoora hill, and east of Hill Tiperah to the Tepai river is the Burmese frontier. The Cachari dynasty ended on the assassination of Govind Chandra, without heirs, in 1830, and in 1854, Tularam Senapati of N. Cachar also died without heirs. The Cachari people must at one time have had an extensive sway in the valley of the Brahmaputra. The people adopted Hindustan about the beginning of the 18th century, and about half the number profess that faith. It yields rice, petroleum, salt from salt wells, and several valuable timbers, tea, caoutchouc from the Ficus elastica. The elephant, rhinoceros, buffalo, metra or wild cow, gavæus gaurus, tiger, black bear, and deer occur, with the sambar and the barah-sinna. The Manipuri women weave excellent cotton cloth, and a fine net for mosquito curtains. The agriculturists hand themselves together as guilds or khel.—Imp. Gaz.; Atchison's Treatises, p. 77; Ann. Ind. Adm. xii. p. 86.

CACHARI. HIND. Cucumis purpureus s. CACHAR KALANG. TAM. Dioscorea alata. CACHU. HIND. Colocasia antiquorum. CACHUR. HIND. Cucumis zedoaria. CACODOXUS ARGUS. Linn. A fish eaten by the natives, though many reject it on account of its reputed disgusting habits. In several examined in the estuaries of the Ganges and at Penang, the stomach contained remains of small fishes and crustacea. According to Bennet, it is in Ceylon angled on hooks baited with a kind of sea-weed (Pendah), of which this fish appears to be particularly fond.

CACRI. HIND. Cucumis utilisissimus.

CACSHA, in the astronomy of the Hindus, the orbit of a planet, or the circle which ancient astronomers called the deferent; for the Cachsha carries epicycles (Paridhi), like the deferent.—Warren.

CACTACE.E or Cactace, the Indian fig tribe or exogenous plants; many genera and species are found in S.E. Asia. Some species are the food of the cochineal insect. Of these the Opuntia tuna seems the most employed in Peru; O. Hernandezii is the most celebrated in Mexico; and O. cochenillifera, the native province of which is somewhat doubtful. The Old Man cactus, Cereus senilis, Salo, is so called from the hoary aspect of the columnar stems. The cactuses are natives, almost exclusively, of the new world, from whence the prickly pear (Opuntia Ficus Indica), now abundantly naturalized in the Atlantic islands, and generally on the shores of the Mediterraneæan, where it serves to form impenetrable fences, was originally introduced.—Engl. Cyc. p. 710; Voigt, p. 60.

CACTUS INDICUS. Roxb.

Opuntia Dillenii, Haw.

Nag-phunee, | ENG. | Kabuli-tsun, Gangi-Naga-kali, | TAM. | sho, Kangi-chii, {PANJ.

Dr. Roxburgh supposed this plant to be a native of India, grounding his opinion on its general distribution and its native names. Dr. J. S. Stewart mentions it as a plant of the Panjab, on which the wild cochineal insect feeds. In the Panjab, it is grown as a hedge up to 4000 and 5000 feet, near the Jhelum. Dr. Roxburgh also mentions C. Chinensis, with its synonym Fabricia bracteata.—Roxb.; Dr. Stewart; Voigt.

CADABA INDICA. Lam., W. and A.

Strenna tetrandra, Roxb.

Indian Cadabas, | ENG. | Chimurudu, | TEL. | ada-morinika, | TEL. | Polomerini, | "

Chekomadi, "VAls, | "

—588—
A straggling shrub, flowers in terminal racemes, of a dingy white, nearly throughout the year; very common about Musalmans burial-grounds. C. Indica, Lam., and C. trifoliata, W. and A., are plants of Coromandel.—Riddell.

CADAGA SALEH. TAM. Rungia repens. CADALACCA. MALEAL, Cadalay, TAM. Cicer arietinum.

CADALI. SANSK. Musa paradisiaca.

CADALI PUA. TAM. Lagerstroemia reginae.

CADAM. HIND. Nauclea parvifolia.

CADAPILAVA, MALEAL. Morinda citrifolia.

CADASSUM, TAM. Barringtiona racemosa.

CADDIS-WORM insects are found in all tropical Asia. They belong to the family Lepto-ceridae, and the genus Setodes contains several of them; they are enclosed in cases with projecting shields.—Hartweg.

CADELARI. MALEAL. Acalyranthes aspera.

CADESIA. The battle on the plains of Cadesia, on the border of the Euphrates, fought in A.D. 632, decided decisively the fate of Iran. This battle lasted for three days; was fought during the khilafat of Omar, by his general Sa'd, against Rustum, the general of Yezdejird III., the last of the Sassanian race. The Arabs are said to have lost about 8000 men, while the loss on the Persian side amounted to nearly 100,000.

CADJAN. ANGLO-MALAY. Jowli, . . . HIND. Tennam ola, , . TAM. Cahan, . . . MALEAL. Taki aku; Cobaral aku, Tel. Pannam ola, . . TAM.

A commercial word, used by the British in India for the dried leaves of the cocoonat and palmyra palms; they are largely used as a thatch, which resists the rain better than tiles; but roofs made of them should be relaid before the commencement of the rainy season; 149,500 were imported into Bombay in the year 1850–51. Books of palm leaves, called kavile in Telugu, are prepared from the palmyra and the fan or cocoonat palm, and are written on with an iron style.

Kajan, MALAY, are mata made from the leaf of the Mang-kwang. See Cocoanut Palm; Fan Palm; Ola; Palmry.

CADJU. MALAY. Anacardium occidentale.

CADU. HIND. Lagenaria vulgaris.

CADUMBH. MALEAL. Barringtiona racemosa.

CÁLEDONES CALYCONUM. Bedd. A plant which grows at Panamassum, at the foot of the Tinnevelly hills, and called kótpira. Its wood is very hard.—Bedd. Pl. Sylv.

CESELINIA. Some of the species of this genus are useful trees or shrubs. C. bondwelica and C. digyna are of the climbing plants, the seeds and oils of which are used in medicine. The pods of C. coriaria, or sumach, a small tree, are used as a tanning material; C. paniculata is a magnificent climber of the Himalayas; and C. sappan yields one of the Brazil woods of commerce. The fleshy pods of a Cæsallinia are largely used as soap in all parts of China, and may be bought in every market town. C. binas grows in the Eastern Archipelago. C. Brasilienensis of S. America, province of Pernambuco, might be introduced into India; its wood yields a red dye; it is the Brazil wood of commerce.

CÆSALPINIA CORIARIA. Wilde.

This small tree is now growing plentifully about Singapore, Salem, Bangalore, Hurnaur, and Chichecole. It is a native of S. America, but in 1842 was introduced by Dr. Wallich into the Botanical Gardens at Calcutta. The seed-pods, for tanning leather, are considered superior to all the Indian astringents, and leather tanned with them is considered equal to that of the best of Europe manufacture. The pods are oblong, compressed, somewhat obtuse, curved laterally, the inner side being concave and the other convex. It is to the curved pod that the commercial term of divi-divi or libi-libi is given. The average produce of pods from a full-grown tree has been estimated at 100 lbs. weight, one-fourth of which consists of seeds or refuse, leaving about 75 lbs. of marketable matter. The divi-divi pods are of a dark brown colour externally, when ripe, and 3 lbs. of an inch wide. Underneath the outer skin of the pods, and separated from the seeds by a layer of woody fibre, is a considerable thickness of astringent matter of a light yellow colour, almost pure tannin, slightly darker in colour than that manufactured from galls, about 60 or 65 per cent. of the whole pod (excluding seeds). At an interval of six feet apart, an acre of ground will contain 1210 trees, yielding an average of 810 cwt., and 30 lbs. of divi-divi, or about 204 tons of marketable matter, worth, at only 5£ per ton, 1£200. The quantity of mucilage it contains precludes it from the use of dyers. One part of divi-divi is sufficient for tanning as much leather as four parts of bark, and the process occupies only one-third of the time. The selling price ranges from £8 to £13 per ton. The imports into the United Kingdom in 1844 were 3900 tons; in 1845 and 1846, about 1400 tons each year; during the subsequent three years the imports were merely nominal; but in 1850 a renewed demand seems to have sprung up, for 2770 tons were imported into Liverpool, and a few tons into London.

—Voigt; M. E. J. B.; Dr. Cleghorn’s Reports; Markham, p. 355; Simmonds’ Comm. Products, p. 503; Indian Annals, No. vii. p. 120; Jurors’ Report, Madras Exhibition, 1855.

CÆSALPINIA DIGYNA. Rott. C. oleosperma, Roxb. F. i. ii. 357.

Umul Kuchi, . . . BEN. | Nune gachi‘a, . . . Tel. This climbing shrub grows in the Peninsula of India, and at Bhagulpur. The seeds yield an oil used in lamps.

CÆSALPINIA PANICULATA. Roxb. Guilandina paniculata, Lam. | Hsao-Kouk, . . . BUM. Grows in all India; magnificent climber in Sikkim, festooning the trees with its dark foliage and gorgeous racemes of orange blossoms.

CÆSALPINIA SAPPAN. L. Sappan wood.

This tree, the Verzina of Caesar Frederic, grows widely over S.E. Asia. Its wood is a very important article of commerce. In 1842 as much as
78,000 cwta. were shipped from Ceylon, but the export from thence has decreased. A large quantity is exported from Siam and the Philippine Islands; as much as 200,000 pikuls annually from the former, and 23,000 pikuls from Manilla. 3524 pikuls were shipped from Singapore in 1851, and 4074 pikuls in 1852. 3670 tons of wood were imported into England in 1852, at £7 to £12 the ton. Fée considers Cesalpinia sappan to be one of the Brazil woods of the merchants. But it is probable that it is the produce of more than one genus. The best Brazil wood is said to come from Pernambuco, where it is called Pao da Rainha, or Queen's Wood, on account of its being a royal monopoly. C. sappan grows in the N. Arcot forests, in the Nalai Malai of Cuddapah in the Kotah jungles; is a native of Malabar, Ceylon, Bengal, Burmah, Tenasserim, Siam, and Amboyna; is found in the immediate vicinity of Prome, growing on the small hills of the place, and near Thounge-za, in the northern part of the Rangoon district, where it is also seen in small quantity. It is cultivated in Palghaut for dying the straw used in mat-making, and from its high price for this purpose, it is not used for carpentry. It grows with great luxuriance in South Malabar, where it is cultivated rather extensively by the Moplahs, who plant a number of the seeds at the birth of a daughter. The trees require fourteen or fifteen years to come to maturity, and then become the girl's dowry. Dr. Cleghorn thinks the dye-wood is damaged by being allowed to float in salt water. In the Bombay forests it grows freely in their cultivated places without any care, but the heart-wood is dingy, and wants that fine pinkish red which the wood of the southern forest has. The heart-wood being cut into chips, steeped for a considerable time in water, and then boiled, is used for dyeing. The cloth or thread is repeatedly dipped in this liquid, and hung to dry between each wetting, till it is brought to the shade required. To fix the colour, alum is added. The powder commonly used at the Hooe festival is extracted from the wood of this tree. The reddish-brown tint so frequently met with in the clothes of the poorer Chinese, is produced from this wood. The seeds are used for colouring milk. The chips are used like logwood, and medicinally.—Marsden’s Sumatra, p. 95; Voigt; Captain Macdonald; Drs. Wright, McClendon, Gibson, and Cleghorn.

C.ESALPINIA SEPIARIA. Roxb. Mysore thorn.

Reichardia decapetala, Roth.

Hao-kyan bo, BURM. Phalwai, HIND. Chilloor; Kilgato, HIND. Urm, Urm, of. KAGHAN. Haidar ka jhar, ...

Grows in Kamaon, Nepal, Bengal, Ava, Tavoy, Mysore, Ajmir, and in all the Himalayas under 5000 feet. It is a scendent, strong-armed shrub, used to fence around fields, and forming a splendid impenetrable hedge, covered with bright green leaves and large yellow spikes of flower. Hyder Ali surrounded fortified places with it.—Voigt; Irvine; Chow-Chow; Thompson; Stewart.

C.ESAR, the Arabic, Greek, and German Kaiser, a title of the emperors of Rome, which was applied to the Byzantine emperor, until the title was transferred to the Turkish sultan.

C.ESAREA ruins stand by the seaside, and from the summit of a tower that is washed by the waves, a view is obtained of the whole coast of Palestine, from Cape Blanco to Jaffa. When Colonel Skinner passed through the area of this great city was used for a burial-ground.—Skinner’s Overland Journey, i. p. 155.

C.ESAR FREDERICKE, a Portuguese jeweller who wandered from Bussora to Karacchee, and thence to Goa and Vijayanagar.

CAFFER BREAD, of the Cape of Good Hope, is from the Euphorobalsamier. The stem, when stripped of its leaves, resembles a large pineapple. It is also called the Hottentot bread-fruit. The Kafir people bury it for some months in the ground, then pound it, and extract a farinaceous matter of the nature of sago.—Captain Carmichael.

CAFFER TEA, the leaves of Helichrysum nudifolium, common in the Cape Colony, and used medicinally.

CAFFEE CHILLEY, Capsicum grossum.

CAFIR, also Kafir, a term employed in India to designate the African race, usually the large-featured, curly-haired variety. La Bourdonnais enlisted many into his army, but the British in India have never enlisted them. They are employed in the city of Hyderabad. A small number were employed in the Ceylon Rifle Corps; comparatively few of their children grew up, usually falling victims to pulmonary complaints. Cahir also is a term to designate the idol-worshiping race in the N.W. Himalaya, known as the Siah Posh Cahir, because of their black-coloured clothes. Also a general term of abuse by Mahomedans to any non-believer in Mahomed. It is from the Arabic, meaning a slanderer, and devoid.

CAGGAR, the ancient Dhaudahvati, a river of the Rajputana desert, also known as the Hakra, but absorbed by the desert sands many centuries ago. The stream took a westerly direction by Phoolra, where it is still to be traced, and fell into the Indus below Cutch. Its absorption occurred during the reign of Rao Hamir, prince of Dhat, and caused great physical and political changes in the country. There are vestiges of large towns buried in the sands; amongst them is the Rung Mahal, west of Bhainar, with subterranean apartments still in good preservation. The tradition is that it belonged to a Powar prince in the time of Alexander the Great, Sikandar Rooni. The absorption of the Caggar river is named as one of the causes of the comparative depopulation of the northern desert of India.—Todd’s Rajasthan, ii. pp. 218, 214. See Sarasvati.

CAHAMILILE. SINGH. A very hard, fine, close, even-grained heavy Ceylon wood.

CAHUÁ. HIND. Pentapetra arjuna.

CAILLEA CINEREA. G. and P.

Diehrostatybus cinerea, W. Densmannus cinereus, W. Mimosae cinerea, Linn. Acacia dealis, D.C. Mavalinga maram, TAM. Venuturu, TEL. This small tree grows in Ceylon, in the Madras Presidency, and is common on sterile plains of the Dekhan, Deuli, Patna, and Paghmam.—Voigt.

CAIN, according to Bunsen (iv. 426), Qayin, is the type of the dwellers in towns. He was the progenitor of the city-building Aryans, as also of the vast Turanian wanderers, who move about all but cut off from the rest of mankind. Cain is called Kabil by Mahomedans, and is fabled by them to rest under Jabil Shamshah, the highest wall of the crater at Aden, where he and his
Cairn.

A heap of stones or tumulus piled over the resting-place of the ancient dead, in different parts of S. India. Prior to the Buddhist stupas or tope, this seems to have been a common mode of covering the dead; indeed, the tope is only a cairn regularly built. On the Neiggerry hills are found remains of cairns, barrows, cromlechs, kistvaens, and circles of upright loose stones. In the cairns or barrows, vases, cinerary urns, and other vessels of glazed pottery, are often found, which sometimes contain human bones, more or less charred, and mixed with ashes; sometimes a little animal charcoal alone. They are met with in almost every part of peninsular India, from Nagpur to Madura, in immense numbers on the Animally hills, a range on the south side of the great Combatore gap, which forms the commencement and northern face of the Southern Ghats, those on the Animally being of a more advanced order and in better condition than the Neiggerry barrows. Similar remains are found in Circassia and Russia; and circles of stones surrounding ancient graves, are found on the southern Arabian coast, and in the Somali country in Africa. All around Hyderabad and Secunderabad, in the Dekhan, are great numbers of cairns; and many of these remains are at Rajan Kooloor, in Zorapur, and also at Siwarji, near Ferozabad, on the Bhima. Neither the hill people, the Toda and Kurubara, nor any Hindus, know anything about the race to which these remains belonged; and neither in Sanskrit literature, nor in that of the Dravidian languages, is there any tradition on the subject. The Tamil people generally call these cairns pandukuri; kuri means a pit or grave, and pandu refers to the Pandava brothers, to whom so much of Hindu mythology relates. The resemblance of the barrows and their contents (with the cromlechs, etc.) to the remains which are discovered in the ancient seats of the Celtic race in Europe, is exact (Dr. Caldwell's Grammar). In India, the tops or tumuli of Kruku-chandra, Kanaka, and Kasyapa existed before the preaching of Saky.; and the ancient elemental deities of the Vedas preceded the worship of Dharma or concrete nature.

Kodi Kul, or umbrella stone, Topi Kul, cap or covering stone, and Pandu Kul or Pandu stones, are other names by which the cromlechs of Southern India are known to the people. The Topi Kul is a large mushroom-shaped stone placed on the ground. Underneath it are urns of baked pottery, containing portions of human bones mixed with charcoal, and a fine powder or sand, in which also the heads had been placed. And whether with the Topi Kul, or the other cairns, a foreign earth, i.e. an earth not belonging to the locality, is used to cover in the funeral urns. Mr. Babington was the first to notice them, about the year 1820. Underneath the Topi Kul he found a flat stone, and beneath it an urn or urns, resting in a shell corresponding to its shape, filled in with fine sand; and on ledges near the urn, were remains of iron implements and weapons, with heads of various kinds, an iron tripod, a lamp, etc. In 1831 Captain Harkness found groups of cairns on the Saroni hill at Ota-

511
to 15 feet. The floor of the pit is flagged with stone slabs, on which is a cist, formed by slabs on edge, with a covering slab. Around the head of each cist were found circular vases, urns of red and black pottery, glazed and unglazed, spear heads, arrow heads, fragments of swords, of bill hooks, iron lamps, iron tripods. In one compartment of a cist Captain Taylor found a perfect male skeleton; in others, one, two, or three smaller skeletons, evidently of women, some with the skulls separate from the bodies, and the skeletons lying on their bellies; and between the upper flagstone and the floor, intermixed with the human skeletons and portions of skeletons in every possible position, the skulls of many being separated from the bodies. These he considered to be the remains of persons who had been sacrificed and thrown into the grave-pit of the cairn. The slabs above, the guiding entrance below, and the cists, lay invariably N.E. and S.E.

In the circles near Hyatnuggur, and other places around Hyderabad, southwards to Zorapur, bells, iron weapons, and pottery have been found. The weapons consisted of arrow heads, a javelin red like that used by the Binjari race of the present day, lance and spear heads, bronze bells and cups. In a Hyatnuggur cairn, also, were found chank shells (Turbinella pyrum), some of them intended to be used as conchis, others as ornaments, necklaces, etc. The pottery articles were cups, and an hour-glass-shaped drum, also human and other bones.

All around in the cantonment of Secunderabad and Bolarum are numerous remains, many of which have been opened, and some very perfect skulls obtained.

There are many cairns on the Masulipatam road, noticed by Captain (now General) Doria. Also at Goor Mukul, between Zorapur and Hyderabad; many near Dewarconda, about 40 miles S.E. from Hyderabad; also at Narkelpilly. A return from Mr. Felly showed 2129 cromlechs and kistvaens in the Bellary district, which the people believe to have formed the dwellings of a diminutive race called Mohori. Cairns, cromlechs, and kistvaens are also to be seen in all the Raichore Dooab; in the district lying between the Krishna and Tumbrada, on the Yemmee Gooila hills.

At Vihathalli Captain Taylor discovered a great group of natural rocks or tors, surrounded by circles of stones. One at Vihathalli consists of a square of 22 rocks on each side. It is partly incomplete, and the area measures 360 by 340 feet. At Shahpur is a parallelogram, where 56 huge rocks enclose a space and tumulus 400 feet by 260. Some of the masses exceed 200 tons in weight, one of them 267 tons, and it is difficult to imagine how such masses were moved from the granite hills at Shahpur, three miles distant. It had been a place of cremation on a large scale, and the tumulus consisted of human ashes, charcoal, and pieces of bone; and the remains of each body had been covered over with white earth.

The Zorapore graves are of two kinds, one in which the dead were buried, accompanied by human sacrifices; the other burned their dead, and placed their ashes in cairns, or collected and placed them in kistvaens.

Captain Congreve regarded these Neolithic remains to be those of Scythic races. Captain (Colonel) Taylor discusses the question whether of Scythic races, Aryan or Turanian. Over vast wildernesses in the northern regions of Asia, along the banks of the Irthi, and beyond the remote Yenisei, innumerable tumuli are scattered, containing the remains of ancient art and long extinct races of men. Implements of silver, gold, and copper, girdles of the precious metals, bracelets decked with pearls, fragments of porcelain, have surprised the travellers who have seen a few of the tumuli opened. Similar tumuli are spread over the north of Europe, in Eschricht, Nilsson, and Retzius, in Sweden and Denmark, Dr. Wilkins in Ireland, and MM. Robert and Serres in France, have attempted to identify in these relics the remains of different races supposed to have inhabited successively the north of Europe in early times. In the opinion of the Swedes, the sepulchral remains of northern Europe may be referred to three successive eras. They display different physical types and different stages of advancement in civilisation. The oldest are the relics of a people with round heads, having the transverse diameter of the cranium large in proportion to the longitudinal. The implements and ornaments which are found in the tombs of this race, indicate the greatest roughness. They consist of tools and the heads of arrows and lances made of stone and bone, but nothing indicating a knowledge of the use of metals. It seems to be the opinion of Retzius and that of Nilsson (Scandinaviska Nordens Urvinarne, af S. Nilsson, Lund, 1838–43), that they were the burial-places of a people much older than the Celts. Similar remains, discovered in France, have been supposed by MM. Robert and Serres to be reifiable in like manner to different eras.

In the Alford district of Aberdeenshire are many cairns of enormous size. Some people think they have been beacons to give warning in time of danger; but many of them are situated in low places, and they are supposed to be tombs of some great men. It is a common saying among the people of that country to this day, when any person makes them a gift, 'God I wat, gin I live abiat you, I' se add a stone to your cairn.' The old Celticks, 'Cairns, thei, me make doon', 'I will add a stone to your cairn,' i.e. I will do homage to your memory when you are dead. And to this day many old people never pass by any of these cairns without throwing a stone to it.

The Gond races in the Vindhya place great stones over the graves. Doorgawati, queen regent of Gurga Mundela, was killed in action against the troops of Akbar, under Asaf Khan, as an inscription of her family asserts (As. Res. x. p. 437). She was interred at the place where she fell (Ben. As. Soc. Journal, vi. 628), and to this day the passing stranger places, as a votive offering, one of the fairest he can find of those beautiful specimens of white crystal in which the hills in this quarter abound. Two rocks lie by her side, which are supposed by the people to be her drums converted into stone; and strange stories are told of their being still occasionally heard to sound in the stillness of the night by the people of the nearest villages. The very ancient custom of casting a stone upon untimely graves is still observed throughout Spain, accompanied by a silent prayer for the dead.

In the Upper Godavery, British side, and Kistna
district south of Jaggipetta, tombs and cairns are found in groups, particularly in the Kistna district, where there are hundreds on one hill alone,—four stone slabs on edge, and slab at bottom, and one on top; then round the tomb a ring of small stones, some 12 feet in diameter, and small stones within that heaped over the grave. The grave is sunk from 2 to 4 feet in the ground, according to the breadth of the side slabs. The size of the graves are from 1 foot 6 inches long by 1 foot broad, to 6 feet long by 2 feet broad. In the Kistna district the slabs are limestone; in the Upper Godavery, trap, hypogene rock and sandstone. In several of these graves has been found a skeleton. The body had been placed so that the head rested on right arm, head always north, feet south. The bones crumbled almost at a touch. The size of the upper slabs on the tombs vary in size from 4 feet by 3 feet to 8 feet by 6 feet; some of the smaller tombs have no slabs on them at top, but only small stones piled up as a cairn.

In the Upper Godavery, also, are tombs without cairns, no slabs at bottom, only four forming the sides. They are generally 4 feet by 3 feet square; some immense slabs on top measured 14 by 5 feet. The graves are filled up with small earthen pots, filled with burnt bones and clay. Beads, apparently made of ivory, and some small glass ones of red and green colour, in the pot that contains the charred remains of the skull. There is a splendid tomb of sandstone on the Nizam's side of the river opposite Lingala; the slab on top is 9 feet square, the tomb surrounded with eight rings of stone (sunk in the ground) some 7 feet in diameter; it is evidently a chief's grave. In another grave, with smaller slabs and fewer rings round, were the usual pots with bones and beads; the rings contained a skeleton with feet in towards the tomb, the skull placed between the knees. These were the skeletons of slaves that had been sacrificed on the death of a chief, number according to rank. Hero-lotus describes this ceremony. Mr. Rivett Carnac, in the beginning of 1847, brought to notice the existence of barrows, a little further northward, at the village of Junapani, near Nagpur, in which were found articles of pottery, spear and arrow heads, battle-axes, a horse snaffle bit, stirrup-irons, and a small iron model of a bow and arrow.

In the Bengal Asiatic Journal, xiii. p. 618, for 1844, is Colonel Yule's description of the Khasaya people of East Bengal, an Indo-Chinese race, who keep cattle but drink no milk, and the sister's son inherits property and rank. They habitually erect dolmens, menhirs, cists, and cromlechs, and cists are gigantic in their proportions; the dolmen similar in appearance and construction, to the so-called Druidical remains of western Europe. The undulatory eminences of the country, some 40 feet to 600 feet above the level of the sea, are dotted with groups of huge unpolished squared pillars and tabular slabs, supported on three or four rude piers. In one spot, burial in a sand grove, were found a nearly complete circle of menhir, the tallest of which was 30 feet out of the ground, 6 feet broad, and 2 feet 8 inches thick; and in front of each was a dolmen or cromlech of proportionately gigantic pieces of rock, while the largest slab hitherto measured is 32 feet high, 15 feet broad, and 2 feet thick. Several had been very recently erected. The method of obtaining the blocks, is by cutting grooves, along which fires are lighted, and into which, when heated, cold water is run, which causes the rock to fissure along the groove. The lever and rope are the only mechanical aids used in transposing and erecting the blocks. The objects of their erection are various,—sepulture, marking spots where public events had occurred, etc. The Khasaya word for a stone, 'maan,' as commonly occurs in the names of their villages and places, as that of man, men, and men does in those of Brittany, Wales, Cornwall, etc. Thus Mauzain signifies in Khasaya the stone of oath; Mauloo, the stone of salt; Muylong, the grassy stone, etc; just as in Wales, Pennaen Mawr signifies the hill of the big stone; and in Brittany a menhir is a standing; and a dolmen a table stone, etc. A cairn of considerable size, on the roadside at the top of the Ajanta ghat, seems to have been a thankoffering for the ascent of the ghat. We added, like the rest of our camp, one stone to the heap.—Ras Mala, Hindoo Annals, ii. p. 387; Dr. Fitchard, Rep. Brit. Ass. 1847, p. 236; Colonel Meadows Taylor in J.E. Soc. 1869; Dr. Caldwell's Grammar; As. Res. v. xx.; Capt. Harkness and Congree in M.L.S.J.; Captain Yule; Beng. As. Soc. Journ. xii. p. 619. See Cheda; Cromlech; Ghorband; Tsalal.

CAIRO, the capital of Egypt, in lat. 30° 6' N., and long. 31° 26' E., a very ancient city in the valley of the Nile, and known to the people as Misr. After the conquest of Egypt by Cambyses (B.C. 525), the Babylonians are said to have founded New Babylon, on the site now occupied by old Cairo. That city, during the Roman occupation, was the headquarters of one of the three legions stationed in Egypt. In A.D. 638 New Babylon was captured by the Arabs, and a new city gradually arose beyond it, which received the name of 'Fastat,' from its having grown up around the tent (fastat) of the Arab general. The modern city was built adjacent to Fastat, in the 12th century A.D., a portion of the stone used in the construction having been obtained from the ancient city of Memphis.

In A.D. 973, the new city, under the title of Misr (al Kahirah, i.e. the Victorious), was constituted the capital of Egypt. The citadel was built in 1116 by the famous Saladin (Salah-ud-Din), who also erected the beautiful aqueduct seen from its walls. Within the walls are the Pasha's palace, the arsenal, mint, and public offices, a mosque, and a well 260 feet deep, known as Joseph's Well. It was not, however, Joseph the son of Jacob who built it, but a ruler of that name, about A.D. 1100. Under the son of Salah-ud-Din, Cairo was greatly extended; its magnificence culminated about 1340 A.D.

On the 26th January 1517, the Osmanli sultan, Selim I, entered the city as its conqueror, and thenceforward its history is a blank down to the 22d July 1798, when it was occupied by the French army under Bonaparte. In 1801 the French garrison capitulated to the Turkish army. On the 3d August 1805, Muhammad Ali Pasha took possession of the citadel, which witnessed the massacre, 1st March 1811, of 400 Mameluk Beys, by his orders. Amir Bey alone escaped by leaping the wall. The population is estimated at 400,000, Egyptians, Mahomeds, Copts, Jews, Europeans, and other strangers from the principal

An excellent pulse, makes a pudding little inferior to that made of peas, and is a particular favourite. When husked and split, it constitutes the kind of dhal which most commonly enters into the formation of the vegetable curry of the Hindu,—moisture, 120; nitrogenous matter, 201; starchy matter, 631; fatty or oily matter, 1;5; mineral constituents (ash), 32. This is sown in fields at the commencement of the rains in June, and sometimes much later; it is ripe in December. The seeds are sometimes ground into flour, or split like dry peas; for the latter they are an excellent substitute. It is one of the plants employed in the Bengal Powder-works at Espharo, in the manufacture of gunpowder charcoal. It might probably be employed in the manufacture of pyrolygenic acetic acid. The green pods are cooked in curries. The seeds are separated from the dried pods by beating, and to give a bright colour are mixed with red earth and steeped in water until they germinate. They are then removed, and dried in the sun for two days, and bruised in a mill to break up the seeds, when it is freed from the testa. The cotyledons are now called dhal, which is cooked for curries; also sweet cakes are made from it. Dhal sells at 18 to 24 lbs. for a shilling. The dry leaves and stalks are given to cattle, and the stalks used as thatch.—Beng. Phar. p. 235.

Cajaputi OIL, Kayaputi, Caqaput oileum. This oil is obtained from the leaves of the Melaleuca caqaputi of Maton and Roxburgh; and it has been said, also from M. leucodendron, which is the species known to the people as the kayaputi, literally white wood. Ramphius described two trees, Arbor alba major and Arbor alba minor, and in 1798, Mr. Smith, of the Calcutta Botanic Garden, was sent to the Molucca islands to obtain the true sort of caqaputi plant. He obtained several of each of the trees, and they were distributed over Europe. Specimens sent to England were examined by Dr. Maton to be those of the Melaleuca caqaputi. It is a small tree with an erect but crooked stem, covered with thick, rather soft, light-coloured bark; branches scattered, with slender twigs which droop like those of the weeping willow. A native of the Molucca islands, especially of Boeroe, Manipe, and of the S. of Borneo. It is called daunikjeel, but also caqaputi. The leaves are collected on a warm dry day in autumn, and placed in dry sacks, in which they nevertheless become heated and moist. They are then cut in pieces, macerated in water for a night, and then distilled. Two sackfuls of the leaves yield only about three drachms of the oil. This is clear and limpid, of a light green colour, very volatile, diffusing a powerful odour, having a warm aromatic taste, something resembling that of camphor, followed by a sense of coolness. Sp. gr. 0.914 to 0.927; soluble in alcohol. It boils at 349°.— Crawford's Diet. O.S.; Rolly; Mason. See Melaleuca caqaputi.

Caju, Gu., Hind, Casearia elliptica? also Hind., Anacardium occidentale. Cashew-nut tree. Caju ka tel, the oil from the apple.

Cajur. Hind. Phoenix dactylifer, the date-palm, properly Kshajur.

Calak. Can. Cathartocarpus fistula. Cala. Sansk. Time in its natural acceptation; a term applied to a variety of mathematical and astronomical subjects. Cala, in Hindu astrology, an arc of one minute of a degree; also the phases of the moon, of which the Hindus count 16. Maha Cala, the conjunction or opposition of the sun and moon. See Kala; Yug.

CALABAR SKINS.

CALABASH, Cucurbita ingenaria, Linna. Horsea kuddoo, Hind. Chooray kai, Tam. Lahoo Ambon, Malay. Anapa kaya, Tel. This is the Lagenaria vulgaris, Ser. It is of two kinds, the long or Ceylon, and the round; they are good vegetables when young, and are useful when dry as vessels, also as fakirs' bottles, as the sounding drum for the sitar, and as a buoy for swimming across rivers. The New World calabash is the shell of the fruit of Crescentia cujete, L, a tree of the West Indies and South America, applied to various domestic purposes, and often carefully carved or painted.—Rohde, MNS.

CALABASH NUTMEG, Monodora myristica, var., of tropical West Africa, bearing globular fruits, 4 to 6 inches in diameter, filled with aromatic seeds. These might, with advantage, be brought to India.

CALABA TREE, Calophyllum calaba, Linna. CALACUTA, in Hindu mythology, a poison produced from the churning of the ocean.

CALADANA. Hind. Phorbittis nil.

CALADIUM XANTHORIZUM.

Coloeasia escallenta, Schott. | Ervi, | Hind.
A small bulbous root, sown from March to July in rows of beds, mostly along a watercourse where ginger is planted. It requires much water, and takes from six to seven months to ripen. When boiled and then roasted, it is very wholesome, and somewhat resembles a yam in taste; the natives also put it into curries. It is not liked by Europeans.

This Chinese arum has a round bulb, used medicinally.—Smith.
CALAH.

CALAH, one of the three cities mentioned in Genesis x. 11, 12 as having been restored by Asshur, son of Shem. B.C. 740, Calah revolted, and Tiglath-Pileser became ruler of Assyria. It has been identified as the modern Nimrud, q.v.

CALAH. H. H. Fennel flower seed.

CALAMANDER WOOD.

A commercial term applied to the woods of two or three species of Dalbergia growing in Ceylon, one of them the D. quesita, Thev. It is scarce even in Ceylon; it is probably the most beautiful of all fancy woods. The figure is between that of rosewood and zebra-wood; the colour of the ground is usually a rich hazel brown, described as chocolate brown with black stripes. It is hard, and turns well. Mr. Rohde (M.S.) met with variegated ebony of rich lustrous in logs of ebony cut at the Northern Circar hills, but whether this was owing to the wood being young, or whether the wood was from a distinct tree, he did not know; but there seems no doubt that very many trees yield an ebony—Ains. Mat. Med. p. 211; M'Culloch; Rohde, M.S.; Holtzappel; Mendis; Ferguson; Thwaites. See Dalbergia.

CALAMARIDE, the family of dwarf snakes. See Rattles.

CALAMARIES, or Squids, are canglossous animals, of the family Teuthididae, section Decapoda. Most of the genera are fossil; but Loligo and Teuthis has twenty-one recent species, and one of them is luminous at night. See Mollusca.

CALAMBAC, Chin-hiang, Chin., also Calambeg, called aloes-wood, is the agallochum of the ancients, and the agila or eagle-wood of the moderns. It is produced in Siam and Sylhet by Aquilaria agallocha.—Royle, Illusr. p. 171.

CALAMBUCO, one of the best timber trees of the Philippines. The wood is largely employed in the fabrication of domestic utensils and agricultural implements.—Crawfurd, Dig. p. 79.

CALA MEEN. TAM. Polynemus Indicus.

CALAMINE.

Rough calamine is prepared for medicinal use by burning; prepared article, usually called oxide of zinc, is often adulterated with sulph. baryta, carbonate of lime, etc.—Royle.

CALAMUS. This genus of palm trees is indigenous to Southern Asia, and Dr. Griffiths enumerated 58 species. They abound in the Madras territories, along the foot of the Himalaya from Dehra Dooon to Sylhet, in Assam, Chittagong, in the Malay Peninsula, Siam, Cochini-China, Sumatra, and in the Eastern Archipelago. The species are mostly spreading shrubs or small trees, erect, or climbing to a considerable height, or trailing the stems several hundred feet along. They furnish the dragon’s blood, Malacca canes, and rattans of commerce, some being formed into walking-sticks; some, as the C. rotang and others, form the canes or rattans of commerce, of which the people of the Khalsa hills make bridges 300 feet long, and those of the Anaumly hills are formed into long looped ladders. The hard flinty coating of the cane stems is readily split into strips, from which the bottoms of chairs and similar articles are manufactured. It is not, however, possible to say from what particular species the canes of the shops are obtained, it being probable that many are gathered indiscriminately; C. rotang has, however, been said to furnish the stouter, and C. scipinum the more slender sorts. But the C. tenuis of Assam, C. gracilis, C. extensus, and others, all furnish the canes of commerce. The stem of Calamus verus is described as being 100 feet long, that of C. oblongus 300 to 400 feet, of C. rudentum upwards of 500 feet, and of C. extensus as much as 600 feet. Rumphius even states (vol. v. 100) that one kind attains the extraordinary length of 1200 feet. The cane stem is closely covered over by the tubular bases of the leaves, through which it is drawn by the cane-gatherers when green; afterwards it is dried in the sun, and then is ready for the market. The ground rattan is distinguished by its straight head and altogether straight and stiff character, as well as by its pale colour, produced by species of Lombara, in inch in diameter, and others not half that thickness, and that is disdained by a hard, and others by a soft bark. It is not known whether the slender are of the same species as the thicker kinds, only growing in different situations, or from roots of different ages; but Rhapsis flabelliformis is said to yield the ground rattan. Another kind of rattan is called dragon cane. This, both light and dark coloured, is thicker than the last, has long internodes and a hard bark, less flexible than the common rattans, but strong, springy, and much valued. A variety, with soft bark, is called Manila dragon cane. Other kinds of canes, imported from China, are known, one with stiff stems and large knots, by the name of Jambee, another as Whanghee. This has a pale, hard bark, and flexible stems, with internodes of about an inch and a half or two inches, and a number of little holes at the knots. Some of the canes of commerce, however, are produced by species of Lombara, saecurum, and other genera. The flesh that surrounds the seeds of this genus is a delicate article of food; limpid water flows from the stems when cut through; and the young shoots of some of them, while still tender, are fritted or boiled, chopped small, and, being fried with pepper and gravy, are said to furnish a very delicate dish. One of the kinds of dragon’s blood or jurnang is the produce of species of calamus; and those which chiefly yield it are the C. petraeus, Lour., C. rudentum, Lour., C. verus, Lour., and C. draco, Wild., of which the last three were by Linnaeus reckoned mere varieties of C. rotang. Mr. Gamble names 39 species. Calamus arborascens, Griff., is an arboreous species of rattan common in the Burma jungles. Griffith justly terms it ‘a very elegant palm.’ Calamus draco, Wild.

This grows in Burma, the Malay Peninsula, Sumatra, and the Eastern Archipelago, and is said to be the species which, as a natural secretion of its fruit, yields the best djurnang or dragon’s blood, an article of commerce from the earliest times, and still in demand. In the forest of Tenasserim, the natives call it ‘red rattan,’ as it produces a red exudation like dragon’s blood. It is little known in the Peninsula of India. The plants when young are elegant, and resemble small palm trees, after which they become secedent,
and overruns any neighbouring trees. The fruits are fleshy, red, and astringent. Dragon’s blood is of more importance in the arts than in medicine, being chiefly used as an ingredient in varnishes and paints. In commerce it occurs in powder, grains, masses, drops the size of an olive, and in sticks, enveloped in the leaf of the talipot palm.

Calamus erectus, Roxb. Its seeds are used as a substitute for betel-nut.

Calamus extensus, Roxb., Nela pokra, Tel. Its seeds are used for betel-nut. See Canes.

Calamus fasciculatus, Roxb. Rattan cane.

Buru-bet, . . . BENG. Parambu, . . . TAM.
Perambu, . . . MALAY. Ama Vadasamu, Tel.

This cane is a native of Bengal, used for walking-sticks.

Calamus inermis, T. And., furnishes the finest alpenstocks.

Calamus latifolius, Roxb., of Chittagong, Burma, and the Andamans, is used for tying timber rafts, and to make cables.

Calamus montanus, T. And., of Sikhim and Bhutan, is the best cane for suspension bridges and for dragging logs.

Calamus rotang, Linn. Rattan cane.

C. Roxburghii, Griff. Roke.
Bet, Betu, . . . BER. Betamu, Betapu, . . . TEL.
Rotan, . . . MALAY. Niru Prabba, Penu, . . .
Bed, . . . PERS. Papiu, . . .
Perambu, . . . TAM.

This species of calamus is said to furnish the stouter of the rattan canes of commerce, which are readily split into strips, are extensively used for the caning in the backs and bottoms of chairs, sofas, and light carriages; are made into matting, seats, sofas, baskets, and cabinets; and throughout the Archipelago vessels are furnished with cables formed of cane twisted or plaited. They are likewise formed into ropes by the people of the forests, to drag heavy weights and to bind wild elephants. The kinds employed for caning chairs, etc., are known in commerce by the name of rattan cane, and are yielded by long trailing species which abound wherever the genus is found. The most northern one, Calamus royleanus, do doubt yields the rattans collected in the Debra Doon, while C. Roxburghii doubtless yields those collected in more southern latitudes. Dragon cane is thick, both light and dark colours, with long internodes and a hard bark, less flexible than the common rattans, but strong, springy, and much valued. C. Royleanus, C. rotang, common in Bengal and on the Coromandel coast, are used for all the ordinary purposes of cane; as also are C. tennis of Assam, gracilis, extensus, and others. Cane form a considerable article of commerce. Between four and five millions of them have been exported from the East Indies. Dampier says: ‘Here we made two new cables of rattans, each of them four inches about. Our captain bought the rattans, and hired a Chinese to work them, who was very expert in making such wooden cables. These cables I found serviceable enough after, in mooring the vessel with either of them; for when I carried out the anchor, the cable, being thrown out after me, swam like cork in the sea, so that I could see when it was tight, which we cannot so well discern in our hemp cables, whose weight sinks them down, nor can we carry them out but by placing two or three boats at some distance asunder, to buoy up the cable, while the long boat rows out the anchor.’

The tow-ropes mentioned by Marco Polo as used by the Chinese for tracking their vessels on their numerous rivers and canals, seem also to have been made of cane, and not of bamboo, as sometimes stated, as they were split in their whole length of about thirty feet, and then twisted together into strong ropes some hundred feet in length. In Java, Sumatra, and throughout the eastern islands, vessels are furnished with cables formed of cane twisted or plaited. This sort of cable was very extensively manufactured at Malacca.

Mr. G. Bennet says (Wanderings, ii. p. 121) that near Macao the rattans are split longitudinally, soaked, and attached to a wheel, which one person keeps in motion, whilst another binds the split rattans together, adding others to the length from a quantity carried around his waist, until the required length of the rope is completed.

Calamus Royleanus, Griff., the most northern of the cases, being found in the Debra Doon, where it abounds. Plentiful in the eastern Kamaon forests, and used in all cane-work.

Calamus rudimentum, Loureiro, grows on the Mahabaleshwar hills and Dekhan, also in Cochin-China and the Moluccas. Loureiro describes this large species as being twisted into ropes in the eastern regions, and employed, among other purposes, for dragging great weights, and for binding untamed elephants.

Calamus steptoei, Loureiro. Griffith considers this to be the species which yields the Malacca cane, but the plant does not appear about Malacca. He was, however, informed that the canes are imported from Sink, on the opposite coast of Sumatra. Some of these are simply mottled or clouded, others of a brown colour, in consequence, it is said, of their having been smoked. The more slender specimens with the longest internodes are those most highly valued.

Calamus siminalis, Ainale. Bet, . . . DUKH. Perapum, . . . TAM.
Vetra, . . . SANSK. Betta, . . . TEL.

It grows in the woods, and its fruit is eaten by the common people. —Roxb.; Griffith; Seemann; Voigt; Royce, Fin. Pl.; Mason; O’Sh.; Bennett; Thompson; Ainale, p. 291: Gamble.

CALANDRA GRANARIA.

Oheda, Ghan, . . . HIND. Makara, . . . HIND.

A weevil very destructive to grain. It is one of the insects styled goon by the people. See Insects.

CALANUS to a Brahman who accompanied Alexander the Great into Western Asia. He was an old man upwards of 80, and went along with Alexander through Gedrosia, the modern Makran. But at Pasargada, in Persia, he fell sick, and ended his life by immobilising himself on a pile. According to Plutarch, his real name was Sphones. His native country was on the banks of the river Camala.—Cal. Rev. See Zarnano Chegas.

CALAPA. MALAY. Cocoanut palm. From this is derived the old word for the cocoanut, calaper, still usual amongst sailors.

CALAPPHATH. HIND. Andrographis paniculata.

CALASTRI or Kalahasti is a zamindari estate in the Madras district of North Arcot, Madras. The town, in lat. 13° 45’ N., and long. 79° 44’ E., is the principal town of a Hindu chief known as the raja of Calastri.

CAUL CAREOUS SPAR. Cale-spar.

Ying-shwu-shih, . . . CHIN. Han-shwu-shih, . . . CHIN.
Peh-shwu-shih, . . . Safed surna, . . . HIND.
The varieties of this mineral are calc-spar, Iceland spar, satin spar, chalk, rock milk, calcareous tufa, stalactite, stalagmitic, limestone, oolite, pisolite, argentite, Fontainbleau limestone, white and clouded marbles, statuary marble, compact limestone, stinkstone, anthracomite, plumbo calcite, mineral argentite. Calcareous spar is used in India medicinally, and they call it white antimony, probably from its rhombohedral fracture resembling that of galena, which is usually employed in lieu of antimony; and natives use this also for the eyes, just as they do sulphide of antimony. At Samkhandergool, 25 miles S.W. of Salem, a great quantity of calcareous spar is burnt and sent to Salem and other parts, for eating with betel, as betel-eaters hold it in esteem. It requires a much greater heat than the ordinary kinds of limestone, and is generally burnt in small circular kilns with a jungle shrub, which gives out a great heat. When burnt it is much whiter than ordinary chunam, takes a most beautiful polish, and is much used for the last coat of plaster in houses, etc., giving the appearance of the whitest marble when polished. It occurs also at Masulipatam and in Travanore; rhomb spar at Nellore, and satin spar, or fibrous carbonate of lime, in the Hyderabad territory. Calcium is estimated to constitute one-fourth part, by weight, of the materials of which the earth consists. The importance of the uses of the compounds corresponds with the abundance of the element itself. But for the use of calcium in separating iron from ore, iron would not occupy the important position it does. Its compounds form ranges of mountains, coral islands, and chalk cliffs. There are few industries which do not depend in some way upon it in the form of carbonate of lime, as limestone, chalk, marble, calc-spar, and shells.

Calced shells, Poh-fen and Hai-koh-fen of the Chinese, when finely powdered, are used in China as a face powder, or for dusting sores. The famed polished wall plaster of the Madras houses is made of lime prepared from calced shells dredged from the neighbouring Pulicat lake. See Chumam.

Calcis carbonas, Chalk, Carbonate of lime.

Chalk is only seen as an article of import into India. The Hindustani, Malay, and Tamil names describe it as foreign lime. It is used in house-holds; but the bones of vertebrata, a large part of the shells of testaceous mollusca, of crustacea, corals, oyster shells, crab’s claws, crab’s eyes, as they are called, are all employed in eastern countries medicinally, as also the lapis judaicus, which is the spine of fossil echinus. All consist of pure carbonate of lime, with some animal matter intimately intermixed.—Royle.

CALCULUS CYSTICUS, bezonr.

Biliary concretions occasionally found in the gall bladders of horned cattle in India. They are generally contained in a little bag, which holds two or three small calculi, each about the size of a tamarind stone, or one large one as big as a marble. They are of a bright yellow colour, and are considered by native practitioners as highly valuable in certain indispositions of young children, owing to their cordial and alexipharmic qualities. A piece about the bigness of a mustard seed is commonly given for a dose to a babe of two months old, in conjunction with an infusion of onum or siragum. This substance is also used, together with kadukai and machakai, in preparing a mixture for cleansing the inside of the mouths of new-born infants. The Veytans prescribe a solution of it in warm ghi, to be poured up the nose in cases of nervous headache; and they administer it internally, in dosages (typhus fever), made into a draught with women’s milk.—Ains. Mut. Med. p. 85. See Bezoar; Gall Stones.

CALCUTTA, in lat. 22° 34' 2'' N., long. 88° 23' 59'' E., at the easterm of the barometer at the Surveyor-General’s office, is 18 feet (G.T.S.) above the sea. It is the capital of British India, built on the left or eastern bank of the Hoogly river. It is a place of great trade, and has a mint, a cathedral, a governor’s house, a fortress, a town hall, great hospitals, schools and colleges, a botanical garden, custom office, high court, and public monuments to Sir David Ochterlony, Warren Hastings, Wellesley, Cornwallis, Outram, and others. The name is from Kalika (Kali, and at), to move, also said to be from Kali Kota, and it was the first concession to the British in that part of India. It was, when they obtained it, only a miserable village known also as Kali Ghat, of which also some believe its present name is a corruption. It is also called Pulicat, or Bay of Bengal. On the 18th June 1756, it was taken by Siraj-ud-Dowla. Messrs. Drake and Minchin had made their escape along with the women and children, but Mr. Holwell held out for forty-eight hours longer, and he and 146 of the people were then imprisoned in a small guard-room, about 20 feet square, and on the following morning only twenty-three issued alive. The guard-room was thenceforward known as the Black Hole of Calcutta. In January 1757 it was recovered by a detachment from Madras under Admirals Watson and Clive, and the treaty of Calcutta was agreed to on the 9th February 1757. The population greatly increased:—

1710, 10,000 to 12,000.
1752. Mr. Holwell’s estimate, 409,066.
1814. By Sir E. Hyde East, 700,000.

1821. By Calcutta Magistrates, 230,552.
1831. By Captain Steel, Superint. of Police, 187,051.
1866. By Mr. Simms Surveyor of Calcutta, 381,360.
1876. By the Justice of the Peace, 377,924.
1872. In the Census of Lower Bengal, 429,535.
1881, 684,658.

In 1686 the English merchants quit Hugli and occupied the three river-side hamlets, Sianaati, Kalikata, and Govindpur, where in 1696 they erected the original Fort William, and in 1700 they formally purchased the site from prince Azim, son or grandson of Alamgir I. Between 1752 and 1773, the present fortress was constructed, at a cost of two kro, and the natives gathered around it. After the battle of Plassey, a mint was established, and the first coin was issued on the 19th August 1757. In 1797 it was declared a presidency. The town has a European and a native portion; and until the latter half of the 19th century, its insanitary condition was cou
Caldani, a body of Christians in Kurdistan who use the Syrian language in their liturgy.—

De Bode. See Kuldi.

This was the Pandanus odoratissimum, Linna, which was brought into India from the Mauritius. Its leaves are valuable for making soft matting; the droops from the stem are a mass of tolerably fine fibres, and the ends, beaten out, are used by plasterers for brushes; the fibre is used for lines and cordage; and the plant itself makes good fences near the sea, but it soon becomes straggling.

—Rohde, MSS.

Caldority, in Travanore, 700 feet above the sea, has a rainfall of 150 to 200 inches. Tea is grown there.

Caldwell, The Rev. Dr. R., during the latter half of the 19th century a missionary for Christianity in the south of the peninsula India; author of the Comparative Grammar of the Dravidian Languages, and On the Shanar Race. His success in conversions was great, and he was created a bishop of the English Church.

Calemberi. Singh. Coromandel or calamander wood.

Calendar. Nations have adopted different divisions of time, from which history has presented difficulties and contradictions. That of the Chaldeans was seen by Calisthenes, the favourite of Alexander. It commenced B.C. 2574. The Chinese calendar was reformed under the Han dynasty B.C. 191.

The Romans called the first day of each month Calend, from a word which signified 'called,' because the pontiffs on those days summoned the people together, to apprise them of the days of festival in that month. The Roman calendar is stated to have been introduced by Romulus, the founder of Rome. He divided the year into ten months only,—Mars, Aprilis, Maius, Junius, Quintilis (afterwards called Julius), Sextilis (afterwards called Augustus), September, October, November, and December. Mars, Maius, Quintilis, and October contained 31 days, and each of the six other months 30 days, so that the ten months comprised 304 days. The year of Romulus was therefore of 50 days' less duration than the lunar year, and of 61 days less than the solar year.

Numa Pompilius placed two months, January and February, before Mars. Julius Cæsar consulted the astronomers of his time, and fixed the solar year as 365 days 6 hours, comprising, as they thought, the period from one vernal equinox to another. The six hours were set aside, and at the end of four years forming a day, the fourth year was made to consist of 366 days. The day thus added was called intercalary, and was added to the month of February, by doubling the 24th of that month, or, according to their way of reckoning, the sixth of the calends of March. Hence the year was called bissextile. This almost perfect arrangement, which was denominated the Julian style, prevailed generally throughout the Christian world till the time of Pope Gregory XIII. The calendar of Julius Cæsar was defective in this particular, that the solar year, consisting of 365 days 5 hours and 49 minutes, and not of 365 days 6 hours, as was supposed in the time of Julias Cæsar, there was a difference between the apparent year and the real year of 11 minutes. This difference at the time of Gregory XIII. had amounted to ten entire days, the vernal equinox falling on the 11th instead of the 21st of March, at which period it fell correctly at the time of the Council of Nice in the year 325. To obviate this inconvenience, Gregory, in 1582, ordained that the 15th of October should be counted instead of the 5th of the future.

The solar, i.e., really the sidereal year, called the Shuboor Sun, or vulgarly the Soor Sun, that is, the year of (Arabic) months, was apparently introduced into the Dekhan by Taghalaq Shah, between A.C. 1341 and 1344, and it is still used by the Marathas in all their more important documents, the dates being inserted in Arabic words written in Marathi characters. The Fasli or Mewar year of the other parts of India was not introduced until the reign of Akbar and Shah Jahan, and they mostly continue to this day to be used even by the British in revenue accounts.

—History of the Sikhs; Captain Cunningham, p. 84; Bunsen, ii. pp. 402, 412; T. of Ind. Cal. See Era.

Calendrellia Brachydactyla, the Alanda brachydactyla, or short-toed lark of S. Europe, N. Africa; rare in Britain; extremely common in India, where it is currently known to Europeans as the ortolan.

Calf. As the Basava and Nandi of the Hindus, the brazen calf mentioned in Scripture as an object of worship by the Hebrews is still worshipped by Hindus in India. It is rarely if ever of wood, is often of brass, but often of stone. See Bull, Lingam; Nandi.

Cali, the Diana Taurica of Greece. See Kali.

Cali, in Hindustan, the expected tenth incarnation of Vishnu in the shape of a white horse with a human head. See Kali.

Cali-chi-Kai. Tam. Bondue nut; Cusalpinia bonducellia.
Cotton cloth, originally manufactured at Calicut on the Malabar coast, still largely made in India, but much of that is brought from Britain. Arrian (i. 539) speaks of the beautiful white linens of India, probably the same with the modern calicoes. These formed, as they do at present, a great part of the people's clothing.

CALICO, a stronghold of the raja of the Kollari race, now ruled by the Paducottah raja.

CALICO PRINTING. This art was common to the Egyptians and the Hindus, and is still largely practised by the latter, with a skill which produces much to be admired, even at the midst of the productions of the world, and after so many attempts have been made to improve this art, certainly imported from the East. Pliny was acquainted with the wonderful art by which cloths, though immersed in a heated dyeing liquor of one uniform colour, came out tinged with different colours, which afterwards could not be discharged by washing. The people of India apply the mortants both by pencils and by engraved blocks. The cloth-printers at Dacca stamp the figures on cloth which is to be embroidered. The stamps are formed of small blocks of kantul (artocarpus) wood, with the figures carved in relief. The colouring matter is a red earth imported from Bombay, probably the so-called "Indian earth" from the Persian Gulf. Though the art is now practised to much perfection in Britain, Indian patterns still retain their own particular beauties, and command a crowd of admirers. This is no doubt due in a great measure to the knowledge which they have of the effect of colours, and the proportions which they preserve between the ground and the pattern, by which a good effect is procured both at a distance and on a near inspection. Printing in gold and in silver is a branch of the art which has been carried to great perfection in India, as well upon thick calico as upon fine muslin. The size which is used is not mentioned, but in the Burmese territory the juice of a plant is used, which no doubt contains caoutchouc in a state of solution.—*Royce, Arts, etc., of India*, p. 483; *Pennant's Hindoostan*, i. p. 132; *McColloch's Commercial Dictionary*, p. 215.

CALICUT, a seaport town on the Malabar coast, in lat. 11° 15' 2" N., long. 76° 15' 6" E., and six miles N. of Beyrur. It is not visible from the ocean, the only building to be seen being a tall white lighthouse. Thick groves of coconut-trees line the shore, and are bounded by the sea by a belt of sand, while undulating green hills rise up behind, and a background of mountains is often hidden by banks of clouds. The name is from Colicodu or Colikutaga, a cock crowing, as Cheruman Pernal gave his sword, and all the land within cockerow of a small temple, to the Zamorin, or raja of Calicut, who attained considerable power in the 15th century. Pedro da Covilham, the Portuguese, landed here about 1486, Vasco da Gama in 1498; in 1501 Alvarez Cabral established a factory here, but the colony was massacred, which Da Gama revenged, and in 1510 Albuquerque burnt the Zamorin's palace. The Danish Government established a factory in 1752. In 1766, when Hyder Ali invaded Malabar, the Zamorin shut himself up in his palace and set fire to it, crying with his family in the flames. It has been repeatedly in the hands of the Portuguese, Dutch, French, British, and Mysoreans, and in 1817 it was restored with Mahé to the French. Tipu Sultan destroyed its flourishing trade, expelled from the country the merchants and factors of the foreign commercial houses, caused the coconut and sandal trees to be cut down, and ordered the pepper plants in the whole surrounding district to be torn up and hacked to pieces, because these plants, as he said, brought riches to the Europeans, and enabled them to carry on war against the Indians. Besides coconut products, coffee, pepper, cardamoms, ginger, cocculus Indicus, gingselly seed, turmeric, arrow of Beypur, sandal seeds, and terra japonica form articles of export. There are many of the Tar and 15,837 of the Moglap race in the Calicut district. The population in 1871 was 48,338, of whom 11,983, or 33 per cent., were Shannars, or toddy drawers from the palms.—*Imp. Gaz.*; *Horsburgh*; *Bartolomeo's Voyage*.

CALICUT MANCHE, a trading ship of the western coast of India. See Boat.

CALIF, from the Arabic khalifah, a viceroy, was the title assumed by the Mahomedan rulers at Baghdad, of whom the first after Mahomed were Abubakar, Umar, Usman, and Ali. Under the Abbas dynasty they attained to great power. In Central Asia, the sultan at Constantinople is even now by most Sunni called the Khalif of Rum. They claim that this dignified position was granted to Selim I. by a descendant of Ahmad; and it is through Ahmad and Mutasawakkil B'Ilah that they claim to have had transferred the right to the office of Khalif of Islam. It is, however, an elective office. See Khalif.

CALL-KASTURI, Beng. Abelmouschus moschatus.

CALIMERE POINT, a cape or promontory in the Tanjore collectorate, the Caligicum of Ptolemy, in lat. 10° 17' N., long. 79° 56' E., the most southerly point on the Coromandel coast. Two pagodas near each other, are about a mile from the shore.—*Imp. Gaz.*

CALI-NADI. The boundary between Dehli and Kauoij was the Cali-nadi, or black stream,—the Calindi of the Greek geographers.—*Tod's Rajasthan*, ii. p. 9.

CALINGOA, an ancient kingdom on the eastern coast of the Peninsula of India, at its upper end. The dynasty ruled at Rajamundry and in the Northern Circars. The meaning of the word is a country abounding with creeks. The town of Kalingapatam alone remains to indicate the rule of that dynasty; but the term Kiling or Kaleen of Burma, and the Hindu religion of the Javanese, seem to have come from them.

Kalingapatam is in lat. 18° 20' N., long. 84° 10' E., a seaport town on the right bank of the Vomahudara river, 15 miles N. of ChicaCoe. It is in the Ganjam district. Under Mahomedan rule it was a trading port of consequence, and the remains of a large town are still to be seen. There is good anchorage. The exports are rice, wheat, oil-seeds, grain, hides, timber, beeswax.

CALINGULA. Tam. A sluice, a weir, or
waterway, constructed in the banks of or dams of tanks to permit the escape of surplus water, and thus guard against the accumulating waters over-flowing the softer parts of the dam.

CALI-SIND. This river comes from Rangri, and its petty branch, the Sodwa, from Fraghugur. There are four rivers in India called Sind,—first the Sind or Indus; the Little Sind; the Cali Sind, or black river; and the Sind rising at Latoti, on the plateau west and above Seronge.

CALI YUGA. See Yuga.

CALLAGOUR ISLAND; lat. 15° 34' 12" N., long. 97° 38' E., in the opening of the Gulf of Martaban, is a small granite island rising about 150 feet above the sea, with few trees, and with a small skirting bay with indenting bay, in which mangroves grow. It has also the name of Curlew Island. Stones for the lighthouse at Cape Negrais were quarried here.

CALLIAN, the Kallara of the Periplus, a town near Bombay. It has all around an extensive series of Buddhist caves, one or two chaitya or waggon-vaulted caves, with the dahgopa; also vihara or monasteries, hermitages, vaulted reservoirs for water. The identity of Callian with Kallara has been disputed, but is generally recognised, as it is mentioned by Cosmas, who was only acquainted with the western coast of the Peninsula.

CALLIANA CYNOTMETROIDES. Reel. An interesting tree growing on the Timnevely and Travancore mountains at 2500 feet elevation, in the dense, moist forest not far from Courtallam. It is in flower and ripens its fruit in November. Its timber is very good.—Beddome. See Inga.

CALLICARP, a genus of plants of the order Verbenaceae. Roxburgh described eleven species,—acuminata, Americana, arboarea, cuspidata, inea, lanata, longifolia, macrophylla, lanceolaria, pentandra, and purpurea.

C. arboarea, Roxb. i. 390, a stout, tall tree of Nepal, Kamaon, Oudh, the Moring mountains, Goapara, Chittagong, and Moulemain.

C. Ineana, Roxb. i. 393.

Mashandari, . BENG. Muttara; Muttraja, . Chhs. Tattharma; Batpattra, . Denbur; Drus, . Rav.

Grows in the Panjahan.—Voigt; J. L. Stewart.

C. Laniata, Linn.

Calliarp cana, Linn., tomentata, Lam. Callicarpa americana, Lour.

Massandari, . BENG. Tondi; Teregam, Maleal.

Aroosha fibre of Chittagong Kat Komul, . Tam.

Basta, . HIND.

This plant is recommended by Dr. Royle for the fibre of its inner bark, Thondy nar. O'Shangnessy says it is bitterish, and rather aromatic.

C. Wallichiana, Walp., a very small tree of the western forests generally.—Royle, F. Pl. p. 310; O'Sh. p. 456.

CALLICHIROS CHECHRA. B. Ham. The butter fish of the rivers of India.

CALLIGONUM POLYGOINOIDES. Linn.

Phuk or Phog, Uis-Indus.

The shoots of this moderately-sized shrub are greedily eaten by goats and camels; the wood is used as fuel; and in Bikanir the twigs are much used for huts and for linings of shallow wells. In the Cis-Sutlej and Southern Panjab, the fallen flowers are used as largely in Muzaffargurh for food; they are made into bread, or are cooked with ghi, and eaten as a relish.—Stewart; Powell.

CALLINICUS, a surname of the second Seleucus, B.C. 246, and the fourth of the Syrian rulers after Alexander. See Greeks.

CALLIOPSIS, a genus of flowering plants, esteemed in India. In sowing, dig and pulverize 18 inches deep; give abundance of manure. Water before sowing; sow thinly, and press, and cover with fine sand.—Richell.

CALLISTEPHUS CHINENSIS. Cass. Chinese star. Several other species are named by Voigt as having been grown near Calcutta.—Voigt.

CALLISTHENES, as the friend of Alexander, was permitted access to the Babylonian records. It is stated in the Dabistan, that Callisthenes sent to his uncle a technical system of logic (Nyaya), which was the basis of the Aristotelian system. See Babylon; Calendar.

CALLITRIS QUADRIVALVIS. Vent.

Thuja articulata, Denf. | Jointed Arbor vitae, Eng.

The plant coppices readily, and is largely used for fuel; its roots furnish the beautifully-grained Citrus wood for ornamental work. It produces the juniper resin or sandarach of commerce.

CALLOCEPHALON GALEATUM, the Ganga cockatoo of Australia.

CALLUCA, an ancient commentator of the Vedas. His era is not known, but he lived at a time when the religious views were on the change.

CALNEH, an ancient town, on the site of which it is supposed that Cesiphon was built.

CALOE or Culaie, SUMATRA. The Rhee, China grass, Boehmeria nivea.

CALOENAS NICOBARICUS, the Nicobar pigeon, is of great size and splendour. Its appearance and habits exhibit a near approach to the gallinaceous birds. It lives chiefly on the ground, runs with great swiftness, and flies up into a tree when disturbed. Its nest is of the rude platform construction usual among the pigeon family. Eggs are white.—Macgillivray's Voyage, p. 244; Jerdon.

CALOMEL, the Shwini-yin-fen and Hung-feng-fen of the Chinese. A chloride of mercury used in medicine by European and native medical practitioners. It is known in India as Raskapur, but this is rarely free from soluble corrosive sublimate, which is often present in poisonous proportions, unfitting such for medicinal use. It is largely made by the Chinese.—Powell.

CALOYCTION GRANDIFLORI. Cheoye.

This beautiful creeper was introduced into the East, from the West Indies. Its large pure white blossoms open at sunset and fade at daylight. Its seeds, when young, are eaten.—O'Sh.

CALYNYCTION ROXBURGHII. G. Don. Ipomoea grandiflora, Roxb., Rhedae.

Nway-ka-zowo a | Chandnee, . Hind.

phyoo, . BURM. Pandit vankaia, . Tam.

A large-flowered species, whose snowy blossoms
open at sunset and shut at daylight. It is sometime

carried on arbours and pannels. It is

'The white moonflower, such as shows

On Serendiah’s high eragos to those

Who are near the island at evening ill;

Scenting her clove trees in the gale.'—Mason.

CALONYCTION SPECIOSUM. Choisy.

Ipomoea bono nox, Linna, | Monda Valli, Van Rheede.

This species is seen in European gardens.

CALOPHYLLUM (from the Greek Kalos, beautiful, and Phyllon, a leaf), a genus of plants belonging to the natural order Gaurciainae. C. angustifolium, inophyllum, and tacamaehaca, grow in S. E. Asia; but in Southern India several species have not as yet been determined. They furnish useful timber,—C. angustifolium yielding one of the poon spars of commerce, and C. calaba, the East Indian tacamaehaca, though C. inophyllum is also quoted as the tacamaehaca tree. In Tenas-serim the house carpenters often use the timber of a species of calophyllum, which also furnishes spars. A species of the Poona marum is a large tree common in the Western Ghats of peninsular India. Its wood is much used in house, and to some extent in ship building. C. angustifolium grows in Penang; C. Blumii, Wight, in Java; C. Burnanni, in Ceylon; C. decipiens, in Travancore; C. longifolium, in Bombay; C. Moonii, in Ceylon; C. polyanthum, Herit, in the Khussya mountains; C. tacamaehaca, in Madagascars and the Seychelles; C. rotundifolium, Wight, in Ceylon. C. tamentosum, Wight, in Ceylon. C. ame-mum, Wallis, is a tall tree of the Andaman Islands. C. bintador grows in the Moluccas. C. Brac-tetum, Thw., a great tree growing in the Saffragam district of Ceylon by the sides of streams, at no great elevation. C. Burnanni, Wight, Illust. i. 129, grows in the hotter parts of the island of Ceylon, and at no great elevation. C. cuneifolium, Thw., a great tree, grows in Ceylon at an elevation of 3000 to 4000 feet at Madamahene-wera. C. Moonii, Wight, Illust. i. 129, Domba keena-gas, Singh., a great tree of the Ceylon forests, in the district between Galle and Ratnapura; not uncommon. C. tamentosum, Wight, Illust. i. 128, Keena tel, Singh., is a tree of Ceylon, growing abundantly in the Central Provinces, at an elevation of 3000 to 5000 feet; common; its timber is valued for building purposes; and the seeds are collected in considerable quantities for the oil they contain. C. tra-peziifolium, Thw., a great tree of Ceylon in the Hunasgiria district, in the Central Provinces, growing at an elevation of 4000 to 5000 feet. C. Walkerii, Wight, Illust. i., a tree of Newera Ellia, Adam's Peak, and other of the most elevated parts of Ceylon. An oil is extracted from the seeds of this and the other species of the genus, which is used for burning.—Thw. Enum. Pl. Zeyl. i. p. 51; Choisy: Rozb.; Voigt; Mason; Gamble.

CALOPHYLLUM ACUMINATUM. Wal-dombe, Singh. A tree of the western parts of Ceylon, the timber of which is used for common house-building purposes. A cubic foot weighs 39 pounds. It lasts 20 years.—Mr. Mendis.

CALOPHYLLUM ANGUSTIFOLIUM, Rozbury, is said to be a tree of Penang, and to occur also in Coorg, Mysore, Canara, and along the ghatas, northwards to Sawantwari, but rarely of any great size beyond the line of the Nilgiri ghat. It is here that, according to Dr. Cleghorn, poon spars are obtained from this tree. Dr. Gibson also says that, to the best of his knowledge, poon spars are furnished by Calophyllum angustifolium, which is a magnificent tree in the ravines of the Southern Ghats. In habit and appearance it is totally distinct from C. inophyllum. He says that it is from the inland forests of Canara, backed as these are by those of Coorg to the east, that the supply of poon spars is principally drawn. In 1850 Dr. Wight was satisfied that Ceylon penta-gynia is a tree which furnishes poon spars,—Dr. Gibson, Cleghorn, and Wight; Mr. Robbe’s MSS.; Dr. Rozbury; Tredgold; Markham, p. 452. See Poon.

CALOPHYLLUM CALABA. Linna. Calaba tree.

Bubbe mara,... CAN. | Gorrukeenee, ... SINGH. | Tsiu panna, ... MALEAL | Cheru Pinnia, ... TAM.

This is a native of the western provinces of Ceylon, of Travancore, and in Canara and Sunda; it grows on the banks of rivers and streams, chiefly above the ghats, and produces the true East Indian tacamaehaca resin. It grows to a height of 60 feet, and its timber is used for building cars, staves, cask headings, house-building, and for canoes. Sir J. Herscetel seems to think the East Indian tacamaehaca to be the produce of C. inophyllum, for he says specimens obtained from C. inophyllum, the tacamaehaca of Ceylon, are desirable in order to aid pharmacologists in accurately determining the tacamaehaca of European commerce.—Herscetel’s Manual of Scientific Enquiry, p. 414; Dr. O’Shaughnessy; Mr. Mendis; Dr. Gibson; W. and A. p. 103.

CALOPHYLLUM DECIPIENS. Wight. Var. a. Folis obovato-oblongis, basi rotundatis, inambus in the Ambaganova district.

Var. b. Folis cordato-obvulatis, grows at Hinnidun Corle, at an elevation of 1000 to 2000 feet.—Thw. Enl. Pl. Zeyl. i. p. 51; Wight, Je. 128.

CALOPHYLLUM ELATUM. Bedd.

C. tamentosum, Wight, Hooker.

Poongoo, ... ANIMALTY. | Poon, Poone, ... MALABAR. | Siri Poone, ... S. CAN.

A very large, straight tree, with numerous longitudinal cracks down the bark. Grows abundantly in most of the moist ghat forests or valleys on the western coast from Cape Comorin to Cape Conoorin, and in similar forests on the lower Pulneys, Anamallai, Coorg, Mysore, and the Sirlumallai. It is never found in dry, deciduous forests. Colonel Beddome says it yields the poon spar of commerce. Thousands of these trees have lately been destroyed by the axe of coffee-planters in Malabar, Coog, and Travancor; quantities still remain, but chiefly in very inaccessible places. In the ghat forests of South Canara they are felled by the Forest Department, and floated down rivers to the coast depots; but the demand for the article does not seem great, though many years ago a single fine spar has fetched as much as Rs. 1000. The wood is scarcely known, except as a spar, though it is occasionally used for building and bridge-work by planters; it is reddish, coarse-grained, but ornamental. The tree has never been planted, and would not succeed except in the moist forests on the mountains at an elevation of 1000 to 4000 feet; it flowers in January and February, and the seeds fall early in the rains, and germinate freely in the dense shade of
the shola forests. This tree was for some years to be the Calophyllum angustifolium of Roxburgh, which is from the Prince of Wales’ Island.—Beddome, Fl. Syle. p. 2.

**CALOPHYLLUM INOPHYLLUM.** *Linn.*

C. bitangar, *Roeb.* Balsamaria inophyllum, *L.*

Undi; Sultana champas, *Hind.* Punnaga chettu, *Tel.*

This beautiful tree, with an appropriate name, grows in the western part of Ceylon, where it is employed for masts and cross sticks of Yettar dhonies and fishing boats, and poles of bullock carts. A cubic foot weighs 40 pounds. In the alpine forests it attains a great size, and it furnishes part of the poon spars so valuable for shipping. This grows to a considerable size in the Malabar coast, but is a still larger tree on the island of Balambangan and along the shores of Bangooy and Saippaunnang, whereby it got the names of ‘Palo-Maria and Dancawn.’ It is also common in the Philippine Islands, where, as in Malabar, the nates prepare oil from its fruit. Near the Burman monasteries this fragrant-flowered calophyllum is occasionally seen. It is in flower and fruit most part of the year; it grows well in sandy tracts close to the sea, where few others thrive; it is rare at a distance from the coast. It yields fruit twice a year, in March and September, and frequently attains the age of 300 years. It is cultivated in Java for the sake of its shade and the fragrance of its flowers, and there the wood is much used in houses and to some extent in shipbuilding. Mr. Dalrymple tells us that no tree is superior to this for knees and crooked timber. A resin is obtained from the roots and trunk, said by some authorities to be identical with the tacamahaca of the Isle of Bourbon. The flowers have the odour of muscinette. The seeds yield about 60 per cent. of their weight of oil. In the Samao islands, the large ava bowl is made from the tamanu, *C. inophyllum,* and occupies a conspicuous place.—*Roeb.*; Capt. Ephphinstone Erskine, Islands of the Western Pacific, p. 46; *Drs.* Wright, Gibson, Mason, Ansle, O’shaughnssy; Eng. Ceyc.; Voigt; *Thev Qtts.* i. 51; *Beau t.* i. 112; *Seaman.* See Oils.

**CALOPHYLLUM LONGIFOLIUM.** *FCl.* Tha-ra-bi, *Burm.* In Fugu this is found near towns, together with two other species of the same genus, which are of smaller growth. It is abundant in Mergui, Tavoy, and in lesser quantities near the Attar can river and its feeders. Maximum girth, 3 cubits; maximum length, 224 feet. When seasoned it sinks in water. It has a red wood, adapted to cabinetmaking, and is there used for planking, masts, and yards of junks; it is excellent for helves. Strongly recommended to make models.—*Dr.* M’Cleland; *Capt.*

**CALOPHYLLUM WIGHTIANUM.** *Wall.*

C. delavayi, *Welw.*

Colonel Beddome unites all these as the Kal-Poon of S. Canara, a middling-sized tree, common near the banks of rivers on the western sides of the Madras Presidency; in S. Canara it is very common, and its timber is much esteemed; it is of a red colour, very hard and heavy, and valuable for engineering purposes.—*Beddome,* p. 90.

**CALOTROPIS METALLICA,** the metallic stinking of the Aru Islands.

**CALOTROPIS GIGANTEA.**

Var. a. *Alba* or white. | Var. b. *Lilacina* or blue. | a. White variety.

Aselepias gigantea, *Linn.*

Shetw Akund, *Beng.* Belerika (white), *Sh.*

Yokadi, *Burm.* *Abi.*

Kerer, *Tell.* Tella jilledu, *Tel.*

Gigantea swallow wort, Racha jilledu,

Madar, Akund, *Hind.* Nalla jilledu (purple), *Tel.*

Calotropis is a genus of plants of the natural order *Asclepiades,* the species produce useful fibres, a ood wool, juice, a gutta percha like substance, and a mummy. Three species are met with all over Southern Asia, but *C. gigantea* is that common in the southern, and *C. Hamiltonii* in the northern parts, and *C. procera* grows in Persia and Syria (Voigt, p. 540). *C. gigantea* is, by the Hindus, held sacred to Siva.
CALOTROPIS GIGANTEA.

Its buds also form one of the five flowers on the darts with which Kama, the Indian god of love, is supposed to pierce the hearts of mortals;

'Infants winged, who mirthful throw
Shafts rose-tipped from nectarous bow.'

Sir William Jones refers to it in his hymn to Kama Deva.

The rope is called Lamb-dor, Hind., Toondee coir, TAM., Gulan taroo, Tel. It will grow in barren places, and it has been suggested to plant it as a barrier to drift sands. It yields a kind of manna called Shakra-al-asurh, also Ak or Madar ka shakar (asgar). Its milky juice has been prepared like caoutchouc and gutta percha, and yields 50 per cent. It is evaporated in a shallow dish, either in the sun or in the shade; when dry, it may be worked up in hot water with a wooden kneader, as this process removes the acridity of the gum. It becomes immediately flexible in hot water, but hardens in cold water; is soluble in oil of turpentine, and readily takes impressions. It is, however, a conductor of electricity. The wood is white, tolerably hard, and grows to a girth of 12 inches. It is used for gunpowder charcoal, and by firework manufacturers. The silky down of the pods is used by the natives on the Madras side in making a soft cotton-like thread. It is susceptible of being spun into the finest yarn for cambric, and has been used for the manufacture of a light substitute for flannel by Messrs. Thresher & Glenrie of London. It works well with either silk or cotton. It is also being tried by Messrs. Cowan & Co. of Edinburgh as a material for paper. In 1856 Major Hollings exhibited carpets manufactured in the jail at Shahpur in the Punjab from the fibre in the seed-pod. He mentioned that the manipulation of the floss was precisely the same as cotton. A carpet 7 feet by 3 feet cost Rs 7. Fibres are prepared from the stem and branches. These are dried in the sun for 24 or 36 hours, when they are taken up and the bark peeled from the wooden parts, and the greenish-coloured fibres gathered. A night's bleaching whitens them.

The cleaned fibres are one of the bowstring hampns of India. This fibre possesses most of the qualities of flax, and can be worked with the same machinery, as it splits to almost any degree of fineness with the hackle, and bears dressing and beating well. It was used by wealthy natives for making strong cloths, cambrics, and lawns; and it is employed for fishing lines, nets, gins, bowstrings, and tiger traps. It does not rot readily in water. It is even considered better adapted for cloth than for cordage. The strength exceeds that of all other vegetable substances, as the following experiments made at Coimbatore, of a three-strand 3½ inch rope, will show:

1. Coir, Cocos nucifera, sustained 224 lbs.
2. Pooley Manjee, Hibiscus cannabinus, 270 lbs.
5. Cutthaldar nar, Agave Americana, 322 lbs.
6. Junapum or Sunn, Crotolarea juncus, 407 lbs.
7. Yereum nar, Calotropis gigantea, 552 lbs.

Its fibre is valued at £90 to £35 a ton. The follicles are supposed by some to be the apple of Sodom. Its juice and the powdered bark of its roots have long been employed as alteratives by the natives of India in leprosy and other cutaneous affections, also in syphilitic ailments, and are supposed to possess active properties. Dr. Duncan obtained from it a principle which he called Madarine. In Arabic authors on Materia Medica it is even supposed to have been known to the Greeks. The leaves, smeared with oil, are used in rheumatism.—Wight’s Contributions; Hooker, Hin. Journ. i. 86; Royle, Hin. Bot. 275; Drs. Riddell, Hunter, Mason, O’Shaughnessy, p. 43; Wight in M. E. Reports of 1857; Royle, Flb. Pl.; Simmonds, Com. Prod.; Burton, iii. 122; Jour. Agri-Hort. Socy. of India, vii. 107, 226. See Carbon.

CALOTROPIS HERBACEA. Carey.

The roots are employed to make gunpowder charcoal. The stem yields useful, strong fibres, and the white, silk-like material of the pods has been successfully mixed with silk.—Vight; M. E. Proceedings.

CALOTROPIS PROCERA. R. Brown.

C. Hamiltoni, W. | C. gigantea, Andr.
Aclepia procera, Att. | C. Wallichii, W. Contr.

Aka, Madar, | Hind. Pashkand, | PANJAB.
Spalnak, | Pan Tork, Naval, | Gro. Spalnak, | Jilledu, | Tel.

This grows in Palestine, Abyssinia, Arabia, in Hindustan, the Peninsula of India, Peshawur, and the Panjub, is quite arborescent, ten or twelve feet high, and in Sind four and five feet in girth. The bark is stripped and made into halters for cattle, ropes, netting, twine, and fishing lines, all durable. The silky floss of its follicles is used for pillows. A manna, Shakra-al-asurh and Shakra-at-Tighal, obtained from it, is sold in the shops. Its acrid juice is applied to cutaneous ailments and in leprosy, and is used by Rajputs to poison their infant daughters. The fresh bark of the root, also the powder of the root, are likewise used in leprosy. The bark of the root and the dried milk possess similar properties to those of the C. gigantea; it is, however, far inferior as an emetic remedy. According to Dr. Wallich, this and C. gigantea are the same species. The insect that causes the manna is called Galtigul.—Royle, Ill. Ind. Bot. p. 275; O’Sb. k. 454; Stewart; Powell.

CALPA. SANSK. Creation or formation. In Hindu theogony, at the end of every calpa (creation), all things are re-absorbed in the deity, who, in the interval of another creation, reposes himself on the serpent seshu (duration), who is also termed annata (endless). Agni savarni, in Hindu mythology, is one of the 14 patriarches who preside successively over the 14 Manwataras of the calpa.—Warren’s Kuta Sanhita, p. 311.

CALPENTYNS, south of Corinda, is a spit of sand which runs off the Ceylon shore on the west coast, and extends from lat. 7° 36′ to 8° 16′ N.; the fog is clear at 8° 15′ N. and long. 79° 45′ E. A statue of St. Anne is on its N.E. end. The people are industrious; cultivate the cocoanut, and gather Calpentyn moss and the orchilla weed. In the Gobh, or lake behind the peninsula, there is an extraordinary abundance of fish, which are dried and exported. Sharks’ fins, trepan, and turtle are also sold. The long tongue of land on the south almost touches the main.

CALPI, a Hindu astronomical term of 4,520,000,000 years. See Calpa.

CALPICARPUM ROXBURGHII. G. Don.

Cerbera fructicosa; periwinkle tree.

Sa lat, | Berr. | Gotti gunneru, | Tel.

553
A handsome flowering shrub, almost constantly covered with blossoms like those of the rosy periwinkle, Vioa rosea, but larger and faintly fragrant.—Mason.

CALUTRA, a small sea-coast town in Ceylon, in lat. 80° 4' E., long. 6° 12' N. A favourite resort of the Dutch and British.

CALUMBA ROOT. Cocculus palnatus, D. C.

Jateorhiza calumba and J. palama, Miers.

A plant of east tropical Africa, which was first made known as a medicine by F. Redi about 1677. Semedus mentioned it before 1722 among medicines from India. In works on Materia Medica in use in India, it occurs by the name of Kalumb. It grows wild in the forests of Mozambique and Obo in Eastern Africa, and got its name because it was imported indirectly through Colombo in Ceylon.

CALUVERE. SINGH. A tree of the northern and eastern part of Ceylon, furnishing a fine black wood, used largely for buildings and furniture. A cubic foot weighs 71 lbs., and it lasts 80 years.

—Mends.

CALYA or Cali-naga, a serpent slain by Krishna.

CALYMERE POINT, on the Coromandel coast, in lat. 10° 18' N., long. 79° 54'/ E., is low, and covered with cocoanut trees, with two pagodas near each other about a mile inland.—Horeburgh.

CALYPTOMENA RAFFLESII, the tapoo tree of Borneo. Its fruit has an agreeable acid flavour, and is largely eaten. The pulp, mixed with rice and fermented, furnishes an intoxicating drink.

CALYPTREIDE, a family of the mollusca, the bonnet limpets, containing several recent and fossil genera, the genus Calyptraea being the cup and saucer limpet.

CALYPTRANTHES CARYOPHYLLIFOLIA. Wilde, Swartz.

Engenia caryophyllifolia, E. Jambolana, Roxb.

Janoon, . . . HIND. Navel maram, . . . TAM. Battedome, . . . SINGH.? Neredi chettu, . . . Tel.

A large-growing timber tree. The wood is light, and chiefly used for making grain measures, but is also made into carriage frames, cots, etc., and in Ceylon for common house-building; a cubic foot weighs 45 lbs. The bark is astringent, and is used in decoction by the natives for dysentery. The fruit which is ripe is of a very dark purple colour, and about the size of a large cherry. In taste it somewhat resembles the sloe, but is much sweeter. A variety of this tree—

Oojla janoon, . . . DUK. [Vullay navel, . . . TAM. Sweta jembo, . . . SANSK. Tella neredi, . . . Tel. has a fruit nearly similar to it in natural qualities, and has got its names from being of a different colour (white).—Riddell; Mends; Ainslie.

CALYSACCION ANGUSTIFOLIA. Gibson.

Soopunni, . . . CAN. [Koolumara, . . . CAN.

Grows in Canara and Snuda, in ravines of the ghats, and below in sheltered valleys, but is not common in N. Canara or Snuda. The tree there furnishes one of the poon spars. It produces an excellent edible fruit. It is a tree which ought to be conserved everywhere, and largely increased.—Dr. Gibson.

CALYSACCION LONGIFOLIUM. Roxb.

Ochrocarpus longifolius, Benth. et Hook. Calophyllum longifolium, Wall., Cat. Mammea longifolia, B. H.
daughter to Deogiri under an escort, but the escort was overtaken, the fair maiden seized and carried to Dehli, where Khizr Khan, the son of Ala-ud-Din, married her. Their union was very happy, and the poet Khusru praised them. But Khizr Khan's eyes were put out by Cafaor. A few years from the death of Ala-ud-Din, the throne of Dehli was filled by a converted Hindu, who filled the capital with Hindu troops, put to death all the survivors of Ala-ud-Din's family, and transferred Dewala Devi to his own zanana.

CAMALAPBABH, a title of Vishnu. CAMAPALIPUR, a large village 32 miles north-west of Cambay; and, from the neighbouring hills is largely smelted here.

CAMARI, according to Abul Ghazi, one of the eight sons of Japhet, whence the Camari, Cimerrin, or Cimber. The Camari are one of the Saura tribes, or sun-worshippers of Saurashtra; claim descent from Garuda, the bird god of Vishnu (who aided Rama to the discovery of Sita), and the Macara or crocodile; and date the fabulous conception from that event, and their original abode from Sancodra Bate, or island of Sancodra. Whether to the Dioscorides at the entrance of the Arabian Gulf this name was given, evidently corrupted from Sancha-dwara to so-cotra, need not be inquired into here. Like the islet in the entrance of the gulf of Cutch, it is the dwara or portal to the Sinus Arabicus, and the pearl shell (sancha) there abounds. This tribe deduce their origin from Rama's expedition, and allege that their crocodile mother landed there, where they still reside. They seem to be a Scythic race from Sakadwipa and the Dashti-Kapchak, and, like the Takshak, Jit, Kat'i, and Hun, have entered India from the north-west.—

Tod's Rajastan, i. p. 604.

CAMBALU, an ancient name of China.

CAMBAY, in long. 22° 51' E., and lat. 22° 5' N., in Gujarat, is at the head of the bay which bears its name, on the estuary of the Mahi, between the mouths of the Sabarmati on the west, and the Mahi on the east. It is said to be the town in which Zaramachebas was born. Marco Polo travelled through it at the close of the 13th century, when on his return to Europe. Cambay or Kambhat is the capital of a feudatory state ruled by a Mahomedan family of Moghul descent, and of the Shiah sect. In 1875 its area was estimated at 500 square miles, and its population at 175,000. Cambay town has 33,700 souls. Near the town, skirting the shore of the gulf, and along the banks of the Mahi and Sabarmati rivers, are vast tracts of salt marshland, submerged at high spring tides. The population consists of Mahomedans, Jains, and Parsees, with the wild tribes of Koli and Wagni, and the languages spoken are Gujarati and Hindustani. The name is from Khambha-tirth or Stambha-tirth, the pool of Mahadeva. Vikramaditya is said to have been born here.

Cambay Gulf is formed by the coast of Gujerat on the west, and the Peninsula of India on the east, and extends due north 80 miles, being about 3 miles wide at its entrance. In ordinary springs the rise and fall is 25 feet. Surat lies at the eastern point of the gulf. The gulf receives the two rivers Tapti and Nerbadda.

—Imp. Gaz.

Cambay Stones.—In 1503, Lewes Urtomenes, a learned gentleman of Rome (See As. Soc. Jl. 1824, vol. xviii.), says, 'In this region is also a mountain where the onyx stone, commonly called the cornelian, is found; and not far from this, another, where chalcedony and diamond are found.' It was visited in 1623 by Pietro de la Vallo. Captain Hamilton, who visited Cambay in 1681, says, 'The cornelian and agate stones are found in this river, and nowhere else in the world. Of cornelian they make stones for signets; and of the agates, cabinets entire except the lils. I have seen some 14 or 15 inches long, and 8 or 9 inches deep, valued at £46. They also make boats of some kinds of wood; and boxes and handles of swords, daggers, and knives, and buttons, and stone seals and snuffboxes of great value.'

Cambay still enjoys celebrity for its silicious minerals,—cornelians from Ratnapur in the Raj-pilla state; agates from Rewakanta, Kapadawanj, and Sukaltirth, on the Nerbadda, and from Rajkot in Kattyawar. The Bihls are the miners. They are worked into every variety of ornament,—cups, boxes, necklaces, handles of daggers, of knives and forks, seals, etc. Cambay stones form a distinct geological formation, derived probably from the amygdaloid trap rocks drained by the Nerbadda and Tapti. They pass in Europe and America for Scotch, Irish, Chamouni, Niagara, Isle of Wight 'pebbles,' according to the place in which they are sold. The Brazils import them as largely as India into Europe, where the terms 'Brazilian' and 'Indian' agates are used indifferently by the trade. The principal varieties sold in Bombay are crystal, milk-quartz, prase, a green variety, moss stone, mocha stone, fortification agate, chalcedony, cornelian, chrysoprase? heliotrope, onyx, obsidian? and very rarely amethyst.

Necklaces, black and green, Rs. 0.8 to 2.8.

Paper-cutters, 0.2, 5.

Knife handles, per dozen, 6, 12.

Stones for brooches, 1 to 8 annas.

Boxed and snuffboxes, 0.12 to 2.

Cups and saucers, 5, 100.

Pen handles, 0.6, 1.

Studs of all sorts, per dozen, 0.6, 2.

Towser buttons, per pair, 8 to 10 annas.

Bracelet beads of all sorts, per pair, 0.12 to 2.

Paper-weights, 4, 5.

Tables of sizes, 15, 50.

Guns, 95, 100.

Ear-rings, per pair, 0.2, 1.

Finger-rings, 1 to 6 annas.

The fragments of a Murhine cup—the little Cambay stone cup still made in Cambay—were exhibited in the theatre of Nero, as if, adds Pliny, they had been the ashes of 'no less than Alexander the Great himself!' Seventy thousand sestercus was the price of one of these little Cambay cups in Rome in the days of Pompey. The price in Bombay ranges now from Rs. 5 to Rs. 100. Nero paid 1,000,000 sestercus for a cup, 'a fact well worthy of remembrance,' syly remarks Pliny, 'that the father of his country should have drunk from a vessel of such a costly price!' The stones are sawn or ground down; for the native lapidary's wheel consists of a strong wooden platform 16 inches by 6, and 3 inches thick. In this are two strong wooden uprights. Between these is a wooden roller 8 inches long and 3 in diameter, fastened into a head at the one end. This works on an iron spindle or axle at each end. On the
one end the axle is screwed and fitted with a nut, by which the saw or grinding wheel can be made fast. The saw consists of a thin plate of iron, the cutting material consisting of ground corundum. The lap wheels consist of two circular discs or cakes of lac, with ground koorund, coarse or fine, according to the work, of a copper disc for polishing, and a wooden one for finishing the work. These are spun backwards and forwards by a bow, the string of which passes round the roller. The lapidary sits on his hams, steadying the wheel with his foot, and holding on the stone with his left hand, while he works the bow with his right. For very fine work, a small-sized wheel, similar to the English lapidary's wheel, but of smaller size, is used. It is driven by a pulley—always the subjects of which trap, and pulley. The custom-house returns give the value of the traffic in Camby stones at an average between £10,000 and £12,000 annually, one per cent. of the stones finding their way to Europe. Gayni or Gajni was one of the ancient names of Cambay, and it was the port of the ancient Balabhipura, the ruins of which are 3 miles from Cambay. Almeysda, when he visited the coast of Cambay, observed a very ancient town, with a large mosque, and near it a spacious place, covered with tumuli.—*Hamilton's New Account of the East Indies*, Lond. 1744; *Report of the Juries in 1851*; *Pennant's Hindoostan*, i. p. 64; *Tod's Travels.*

**CAMBESDEA OPPOSITIFOLIA.** *W. & A. Mangifera oppositifolia, Roxb.*  
This indigenous tree of Tenasserim has a reddish-coloured, hard, close-grained wood, said to be durable. It produces a fruit much like a plum. There are two varieties, one bearing an intensely sour fruit, and the other one as insipidly sweet.—*Mason; Voigt.*

**CAMBODIA,** or the kingdom of Khmer, extends from long. 101° 30' to 104° 30' E., and lat. 10° 30' to 14° N., with an area of 62,000 square miles. It was reduced to its present dimensions in 1862, by two of its provinces being annexed to Siam. It is bounded on the S.W. by the Gulf of Siam, on the S.E. by French Cochin-China, on the N. by Laos, and on the N.W. and W. by Battambang and Angcor. The Meï-kong flows through the kingdom. The population is 1,000,000, of whom four-fifths are the native Kho. The Chinese number 100,000. Buddhism prevails. Its capital is Phnompenh, on the Meï-kong. Cambodia town is nearly 240 miles up the river. It has four provinces, Potissat, Kampong-Suai, Kampong, and Kampot-Son. For the past three centuries its independence has been lost, Siam on the one side, and Cochin-China on the other, having encroached on it. In Cambodia is the great temple of Nakhon-Vat, which seems to have been built in the 10th century. Every angle of the roof, every entablature, every cornice, bears the seven-headed serpent. The outer enclosure measures 570 by 650 feet. It is a towered pyramid more than 600 feet in breadth, and rising to 180 feet at the summit of the central tower. It is built of large stones, beautifully fitted, without cement. M. Delaporte says that the ancient Khmer temples were dedicated to Brahmianism. At Angkor-Wat he detached from the harder parts the chefs d'œuvre of Cambodian sculpture—bas-reliefs, once brilliantly gilt; pediments, and walls adorned with bas-reliefs. M. Delaporte maintains, down to those which decorate the most secluded sanctuary, are devoted to the exploits of Rama and the glories of Vishnu. At Angkor-Tom, M. Delaporte visited several new monuments, on most of which he also finds on the principal pediments the exploits of Rama and Vishnu. He cleared of rubbish and explored the ancient palace of the Khmer kings, a work of magnificent and wonderful sculpture, the rising terraces of which are adorned with superb compositions in bas-relief; the enormous three-headed elephant, Iravati, is there enthroned in all the places of honour, as at the angles of all the gates of the city, where he is shown by the god Indra, accompanied by two apsaras. When the country became subject to the government of Cochinchina, the trade of Cambodia was transferred to Sai-gon, which was occupied by the French in 1808. Cambodia river, also called the Mei-kong, discharges itself into the sea by three principal branches, of which the most western is the best for ships. Its entrance is in lat. 9° 31' N., and long. 106° 36' E. It is one of the largest rivers in Asia, and is said to rise in a lake in Yunnan.—*Chin., Jap. and Phil. Chr. and Der.,* 1881.

**CAMBOO, TAM. Holecus spicatus,** CAMBRIC or Cambriek.  
Cambranja, *It.*  
A fine cotton or linen fabric, largely imported into India.  
**CAMBRIDGE,** author of War in India, London 1762.  
**CAMBYES,** a king of Persia of the Kaianian dynasty, and father of Cyrus. He conquered Egypt, b.c. 529 to 522. He took Memphis by storm; and he visited the tomb of Menes. Cambyses is a Greek variant of the cuneiform Kabujuya.  
See Pars; Persian Kings.

**CAMEL.**  
Oont, *Dutch.* Lotti-itta, Wonte, *Tel.*  
Camels are mentioned in 1 Kings iv. 28, Esther viii. 10, and Isaiah ix. 6; and they are still largely used as beasts of burden, or to carry messages, and for war purposes, in Egypt and in all the countries in the south of Asia, from Syria up to the Burmese countries and China. There are two kinds, that with one hump and another, and still with two humps. The species employed on the European steppes through which the Don and Volga flow to their respective seas, are the two-humped; and Lieutenant Irwin distinguishes two varieties of two-humped camels. Beyond the Jaxartes, he remarks, is the two-humped species, in the Turki language called uzhri, and by British writers Bactrian. His height is far less than an Indian camel, his hair longer; he is not capable of bearing severe heat, and is not easily naturalized even at Bokhara. In Khzakan he is the prevalent species. The camel called Baghiduli has also two humps, but his height is equal to that of the Indian. He is found chiefly in the south-west of Khurasan, yet even there it is much outranked by the Indian species, meaning we presume, the one-humped camel of Turkestane.

In Arabia there are three varieties of one-hump camels. The largest and clumsiest, called khowas,
are used to carry heavy burdens at the slow and measured pace of a large caravan; the second, called delou, or saddle camel, are selected when young from the former, and are employed in journeys, singly, or with light caravans consisting of similar animals; the third bears the name of hajin in Arabia, maherry in Africa, hurkary in S. Asia, and is the dronemary of the Hebrew Scriptures. It is lightly formed, and of a very pale brown, approaching a cream colour. Being well-trained, its speed will outstrip that of its Mediterranean allies. One can walk between nine and eight miles per hour, and it can accomplish at the utmost 70 miles in 24 hours for two or three days in succession. Wellsted tells us (i. 292) that Nejd is equally the nursery of the camel as of the horse; but the camel of Oman in all ages has been celebrated in the songs of the Arabs as the fleetest. Their legs are more slender and straight, and their eyes more prominent and sparkling. The single hump of the camel of Arabia is round and flabby whilst the animal continues in good condition, but wastes away when out of condition. Wellsted had known £28 paid for one in Oman; but £6 to £10 is their average price. Depth of chest and largeness of barrel constitute their chief points of excellency. A camel of Hejaz can carry from 250 to 500 lbs.; and an ordinary burden camel can walk about 2½ miles an hour, making daily a march of 20 or 30 miles. M. Fontaine mentions an instance of an Arab on his council journey and returning with a message from Coseir to Canneh, a distance of 225 miles, in 28 hours, at the rate of 8 miles an hour continually, which seems incredible. Colonel Chesney mentions that he crossed from Basrah to Damascus, 958¾ miles, in 19 days, or daily 50 miles. Nizam-ud-Din Ahmad, author of the Tabakat-i-Akbari, while Bakshi of Gujerat, was summoned to Lahore by the emperor (A.H. 998) A.D. 1589-90. The Wakiat-i-Mushtaki says that he took with him a party on camels, and that they accomplished the journey of 600 kos (1200 miles) in twelve days, for which the king bestowed honours on him. General Ferrier tells us that the camels from Turkistan and the country of the Hazara are exceedingly large and strong, but not very active. Those from the Seistan are slenderly formed and wiry, but, though small, are as hardy an animal as can be found, and incredibly swift; they will travel 25 leagues in a day without feeling fatigue, and are never affected by the great heat of the sun. These are generally used for riding, and those of Turkistan as beasts of burden. The Bokhara camel and the two-humped Kirghis camel are only surpassed in strength and swiftness by the Arab, and especially the camel of the Hejaz. Besides the Bactrian camel, the Turkomans have a mule breed between this and the Arabian animal, with a hump which can neither be called single nor double, though more near the latter than the former. This is a large, useful, and highly-prized animal, capable of transporting from 1000 to 1200 lbs. with ease; but the creature is short-lived, and the Arabs do not breed from it, giving as a reason that the progeny are intractable and bad-tempered.

In Colonel Stewart's 'Journey through North-Eastern Persia,' he states that the load of the Khorasai camel is 600 to 700 lbs. A correspondent of the Pioneer writes: 'I have frequently seen Brahui camels go out of the fort at Dadur, in Southern Afghanistan, laden with 12 mounds, about 1000 lbs., the ordinary load being 8 mounds, or 650 lbs. I have also met them frequently on the line of march with these loads, and yet one rarely saw a dead Brahui camel.'

They were used by the British in the wars on the N.W. frontier of 1879-1881, but they died in great numbers.

Camels are extensively bred in Murwut, Meenawul, and Esakhail, and are purchased by the Povinda and other wool traffickers. In Syria, the rutting season is in spring, and the males then become extremely unruly. The female carries twelve months, and breeds one at a time. The young camels are weaned at the beginning of the second year. Camels are known to attain to the age of 40 years; but after 25 or 30 its activity begins to fail, and it is no longer able to endure much fatigue. In the northern districts of Arabia, the hair is not shorn from the camel, like wool from sheep, but is plucked off, about the time it is naturally shed by the animal, and seldom amounts to more than two pounds. It is woven into stuffs for clothing.

M. Hue, however, tells us that in Chinese Tartary the fur of an ordinary camel weighs about fourteen pounds. It is sometimes as fine as silk. That which the entire camel has under its neck and along its legs is rough, tufted, and black, but the hair in general is reddish or grey. The Tartars do not take any care of it, but suffer it, when it falls off, to be lost. The milk of the camel is excellent, both for butter and cheese; the flesh is tough, ill-tasted, and little esteemed by the Tartars. They make use, however, of the hump, which they cut in slices and take with their tea. It is said that the emperor Heliogabalus had camel's flesh served at his banquet, and that he was especially partial to the foot; but to modern taste the flesh of the camel is detestable. Like the sheep and goat, their need for water to drink varies with the dryness or moistness of their food. A succulent grass, moist with rain or dew, and near the bank of rivers, of itself furnishes almost sufficient fluid for their wants; but a dry grass, an arid atmosphere, and a burnt-up soil render them very thirsty, and they then readily rush into water. Skinner mentions (ii. pp. 112, 113) that his camels had been 19 complete days without drinking. In the United States, the camels are raised on a large store of food. Pottinger mentions that he allowed his camel 15 lbs. of flour daily, in addition to all the grass it ate. The camels eat the tamarisk and the camel thorn. In parts of the Panjnad country, where camels are reared in great numbers, they delight especially in lana, plants of the salso-laccaceae tribe, which are also useful for burning to get soda. There is often quite a rivalry of interest over a patch of salola land,—the camel-feeder wants it for his animal, and the soda burner for his furnaces.—Pocock's Handbook; Dr. J. L. Stewart, M.D.; Chesney's Overland Route; Hue's Recollections of a Journey, p. 130; Postans' Personal Observations, p. 108; Mignan's Travels, p. 27; Wellsted's Travels; Burton's IV.; Pottinger's Bunch, and Sinde; Fontaine's Egypt; Robinson's Trav. ii. p. 183.

**CAMELopard,** or giraffe, a mammal of S. Africa, the Camelopardis giraffa of naturalists. One variety has been named C. Ethiopia, Ogilby; another variety, C. Sennaarensas.
CAMELID.E. Fossil remains of this family have been discovered in the Siwalik hills and in Burma. So-Cam; Camel; Camilla.

CAMEL: the aba cloak of the Arabs, made of camel's hair. The aba, or cameline, as it is called in the Persian Gulf, is worn in Oman by all classes; it is the camel's hair cloak of Arab shaikhs, and is often striped white and brown.

CAMELIA, a genus of the east of India and China, of the nat. ord. Ternstroemiaceae, and furnishing several species of ornamental flower plants, such as C. Japonica, malliflora, reticulata, drupifera, and thea. C. oleifera of China yields a valuable oil, C. kisii is a tree of Nepal, and C. cedula is a shrub of the Khassya hills.— Voigt.

CAMELLIA JAPONICA. The single red variety of this species grows spontaneously in the woods of China, from 20 to 30 feet in height, and with stems thick in proportion. Its elegant flowers are much admired by the Chinese, who enumerate thirty or forty varieties, for each of which they have a separate name. Many of these varieties are unknown out of China, and Chinese gardeners are likewise ignorant of a large proportion of those found in western conservatories. This elegant flower is cultivated solely for its beauty; but there are other species of camellia raised for their seeds, the oil expressed from them being serviceable for many household and mechanical purposes. The camellia bears the same Chinese name that the tea plant does; and the term cha is likewise employed, as tea is with ourselves, to designate any infusion.—Williams' Middle Kingdom, p. 265; Fortune's Residence.

The Assam tea plant is a shrub with a thin grey bark, and grey soft wood, weighing 50 lbs. per cubic foot. It is cultivated in Kanger, Kuhi, Debra Dün, Kumaun, Darjeeling, the Western Duars, Assam, Cachar, Chittagong, Hazaribagh, in Northern India, and also on the Nilgiri Hills and Ceylon.—Gamble.

CAMEL'S HAIR. Poil de Chameau, Fr. Mu-l-Shatur, Pkns.

Laine de chevron, Fr. Pelo-o-lana de Camello, Ger.

Oont ka bal, Hind. Ottagam mair, Tam.

Pelo de Camello, It. Wonte ventrenkula, Tel.

Unu Runu, Malay.

The soft underwood is of a light-brown colour. In the Panjab it is made into chogas of a cheap kind, but they are soft, warm, and useful. The long hair is not made use of; it is employed in Europe for making paint-brushes.—Powell, Handbook, Panjub; M'Culloch's Dictionary.

CAMEL'S-THORN, Alhaji maurusum.

CAMEL THISTLE, Echinops echinatus.

CAMELUS BACTRIANUS. Linn.

C. dixthorpe, Walther. C. turecuss, Alpinus.

Mecheri, ? Fr. Le chameau, Le camel, Fr.

Bactrian camel, Eng. Trampel their, Ger.

It is found in N. Persia and Turkestan. It is about 10 feet long, has two humps on its back, has dark-brown shaggy hair, long under the throat.—Eng. Cyc.

CAMELUS DROMEDARIS. Linn.

C. monophotus, Eversmann.

C. dromas, Gesner.

C. minimus, Klein.

C. virginus, Forkal.

Camel, dromedary, Eng.

Its countries are Africa, Arabia, Persia, Baluchistan, Rajputana. It is about 8 feet long, has one hump on the middle of the back, pale brown hair. An instance of great endurance of this camel is mentioned by Captain Smith, who purchased one, named Tipu Sahib, for Rs. 300, that carried him 680 miles in 12 days across the desert of India from Jodhpur to Sukkur in Sind. On another occasion, the same camel carried him 110 miles from Sukkur to Kotri, without a halt, in 30 hours.—Smith's Nepal, pp. 20, 26; Eng. Cyc. See Camel.

CAMELUS SIVA VLENISIS, a fossil species discovered by Dr. Falconer and Captain Cautley in the tertiary deposits of the Siwalik Hills of Hindustan. Its crania, jaws, and teeth are in the British Museum. It was nearly related to the existing species, but exceeded them by at least one-seventh in height.—Eng. Cyc. p. 733.

CAMEO, the cyannea of a Tin. They are still largely manufactured in Italy from the large red shield shell of the Maldives Islands, the Casia rufa. It is brought from the Maldives to Ceylon as tribute, and is exported to Italy. It is not a manufacture of India. In 1846 the average value of the large cameos made in Paris was six francs each, giving a sterling value of £8,200; and the value of the small cameos was about £8000, giving a total value of the cameos produced in Paris in 1846 at £40,000. At the same time, in England not more than six persons were employed at the trade. The black helmet, on account of the advantageous contrast of colour in the layers, produces very effective cameos. In 1847 the consumption of shells in France for this purpose was—

The art of cameo-cutting was confined to Italy until 1890, at which time an Italian began cutting cameos in Paris. It might be introduced into India.

CAMERON, JOHN, F.R.G.S., author of The Tropical Possessions in Malayan India.

CAM-HI, an emperor of China who first subdued the Mongol Tartars, which he effected more by kind than by the sword.

CAMJIOO of Tibet, Capra hircus, Linn.

CAMLET. Kamelot, Dyt. Ciambelotto, It.

Camelot, Fr. Kameleon, Rm.

A fabric of wool or long hair.—M'Cullock.

CAMMETTI. Malay? Exoeocaria cemmetia.

CAMOENS. Luis de Camaoens, a native of Portugal, was born at Lisbon about a.d. 1524, and educated at the University of Coimbra, but, falling in love with Catharina de Atayade, he was banished from court. He joined the army invading Morocco as a soldier, where he was often wounded, and lost an eye, and he describes himself then as with 'one hand the pen and one sword employed;' but, neglected, he left Portugal a.d. 1553, and landed at Goa, after a voyage of nine months. He joined an expedition against the king of Benimmen, and a year afterwards accompanied Manuel de Vincencellos up the Red Sea, and returned to Goa, but he involved himself by writing his Absurdities of India, and was banished to the Moluccas. During the five years
that he remained there, he visited some of the islands of the Archipelago, and amassed a small fortune, but, embarking it in trade, he was shipwrecked near the river Mei-kong in Cambodia, saving only the manuscript of his poem, the Lusiad, deluged with the waves, through which, clinging to a plank, he forced his way to the shore. The Lusiad describes the system of modern commerce, founded on the discovery of the Cape route. The geographical descriptions are singularly accurate. He returned to Lisbon, where he lived in great poverty, till his death in the Lisbon hospital, A.D. 1579. His poem, the Lusiad, celebrates the great voyage of Vasco da Gama, and gives a history of the Portuguese in India. The 'Cave of Camoens,' where he is supposed to have written a portion of his Lusiad, is a place of interest at Maona. It is picturesquely situated on the summit of a small hill on the margin of the inner harbour.—American Expedition to Japan, p. 165.

CAMPHOMILE, Anthemis nobilis.

A herb much employed in domestic medicine.

CAMPANULACEÆ, the Campanula tribe of plants, comprising the genera Campanula, Cephalostigma, Cidipnos, Symphyandra, and Wahlerberga. The genus Campanula consists of flowering plants, the Canterbury bell, Venus's looking-glass. C. dehiscent and C. lancifolia are noticed by Roxburgh as growing in Bengal. C. edulis is a native of Arabia Felix. Its thick and rapid root contains a considerable quantity of starch, and is eaten by children. C. glanca, its root is used by the Japanese in syphilis. C. grandiflora grows wild amongst the Chinese hill.—Fortune's Waverings.

CAMPBELL, A., M.D., a medical officer of the Bengal army, who was political officer at Darjiling for upwards of a quarter of a century. When he first took charge of the office, there were not twenty families, but by 1853 a population of ten thousand had gathered together. He found it an inaccessible tract of forest, and left it an excellent sanatorium, with a revenue of fifty thousand rupees. He journeyed to the confines of Tartary. He wrote an itinerary from Phari, in Tibet, to Lhasa, with appendices; Routes from Darjiling to Phari; Report of the Death of Cosmos de Koros, the Tibetan Scholar; The Literature and Origin of certain Hill Tribes in Sikkim; Memorandum on the Bora Chung of Bootan; On the Native Alum or Salaght of Nepal; On the Inhabitants of Sikkim and their Language; Limboos of Sikkim and other Hills.—Beng. Jour. and Journ.

CAMPBELL, Sir COLIN. See Clyde.

CAMPBELL, Sir GEORGE, K.C.S.I., a Bengal civil servant, born in 1824, and sailed for India in 1842. In 1845 he was appointed the assistant to the Governor-General's Agent, N.W. Frontier, subsequently Deputy-Commissioner, Cis-Sutlej States. On returning to Britain, he published Modern India; and India as it May Be. He wrote extensively on the ethnology of India generally. In 1854 he was called to the bar; in 1855 he was appointed Commissioner of the Cis-Sutlej States; and in 1867, Commissioner of the Central Provinces. He was Lieutenant-Governor of Bengal; and on retiring from the service, became a member of the Indian Council in London, and subsequently a member of Parliament.

CAMPBELL, Lieut. J., Assistant Surveyor-General, an officer of the Madras army, wrote on the use of Sir Howard Douglas's Reflecting Semi-circle; On the Use of Kater's Altitude and Azimuth Instrument; Suggestion of a Tide Register; Table of Specific Gravities of Aqueous Vapour, and Dry and Saturated Air; Meteorological Journal of Boyacottah; On the Advancement of Geological Science in India; On the Construction of the Portable Barometer; On the Formation of the Table-land of Southern India; Plain of Baramaral, 2000 feet above the level of the sea; Soils of; On the Manufacture of Steel in Southern India; Improvement of the Silk manufactured in Mysore and the Salem Districts; Report on the Kaolin Earth of Mysore; Report on the Construction of Philosophical Instruments in India; On the Manufacture of Pottery-ware in Southern India; Meteorological Experiments at the Gunnsar Mountains; Journey overland to India; On estimating the distance of Objects of Known Height at Sea.—Mad. J. L. and S. Col. J. Nat. Hist.

Camphor of Borneo, or Bornea Camphor, Lang-nau-hiang, Po-lal-hiang, Hoh-po-lo-hiang, Ping-pien, Mei-hwa-pien.

The camphor of commerce is obtained from two trees, one of which, Dryobalanops camphora, grows in Sumatra, Borneo, and Labuan; the other, the Camphora officinalis, or Laurus camphora, grows in China. The names for it in many languages of the world, are sufficiently alike to show that a knowledge of the substance came from one source, probably China or Sumatra, and the words Dutch, or Japan, or Tub camphor, Burus camphor, China camphor, Formosa camphor, have been added merely to indicate the place of production. The unrefined or crude camphor of commerce is the product of the Camphora officinalis, and is of two kinds, viz. Dutch or Japan, or Tub camphor, so called from being brought from Batavia to Europe in tubs, containing 1 cwt. to 1 1/2 cwt., and is in the form of lumps of pinkish grains. The second kind is called ordinary or crude camphor, China camphor, and Formosa camphor, much of it being produced in Formosa, shipped to China, and re-shipped to Europe in square chests lined with lead-foil, and containing from 1 to 1 1/2 cwt. In this crude state it consists of dirty greyish grains. This crude material is obtained by distillation from the roots and wood of the Camphora officinalis tree, which is chopped up and split up into billets, which are boiled in plenty of water in large boilers, with a conical or round straw cover smeared with clay outside; and, as the water boils, the crude camphor is deposited on the inner straw. Refined camphor is obtained from this product by
CAMPHORA.

distillation, which is carried on in various ways; but the whole process consists in using two round vessels, inverting one above the other, and adding 2 per cent. of quicklime in order to absorb any oil, and distil from one vessel to another. Two earthen pots, luted together, answer perfectly, as a very small aperture being left for the escape of air on the first application of heat. It is largely refined in Bombay. In China it is prepared very carelessly, by soaking in water the chipped wood of the root, trunk, and branches, and subliming it.

The Borneo or Barus camphor, the Lagus-nauhu-hiang or 'dragon's-brain perfume' of the Chinese, is a product of the Dryobalanops camphora, Colebrooke. It is much esteemed in China, and is called by the natives and in commerce, 'kapur barus,' or Baruscamphor, to distinguish it from the product of the Camphora officinalis, or Japan camphor. It derives its name of Barus from a place in Sumatra where it is produced, and whence it was probably first exported. The tree is found on all the northern parts of Borneo, and is said to be particularly abundant in the country of the Kyan, in the interior, on the Bintulu and Rejang rivers. The produce, though so valued by the Chinese, is not much used by the natives, though it is occasionally taken inwardly as a medicine. The price in China of the Borneo camphor is said to be higher than that of Japan, in the proportion of twenty to one; it has been supposed that this disproportion is caused more by some fancier of the consumer than any real distinction of properties. As not one in ten trees is found to produce camphor, its presence must be suspected by a particular state, either of vigour or disease, in the tree; and the camphor collectors cut notches in the trees, in order, before felling, to ascertain whether they are likely to produce camphor. It is said that in those which produce it, the younger and smaller trees are often found to be quite as prolific as the older and larger trees. The camphor is found in a concrete state in the crevices or fissures of the wood, so that it can only be extracted by felling the tree which is afterwards cut into blocks and split into wedges, and the camphor, which is white and transparent, is then taken out. An essential oil is also found in hollows in the wood, which the natives crystallize artificially; but the camphor thus obtained is not so much esteemed as that found naturally crystallized. For the distinction of palm and richest trees they rarely collect more than two ounces. After a long stay in the woods, frequently of three months, during which they may fell a hundred trees, a party of thirty persons rarely bring away more than 15 or 20 pounds of solid camphor, worth from 200 to 250 dollars. The quantity and value of this costly substance are enhanced by a custom which has immemorially prevailed among the Batta race, of delaying the burial of every person who, during his life, had a claim to the title of raja (of which each village has one) until some rice, sown on the day of his death, has sprung up, grown, and borne fruit. The corpse, till then kept above ground among the living, is now, with these ears of rice, committed to the earth, like the grain six months before, and thus the hope is emblematically expressed that, as a new life arises from the seed, so another life shall begin for man after his death. During this time the corpse is kept in the house, enclosed in a coffin made of the hollowed trunk of a durion, and the whole space between the coffin and the body is filled with pounded camphor, for the purchase of which the family of the deceased raja frequently impoverish themselves. Camphor oil is also said to be collected by incisions at the base of the trunk, from which the clear balsamic juice is very slowly discharged. Barus camphor is getting scarce, as the tree must be destroyed to obtain it. About 800 pikuls are annually sent to China. Malay camphor is more fragrant and not so pungent as the Chinese camphor. 983 tons of camphor were exported from Java in 1843; 625 bales were imported in 1843, the produce of the Japanese empire, and 559 pikuls exported from Canton in 1844. In London in 1889 it was selling at 5s. the cwt. The wood of the camphor tree is good timber, suited for house and ship building. The liquid camphor of the same tree appears of the nature of camphogen. Dr. A. T. Thomson, by passing a current of oxygen gas through it, converted it into camphor. In Spain, a camphor has been obtained from some of the Labiatae. In Burma considerable quantities have been produced from the Blumea grandis; and a similar chemical product has been obtained in Europe, by passing a stream of muriatic gas through turpentine. It is largely employed in medicine; and to burn camphor before an idol forms part of the ritual of the Hindus.—Low's Sarawak, pp. 44-46; Marsden's Sumatra, p. 150; Royde's Mat. Med.: Crawford's Dictionary, p. 51; Simmonds' Comm. Prod.; O'Sh.; Mason's Tannearium Tomum, pp. 287-8.

CAMPHORA, a genus of plants belonging to the Lauraceae, of which three species, C. glandulifera, C. officinarum, and C. porrecta occur in the south and east of Asia.

Camphora glandulifera, Nees, is the Laurus glandulifera, Wall. It is a tree of the Nepal mountains, with small yellowish-green odoriferous flowers, and pale yellow light wood, smelling strongly of camphor while fresh. It is weak and unfit for furniture. Its bark has been named the sassafras of Nepal. Dr. Royde says (Ili. Him. Bot.) it contains solid grains of camphor in its wood.

—Voigt, p. 308; Royce, p. 324; O'Sh., p. 545.

Camphora officinarum. Bours. Laurus camphora, Linn., oflicial camphor tree, camphor laurel. A considerable tree of Cochlin-China, Formosa, Japan, and China, principally near Chiu-chu, in the province of Foh-kien; also in Canton, Hu-phe, Kwang-si, and Foh-kien. The tree furnishes excellent planks, beams, and boards. Camphor is diffused through all parts of the plant; the root, trunk, and branches, when cut into chips, are boiled in water and then sublimed into inverted straw cones contained within earthen capitals. It is thus obtained in the form of crude camphor, chiefly from the province of Foh-kien and the opposite island of Formosa, but some of good quality is also procured from Japan. It is sometimes imported into Britain from Batavia.—Williams' Middle Kingdom, ii. p. 157; O'Shaghnessy, p. 455.

Camphora porrecta. Linn.

A tree of Penang, Sumatra, and Java, furnishing a strong gum which is durable if kept dry.

—Voigt; Biez, ii. 708.

Camphor Oil, Kapur minyak, Malaya; the liquid camphor of the Dryobalanops camphora tree.
Camphor Cup, a cup for use after the manner of the quassia-wood or 'bitter cup.'

Camphor Wood of Simatra is from the Dryobalanops camphora, of which the wood is hard, compact, and brownish-coloured. The fragrant, light-coloured, soft wood of which the trunks and boxes of China are made, is supposed to be that of the camphor tree of Japan, Laurus camphora, or Camphora officinarum. Camphorwood is valuable for the construction of chests and almirahs, as its powerful odour protects the contents from the ravages of white ants and other insects. The Martaban camphorwood, Laurus sassafras, is from a very large tree, scattered sparingly throughout the Tenasserim provinces. Wallisch wrote that it was very like Laurus glanduliferæ, which furnishes the sassafras and camphorwood of Nepal. The Karens call it the 'tree galanga,' from its fragrance. — *Holtz; Mason; O'Shaunessy.*

CAMPOSHERMA ZEYLANICUM. *Thur.* A tree 30 to 40 feet high, not uncommon in Ceylon, growing on the banks of streams at Ratnapur and lower part of the Saffragan district up to 400 feet elevation. — *Bedd. p. 188.*

CAMONG, MALAY. A village, an enclosure, a courtyard, the Anglo-Indian compound, the Hindi जिंगान.

CAMRUKH. HIND. अवर्होस carambola.

CAM SING MOON or Cum sing moon, a safe harbour in the Canton river, formed between the southern port of Keow island, and a point of Macao island called Bluff Head. It was much frequented by opium vessels. — *Horsburgh.*

CAM-WOOD, a dyewood from the Baphia nitida of Africa, used in dyeing the bright red of English bandana handkerchiefs.

CANAAAN. This name, according to one authority, is from Chana, the ancient name of Phœnicia. According to another, Canaan or Palestine was called after Canaan, the youngest son of Ham.

CANADA TURPENTINE, or Canada balsam, is obtained from the Abies balsamea in Canada. Between the bark and the wood of the trunks and branches of the trees are vesicles containing the oleo-resin, which exudes when they are broken. Canada balsam is much used by varnish-makers in the manufacture of some of the most transparent varnishes. It is also extensively employed by opticians as a cement. The great value of Canada balsam for optical purposes, depends on its transparency and its refractive power, which is nearly equal to that of glass. When used to connect the pieces of an achromatic lens, it prevents the loss of light by reflection, and excludes moisture and other foreign bodies from the space between the surfaces of the glasses. In Nicol prisms (single image prisms of Iceland spar) it serves the important purpose of transmitting the ordinary ray, and of interrupting the passage of the extraordinary one; its index of refraction being intermediate between that of Iceland spar for the ordinary ray, and that of the same substance for the extraordinary one. — *Brockman.*

CANAGA, CAN., TEL. Pongamia glabra. CANAILS for irrigation are of the greatest importance in all the tropical countries liable to the calamities resulting from excessive droughts.

The great canal of the world is that of *Suez,* connecting the Red Sea with the Mediterranean, and separating Africa from Asia. It was com-

menced 25th April 1859, the first ships passed through it in the year 1867, and it was formally opened for traffic in December 1869. It had occupied ten years of labour to bring it to that state, and cost to that period 13 millions sterling = 13 kr of roupas.

In British India the great works are the Ganges Canal, the Eastern Jumna Canal, the Agra Canals, and the Lower Ganges Canal.

The *Multan Inundation Canals* supply the district of Multan between the Sutlej and the Chenab, where rain hardly ever falls, and convert it into a succession of beautiful gardens, shaded by palm trees. There is a burning sun above and canals flowing below.

The rude inundation *canals of Gujair and other districts of the Bari Doab above Multan,* are of value, and from those in the rich country of Muzaffargarh, between the Chenab and the Indus, the land is made one sheet of cultivation.

The inundation canals of the *Shahpur district* draw their supply from the Jelum.

The *Derajug Canals* run parallel with the river Indus and fill during the periods of inundation.

The *Kohler lands of the Bakhawalpur State* are 10 or 12 miles wide, and border the Indus. They are irrigated by inundation canals from the Sutlej.

The aggregate length of the *Upper Sutlej Canals* is 213 miles.

The *Khanewal Canal* leaves the Sutlej at a point 20 miles below Firozpur, by a month 90 feet wide, narrowing to 20 feet at the end of its length of 55 miles.

The *Sohag Canal, 73½ miles long,* leaves the Sutlej a little below the mouth of the Khanwah, and irrigates the country between that canal and the river.

The *Para Nullah* is a continuation of the Sohag, and is connected with the old bed of the Beas by a channel called Nawabbin.

The *Kutaura Nullah* is to the north of the Khanewal canal, and it was proposed to bring into it the waters of the Sutlej.

The *canals of the Lower Sutlej* and the *Chenab* fertilize the *Multan* district, irrigating 120,000 acres, belonging to 120,000 villagers. In 1871–72 they were 39 in number, with an aggregate length of 632 miles; 11 had been made by the British.

The *Indus Canals* include those of Muzaffarnagar and the Derajat. There are 66 in the Muzaffarnagar district, drawing their supplies from the Indus and the Chenab. Those of the Derajat are 592 miles in aggregate length, of which, up to 1871–72, 108 had been constructed by the British.

The *Dera Ghazi Khan district* and the Sind Sagar Doab need irrigation.

The *Peshawar valley,* with the exception of a small opening towards the Indus, is encircled by mountains, and comprises 2400 square miles, divided into two by the river Kābul, which enters the plain at Michīn. It is joined midway by the Swat river flowing from the N.W., and entering the plain at Peshāvar, it waters Yusufzai by many channels, the Bara from the S.W. entering the plain at Shaikhān.

Bakawalpur State extends for 300 miles along the left banks of the Sutlej, Chenab, and Indus. In former times, the Ghaggari, the ancient Saraswati, flowed through it from the Siwalik mountains to the Indus, between Rori and Uch, parallel
with the Sutlej, but it dried up; and ruins of old towns are dotted along its banks, and all the once fertile tract is now barren and sandy, drifted from the desert, and is known as the Bawahulpur-Bangar. To the west of the Bangar are narrow strips 10 or 12 miles wide, along the left banks of the Indus, Chenal, and Sutlej, called the Khadar. In 1807-70, Major Minchin, political agent, led a canal 105 miles long from the Sutlej, and called it the Fowndow. He also formed six small canals in the Khairpur district.

Below Khairpur are the Vahind, the Khanwah, Naoranga, Kutubwah, Sultanwah, Mubarakwah, Minchinwah, Baruswah, Sidikwah, and the Harihari or Fertiliser, all of them large channels 100 to 200 feet wide, irrigating a vast area by an endless network of branches, and annually cleared out.

From the Indus nine canals lead, two of them excavated by the British; and in July and August the Indus floods the face of the country, the waters reuniting to run into the eastern Narra, a great channel belonging to the Sind system of irrigation.

In the Bari Doab, between the Beas and Ravi rivers, there has been a great State canal completed; but canals are still needed for the 7,000,000 acres unirrigated in the Rechna Doab, between the Ravi and Chenab, which are the Chenab and Jhelum; and the Sind Sagar Doab, between the Jhelum and the Indus.

That of the Bari Doab up to 1871-72 cost upwards of £2,000,000, and was irrigating 300,000 acres.

The great Sirhind Canal, commenced in 1871-72, was projected to draw its waters from the Sutlej, to irrigate an immense area now desert, and the total cost was estimated at £2,950,427, a third part of which was to be borne by the native states.

After the rivers of the Panjab unite at Mithankot, the Indus flows for 450 miles to the sea, through the arid rainless country of Sind. Here artificial irrigation is essential to cultivation of the river during the dry season, and its banks are now greatly above the alluvial plain. When the bed attains a certain height the water falls over, and since historical times the river has been changing its course to the west. The banks are permanent only at Sukkur; at Jharrak, where it is bound by rocky banks; and at Kotri, by hills and deep tenacious clayey soil. The canals are excavations carried away from the river in an oblique direction, so as to secure as great a fall as possible. They vary from 10 to 100 feet in width, and from 4 to 10 feet in depth, and none are deep enough to draw off water from the river except during inundations. The irrigation is carried on by the water flowing into the channels during the inundations, or it is raised by the aid of machinery or Persian wheels. Some of the canals are 70 and 80 miles long. On the western or right bank, the chief canals are the Sind, 654 miles, Ghar or Larikhana, Bigari, and Western Narra.

On the east or left bank of the Indus river is the Eastern Narra. It was an ancient channel which passed through the Thar, and had near it among the sand-hills, about 400 small dunds or lakes or bottoms. In 1859 a channel from the river at Rori was led into it, and its channel was dammed at places to prevent the escape of water into the large dunds.

Two canals have been led from the Eastern Narra,—the Mitraw, which in 1866 had 190 miles open, and irrigated 156,803 acres, and the Thur canal, irrigating 38,000 acres. Under Sir Bartle Frere's administration, the ancient channel of the Narra, 120 miles long, was reopened on the 7th May 1867, to distribute water over the vast plain of Mirpur, the Haur, and the Doab.

From Hyderabad southwards, the Fullali canal is the main feeder of irrigation canals. Originally it was a natural branch of the Indus, which it rejoined 16 miles below Hyderabad; this was stopped by a dam in the time of the Amirs, and its waters were sent into the Gaja, the Gun, and other canals.

In 1861 the cost of clearances of the main canals was £41,041, but the allotment in 1871-72 was insufficient. Canals of a permanent character, proposed to be led off the Indus from Sukkur, Jharak, and Kotri; and the first of these, from Sukkur, was opened in 1870.

In the valley of the Ganges, above its junction with the Jumna at Allahabad, and in the whole length of the country through which the Jumna flows, the rainfall does not exceed 30 inches.

Firoz Shah, emperor of Delhi between 1351 and 1388, drew a canal from the Jumna to water his favourite hunting ground at Hisar, but it had long fallen into disrepair, when Akbar in 1588 ordered its restoration. In 1626, Shah Jahan's engineer, Ali Murdan Khan, projected a canal in the Doab, which shortly ceased to flow. He also led one from that of Firoz, to convey water to the city of Delhi. The Delhi canal crossed the lowland by a masonry aqueduct, traversed the Aravalli hills by a canal cut through the solid rock, 60 feet deep at the crest, and flowed through the city in a masonry bed, throwing off innumerable minor streams; but in 1703 this branch ceased to flow.

When the British came into possession, all these works had fallen into ruin, and in 1820 the canal of Firoz was restored from where the Jumna issues from the Siwalik hills. At Delhi it separates into a branch which enters the city at the Kabal gate, and part of it flows down the Chandni Chowk; the other branch follows that of Firoz to Hisar, and sends off the Rolotak branch. The united length is 445 miles, and that of the watercourses 728 miles; and the total outlay up to 1871-72 was £282,517, from about 447,171 acres.

The Ganges Canal, commenced in 1848, was opened on the 8th April 1854. It is wholly a British project. The water is brought from Ganges Ghat on the Ganges, 24 miles north of the town of Hurdwar, close to the foot of the Siwalik mountains. The main channel is 341 miles long, and the branches 306 and the distributaries 3078, in aggregate length; and 767,000 acres in 5061 villages are irrigated by them. The principal engineer was Sir Proby Cantley. Commencing at Hurdwar, as the river Ganges issues from the mountains, it runs through the country on the right bank of the river. One of its many branches re-enters the Ganges at Cawnpur, and another joins the river Jumna. The canal is carried by a great viaduct, three miles long, over the river Salani. It is of earth, and is protected by a wall of masonry and a bridge of fifteen arches, each of fifty feet of span, through the volume of another river, and beneath the bed of a third, and was planned to re-enter the Ganges at Benares. The Solani aqueduct leaves a clear waterway of
CANALS.

700 feet, and cost £300,000. The total cost of the canal was not less than two millions sterling (£2,056,000). It takes about 75 per cent. of the water of the Ganges, whose volume, however, is not diminished. It traverses the Doab, and by countless branches, dykes, and channels, irrigates almost every village throughout a tract of country upwards of 800 miles in length, and is supplied to every tiller on payment of a water tax. At Hardwar, the pass through which it issues, at the lowest ebb discharges about 7000 cubic feet of water every second. Its current was too strong for navigation, and the expected advantages from it for irrigation were not attained. It is carried through Hardwar, Alighur, Cawnpur, Hamirpur (330 miles), with branches to Futehghur, Bunder-shah, and Koel. A ridge of land rises slightly above the level of the adjacent country, and runs along the 13 miles of the Doab, sloping down on the one side to the Jumna, and on the other to the Ganges. The canal has been constructed on the top of this ridge to the vicinity of Alighur, whence it diverges into two channels, one to Cawnpur, and the other to Hamirpur and Etawa. On the completion of the canal, it was opened in April 1854, and the water admitted on an aqueduct across the Solani river at Roorkee. The engineer, Sir Proby Cautley, on leaving Calcutta, was honoured with a salute from the batteries of Fort William, and was favourably noticed in the Government Gazette.

The Agra Canal has been led off from the Jumna below Dehli, to irrigate the lands of Dehli, Agra, and Muttra. It irrigates 350,000 acres. The Fatehpur Sikri reservoir may also be mentioned.

The Rohilkhand Canals comprise the Nehtore, the Kurnia, the Jyogool, 180 miles, the Muradabad, the Paba, 13 miles long, and the Kailas canals; and the Kiteka and Dhura watercourses, 52 miles. They irrigate the belt of country along the Terai, where much rice is grown.

There are five canals in the Dehra valley, between the Ganges and the Jumna, aggregating 67 miles in length, and irrigating 11,039 acres. There are ten miles of rajbhu.

The tanks in Mahrwaras in 1871-72 had a total area of 8675, and irrigated 14,826 acres. They were largely constructed by Colonels Hall and Dixon.

The canals of the N. W. Provinces have irrigated on the average 1,065,450 acres.

A dam has been thrown across the Sone river, and two main channels lead off from it.

The Midnapur Canal was partly open in 1871-72. It is 52 miles long, to irrigate 290,000 acres.

Mention may be made of the Arruch Canal, 70 miles long, to irrigate 439,000 acres, and of the Patna Canal, 84 miles long, to irrigate 390,000 acres.

The Humirpore and Jhansi irrigation works consist of lakes and reservoirs, partly natural, partly artificial, and are under the direct control of the civil authorities (Friend of India; Annals of Indian Administration).

The Mahanadi river drains the fertile plain of Chatisgarh, in the Central Provinces, and falls into the Bay of Bengal after a course of 529 miles. Its basin covers an area of 45,000 square miles. It is liable to heavy but short-lived floods, and the province of Orissa at the deltas has long suffered from them. The E.I. Irrigation Company undertook to form a great anicut, and it was commenced in 1862; they failed, and in 1868 transferred their works to the Government for £1,050,000, but the water has never brought remunerative rates.

Canals, as watercourses for cultivation, have only since 1862 been in progress in the Bombay Presidency. A weir of 1550 feet has been thrown across the Girnar river, in Kandlesh, and one across the Panjir. In Sultanah a weir 2000 feet long has been drawn across the Kistna, to feed channels 45 miles long. A large tank has been formed at Koorgaum near Barsee, a reservoir at Muki near Duiila, and a tank at Hurtola. A reservoir has been constructed near Shokapur at a cost of £90,000. Large works have been planned for Gujarat and the W. Dekhan, and others for the Central Provinces; for works from the Pench river north of Nagpur, and from the Warda river to its south, and for the waters of the Betwa river to be led to irrigate Bundelkhand, which has been fifteen times desolated by famine in the last three centuries. One-third of the water will go to the Patiaila State.

In Madras, of the native engineering works, those for the application of water to irrigate fields and gardens, wells, tanks, and river channels take the first rank. There are innumerable tanks or artificial lakes of various sizes formed in basins, that near Cumnum being seven miles in circumference. The most northern of its rivers, the Godavery, at Rajamundry, is about fifty-five miles from the sea, divides into two streams, forming a delta of rich alluvial country. A little above this point the river is 2000 yards broad, but it soon expands at Dowlaishwarara into a width of three times that extent, parted, however, by islands into four branches. An anicut has there been thrown across the channel, the united length of the four damps being 3955 yards. Upwards of two miles of stream is blocked up by a solid, well-protected mass of stone, in lime cement, with a breadth at the base of nearly 130 feet, and a height of twelve feet above the natural surface of the water. Along the left bank of the river is one channel, another to Cocanada, and other channels; the total being 840 miles of main channel, irrigating 780,000 acres of land. In 1871-72 there were 56,471 boats and rafts engaged in traffic on this canal.

The rajas of Vijayanagar in 1521 constructed nine dams across the Tumbudra river, and had channels of 89 miles of total length. The old travellers, Cantl and Cesar Frederick, tell of cool streams flowing through the streets of the city. In 1860 the Madras Canal and Irrigation Company undertook to bring a navigation and irrigation canal from the river, throwing an anicut across Sankasala; its history is useful. It was thus to provide for the continuous irrigation of the Bellary district, of the Koundy valley and the Nellore district. The weir across the Tumbudra at Sankasala was 1500 yards in total length of clear overfall, which was broken into two lengths by an intervening island. The Hindry Aqueduct carried the canal, 90 feet broad and 8 feet deep clear waterway, over that river, at an elevation of 32 feet, by 40-feet arches, the length between the abutments being 651 feet; the cost of the first 75 miles was £8710 per mile; the next 115 miles cost £2900 per mile; and the whole
CANALS.

The Grand Canal of China has been led through and near a series of lakes, some of considerable extent, extending all the way from Nan Wang, in lat. 35° 55' N., long. 116° 30' E., down to the Yang-tze-Kiang.—Morai and Material Progress, 1871-2; Markham's Embassy; Ann. Ind. Adm.; Report on the Administration of the Punjab; Powell's Handbook, Econ. Prod. Punjab; Jackson's Manual. See Irrigation.

CANAMBOO. Tam. Crotalaria juncea, Linn.

CANARA, a maritime province on the western coast of the Peninsula of India, with an area of 7,800 square miles. It is arranged by the British into two revenue districts, North Canara and collectorate of Honore, and South Canara as far south as the Chundrakherry river, and from that river commences Malabar. Canara formed part of the Mysore Dominions, and came under British rule after the fall of Seringapatam in 1799. Below the mountains the country is rocky, mountainous, intersected by numerous mountain streams running to the sea, with exceedingly fertile valleys. The Garsuppal falls of the Sherranuty river have four portions. The Grand Fall falls perpendicularly 880 feet. Three languages are spoken, viz. Tulu in the ancient Tuluva country, Malealam as far north as the Chundrakherry river, and Canarese in the taluks of Honavar and Kundapora above the Ghats. In the Buntwal taluk are colossal images of Gomata Raya, carved out of single blocks of granite, and placed on the tops of hills. The interior of the Jain temple at Mood, bidderly is beautiful. Near Kundapora, close to the sea, is a small fresh-water lake, in which the Howana or flower fish is caught.

North Canara, since the 1st Feby. 1862, has been administered by the Bombay Presidency. It lies between lat. 13° 52' and 15° 31' N., and long. 74° 10' and 75° 7' E., with an area of 4,235 sq. m., and in 1872 a population of 398,406 persons, 364,492 of them being Hindus. The Havik Brahmas cultivate betel-nut gardens. The Nannai Mahomedans are seamen; they are well to do, and represent the colonies of Arab merchants of whom a remnant still exists along the coast from Gogo southwards. There are Sidi Mahomedans, descendants of African slaves whom the Portuguese held. They have the woolly hair and black skin of the pure African negro; are poor, and cultivate little patches rudely in the forests.

South Canara is under the Madras Presidency. It lies between lat. 14° 31' and 15° 31' N. and long. 74° 1' and 75° 2' E., and has as its eastern boundary the Western Ghats, through which the Manjarabad, Kolur, and other passes lead up to Mysore and Coorg; its area is 3902 sq. m. The people, about a million in number, consist of Saraswati, Konkani, and Sivakul Brahams, Baut, Korargar; Portuguese of mixed descent, native Christians, Mopla of Arab descent. The aborigines include the Malekudi, Koragar, Holyar. The Malekudi are a forest race who practise the Kumari cultivation, but labour on coffee estates. The languages spoken are Tulu, Malealam, Canarese, and Konkani, besides Urdu and English. The language of Tulu, is spoken between Udipi and Kumbla by about 180,000 people, south of the Pushevenni river and elsewhere; with Moplas, Malealam is the prevailing tongue. Prior to British rule, the Holyar were the slaves of the Wargdar or proprietors, and even yet continue in a state of modified serfdom.—Findlay; Imp. Gaz.; Madras Records.

CANARESE.

The Eknuk tank is four miles north of Sholapur on the Adela, a branch of the river Bhima. Its dam is 7200 feet long, and 72 feet high in the centre, and the lake formed is 63 square miles. It submerged five villages, two of them in the Nizam of Basseor, but 35,840 acres are brought under the influence of the tank.

An aqueduct was completed across the Pennar river at Nellore in 1855. It was breached by the hurricane of 1857, but restored in 1861, and in 1863 the irrigated area was 32,874 acres. It is 520 yards in length.

The Cauvery and Colerun anicuts are the most ancient in Southern India, and those to which the British first directed their attention. At the head of the island of Sirrangam, near Trichinopoly, the main river divides into two branches, the southern retaining the name of Cauvery, the northern being called the Colerun; and the tendency was for the Cauvery to silt up, and the whole of the water to pour into the Colerun. The native anicut had been built about the third century of the Christian era, and consisted of a solid mass of rough stone 1080 feet long and 60 feet broad, irrigating 669,000 acres. Sir Arthur Cotton threw a masonry anicut, 750 yards long, across the Colerun, resting it on three lines of walls 6 feet in diameter in the sandy bed of the river, which has thrown the water into the Cauvery and cleared the bed of the Colerun. In 1836 an anicut was thrown across the Colerun to regulate the supply of water for S. Arcot. Colonel Sim was the engineer.

The Mardi Conwai river is in Mysore, with the Nundoor Sreeramadwara and Maseehully reservoirs.

The Periar river runs to waste into the Cochin marine lagoon, and it has been proposed to turn it to the eastern districts by a cutting 140 feet deep and a dam 60 feet high, and add to the water supply of Madura and Ramnul, now obtained from the Vaiga.

The Tambaprapura river waters the Timneckly district. It has been crossed by several dams in very ancient times.

The East Coast Canal from Madras to Sadras is for traffic.

The Grand Canal of China has been led through and near a series of lakes, some of considerable extent, extending all the way from Nan Wang, in lat. 35° 55' N., long. 116° 30' E., down to the Yang-tze-Kiang.—Morai and Material Progress, 1871-2; Markham's Embassy; Ann. Ind. Adm.; Report on the Administration of the Punjab; Powell's Handbook, Econ. Prod. Punjab; Jackson's Manual. See Irrigation.
spoken by about nine millions of people, partly under the Hyderabad, the Mysore, and the British Governments of Bombay and Madras. The ancient Hindu term, Karnatica, comprehended all the high table-land in the south of India above the Eastern and Western Ghats, and its rulers seem never to have held sway beneath the Ghats; though in the present day, by a strange fatality, it is now only the countries below the Ghats, the Karnatic on the east and Canara on the west, to which the name of the ancient Karnatica kingdom has come to be applied, and its name is now never given to the Bala Ghat, or country above the Ghats.

The great bulk of the Canarese-speaking people are of one race, who are pure Dravidians. They have adopted the Jangama sectarian faith, the followers of which, by their tenets, ought to have no caste distinctions. Most of their subdivisions are restricted to vegetable products as food; and so carefully do they act up to these, that no one of these vegetables will come near bringing a living creature for sale to any one of the flesh-eating people. Their sect is, perhaps, amongst the most exclusive of all in India. It is doubtless this tenderness towards animal life that guides them to their avocations, which are mostly those of civil life, cultivators and shopkeepers, and may have led to their non-resistance to invaders; but in all the great armies which the British have formed during the past century, of the Canarese Jangama sectarians not more than a few thousand men may have become soldiers, and certainly not even one of that portion who abstain from animal food. The Teling and Canarese nations have, till recently, continued equally advanced as to elementary school education; and though, in this respect, both races fall short of the progress made by the energetic, restless, impetuous Tamil people, they are greatly in advance of the Mahratta. For nearly 200 years the inland tract occupied by the Canarese-speaking people had been traversed by great armies, bent on conquest, and since the fall of the great Vijayanagar dynasty all comers seem to have crossed this tract without opposition.

Canaree, properly the Kannadi or Karnatka language, is bordered by the Tamil and the Telugu on the east. It is spoken throughout the plateau of Mysore and in the western districts of the Nizam’s territory as far north as the village of Murkundah, lying 30 miles south-west of Beder. Also it is spoken in part of the ancient Tulva country on the Malabar coast, now long designated as Canara, a name which it acquired from having been subjected for centuries to the rule of Canarese princes. But in Canara, the Malenam, the Konkani, and the Tulva are also spoken, though less extensively than the Canaree. From A.D. 800 to 1500 it was free from any admixture of foreign words, but since then Sanskrit words have been extensively introduced, and it is now in the vicinity of Hyder Ali and Tipu, Urdu words were largely imported into it in Mysore, while it added Marathi in the N.W. and Telugu on its N.E. The Canaree character differs slightly from the Telugu, from which it has been borrowed, but the characters used for Tamil, Malenam, and Telugu are quite distinct from each other. The ancient Canaree character, however, entirely differs from that of the modern Telugu, and the Canareese language differs even more widely from the Telugu than it does from the Tamil. There is an ancient dialect of the Canarese language current, as well as modern, the latter differing from the former by the use of different inflectional terminations. The ancient Canaree dialect, however, has no connection with the Sanskrit character to which that name has been given, in which, viz. the Hala Kannada, many very ancient inscriptions in the Mahratta country as well as in Mysore are found.

**CANARIUM, a genus of plants of the natural order Burseraceae.** Wight says the resinous juice of C. commone has properties similar to copaiva, while the kernels of the seed afford by expression a bland, edible oil. C. strictum, Rozb., is known in Malabar under the name of ‘black dammer tree,’ in contradistinction to the Vateria Indica, which is the ‘white dammer tree.’ This tree is rather common in the alpine forests about Courtallum in the Tinnevelly district, and is regularly rented there for the sake of its dammer. The dammer is transparent, and of a deep brownish-yellow or amber colour when held between the eye and the light, but when adhering to the tree has a bright, shining, black appearance. The fruit is a very hard, three-celled, oval nut, tapering at each end.

Under the names Dhoo and Googul, Dr. Gibson mentions two species of Canarium in Canara and Sunda, one on the ghats above, and the second species of great size cultivated near Biligil and at Siddapore. The choice gum-resin afforded by these trees is extensively used in the arts, and exported both inland and to the coast.—*Wight, Ill.; Dr. Gibson. See Boswellia; Resins.*

**CANARIUM BENGALENSE.** Rozb. An immense forest tree of Assam, Sylhet, and the adjacent mountainous countries, flowering in May and June. From fissures or wounds in the bark, a large quantity of very pure, clear, amber-coloured resin exudes, which soon becomes hard and brittle, and is not unlike copal. But in the Calcutta bazar it was only valued at from Rs. 2 to Rs. 3 for seven maunds of eighty pounds each.

—*O’Shaughnessy, p. 255; Voigt, p. 149; Rozb. iii. p. 136; Boyle’s Hist. Bot. p. 177.*

**CANARIUM BRUNNEUM.** Thw.

Senticans the brunneum, Thw.

Maha-bulu marn,... . ... SINGH.

A tree 50 to 60 feet high, growing in the Central Provinces of Ceylon at elevations of 2000 to 3000 feet.—*Boedome, Pl. Syst. p. 127.*

**CANARIUM COMMUNE.** Linn. Java almond.

C. mehennethene, Gert. | Colophonía Mauritania, D. C.
Ampyras Zeylanica, Ret. | Balmsolaneenten Zeylanice, D. C.

Bois de Colophane, Fr. | Jungli Badam,... HIND.

Grows in the Mauritius, Ceylon, the Peninsula of India, the Moluccas, and the Indian Archipelago. It was brought from the Moluccas to the Calcutta Botanic Garden, but in Roxburgh’s time did not thrive, owing to the coldness of the winter months. The bark yields an abundance of limpid oil, with a pungent turpentine smell, congealing into a buttery, camphoraceous mass. It has the same properties as balams of copaiba, for which it could be substituted; and is said to yield East Indian elemi. Its nuts are three-cornered
and edible, but apt to produce diarrhoea.—_Roxb._

_ACIARUM GENICULATUM._ M-C. A
large and valuable timber tree found in the Pegu
valley, but scarce. The wood is white-coloured,
and adapted to house-building.—_M-Clelland._

**CANARIUM NIGRUM.** _Roxb._

_Marignia acutifolia,_ D. C. | _Dammara nigra, Ramp._

_A tree of Amboyna and the Moluccas; a
reddish, soft, viscid, heavy - smelling substance
exudes from wounds in its bark._ —_Voigt_, p. 149.

**CANARIUM PIMELA._ Smith. Pimela nigrum.

_Luh-lan, Wu-lan._ | _Chin._ T'ing-kwo, | _Ctn._

_Kam-lan._ | _Chinese olive._ | _Eng._

This tree grows in the Chinese provinces of
Kwang-si and Foh-kien. Its pointed oblong
fruits, from 1½ to 1½ inch long, are eaten green or
shrivelled and are full preserved in salt. At
Amoy the hard kernels are often beautifully
carved for heads. Lau-tang, a kind of gum or
black dammer, is obtained from its branches,
and leaves. The kernels of the Pimela alba (Luh-lan) are similarly used.—_Smith._

**CANARIUM STRICTUM.** _Roxb._

_Dammara nigra legitima, Ramp._

_Manda-du._ | _Beng._ Thelli marr, | _Maleal._

_Gugal, Dup._ | _Kongilam maram, | _Tam._

_Black dammer tree._ | _Eng._ Karapa Kongilamu, _"_ | _Maleal._

This very beautiful, large tree is most abundant
in all the moist ghat forests on the western side
of the Madras and Bombay Presidencies up to
4000 and 4500 feet, but it does not occur in
Ceylon or elsewhere, and it is never seen in dry
forests. Its brilliant crimson foliage makes it a
most beautiful sight when in young leaf. The
leaves of saplings and young trees are very much
larger than those of full grown trees.

This is the black dammer of the Tinnevelly
and Malabar, and is so named in contradistinction
to the Vateria Indica, which is called the white
dammer tree. _C. strictum_ is common near Court-
allam, where it is rented for its dammer. While
adherent to the tree, it gives a bright, shining
black tint, but by translucent light is of a deep
brownish-yellow or amber colour. The balsam
exudes in a very fluid state, and trickles down
the trunk, where it gradually hardens by exposure
to the sun; the fresh resin continuing to flow over
that already hardened, gives the stalactitic ap-
pearance to the huge lumps of resin, in which
form the resin is brought to the market. It is
perfectly homogeneous, has a vitreous fracture.
It is insoluble in cold, but partially soluble in
boiling alcohol on the addition of camphor; when
powdered, it is readily soluble in oil of turpentine.
Powdered and burnt on the fire, it emits a more
resinous smell, and burns with more smoke, than
white dammer. The size of the lumps of this
resin, together with its colour and the peculiarity
of shape already mentioned, suffice to distinguish
it from other Indian resins.—_M. E. J. R.; Voigt,
_149; Roxb._ iii. 138. See _Gums and Resins._

**CANARIUM SYLVESTRE._ Gartn._

_C. Sylvestralum, Rum._ | _Schinus Bengalesis, S._

_A tree of Chittagong and Assam. Timber hard,
tough, and close-grained, used for furniture._

**CANARIUM ZEYLANICUM._ Blume,

_C. Balsamiferum, Moor._ | _Kakooon-sgas._ | _Singh._

_Occupies the warm, moister parts of Ceylon up
to an elevation of 1500 feet. A resinous balsam
exudes copiously from the trunk of this tree,
which, mixed with paddy chaff, is used by the
natives for burning, as the smoke drives away
snakes from the domicile. C. coccineo-bracteatum
and _C. euphyllum_ are also known._—_Thew._ i. p. 79.

**CANYREE SEED.** Phalaris canariensis, _Linn._
_Mainly used to feed caged birds. The annual
British consumption may be estimated at about
10,000 quarters, of which about 8000 are grown
in England, especially in the Isle of Thanet and
Essex._

**CANAVALLIA GLADIATA._ D. C. _Sword-
bean._

_Dolichos gladisatus, Roxb._ | _Dolichos ensiformis, Lour._

_Mekhun._ | _Beng._ Thambatin, | _Tam._

_Segapu Thambatin? _"_ | _Tela._

_Pai-noung-nee._ | _Burm._ Tamma ; _Chama? _"_ | _Tel._

_Kalsamba._ | _Hind._ Segapu? _"_ | _Sank._

_This plant has four varieties, viz._ :—

_a. Flowers and seeds red._

_b. Flowers and seeds white._

_The three first of these are cultivated for their
large swordlike pods; that with the white flowers
and white seeds is considered the best, and is
often two feet long. It is esteemed by Europeans._—_Mason ; Voigt._

**CANAVALLIA OBTUSIFOLIA._ D. C._

_Koyi avari._ | _Tam._

_Is a common plant on the Coromandel coast,
where it occurs along with the Ipomoea pescaprae,
and is a useful binder of loose sand._—_Cleghorn._

**CANAVALLIA VIROSA._ W. and A._

_Dolichos virosus, Roxb._ | _Dolichos cusiformis, Lour._

_Kalo Shim._ | _Beng._ Wild sword-bean, | _Eng._

_Kat Shim._ | _Adavi chamma, | _Tel._

_Kudusmar of Bombay._ | _Karu chamma, _"_

_Grows on the Coromandel and Kousan coast,
and on the seashore of the Tenasserim provinces,
in great profusion._—_Mason._

**CANAXA.** This battle, in which the younger
Cyrus lost his life, was fought in the plain between

**CANCER.** The crab genus of crustacea of the
family Canceriidae; several species occur in Southern
and Eastern Asia. _C. carcinus, C. hydromus, C.
coralinus, C. maculatus, and C. tenax have been
transferred to the genera Gecarcinus, Carpillus,
and Rupella._

_C. calculosus,_ _Ed., New Holland._

**CANCHI,** the Tamil name of Converam._

**CANCHI PANDU._ Tel._ Solanum nigrum._

**CANCHORI VER._ Tam. Tragia involucrata._

**CANCRA._ Hind. Pavetta Indica._

**CANDAHAR.** A town in Afghanistan, in long.
65° 26' E., and lat. 31° 37' N., 3184 feet above the
sea. It is the Khenta of the Vendiaal. Accord-
ing to Elphinstone (Cautib, p. 456), there has been
a city here since the time of Alexander, and the
ancient city stood till the reign of the Ghilaz, when Shah Hussain founded a new city under
the name of Husainabad. Nadir Shah attempted again to alter the site of the town, and built Nadirabad; at last Ahmad Shah founded the present city, to which he gave the name of Ahmad Shah, and the title of Asraf-ul-Balad, or the noblest of cities; but the old name of Candahar still prevails among the people, though it has lost its rhyming addition of Dar-ul-Karar, or the abode of quiet. Ahmad Shah himself marked out the limits of the present city, and laid down the regular plan, which is still so remarkable in its execution. The houses in the town are from 16,000 to 20,000; the population, 45,000 in number, consist of different tribes. Houses as under:—

Agyi Khel, 50 Dowlat Shahi, 50 Makuzai, 100
Arab, 50 Ghilzai, 100 Nurzai, 600
Alikozai, 600 Hossain, 200 Parsian, 120
Ali, 200 Ishakzai, 600 Pathna, 200
Achakzai, 150 Ismail Zai, 100 Popalzai, 600
Babi and Kakar, 50 Pirian, 100
Barab, 200 Kashmil, 100 Sddazai, 100
Bakozai, 400 Sardani, 300 Sarkani, 200
Bardurani, 150 Khordi, 200 Turki, 50
Barnezai, 400 Khugiani, 150 Others, etc., 440
Bisakzai, 100 Madozi, 150

The more remarkable objects are the tomb of Ahmad Shah, the public baths, the citadel. It was occupied by the British Indian army from 20th April 1839 till the 8th August 1843, and was re-occupied in 1879. See Afghanistan; Candahar.

CANDALLA, in lat. 20° 3' N., and long. 74° 49' E., in the Dekhan, N.W. of Aurangabad. The entrance to the caves of Candalla is 1982 feet above the sea.—Wise, Schi. See Candalla.

CANDALOO, Tex. Caj. Ceylon Indica, is a candle-leaf, found in Labuan and Sarawak. It has a curved and pointed head. It frequents the tops of lofty trees.

CANDESH. See Kandesh.

CANDIA or Crete, an island in the Mediterranean. Mount Ida, famous in history, is in the centre of this island.

CANDLES.

Kaaren, ... DET. Dyian; Lidin, MALAY. Chandelle, ... FR. Kandil, ... Kerzen; Lichter, ... GER. Velass, ... PORT. St. Butti, ... OULIH. Swietach, ... RUS. Candelle, ... IT. Vatti, ... TAM. CANDELARIA, or candle-fly, is found in Labuan and Sarawak. It has a curved and pointed head. It frequents the tops of lofty trees.

Almost all the candles in use in the East Indies are imported from Europe and America. For lighting, the natives use oil lamps of various shapes, often of metal fixed on an iron spike, which they stick into the ground. Wax and tallow candles are, however, made in several parts of India,—in Vizagapatam, Coa, Malabar, Patna, Calcutta, Pedlalore, and Berhampur; but the large importations of candles from Europe have caused the manufacture to decline considerably. It is useful to place two thin instead of one thick wick in each, and the wicks should be plaited, not twisted. Wax candles improve with age. The candles used in Japan are made of an oil said to be pressed out of the seeds of the Rhus succedanea? This oil becomes, when exposed in the sun, gummy; when used in candles it hardens, and is not solid as wax. The province of Fetsigo, more particularly, produces this tree, and consequently supplies the greatest quantity of this oil. In the eastern parts of China, the product of the tallow tree, Stillingia sebifera, and beef and hog’s tallow in the south, are used in the manufacture of candles. Wax is only employed to encase the tallow or hard, which, from the heat of the climate and its unclassified condition, never becomes hard.—Royle, Arts, etc., of India, p. 484; Thunberg’s Travels, iii. p. 188; Rohde, MSS.

CANDLESTICKS.

Kandelaars, ... DET. Candelieri, ... IT. Chandeliere, ... FR. Podwiesnikii, ... RUS. Leuchter, ... GER. Candeleros, ... ES. Candelabros.

Candlesticks are in general use in the East Indies, but to shield them from the wind are usually covered with glass shades.

CANDLE-TREE, Candle-nut tree, Aleurites triiloba. Its nuts are strung together and used for candles. Torches are made from the candle-wood of Demerara.

The Candle-tree, Parmantiern ecerifera, might be introduced into India. It is confined to the valley of the river Chagres (Isthmus of Panama), where it forms entire forests. In entering them a person might almost fancy himself transported into a chandler’s shop. From all the stems and lower branches of the trees hang long cylindrical fruits, of a yellow wax colour, so much resembling a candle as to have given rise to the popular appellation, ‘Palo de velas,’ candle-tree. The fruit serves for food to numerous herds of cattle.—Dr. Seemann.

CANDY, a province of Ceylon, formed out of an ancient kingdom, subdued in the early part of the 19th century by the British. The town of Candy was taken on the 19th July 1819.

CANDY, Sugar-candy.

Kurri-shakur, GUJ., HIN. | Kal-kando, ... TAM. Gula batu; Batu, MALAY. Kala kanda, ... TEL. Nabatt, ... Pers. | ... Crystalized sugar was at one time largely imported into India from China, but is now made in many parts of India.

CANDY, a measure of weight equal to 500 lbs. in some places, but it varies in different towns. A candy (khundee) in one place differs very much from the candy of another place. Again, a candy, for instance, of metal, is not the same as a candy of tobacco; and there is a different candy for cotton and sugar. The candy used in buying is not always the same in the same place as the candy used in selling.

CANEER. HIND. Nenir. odorum.

CANES or Rattans.

Canne, roseau, ... FR. Bed, ... HIND. Cane, ... SP. Baton, raton, ... IT. Cano, ... Ger. Rohrt, ... Junco de Indias, ... Nahur, ... GUJ. Perambugal, ... TAM. Rotan, ... MALAY. Betamulu, ... TEL. Canne, bastone, ... It.

Canes are the produce of the Calamus genus of palms, of which the species are numerous in the islands of the Indian Archipelago, in the Malay Peninsular, in the humid parts of the Madras territories, in the forests of the districts of Chittagong, Sylhet, and Assam, along the foot of the Himalaya as far north as the Dehra Doon, where a species is found which Griffith named C. Roylanceanus; and he applied the name of C. Roxburghii to the plant which Roxburgh called C. rotang, common in Bengal and on the Coromandel coast. Both are used for all the ordinary purposes of cane; as also are C. tennis of Assam, C. gracilis, C. extensus, and others. But those of the shops
are gathered indiscriminately, and it is not possible to say from what particular species they come. C. rotang has, however, been said to furnish the stouter, and C. Scipionum the slenderer sorts. Mr. Griffith considered C. Scipionum of Loureiro to be the species which yields the well-known Malacca cane, but the plant does not appear about Malacca, and the canes are stated to be imported from Siak, on the opposite coast of Sumatra. Even this does not, however, seem to be correct, as the Malacca Committee for the Exhibition of 1862 sent Malacca canes, as cut from the jungle, previous to being subjected to the process of smoking, which gives the cane its rich brown tint so much admired in Europe. The stem of Calamus versus is described as being 100 feet long; that of C. oblongus, 300 to 400 feet; of C. rudementum, upwards of 500 feet; and of C. extensis, as much as 600 feet. Rumphius even states that one kind attains the extraordinary length of 1200 feet (vol. v. p. 100). In the Tenasserim Provinces there are numerous species indigenous in the forest, and the Kares have different names for seventeen species or varieties, used extensively instead of cordage. The stays of the masts in Burmese boats are usually made of rattans, and they are split up into strings for the innumerable purposes to which cord and twine are usually applied. All that gives stability to bamboo houses, is the rattan which ties them together. The Calamus rudementum of Loureiro is manufactured at Malacca into cables, and is employed for dragging great weights and binding wild elephants. A canoe bridge over the Temisang in the Khassya hills is 312 feet long, and 50 feet above the river. It oscillates greatly.

CANGNI. Hind. Panicum Italicum.
CANGOO. Tam. A Timewelly wood of a whitish brown colour, used for handspikes and wheelwright’s work.—Col. Frith.

CANGUE, a wooden yoke, by which Chinese criminals are punished, and are led about the streets as a spectacle to the people. It consists of two large pieces of wood fitting into each other, and having one to three openings, through which the head and one or both hands are drawn, according to the pressure of the crime. Such a yoke weighs from 50 to 100 lbs., and presses so heavily upon the back and shoulder, that the criminal is unable to feel himself, and must wait till some compassionate person lifts the food to his mouth. Such punishment is inflicted for periods varying from a few days to several months, and in the latter case it is almost always fatal. This instrument of torture makes a man resemble the foot of a huge heavy table.—Sinnett’s Lady’s Voyage, p. 49; Huc, Chinese Empire, i. p. 272.

CANHO. SIND. Citrullus cucurbita, Linn.
CANIATCHI. Cani, land, and Atchi, heritage.
In the south of India, land property. Tod thinks the atchi, like the ote and awut, Jafput terminations, implies classship.—Todd’s Rajast. i. 496.

CANDE, the dog tribe, family of mammals, comprising the genera Canis, Cyno, and Vulpes, of which the common dog, Canis familiaris, and its many varieties, the wolf, Canis pallipes, and the jackal, Canis aureus, occur in India. The wild dogs of India have been removed to the genus Cuon, and the foxes belong to the genus Vulpes.

CANIS? in Penang, a large tree, used for door frames.—Col. Frith.

CANIS AUREUS. Linn. The jackal.
C. aureus Indicus, Hodg. | Lups aureus, Kennep.
Shighal, | Duk. | Srigala, Sans.
Jackhals, | Duk. | Nakka, Tel.

The jackal is found in a great part of Asia, Syria, Arabia, Persia, and North India west of the Brahmaputra. Along the line of the Ganges, in Lower Bengal, they move in packs, and eat indiscriminately. In the Peninsula they are of larger size, and seen singly or in pairs; and in the Dekhan live much on wild fruits; the coffee bean of the plantations is largely eaten by them. Their cry when moving at night is very disagreeable, and even when cackling their call is unpleasant. Native sportsmen believe that an old jackal, which they call bhalu, is in constant attendance on the tiger, and whenever his cry is heard, which is peculiar and different from that of the jackal generally, the vicinity of a tiger is confidently pronounced. Sir W. Elliot says he has frequently heard the cry attributed to the bhalu.—Cat. of Mammalia, Jordan. See Jackal.

CANIS FAMILIARIS. Linn. Var. Indica. The Pariah, Polygar, and Brinjara dogs, and Tibetan mastiff. The Brinjara dog is a large, powerful animal, in shape and with limbs somewhat resembling the Persian greyhound, only much more powerful. The breed seems, however, to be disappearing from amongst the Brinjara tandas, and replaced by the ordinary pariah. In 1868 the editor met a great tanda on the march at Ajunta, but only pariah dogs amongst them. Indeed, between the Brinjara dog and many of the pariah dogs there is so great a resemblance, as to impress with the belief that they are the same variety. In many villages are pariah dogs in no way distinguishable from the Brinjara. The large Brinjara dog is an eager hunter of the larger game, a faithful, intelligent, and good watch-dog, but does not crave attention. The Pariah dog is very intelligent, and powerful, and is peculiar in being without hair. The Beder race of Zorapore and Gurbhunata hunt the wild boar with a large powerful breed of dogs. A peculiar breed is raised by the raja of Rampur, seemingly between the Persian greyhound and the Tibetan mastiff. The Tibetans have a mastiff, a terrier, and a poodle, and the two last are pets, and the poodle is often fed for the table. The Chinese dogs from Japan, the original of the King Charles spaniel, is sometimes seen in India. The C. Egyptianus, C. cauda, C. Dukhunensis, do not need separate remark. See Dog.

Canis laniger, Hodg., Tibet white wolf.
Chankodi, | Kamaon. | Changu, | Trs. | Himalaya.

Canis niger, Jerd., black wolf of Tibet.
Hakpo-chanko, | Trs.
Canis pallipes, Sykes, Blyth, Indian wolf.
C. lupus, var., Eid.
Bighana, | Bundelkh. | Landgah, | Hind.
Tobs, | Can. | Nekra, |
Bhures, | Bheria, | Hind. | Handar, | Hurrar, | Byra, | Bhaya, | Hind. | Toralu, | Tel.

The wolf roamst in Central and Southern India; they are never seen singly, but always in large or small packs. If a single one appears, it
may be assumed that others of the pack are near. They are bold, even in the vicinity of towns, scarcely moving off from a horseman. Length from muzzle to insertion of tail, 36 to 57 inches; do. of tail, 16 to 17½; height at shoulder, 24 to 26; length of head, 10; circumference of do., 10 to 17; weight of an adult female, 347. The wolves of the Southern Mahrrata country generally hunt in packs, chase the goat antelope (Gazella Arabica), steal round the herd of Antilope cervicapra, and conceal themselves on different sides till an opportunity offers of seizing one of them unawares, as they approach, whilst grazing, to one or other of their hidden assailants. On one occasion, three wolves were seen to chase a herd of gazelle across a ravine, in which two others were lying in wait. They succeeded in seizing a female gazelle, which was taken from them. They have frequently been seen to course and run down hares and foxes; and it is a common belief of the ryots that in open plains, where there is no cover or concealment, they scrape a hole in the earth, in which one of the pack lies down and remains hid, while the others drive the herd of antelope over him. Their chief prey, however, is sheep, and the shepherds say that part of the pack attack and keep the dogs in play, while others carry off their prey; and thus, if part of the former in the same plan, part turning and checking the dogs, while the rest drag away the carcass, till they evade pursuit. Instances are not uncommon of their attacking man. In 1875, 1061 persons were devoured by wolves; in the next five years, 887, 564, 845, 492, and 347; and from four to six hundred are annually destroyed. Sometimes a large wolf is seen to seek his prey singly. These are called won-tola, and reckoned particularly fierce. In Oudh and the Punjab they destroy large numbers of children. Their ordinary prey are deer, sheep; and in pursuit, they display great sagacity, throwing out flanking parties, and surrounding game. In 1866 the editor witnessed a sambar run close up to a railway train in Berar, halt as the train moved on, and it then fled at speed; looking beyond, a body of wolves were seen in pursuit.

CANNABIS SATIVA. Linnaeus.

The hemp plant is grown in Persia, Syria, Arabia, and throughout India, in some places for its fibre; in others, and generally, for its intoxicating products. It is common in waste places in many parts of the Punjab plains, Cis and Trans India, and much more abundant and large (reaching 9 or 10 and 12 or 14 feet in height at times) in many places in the Himalayas, up to 10,000 feet. It appears to be commonly cultivated in Garhwal, etc., than in any part of the Punjab Himalaya, but in the latter it is frequently grown in small patches on the Sutlej and Bias at 5000 to 7000 feet; and Dr. Stewart had seen fields at 10,000 on the Chenab in Lahou. On the Sutlej the seeds of the cultivated plant are roasted and eaten in small quantity with wheat. The most important product of this plant is the resinous exudation, which does not appear to be produced below a certain elevation in the hills. It is used as a narcotic, as are the dried tops of the plant. The latter are gathered for home use in many parts of the hills, and also occasionally in the plains (they are largely used in Sind, where the plant appears to be grown in the fields for this purpose), but the great source of the charras is Turkestan. Dr. Cayley states that in October 1867 this drug to the value of Rs. 44,700 was imported from Yarkend into Leh, and Rs. 1,92,220 hemp was exported from the latter to the Punjab in the same month. During 1867, 1830 maunds were imported from Yarkand to Leh, and 817 maunds were sent from the latter southward by various routes. The drug is mostly consumed with tobacco in a hookah, its use extending to Afghanistan, according to Bellows (Dr. J. Stewart, P. Plants, p. 216). In 1859, an experimental consignment of two tons of Himalayan hemp was valued in the English market at from £30 to £32 per ton. The price at Lahore is about £15 or £16 per ton.

The hemp plant secretes the resinous principle in its leaves, on which account these, as well as the charras collected from off the young tops of the stem and flowers, is highly esteemed in all eastern countries, on account of its exhilarating and intoxicating properties. Among the Arabs the hemp has a variety of names, as 'the increaser of pleasure,' 'the emenstor of friendship,' etc. By its name of Hasha, it is often seen painted in the works of travellers in Egypt, Arabia, and Syria, while the name of Bhang is not less known in the far east.

Of the intoxicating products, Charras is the concreted resinous exudation from the leaves, slender stems, and flowers, collected in the Himalayas, Yarkand, and Herat. It is eaten in a sweet-meal, or smoked like ganja.

Ganja, the dried hemp plant which has flowered, and from which the resin has not been removed; also the whole plant. It is smoked in a water pipe until a peculiar contraction of the throat is felt.

Bhang, and Subza, and Sidhi, the larger leaves and capsules without the stalks; also Sukho or Sawia, the small leaves, seeds, and husks ground and made up with water, milk, etc. These are highly aphrodisiacal, but often lead to impotency, inanition, delirium tremens, catalepsy.

Majum is a concoction made of bhang, ganja, charras, opium, poppy seed, datura, leaves and seeds, cloves, mastic, cinnamon, aniseed, cumin, cardamoms, made up with milk or ghee and sugar.
Canna edulis.

Tadhal is a preparation from bhang, poppy seeds, and other similar articles. It is believed to have cooling properties. The charnas produces visionary ecstatic pleasures, sometimes catalepsy; or the intoxicated, with his arms outstretched, balances on his toes as if soaring. The misuse of bhang is a frequent cause of insanity.—Materia Medica; O'Shaughnessy, p. 581; Pouss; Hand- book: Cleghorn, Punj. Rept. p. 66.

Canna edulis. The Thubers afford 'Tous les-mois,' a farmcourt food used by invalids.—Mason; Ains. Med. Med. 142; Biddell.

Saba jaya, Hakik, Hind. Guri Genza chettu, Tel. Katu Balu, Maleal. Krishna tamarachettu,

There are several varieties of this, the colours of the flowers scarlet, orange, red and yellow mixed. Varieties are often seen in gardens, and much cultivated by the Burmese for the seeds, which they use for sacred beach. CANNANORE, a seaport town on the west coast of India, in long. 75° 24' E., and lat. 11° 51' N., known to the natives by the name of Kouryal-bandar. In 1871, population 10,265, rainfall 97 inches. It is a military cantonment, and has been known to Europeans from the earliest times. Proceeding along the sea-coast, says Bartolomeo, you then arrive at Cannanore, a town with a castle, and subject to the government of queen Collatiri, by the Europeans called Collas- tri. This city is of great antiquity, and the king of Collatiri belongs to the first class of the Indian princes. The capital of the kingdom of Cannanore, called also Colunas, lies in the latitude of 11° 50', and is distinguished by the same name. The whole surrounding district, which extends towards the north as far as Mount Dely, is inhabited by the Molandis, who live merely by piracy. Several seamen are mentioned by Pliny, Arrian, Ptolemy, and other ancient authors. They unite themselves to other pirates who reside on the Angedib islands, near Goa, and capture all the small vessels which sail from Goa to Cochinn. The huts in which their wives and children live, stand on the eastern side of Mount Dely.' This mountain, which forms a cape or headland, lies in the latitude of 12° 8'; and here Malabar or Maleala, properly so called, ends. Cannanore is now in British territory, held by a body of European and native soldiers; it is a place of large trade. There is a fort which was built by the Dutch in 1636, and the cantonment lies to its north. Across the bay from the fort is the quarter occupied by the Mopla race of Mahomedans.—Imp. Gaz.; Voyage to East Indies.

Cannibal.

Mr. Stanley and the missionaries describe many cannibal tribes on the banks of the Congo river in Central Africa, and of other races on the New Calabar river. The Immulthanga, a Zuul tribe, and the Moshesh in S. Africa, were cannibals; also the Fan of the west coast of Central Africa, and the Niam or Sandhe in the region of the Gazelle Nile, and the light-coated civilized Mibutton race on the Uelle river. In the instance of the Basuto people the habit had newly arisen.

At the time of the Tai-ping insurrection in China, an English merchant in Shanghai met his servant in the street carrying home the heart of a rebel, with the avowed intention of eating it to increase his own courage. The ancient Mexican were cannibals. Papuans of New Guinea, the Solomon Islands, New Hebrides, New Caledonia, and the Fiji group, were cannibals. It is common to all Polynesians, in the Marquesas Islands, the Hawai group, Tahiti, and the Maori of New Zealand. The Australians are not habitual cannibals. The odious rite exists with considerable civilisation. The natives of the Solomon Islands are dwarfish, but they build canoes which are 'perfect gems of beauty,' and they have a fine sense of vocal harmony. The New Hebrides have a yet more inveterate love than these vocalists for human flesh. In one of the islands, Anetityum, the natives have been cured of the bad habit by the missionaries; but the population, which was 12,000, is now but a sixth part of that total. Epidemic diseases and a sudden change from barbarism to civilisation are the causes. Nowadays was the passion for human flesh more violent than with the Fijians. At great feasts twenty bodies were served up at once. No solemnity was perfect in the times before British domination without human sacrifices. When a chief died, wives and slaves were buried with him. When a chief's house was built, a slave was buried under each pole which held it up. The Fijian had a fixed belief in a future state, in which the actual condition of the dying person is perpetuated. Thus a young man, being unable to eat, was buried alive by his father at his own request, lest he should grow thin and weak. Somewhat luxuriously he was asked to be strangled first; but he was scolded and told to be quiet, and be buried like other people, and give no more trouble; and he was buried accordingly.

Anthropophagy has vanished with the people themselves from among the Iroquois and Algon- kin; it has disappeared from among the people of the high plains of Anahuac, the Indians of Peru, and most Brazilian races. It is increasingly circumscribed in the Southern Ocean by the dying out of the cannibal races, and the pressure of white settlers. The number of cannibals is still, however, very considerable. The Bata of Sumatra, according to Fredman, may be reckoned at 200,000 souls; the cannibals of the Niger delta at 100,000; the Fan, according to Fleuriot de Langle, at 80,000; the cave dwellers of the Basuto country (about a tenth of the whole population), at 10,000; the Niam- Niam, at about 500,000; the Mirenga and Masey, according to Marley, at 2000; other South American cannibals, at 1000; the Australian aborigines at 50,000; the Melanesians (without including New Guinea), 1,000,000,—a total at the present of 1,943,000 human beings addicted to

570
anthropophagy. A native paper of British India, in A.D. 1870, stated that a person had been transported for life by the Session Court at Jhansi, on a charge of eating dead human bodies stolen from graves. It was said that he lived on this fare for a number of years.—P. M. Gazette; Richard Andre in the Erganzcungen blatter; Dalton's Ethnology; Neubold's British Settlements, ii. pp. 379-375; Pitchel, Races of Man, p. 161. See Aghora; Batta; Birbor.

CANNING. Charles John Canning was born at Gloucester Lodge, Brompton, in 1812. He was the third son of George Canning, a celebrated statesman, and was educated at Christ Church, Oxford. He entered upon public life in 1836, as member for Warwickshire. In the following year his mother died, and he went to the House of Lords. When Sir R. Peel came into power in 1841, he was appointed Under Secretary for Foreign Affairs. For a month or two, in the re-constructed ministry of Sir Robert Peel, Lord Canning was Chief Commissioner of Woods and Forests; but in July 1846 he resigned with his party, but returned with the Coalition Ministry in 1858. In the government of Lord Aberdeen, Lord Canning was Postmaster-General, and distinguished himself by his administrative capacity. He made many changes in the internal organization of the department, and set on foot the practice of submitting annually to Parliament a report of the work, and especially the progress, achieved by the post office. He held the same appointment for a short time in Lord Palmerston's cabinet. Lord Canning began his rule in India on the last day of February 1856, when the army of Bengal revolted, and much of Northern India rebelled, under the guidance of Nana Rao of Bittur, and of the emperor of Delhi. The years 1857-1858 were employed in suppressing the mutiny, in which he displayed great boldness and self-reliance, and when the embers of the insurrection alone remained, he was the first to urge clemency.

On the 3d March 1858 he issued a proclamation declaring his policy he intended to pursue with regard to the talukdars of Oudh, which he afterwards modified, on the remonstrance of Sir James Outram, then Chief Commissioner. Oudh had been the centre of the rebellion, and on its suppression the inhabitants were disarmed, and the forts of the petty chieftains dismantled. He was the first Viceroy of India, having been appointed Viceroy and Governor-General 1st November 1858, and 12th March 1862. During his administration, the loyalty of the Sikhs and of the Nepal ruler, Sir Jung Lang, was maintained, and so was the prosperity of Nana Rao and the emperor of Delhi. Several servants of Government, Sir Henry Lawrence, Sir John (Lord) Lawrence, Sir Robert Montgomery, Sir Colin Campbell, Sir Nevil Chamberlain, Sir George Balfour, Sir Hugh Rose, Sir Robert (Lord) Napier, Sir Hope Grant, Sir Henry Norman, Sir Bartle Frere, by their labours in war and in peace did the state service, and won honours for themselves. Earl Canning, on his return home, was appointed a Knight of the Garter by letters patent, dated Balmoral, May 21, but he died at London on the 17th June 1862.

CANNON.

The cannon used for war in Eastern and Southern Asia by the eastern nations, or by the Europeans, are either imported from Europe and America, or are cast in the foundries of the several countries. The British have a considerable foundry near Calcutta, but cannon of the more recently invented forms are all imported from Britain. From the Persian term top, is the Hind term top-khana, a battery of artillery. The British in India have mounted batteries drawn by bullocks, ponies, horses, and mules, also camel batteries and elephant batteries, and mountain trains.

CANOES.

Canoon. Fr. Canois, Sp. Barchetta, It. "Canoe." Canoes are largely used in India as river and ferry boats, and have shapes and forms to suit the rivers and waters. Canoes at Calcutt are hewn out of the trunk of the jack-fruit tree, Artocarpus integrifolia. Coast canoes of Point de Galle and the Madabar coast have weatherboards on an outrigger in the form of a smaller canoe; they are sharp at both ends, and beat to windward without tacking. The Jangar of the Malabar coast, for rivers, is a kind of canoe. The rivers of the Northern Circars are crossed by a double canoe, formed out of two pieces of a coconut or a palmyra tree hollowed, and kept apart by cross ties of wood. Canoes scooped out from single trees are in universal use in Burma, the Malay Peninsula, and the Malay and Eastern Archipelago. Canoes of the Solomon Islands have no outriggers. The practice of standing up to paddle canoes seems to be general throughout the coasts of New Guinea. The brown-skinned natives of the Archipelago all sit, or squat, while paddling their canoes, excepting the Bajau Laut, or sea gypsies, who stand like the Papuans, and give as a reason for assuming this posture, the superior facilities it affords them of seeing turtle, and of chasing them when discovered. See Boats.

CANOON-GO. Arab. Pers. The village clerk; an expounder of the rent terms, literally, teller.

CANOPUS STAR. See Kumbhha yoni.

CANOUJ, in the N.W. Provinces, in lat. 27° 2' 30" N., long. 79° 38" E., with a population of 17,093. It is said to have existed from 1000 B.C., and to have been founded by two sons of Cush, who named it Mahadya, afterwards changed to Kanya knjia. It was not unfrequently called Gadhipoora Jye-Chand. It was held by the Raitor dynasty from the close of the 6th to that of the 12th century, and terminated with Jye-Chand, A.D. 1194. In S. 1222 (A.D. 1219), eighteen years after its fall Seoji and Satrun, grandsons of Jye-Chand, abandoned Canouj, and with two hundred retainers journeyed westward to the desert,—according to some of the chronicles, on a pilgrimage to the shrine of Dwarica, but according to others, to carve their fortunes in fresh fields. Seoji, on the banks of the Looni, exterminated, at a feast, the Dabeys of Mehwo, and soon after killed Moheslas, chief of the Gohils of Kherdur. One of the chronicles asserts that it was Astothana, the successor of Seoji, who conquered 'the land of Kher' from the Gohils; and he established his brother Soning in Eedur, a small principality on the frontiers of Gujerat, appertaining, as did Mehwo, to the Dabey race; it was during the mithan, a period of mourning for one of its princes,
that the young Rahtar destroyed the clan. His
descendants are distinguished as the Katondia
Rahtar. The third brother, Uja, carried his
forays as far as the extremity of the Surashtra
Peninsula, where he decapitated Beekumi, the
Chawara chieftain of Okanundula, and established
himself. For this act his branch became known as
the Badhali; and the Badhali are still in consi-
derable number in that farthest track of ancient
Hinduism. Its wars with Delhi accelerated the ruin
of Hindu independence. This kingdom appears to
have been like Panchala. It seems to have been a
long narrow territory, extending on the east to
Negal (which it included), and on the west along
the Chambal and Banas as far as Ajmir. The
identity of Canouj and Panchala is assumed in
Moen 11, 19. Its limits, as assigned in the
Mahabharata, are made out by connecting notes
(vol. iii. p. 135, vol. iv. p. 142) in the Oriental
Magazine. These boundaries, enlarged a little on
the south and on the west, are the same as those
assigned by Colonel Tod to the same kingdom at
the time of the Mahomedan invasion. Mr. James
Fergusson (p. 735) gives the following rulers in the
Christian era—

stone's History of India, i. p. 402; Ferg. p. 735.

CANTHIJA. A clan of Gaur Brahmans. Also
tribes in the north-west of India, who trace their
origin from the city of Canouj. The Canouj
Brahmans are met with from the Himalaya to the
Narbada and Bay of Bengal. They have many
subdivisions, but the khutkool or six houses—
(1) Sandel-got, (2) Oopmun-got, (3) Bharadwaj-
got, (4) Bhuradwaj-got, (5) Koteayun or Visva-
mitra-got, (6) Kusip-got, and (6) Sakrint-got—are
chief. The honour of an alliance with the
privileged khutkool such as the Kulis, Kullu,
Barlamas, and of Bengal, some of them have as
many as twenty or twenty-five wives. Amongst
them are included the Sumulakhee, who are said to
have been made Brahman by Raja Ram Bug'heil, when
he was in a hurry to make a sacrifice, but as he
could not perform it without assembling a lairk and
a quarter of Brahmans, he collected people from all
classes and parts, and invested them with the
junci, or sacred thread. Others say that Manik
Chand, the brother of the famous Jye-chand
Rahtar, others that one of the Surneyt rajas, others
that the redoubtable Ram Chunder himself, was
the manufacturer. However this may be, the
Sumulakhee rank very low in the scale of
Brahmans.—Gloss; Elliot, Sappl.

CANTH. HIND. Placourtia separaria.

CANS. HIND. son of Ugra, a tyrant killed by Krishna.

CANTA. HIND. Agave vivipara and A. yuccanoila.

CANTHA-JATHI. BENG. Barleria priocititis.

CANTHARIIDE. A small tribe of vesicatory
beetles, containing eleven genera, among which
are Cantlaris, Mylabris, and Meloe, species of all
of which have been employed as vesicatories.

The genus Cantaris does not occur in India, but
is largely imported. The genus Mylabris is very
common in the Dekkan. Cantanthes erythrophorj
occurs in Shanghai and Chefoo.—Ryle.

CANTHARIS VESICATORIA. Latrenelle.

Blistering beetle. Eng. Canterelle, IT.

Mouches d'Espagne, Fr. Cantaridas. Span.

Spanish Fliegen, Gen.

A genus of Coleopterous insects, abundant in
all the south of Europe, and spread into Germany.
This insect was at one time largely imported into
India, but since the year 1850, species of Mylabris,
obtained in India, have been substituted.—Ryle.

See Cantaridece.

CANTHUM, a genus of plants of the natural
order Cinchonaceae. The species now recognised
as of the E. Indies, are C. angustifolium, Chinense,
didymum, floribundum, longifolium, parviflorum,
parvifolium, and recurvum. Other species have been
described by the present writer to the genus Randia, Stylcocorne,

CANTHUM DIDYUM. Gartn.

C. cymosum, Pers., Webers cymosus, Wildi.

C. umbellatum, W. J., Rendellea cymosa, Poir.

Peydax diconos, Gartn., Cupea cymosa, D. C.

Ursool, ..... MAHR. Tolan, ..... URIYA.

Nalla balu, ..... TAM. Tel. Foruwa, ..... SINGH.

Nalla Kegi, ..... TAM. Tel.

This is a small or middling sized, very handsome
tree with deep green foliage. It is very abundant
on most of the mountains in the Madras Presidency,
particularly so on all the hills in the Salem dis-
trict; grows in the Godavery forests, and is very
common in Ceylon. A variety was considered by
Wight as a distinct species from the Didymum of
the eastern coast, but it only differs slightly in the
inflorescence, and is not now considered specifically
distinct; the wood is close-grained and hard, and
mottled and very dark-coloured in the centre, like
old seasoned oak.—Beddome, Fl. Sylc, p. 221.

CANTHUM NITENS. W. Jc. Malai caurai.

TAM. Dr. Gibson seems to consider Dr. Wight's C.
nitens identical with C. didymum (the Canthum
umbellatum, Wight), and adds, that if right in
this conjecture, the tree is a common one on the
Bombay Ghats, and, from its flowers and shining
leaves, is well worthy a place in gardens. The wood
is small, and is said not put to any use.—Wight;

Gibson.

CANTON, a city and seaport of China, capital of
Quang-tong, in the south-west of China, built
on a river of same name. At an early date after
the Hijira, the Arab Mahomedans established a
factory at Canton, and their numbers were so
great by the middle of the 8th century, that in
758 they attacked and pillaged and fired the city,
and fled to their ships. In their commercial trans-
actions with the Chinese, the natives of Europe
were long restricted to this town. The city con-
ists of three sections, divided by high walls; the
streets are narrow, paved with small round stones
in the middle, and flagged at the sides. Canton
river has two tides in the 24 hours, greatly
influenced by the moon's declination. At its
entrance it is called Choo-zeang. It is divided
into two channels by the Wun-tong islands, the
eastern one of which is the Hoo-mun or Hoo-tow-
mun, or Tiger's Head entrance of the Chinese, the
Boca Tigris of Europeans, and Foo-mun of pilots.
The channel to the west is called Bremer channel.
Canton city is on the N. bank of the river, about
CAOUTCHOUC.

30 miles above the Bocca Tigris, 75 miles from Hong-Kong, and 70 miles from Macao. The wall is 6 or 7 miles in circumference. Canton was captured by the British, and ransomed 25th May 1841.—Horsburgh.

CAOUTCHOUC, Gummi, Gomme Verderhars, veraceae, Canvas lencio, Canvas voile, or canvas, is one of the most valuable rubber, or caoutchouc, and is much used in Europe as sailcloth for ships’ sails, and a finer kind is made for tows and common tablecloths. Canvas is manufactured at Pondicherry and at Cuddalore, and sold in bolts, containing 40 yards, at from 20 to 25 rupees, and a coarser at 8 to 15 rupees a bolt. Canvas of excellent quality is manufactured in Travancore. European canvas, though much dearer, is generally preferred in India to the native material.—Europe material selling at 24, 25, and 26 rupees per bolt, while the ordinary country canvas can be had for 16 rupees. A coarse description of very hard brown canvas has been for some time produced in Bengal. In some parts of the Madras Presidency, cotton canvas of very good quality is produced; two or more threads are placed together, sometimes the threads of the web are twisted either wet or dry. Native vessels have all their sails made of an inferior description obtained in the northern parts of Madras Presidency, at the rate of 6 to 8 rupees a maund of 25 lbs.—Rohde, MSS.

CANYA, in Hindu astronomy, the solar sign Virgo.

CANYA KUBJA, an ancient name of the town of Canouj.

CAOUTHOCUH, India rubber.

India rubber, or caoutchouc, is a vegetable compound which is found in all plants with a milky juice, as in the moraceous, euphorbiaceae, artocarpaceae, apocynaceae, eichoraeae, papaveraceae, campauelaceae, and lobilaceae. India rubber has long been known to the natives of the East Indies and South America. It was not, however, till the expedition of the French academicians to S. America in 1735 that its properties and nature were made known in Europe, by a memoir upon it by M. de la Condamine. And subsequent notices of it were sent to the French Academy in 1751 by M. Fresnay, and in 1768 by M. Macquer. It is used for machinery, in electric and surgical apparatus, weaving, and clothing.

The selling prices in London per lb. are—

Africa, 1s. 5d.; Borneo, 1s. 9d.; and Central America, 2s.; and Madagascar, 2s. 3d.

The plants yielding the caoutchouc of commerce are—

Vieus elastica, Assam. Chavannesia esculentu, Burma.

Vieus, Madagascar. Landolphia, Africa.

Castilla elastica, S. America.

C. Markhamiana, Collina, S. America.

Caoutchouc is obtained in Borneo from three trees,—mangoon, mangoon putih, and mangoon manga, from 50 to 100 feet high, and about 6 inches diameter,—seemingly three species of Willoughbeia.

The American sources of the commercial supply are from the Hevea Braziliensis, H. Gwynanius, Castilloa elastica and C. Markhamiana, and Han-cornia speciosa. The African caoutchouc is got from the Vahea gymnifera of Madagascar, and Landolphia Owariensies; and the Asiatic plants are Ficus elastica, Urecola elastica of Sumatra, Borneo, and Penang, Willoughbeia edulis, and Chavannesia esculenta. Other plants are named, viz. Siphonia elastica, S. calinanch, Jatropha elastica, and Melodinus monognus. The banyan tribe generally yields a milky juice, which, for many purposes to which caoutchouc is applied, might be rendered serviceable. So long ago as 1806, Dr. Royle reported fully on the Assam caoutchouc from the Ficus elastica. The tree has been introduced into the Tennessee Provinces, and appears to grow as well as an indigenous plant. Caoutchouc from Ficus elastica was brought to Arakan in 1878 by clans of the Shando or Poor race, who receive it in barter from the Lushai. They reside north and south of the Blue Mountains. The plant is indigenous for thirty miles south of the Blue Mountains. In 1873 the Government of India formed plantations of it. It has aerial roots, and grows to a large size, above 100 feet, in the evergreen forests at the foot of the Assam hills.

Chavannesia esculenta, a troublesome creeper in the Burma forests, attains a girth of 11 inches, and its crown covers an area of 300 square feet. Its caoutchouc is similar in quality to that of the Ficus elastica.

Species of Ficus produce the caoutchouc brought from Java; and F. rubra, F. elliptica, and F. prionoides are noted for those mentionable affords a portion of that brought from America. Next to the Moraceae, the order Euphorbiaceae yields the largest quantity of caoutchouc.

Siphonia elastica, a plant found in Guyalla, Brazil, and extending over a large district of Central America, yields the best kinds of India rubber that are brought into the markets of Europe and America. The caoutchouc which is brought
from the islands of the Indian Archipelago is from the Urceola elastica, a climbing plant of very rapid growth and gigantic dimensions. A single plant is said to yield, by tapping, from 50 to 60 lbs. annually. It is also obtained from the juices of Calophora utilis and Camerania latifolia, plants of South America and Willughbeia edulis, in the East Indies. Caoutchouc, whilst it is in the tissues of the plant, is evidently in a fluid condition; but after its separation from the other fluid parts, it forms a solid mass similar in its external characters to vegetable albumen. In this state it is dense and hard, but may be separated and rolled out so as to form a sheet resembling leather. Caoutchouc is employed to rub out pencil marks made on paper, and largely for waterproofing. When distilled, it yields oils which have a composition similar to oil of turpentine. In N.E. India, an India rubber tree grows to some 70 to 100 feet high. Immense forests of it are found on the west side of the Brahmaputra, extending along the Miri and Abor mountains. The rubber from this tree from some chemical property cannot bear the heat of a passage to Europe. It becomes a fluid during the voyage. Otherwise, in cold climates it is equal to other rubbers. The Caoutchouc trees of the Bhamo and Mogoung districts are estimated at 400,000. They thrive most in damp moist soil, and in thick forests, shady and cool. They grow to from 75 to 150 feet high, and their roots grow over the ground to some distance. They are fit to tap when from 6 to 10 years old, at which time they are 21 to 30 feet high, and 44 feet in girth.

In the Tenasserim Provinces, also, a species of Echites, an indigenous creeper, yields caoutchouc not at all inferior to that which is obtained from the elastic fig tree. The Agricultural and Horticultural Society, in reporting on a specimen sent them by Major MacFarquhar of Tavoy, observed: "With care in preparing, it would be equal to the best South American." Caoutchouc is also procurable from the Nerium grandiflora, a beautiful climbing shrub often met with in gardens. The Loranthi abound in Malabar; and a similar substance might readily be procured, as obtained from Urceola elastica in Penang and the Archipelago, Ficus religiosa, F. Indica, Hippomane biglandulosa, Cecropia peltata, and the Jintawan of Borneo.

Castilla, the Ule of South America, belongs to the Ar tocarpacea, and is one of the loftiest of the forest trees of tropical America. There are two known species, Castilla elastica, Cerru, and C. Markhamia. Which yields the India rubber is at present (1876) disputed. The collectors are called Hulero. C. Markhamia attains to 180 feet in height, with a diameter of 5 feet, and a yield of 100 lbs. of India rubber; wood soft and spongy; leaves 14 inches long and 7 broad.

Hevea Brasiliensis (Siphonia Brasiliana, Küh.) grows in the valley of the Amazon. It is the Castilla of South America. It is the most valuable of the India rubber trees, and furnishes the Para rubber. It was introduced into India in 1873, as it affords the best caoutchouc; exported from Para in Brazil. The juice is obtained by incisions cut through the bark; it falls freely from any wound. The stiffening milky juice is plastered over bottle-shaped clay moulds; the clay being removed, when sufficiently coated, by washing. Other species of hevea yield juice abounding in caoutchouc of various qualities. It is dissolved by turpentine and spt. eth. sulphur. In Britain there are about twenty factories where this article is made into shoes, boots, caps, cushions, elastic bands.—Poole's Statistics of Commerce; Rode, M.S.; Rose, Productive Resources of India, p. 76; Mason's Tenasserim; Bonyng, America, p. 258; Reports, Exhibition of 1851; Eng. Cyc.; Trans. Royal As. Soc.; Tomlinson, pp. 296–299; Captain Strover, 1873; Markham, Perw. Bark.

CAPA. See Eleusine coracana.

CAPALA. Hind. Rottleria tinctoria. The oil, which is obtained plentifully from the kernels of this fruit after the removal of the celebrated kupti or kamala powder, promises to be of some importance medicinally as a cathartic oil, and deserves a more complete investigation. See Dyes.

CAPE ADEN, a high, rocky, peninsular promontory on the south coast of Arabia, 5 miles long and 3 broad. Its most elevated part, 1776 feet high, is called Jatal Shamsham, and in clear weather is visible 60 miles off. This peninsula was taken by the British in 1839, and has since been fortified. Several ports on and near it are named, as Hejaf, Al-Ainah, Shaikh Ahmad Island, Ras ibn Jarbeh, Ras Marbut or Steamer Point, Ras Tarsheim, 988 feet; Ras Marshagh.—Findlay. See Aden.

CAPE BUNGO, in Japan, in lat. 33° 32' N., long. 132° 2' E., at which Ferdinand Pinto landed in 1642. See Pinto.

CAPE CALDER, in lat. 8° 4' 20" N., and long. 77° 35' 35" E., is a low, sandy point, with a small white, square pagoda at its extremity. A little to the W. is a large village. Inland, the Cape rises in a gradual slope to the base of the ghats, the nearest of which, at 4 m. N.W., is an isolated, very sharp conical hill, 1403 feet high, often mistaken for the Cape itself. It is the most southerly point of the Peninsula of India. The name is from Kumari, a virgin, the virgin goddess Durgah, and has a legend that a virgin once leaped from it into the sea. It is covered on the eastern ridge with palmyra trees.—Horsburgh; Imp. Gaz. See Comorin.

CAPE DALIGADO, on the E. coast of Africa, in lat. 10° 41' 12" S., and long. 40° 39' 51" E.

CAPE GUARDAFUI, a headland on the coast of Africa, nearly opposite Aden.

CAPE BEN, or Socoty Petrel, is the Puffinus major, also known as Dorothea fuligiosa.

CAPE JASHK is the N.E. limit of the Gulf of Oman.

CAPE LIANT, in the Gulf of Siam, in lat. 12° 34' N., long. 101° 11' E., called by the Siamese Lem Samme San. The whole of the coast, from Cape Liant to Kamas in Cambodia, is an uninterrupted archipelago of beautiful islands. One of them, Hin Chalan, is in lat. 12° 27' 4" N., and long. 100° 57' E. See Cambodia.

CAPE MONZE, a cape in the southern part of Baluchistan, in lat. 25° N. It is the most westerly point in India. The mountains of Baluchistan are there only a few miles broad.

CAPE NEGRAIS, its extreme S. point in lat. 16° 1' 30" N., and long. 91° 19' 16" E., is the termination of the mountain range that runs N. and S. along the Arakan coast.
CAPE OF GOOD HOPE.

CAPE OF GOOD HOPE, the southernmost point in Africa. It was rounded by the Egyptians ages before the Portuguese succeeded under the command of Vasco da Gama. Cape Town, the capital of the territory of the Cape, stands on the west side of Table Bay, and rises in the midst of a desert, surrounded by black and dreary mountains, Table Mountain (3315 feet high), the Sugar Loaf, the Lion’s Head, Charles Mount, and James Mount, or the Lion’s Rump. From these several rivulets flow into Table Bay, False Bay, etc. This town surrendered to the British in 1795, and was restored in 1802 by the treaty of Amiens; it again surrendered to the British in 1806, and was finally ceded to them in 1814. Long. 18° 23' E., lat. 33° 50' S.

Cape Gooseberry, Physalis Peruviana, also Brazilian cherry.

CAPE PALMYRAS, a projecting land in Orissa.

CAPE PETEL, also Cape Pigeon, the Daption Capense, Stephen, also called Pintaloa, and by sealers the Egli bird.

CAPE RAMAS, in lat. 74° E., and long. 15° 6' N., on the west coast of India, near Goa, has a small fort on it belonging to the Portuguese.

CAPERS.

Kebbir, ARAB. Carparis, LAT. Kappers, DUT. Kebbir, PERS. Capres, Fr. Kappersii, Rus. Cappari, GER. Alekapparissis, SR. Cappari, IT.

The capers of commerce are the unexpanded buds of Capparis rupestris of Greece, C. fontanesii of Barbary, and C. Aegyptiacae of Egypt. Preserved in vinegar, these flower-buds constitute a well-known article of commerce and of luxury at our tables. The quality depends exclusively upon the age at which they are gathered, the smallest and youngest being the dearest and most delicate, and the largest and oldest the coarsest and cheapest. On an average, each plant of the caper bush gives a pound of buds. The consumption of capers in Britain is about 60,000 lbs. a year. Several other species of Capparis possess stimulating properties.

CAPER SPURGE, Euphorbia lathyris.

CAPILLAIRE, a syrup prepared with leaves of the Adianthus capillus Veneris and A. caudatum. The last grows in Ceylon, also amongst the Courtallum hills in the Indian Peninsula, in Cochín-China, and at Ambony; the first is called by Rumphius, Micia Miccan Utan. — Ainslie’s Mat. Med. p. 297.

CAPOETA MACROLEPIDATA, a fresh-water fish of Tenasserim, Penang, and Java, with a large swimming bladder of which isinglass is made. See Isinglass.

CAPOOR KICHILIE. TAM. Curcuma zedoaria. Likewise the root of a plant called also Kakhar, sent to India and Persia for medicinal purposes, and for perfumery, and to preserve clothes from insects. It is about half an inch in diameter, and cut up when brought to market; it has a pungent bitterish taste, and slightly aromatic smell. — Middle King ii. p. 400.

CAPPARIDACEAE, the capper tribe of plants. Sixty or seventy species occur in the East Indies, of the genera Gynandraopsis, Cleome, Polanisia, Crataeva, Nicobahria, and Capparis. Some American Cappariaceae are very poisonous, others act as vesicatories, and a few are merely stimulant. To the latter class belongs the Capparis spinosa of the south of Europe.

CAPPARIS PHYLLA. Roxb.

Karai, HIND. Khero (unripe fruit), SIND. Kirrun, HIND. Pulpku (flower).

This small tree grows on the banks of the Jumna, in Tungevelly, Dakhun, Gujerat. On his journey to Kābul, the Honourable Mr. Elphinston found it growing in the midst of the desert. All over the Panjab its flower-buds are cooked as a pot-herb; its unripe fruits are gathered, made to assume the acid fermentation, and made into a pickle with pepper, mustard, and oil, and eaten with bread. The fruit is about the size of a marble, and is gathered both green and ripe by great numbers of the natives, who eat it largely. Its wood is durable, and not eaten by insects. Karil fruit is considered by natives useful in boils, eruptions, swellings, piles, and in affections of the joints; also as an antidote to poisons. — Rozb.; Voigt; Dr. J. L. Stewart; Powell’s Handbook.

CAPPARIS BREVISPINIA. D C.

C. acuminata, Rozb. ii. 566.

Kalo-kera, BENG. Pallkeo, TEL. Autunboody kai, TAM.

A scrambling shrub of Malabar and Bengal, common in hedges, with a beautiful red fruit, the size of a small pear; the stem armed with yellow thorns in pairs at the leaves. The green fruit is used in making pickles. — Jaffrey; Voigt; Rozb.

CAPPARIS DECAISNEI. Its buds, Pameero, SIND, are pickled, and would well replace the ordinary capers of commerce; leaves epistatic.

CAPPARIS DECIDUA. Its fruit, Karil, called also Dèle, is gathered from the tree when it is of a bright red colour, and about the size of a cherry; it is used as a pickle. — Powell’s Handbook.

CAPPARIS DIVARICATA. Lam., W. and A.

Pachoonda, MAHR. Budareni, TEL. Toaratti maram, TAM.

A small tree of Coimbatore, and not uncommon on the more arid wastes and in the dry hedges of the interior of the Bombay Presidency. Wood only fit for fuel. — Wight; Gibson.

CAPPARIS GRANDIS. Linn., W. and A.

Waghutty, MALAY. Guli, TEL. Vellai toaratti maram, GUILEMchetu, TAM. Regutti ...

A small tree of Coimbatore, and common in waste places inland of the Bombay Presidency; wood close-grained, hard, and good; too small for general use, but good for turning. — Wight; Gibson; Elliot, Flor. Andh. Usef. Pl.

CAPPARIS HEYNEANA. Wall. Chayruka, HIND. A shrub growing in S.W. India, at Cochín and Courtallum. Its leaves are used for rheumatic pains in the joints, and its flowers as a laxative drink. — Voigt, 74.

CAPPARIS HORRIDA. Linn., W. and A. IC.

C. Zeylanica, Rozb. ii. 567.

Thorny caper bush, ENG. Katalikai, TAM. Aranda, HIND. Attaday, SANSK. Adonna; Arundola, TEL.

Grows in the Panjab, Bengal, and the Peninsula of India. The natives eat its fruit dressed in different ways, but chiefly as a pickle. — Dr. Ainslie, p. 238, Stewart, Rozb.
CAPPARIS OBOVATA.

CAPPARIS OBOVATA is found in the Sutlej valley between Rampur and Sungnam, at an elevation of 3000 to 5000 feet. Its fruit is pickled.

CAPPARIS PANDURATA. Linn.

Kantagar; Kamai, Beng. Nalla uppi, Tel.

Grows in Bengal and Peninsula, and is a good hedge plant. — Voigt, pp. 74, 75.

CAPPARIS SINICA. The buds of the caper of Mount Saini are the Filılı-ul-jabl, or mountain pepper of the East.—O'Shaughnessy.

CAPPARIS SPINOSA. L.

In Europe this plant furnishes the caper. It generally grows in the Panjab, exactly as a recent traveller has described it on Saini, viz., 'in bright green tufts hanging down from the efl ects of the rocks,' and adorned with very handsome large flowers. It is found near Multan, in the Salt Range, along the Trans-Indus hills to Peshawur, and in the valleys of some of the great rivers, ascending to 5000 feet at Wargiri, on the Sutlej 8000 feet, Thomson, and on the Indus above Skardo to about 10,000 feet (Jacquemont and Thomson), and it occurs to 12,000 near Leh. The ripe fruit is made into pickles by the natives of the Salt Range, etc., in some places at least eaten only by Hindis. Mr. Edgeworth prepared the buds in the European style as capers, and found them excellent. In Ladakh the leaves are used as greens; they are eaten by goats and sheep; and in Kangra the roots are said to be applied to sores.—Dr. J. L. Stewart, p. 616.

CAPPER, COLONEL, Quartermaster-General of the Madras army in the latter part of the 18th and beginning of the 19th century, and his house on the sea-beach is still known by his name. He was the first to put forward the view that the storms of the Indian Ocean are rotary, and in 1801 he published a book on the Winds and Monsoons, adopting the view that hurricanes are whirlwinds. He took an active part in the troubles of the Madras army, and was embarked for England but the ship never reached.

CAPRA ÆGAGRUS. Gumelin, Blyth, Hatton.

This has five varieties, viz.:

Var. a. Capra Ægagrus, Bock, lives in the highest Khasia mountain, where they are reared by the people. It has no wool, and is used for food.

This is domesticated in Tibet, and the wool is exported to Kashmir, where it is made into the finest shawls. It has on the body a long coarse hair, intermixed with which is a fine soft wool, which is the article used in the manufacture.

Var. c. Capra imberbes, the Berbura, Bocc. The Berbura goat is found to the west of the Jumna. Its female is the Berburi, and the Bengal call it Ram Sagul. The body is very like the long-legged goat of the south of India; in manners they are similar. The scrotum of the male externally is separated into two distinct bags.

Var. d. Tibetan goat of Ladakh; has a short tail, and very short ears, scarcely two inches long, and concealed; has long, soft, pendulous hair, but no wool.

Var. e. Tibetan goat of Ladakh; has long, soft, pendulous hair, but no wool. C. Ægagrus, of the mountains of Asia, is believed to be the parent stock of all the goats, mingled perhaps with the C. Falconeri of India. The breeds greatly differ from each other, but they are fertile when crossed.—Darwin.

CAPRA MEGACEROS. Hutton, Blyth, Jerdon.

The Mar-khor inhabits the highest parts of the Tibetan Himalaya, also the Sulinam range, the Pir Panjal, Kashmir, the Hazara Hills, the hills of the Jehlum and Chenab, and Ladakh. The Kashmir variety (Capra Falconeri) has openly spiral horns. The horns of the Sulinam variety more nearly approach a straight line. The Sind goat or sind ibex is identical with the wild goat of the Caucasus, Armenia, and Persia, probably of Crete. It is not found east of the Indus. The famed bezar (pa-zahr, Fars., fa-zahr, Pers.) of commerce is obtained from this goat. It associates in small herds frequenting steep and rocky hills, in winter descending to the bare spots in the wooded region. It is much sought after by sportsmen, and the horns are considered a great trophy.—Jerdon, p. 291.

CAPRA SIBIRICA. Meyer, Blyth.

C. sakeen, Blyth. C. Pallasii, Schinz. Himalayan ibex, Eng. Kyl. of. ... KASHMIR. Skia (male), Iskin, Him., Tangrol of Kurr. D'Ham (female), Hind. Buz of. ... SUTLEJ.

It is found throughout the Himalaya from Kashmir to Nepal; rare in Kashmir. The soft under fleece is called ashi-tus, and is used for lining shawls, stockings, gloves, and is woven into a fine fabric called Tusi. No wool is so rich, so soft, and so full. The hair itself is manufactured into coarse blanketng for tents, and twisted into ropes.—Jerdon, 292.

CAPRELLA, the phantom shrimp, is found on seaweed sitting upright like a monkey, holding on by its hind claws, and, with ghastly grimaces, mesmerizing all passers-by with its fore-claws. It sits in like guise upon sponges a mile or two deep in the darkness,—there, however, not a quarter of an inch, but three inches long.

CAPRIFOLIUM CHINENSE. Smith. Kin-yin-hwa, of the Chinese; a climbing plant with gold and silver flowers; one of the Caprifoliaceae.

CAPRIFOLIUM SEMPERVIRENS. B. et S. Lonicera sempervirens, D. G. | Trumpet honeysuckle.

The honeysuckle occasionally seen in India.
CAPRIMULGID.E.

CAPRINE, a sub-family of mammals of the family Bovidae, comprising goats and sheep, 1st capricorns, or antelope goat or mountain antelope; 2d, the true goats. See Antilopinae, Bovidae.

CAPROVIS ARGALI.

Agocerus argali, Pall. | O. argali, Pall. Ovis ammonoides, Linn. | O. Hodgsoni, Bhlyth. O. ammonoides, Hodg. |

Hayan, nyan, nyund, nuan, niar, snoow, ... Tin.

Dr. Gray says this species, the Nyan or Bamberra, or wild sheep, seldom or never crosses the Himalayas, the land-side of which range is the special habitat of the Nubian, while the north and west beyond Tibet, C. argali is replaced by other species; so that Tibet may be considered as the special habitat of one species (Ovis ammonoides), and the plateaux north of Tibet as far as the Altai of another (Ovis ammon.), cited as types of the true ovine form; and it may be added, that the six sorts of tame sheep of Tibet and the Sub-Himalayas, all without exception exhibit the essential characters of that form. There are several species that may be confounded under this head. The Siberian Argali is found in the most northern part of that country, and it is probably different from the Himalayan animal; but Mr. Byth had not been able to discover any difference between the specimen received from Mr. Hodgson and those which were sent from Siberia by the Russian naturalist.

CAPROVIS VIGNEL, the Houriar, extends along the eastern spurs of the Salt mountains, but becomes less common as we go eastward, and is seldom met with on the ranges beyond the town of Jhelum, or southwards of the Beas river. It is confined to the north and western portions of the Panjab, including the Suliman chain, where it is known by the name of Kuch. It is also a denizen of the mountains around Peshawur, including the Khabar pass, Hindu Koh, and Kafiristan. The Shapoo or Shalmar of Ladakh, if not identical, is certainly very closely allied; its differences are slight, and such as might result in a great measure from the marked diversity of climate, food, etc., of the two regions. This species is no doubt the Sha of Tibet described by Vigne; and possibly the wild sheep of western Afghanistan, Persia, the Caucasus, Armenian and Corsean mountains, is the same species altered mayhaps by climate and other external agencies. The eastern limits of the Shapoo have not been fixed with certainty; but it would seem that, commencing at Ladakh, it proceeds westward towards the Indus into the regions where the Houriar is found; and probably when these regions are explored, we shall find out the relation between what has been supposed distinct, but which Dr. Adams is inclined to consider one and the same animal.—Adams.

CAPSELLA BURSA PASTORIS. | Manch. Mullay muntha keery, 7m. | Shepherd’s purse, | Eng. Common on the Neighherries; also grows in Europe, Persia, Asia, and Japan; used by the natives as a pot-herb.—Jaffrey; Wight.

CAPSICUM, red pepper, chillies.

Fihli, ... Abar, Chabu, ... Malay. Nga yook thu, ... Bom, Leda mera, ... Chieh, Tsu-hou-teen, ... Chana, Lala chien, ... Lah-liau, ... Lao, Choe subrang, ... Lall mirich, ... Dukhi, Fihli i Siah, ... Pers. Mirchie, ... Guj, Mallaghai, ... Tam. Chabai, Chabo, Malay, Mirapa-kai, ... Tel.

The shell of the fruit is fleshy and coloured, and contains a pungent principle, which also exists in its seed in great activity. On this account both the fruit and seeds of different varieties of Capsicum are in request as a condiment, and either in the raw uncooked state, or ground, when they are called cayenne pepper, form a conspicuous feature amongst the plants affording stimulating substances used by man. In Europe the Capsicum enters largely into the seasoning of food and the preparation of pickles, and in warmer countries it constitutes one of the first necessaries of life, either green or ripe. It is the species of this genus, and not any of the genus Piper, which is the peppery condiment of all the inhabitants of India and the Asiatic islands in Eastern Asia; the latter, indeed, being little used, and mostly raised for exportation. Foreign species or varieties of Capsicum have been introduced into the Archipelage, and are named by the Malays, Chabo China, the Capsicum of China; and Chabo Sabrang, the Capsicum of India, literally, of the other side of the water. There are now numerous varieties of chillies in India, many of which have been introduced. They are raised from seed, which have been kept up for several years, or if fresher, the crop is generally a failure. One species, called 'devil’s pepper,' introduced by Lord Harris from Trinidad, is so intensely hot that the natives can hardly manage to use it. It is cultivated during the cold months. In the Tenasserim Provinces two or three species enter into all the native dishes, not in the form of pepper, but the fruit, stewed or roasted, is eaten with the food. In India, the dried fruits of several species and varieties of Capsicum usually seen are the C. annum (common Capsicum), C. frutescens (goat pepper), C. grossum (bell pepper), C. minimum (bird’s eye pepper), perhaps only cultivated varieties of one species. They are valued as a digestive condiment, and are raised all over the S.E. of Asia as condiments, and to make cayenne pepper and chilli vinegar.—Tomlinson; Crawford, Dict. p. 82; Jaffrey; Matson.

CAPSICUM ANNuum. | Linn. Common chilli. Gach mirich, ... Beng. Kapo molag, ... Mala. Fig. ... Spanish pepper, | Mollag etwanga, | Pan. Common capsicum, ... Mollag; Mollaghai, Tam. Red pepper, ... Mirapa-kaia, ... Tel. Is largely cultivated in South America, Mexico, and India. C. baccatum, Linn., bird’s eye pepper, var. of C. annum, Linn.—Roth, i. 573. See Chillies.

CAPSICUM FASTIGIATUM, var. of C. annum, called red pepper, Guinean pepper, cayenne pepper, common capsicum, chilli pepper, Usari mollaghai, Tam., a small conical orange-coloured pod, shining externally, internally containing spongy pulp, and white flat reniform seeds in two cells. It contains a volatile neutral principle called capsicine, and acts as an acid stimulant, and externally a rubefacient. It is used in putrid...
sore throat, scarlatina; also in ordinary sore throat, hoarseness, and dyspepsia, and yellow fever, and in diarrhoea occasionally, also in piles.—Pocell's Handbook, i. p. 363.

CAPSICUM FRUTESCENS. Linn. Var. of C. annuum, Linn.

Lati Lamha mirch, BENG. Chabai, MALAY. Chabo Lombok, ENG. Lada mera, GOgeoda chilli, MALAY. Johan, GOgeoda chilli, ENG. India, Ceylon, Sri Lanka, Burm. used Burm. used Beng. Singh.

Lall mirch, HIND. "

Lanka mirch, "

Lalgach march, "

This, the large red capsicum, is grown all over India by sowing the seed broadcast, and when the plants are about 6 inches high, putting them either in rows or beds 18 inches apart. The soil should be rich. They require watering, and to be kept clear of weeds: a yellow variety is C. flavum. —Roth. i. 574; O'Shaughnessy, p. 468.

CAPSICUM MINIMUM.

Gna yoke, BURM. Bird's eye pepper, ENG. Gna yoke mo-hnyau, Beng. Oosi-mulaghali, TAM. E. Indian birdpepper, ENG. Sudi mirapa kain, TEL.

This plant yields its fruit for a series of years. Its fruit is very hot.

CAPSICUM NEPALENSIS. Var. of C. annuum, Linn.

Gach march, BENG. Mallaghai, TAM. Cepoo Modalgoo, MAZAL. Mirapa-ki, TEL. Ratnamirs, "

This is the most acrid and pungent of the species Capsicum.

CAPSICUM PURPUREUM and C. minimum are cultivated in small quantity in Pegu for domestic use.—M'Clelland.

CAR, the ruth of India, used at the Hindu temples to convey the idol from one place to another. This is usually preceded by native music, flaring torches, dancing girls, and priests, the deity bedizened with jewels, and carried on a richly-constructed throne, and fanned with gorgeously-constructed fans. While Sir G. Campbell was Lieutenant-Governor of Bengal, twenty people fell while the car at Geopto was being dragged; eight were run over, five were killed on the spot, and three were wounded, of whom one died. The six victims were women.

CARABIDE. Leach. The family of ground beetles, about 9000 species are known. Almost all possess a very pungent, disagreeable smell; and a few, called bombardier beetles, have the peculiar faculty of emitting a jet of very volatile liquid, which appears like a puff of smoke, and is accompanied by a distinct crepitating explosion. They are mostly nocturnal and predacious. They are chiefly remarkable for brilliant metallic tints or dull red patches, when they are not wholly black, and are therefore very conspicuous by day, but insect-eaters are kept off by their bad colour and taste. They are sufficiently invisible at night, when it is of importance that their prey should not become aware of their proximity. Many species of Carabus, a genus of the family Carabide, occur in India. C. coelestis is a beautiful beetle of China. C. impressus Fabr., and C. politus, Fabr., occur in the East Indies.

CARAB TREE. Ceratonia silicium, W. CARACAL, Felis caracal, Schreber, the Indian lynx, occurs in Africa and Asia. It has immense speed, runs into a hare as a dog into a rat. It often catches crows as they rise from the ground, by springing 5 or 6 feet into the air after them. CARAGANA FLAVA. Smith. Huwang-teing of the Chinese. In China its root is eaten as food in times of scarcity. It is obtained from the provinces of Ngaan-hwui, Che-kiang, and Hunan. CARAGANA GERARDIANA is the Tartarian furze. C. arborescens is the tea tree of Siberia. CARAGANA VERSICOLOR. Royle.

Caregana pignase, D.C. | Dama, . . . . . . . . . . Tis.

A small shrub which grows in Tibet and Western Himalaya at elevations of 14,800 feet, and is very useful for fuel.—Dr. Stewart and Thomson.

CARALLIA CALYCINA. Benth. This large Ceylon tree has two varieties,—var. a, Singhe Raja forests, between Galla, and Rattanapura, at no great elevations. var. b, Central Province, at an elevation of 4000 to 5000 feet.—Trew. ii. p. 121.

CARALLIA INTEGRIRAMA. D. C.

A very common tree in the Western Ghat forests, up to 4000 feet, from Bombay down to Cape Comorin, also on the Cuddapah hills; most abundant in S. Canara. In Ceylon it is met with up to 3000 feet, and it is indigenous in Bengal, Burma, Hong Kong, and tropical Australia. It is a highly ornamental tree, on account of its beautiful flaring branches. The timber is useful for household and ornamental purposes, and is also required for furniture, cabinet purposes, and fittings. It is tough and not easily worked, brittle and not durable, and has a pretty wavy appearance, and is peculiar in structure, having a great deal of cellular tissue. A cubic foot unseasoned weighs about 56-60 lbs., and 44 lbs. when seasoned, and its specific gravity is 064; in Burma, where the tree is known by the name of Manicoga, it is used for planks and rice pounders. In Calcutta it is in use for house-building.—Beidome, Fl. Syl. CARALLIA LANCE/EFOLIA. ROZB. A tree of Sumatra.—Voigt.

CARALLIA LUCIDA. ROZB.

Carallia integerrima, D.C. | Carallia integrifolia, Graham. Kierp, Kierpa, BENG. | Dewata gass, SINGH. Manicoga, TAM. | Plumbo, "

This handsome tree grows on the Malabar side of India, in the Konkans, the Circars, Kamaon, Sylhet, Chittagong, Pegu, Mergui, and in Ceylon up to 3000 feet. On the Bombay side it is small, but pretty frequent in the forests of the S. Konkan. Wood hard, close-grained, and might be used in turning. Thwaites says it is rather ornamental, and adapted for furniture. It is a large and common tree north of Rangoon and throughout Pegu. Wood of a peculiar structure, thick medullar rays going through from the centre to the circumference; colour red; used for planks and rice pounders, and may possibly be found useful for cigar boxes. In the southern forests of Pegu it is a plentiful tree of large girth, and in Calcutta is employed in house-building, under the name of Kierpa.—Dr. Gibson, M'Clelland, Brandis, and Voigt.
CARALLUMA ADSCENDENS.

CARCHARIAS. R. Br.

Stapelia adscedens, Roxb. | Collee moolayen, . TAM.

This curious-looking fleshy plant, with angular stems, belonging to the natural order Asclepiadaceae, is used by the natives in making pickles, and sometimes in chatni.—Jeffrey. See Vegetables.

CARAMBOLA TREE, Averrhoa carambola. Highly cultivated in the Kwang-tung province of China.

CARAMBA VULGARENSIS. Its seeds yield a solid oil or vegetable milk. It is a large tree of Guiana. See Dyce.

CARAMBA MOLLECCENSIS. Lam.

Xylocarpus granatun, Ken., Willde.

Kadul, . . . SINGH | Kandilangha, . . . TAM.

This tree is a native of the coast in Malabar, Ceylon, and in the Sunderbuns; is also found in Africa, Australia, Madagascar, and the Malay Archipelago.—Beddome, Fl. Syst. p. 136.

CARAT, from the Greek keration, a kind of vetch. A carat weighs 4 grains French, or 33 grains, troy. It is used in weighing precious gems, and also in valuing the alleged precious metals, in this case standing for an imaginary 24th part of the pound troy, the number of carats indicating the pure metal, and the remainder the alloy. Thus the carat standard of the sovereign is 22, or 2 parts alloy; of watch-cases with the Goldsmiths' Hall mark, 18, or 6 alloy. In France the latter is the lowest legal standard.—King.

CARAVAN. See Kasfah; Karwan.

CARAVANSARY. These, in Syria, form four sides of a large quadrangular court. The ground floor is used for warehouses, the first floor for guests, and the open court for the loading and unloading of their burdens, and the transaction of mercantile business generally. The apartments used for the guests are small cells opening into a corridor, which runs round the four sides of the court.—Eothen, p. 243. See Dharmasala; Serei.

CARAYA PILLAY, TAM. Bergera Konigii.

CARRYA SEED.

Carvi; Cumin despres, Fr. Carvi . . . Tr. Brouckemel . . . GER. Carum Carai, . . . LAT. Kummel . . . A. Rapp. Acalawa, . . . SF.

These aromatic seeds are used to flavour cheese, spirits, liqueurs, and articles of medicine.—O'Sh.

CARBI or Karbi. Beng. Stalks of Sorghum vulgar, used as fodder.

CARBON, when pure, is diamond; less pure, is plumbago, coal, and charcoal.

CARBONATE OF LEAD, white lead, ceruse.

CARBONATE OF LIME.

Kwang-fu, . . . CHIN. Carbonate de chaux. Fr. Chalk. . . . ENG. | Carbonas celeis, . . . LAT.

A very abundant mineral, and embraces several varieties, of which stalactical carbonate of lime is one. All the limestone caves of Tennesserin have stalactites hanging from their roofs, and stalagmites rising on their floors. The Siamese Karrins often bring over bits of limestone of the shape of a shell, and, when broken, a shell usually of the genus Melania appears, that has been encrusted with carbonate of lime. Much of the alabaster of which ornaments are made in Burma, is stalagmite; but all the alabaster images of that coast are made of marble, and not of compact gypsum, which they much resemble.—Mason.

CARBONATE OF SODA. Impure carbonate of soda, called Sajji or Sajji matti, occurs as an efflorescence in some part or other of almost every district in India. Muriate of soda and carbonate of lime exist in the soil, and the natron is found on the surface of the moist earth or mud. Near Gundyctoth, on the banks of the Penmar, common salt is interstratified with the upper schistose strata of the argillaceous limestone on which the sandstone rests; and on the surface of the neighbouring soil, salt contaminated with much muriate of soda, is collected. Barilla, an impure carbonate of soda, is prepared by burning plants of the Salsola and other species, and collecting the ashes, which melt into a coloured mass. Sajji loto is a somewhat purer kind, but still contains an immense amount of organic and other foreign matter, such as the sulphates of soda and lime, chloride of sodium and potassium, sulphure of sodium, sulpho-cyanide of sodium, together with silica and clay. The Kangon khar plant yields the best alkali. The pure sajji from this plant is called loto sajji, and the residue mixed with ashes is called Kangun khar sajji. The other two plants yield only a dirty and inferior substance known as Bhutni sajji, 'devil's soda.' This is black in colour, and sold in pieces like lumps of ashes. The plant burned in the Punjub is termed Khur, or in Persian Ashkhar; its scientific name is Caroxylon Griffithii. There are many square miles densely covered with this last, whereas the Khar is comparatively rare. Khar is applied to various herbs belonging to the natural order Chenoectedae, particularly the Anabasis multiforma and the Caroxylon Griffithii. The ashes, which fuse, run into a pot placed beneath the burning heap.—Powell; Stewart.

CARBUNCLE.

Escaraboucle, . . . Fr. Carbunculus, . . . LAT. Karfunkel, . . . GER. Merah; Dalima, MALAY. Anthrax, . . . Fr. Mastigo, . . . LAT. Barekeith, . . . HEN. Carbunculo, . . . SF. Carbonel;Carbonelles,Fr. Manikiam, . . . TAM, TEL.

One of the inferior gems; that variety of the garnet called almandine. Common in Southern India. Carbuncles, from the most ancient times of the Romans, have been set with a backing to enhance their colour. The carbuncles of superior brilliancy are called males, and those of inferior colour, females. Under this term the ancients included all the red corals, such as lychnias, rubies, garnets. The carbuncle, in Hebrew, Bareketh, signifying flashing stone, or lightning stone, was supposed to fall from the clouds, amid flashes of lightning.

CARCATA, also Caractaca. Sansk. The solar sign Cancer. See Varsha.

CARCHARIAS, a genus of heterocerous fishes, belonging to the Squalidae or shark family. C. leucos, Palen., is found in the southern seas. It is about 12 feet long. Carcharodon Rondelletii of Australia, a large shark; one of them measured 36 ft.
CARCHEMISH.

CARCHEMISH, the capital of the Hitittes, is the modern Kala Jerabulus, on the west bank of the Euphrates, 20 miles below Beredjik.

CARDAMOM HILLS, a range of hills in Travancore, rising 2000 to 4000 feet high, and lying between lat. 9° 27' and 10° 4' N., and long. 76° 52' and 77° 17' E. They are unhealthy and sparsely occupied. The cardamoms grow best at about 3000 feet; and annually about 10 tons, value £30,000, are collected.

Cardamomi, . . . Tr. . . . Yeylakulu, . . . TEL.
Kapel, . . . YALAKIU.

The cardamoms of the shops are the produce of several genera of plants—Alpinia, Amomum, Elettaria, and Renealmia. The round seeds of Amomum cardamomum of the Burna forests, Surnatra, and Malacea, are used by the Malay in lieu of the true cardamom. A. angustifolium of Madagascar supplies some of the cardamoms; A. maximum of the Malay Islands, Nepal, and Ceylon, also produces a cardamom of an inferior character. Alpinia cardamomum of the western coast of India in the Travancore forests, produces a cardamom in great request. Amomum granatum parvisildis of Madagascar and Ceylon yields an inferior sort. Elettaria cardamomum of the hilly parts of Mysore, Coorg, Malabar and Travancore, and Canara, yields the true cardamom, and is both cultivated and wild. In the Travancore forests they are found at elevations of three to five thousand feet. The mode of obtaining them is to clear the forest of trees, when the plants spontaneously grow up in the cleared ground. The average number of candies is about 140 to 300 candies; value, 1000 to 2000 rupees the candy of 600 lbs. Cardamoms are much esteemed as a condiment, and great quantities are annually shipped to Europe from Malabar and Travancore. In commerce there are three varieties, known as the short, short-long, and the long-long. Of these the short are more coarsely ribbed, of a brown colour, and are called the Malabar cardamoms or Wynch cardamoms. They are reckoned the best of the three. The long-Longs are more finely ribbed, are of a paler colour, and the seeds are white and shrivelled. The short-Longs merely differ from the latter in being shorter or less pointed. It is usual to mix the several kinds together, when ready for exportation. Some care is required in the process of drying the seeds, as rain causes the seed-vessels to split, and otherwise injures them; and if kept too long in the sun, their flavour becomes deteriorated. They are chiefly procured from the high lands overlooking the Dinidigul, Madura, and Timnevelly districts. In these mountains the cultivators make separate gardens for them, as they thrive better if a little care and attention be bestowed upon them. Cardamoms are a monopoly in the Travancore State, and cultivators come chiefly from the British provinces, obtaining about 200 to 240 rupees for every candy delivered over to the Government. In the forests on the western slopes of the Coorg mountains, cardamom cultivation is carried on to a great extent. In February, parties from Coorg start for these western mountains, and, selecting a slope facing west or north, mark one of the largest trees on the steepest declivity. A space about 300 feet long and 40 feet broad is then cleared of brushwood at the foot of the tree, which is cut down about 12 feet from the ground, and carries with it a number of small trees in its fall. Within three months after its felling, during the first rains of the monsoon, the cardamom plants in the soil begin to show their heads all over the cleared ground, and before the end of the rainy season, October, they grow two or three feet. The ground is then carefully cleared of weeds, and left to itself for a year, and then, 20 months after the felling of the great tree, the cardamom plants are the height of a man, and the ground is again carefully and thoroughly cleared. In the following April, the low fruit-bearing branches shot forth, and are soon covered with clusters of flowers, and afterwards with capsules. Five months afterwards, in October, the first crop is gathered, and a full crop is collected in the following year. The harvests continue for six or seven years, when they begin to fail, and another large tree must be cut down in some other locality, so that the light and air may cause a new crop to spring up. The harvest takes place in October, when the grass is very high and sharp, sorely cutting the hands, feet, and faces of the people, and concealing numerous large leeches. The cultivators pick the cardamom capsules from the branches, and convey them to a temporary hut, when the women fill the bags with cardamoms, and carry them home, sometimes to distances of ten or twelve miles. Some families will gather twenty to thirty mounds annually, worth from 600 to 1000 rupees. The cardamom tracts of Travancore are almost all granitic and gneiss. The smaller capsules, or lesser cardamoms, are the most valuable. The Elettaria cardamomum is also cultivated in Ceylon, and a species occurs wild. The Karen forests of Tavoy and Mergui abound with cardamom plants; and, while subject to the Burmese government, the Karen were required to collect the seeds and pay them in as tribute; but they now employ their time more profitably. When they did collect, they were in the practice of mixing a spurious kind of cardamom with the true produce of a plant belonging to the genus Amomum, believed to have been A. cardamomum. The cardamom called by the Chinese Yang-chun-sha, the lath China cardamom of pharmacologists, is said to be found in the province of Kwang-tung.—Maidris Ez. Jur. Rep.; Drs. Mason, Voigt; Crawford's Dictionary; Thwaites, En.; Drury, Cochlin; Rozb. i. 72.

CARDAMOMS, bastard or wild.

Kapulaga, . . . BALL. . . . JAV. . . . Kurrocha, . . . GUJ. . . . HIND. . . . MALAY. . . Hii kilan, . . . PERS.

Wild or bastard cardamoms are much larger than the true cardamom, more pungent but less aromatic, with a strong camphoraceous taste. They are not much esteemed, and are only used by the poorer classes of natives as a substitute for real cardamoms. They are brought to Bombay from the Malabar coast. The wild or bastard cardamom of Siam is produced by Amomum xanthioides, Wollich; the seeds have been imported into England, while the empty capsules found in the drug shops of China are exported from Siam. The plant bearing scintamine fruit,
to which the name 'large round China cardamom' has been given, and which is known to the Chinese as Tsau-kan, continues unknown; and the same remark applies to the bitter-seeded cardamom, Yih-eh-chee, and ovoid China cardamom, Tsakou or Qua len. It is probable that all of them are productions of the south of China, or of Cochinchina. — Paulkner.

CARDIAE, a family of molluceae, comprising the genus Cardium, the cockle, of which there are known 270 fossil and 200 recent species, with four sub-genera and the fossil genus Conocardium. Many species of Cardium occur in India.

CARDIOPTERIS. At Caheer, in the Assam valley and Chittagong, this remarkable plant covers the trees for upwarads of sixty feet, like hops, with a mass of pale-green foliage, and dry white glistening seed-vessels. — Hooker, Hist. Jour. ii. p. 334.

CARDIOSPERMUM HALICACABUM. Linn.

Mel. Mudul-cottan, ... ARAB. An annual climbing plant, with an inflated membranous capsule, hence its name. The root is aperient. It is mucilaginous, and slightly nauseous to the taste; is raised in great quantities by the natives of Tenasserrim; but more as a vegetable than a medicine. Grows all over India; and popular superstition asserts that by eating the seeds, the understanding is enlightened and the memory rendered miraculously retentive. C. canescens, Wall., grows on the Irawadi. — Rozb. ii. 292; Voigt, 93; Mason; Ains. Mat. Med. 89; Dr. J. L. Stewart; Powell, i. 330. See Jyotishmati.

CARDOLE, a thick black oily substance obtained from the pericarp of the cashew nut, Anacardium occidentale. It is a powerful vesicating agent.

CARDS, playing cards.

Kaerten, Speel-Karden, ... DUT. Karti, ... Rus. Cartes à jouer, ... FR. Carnas, Naipes, ... Sp. Spiel-Karten, ... GER. Kort, ... Sw. Ganjihal, ... HIND.

The playing cards of the Hindu and Mahomedan are round pieces of strong card, painted with figures of men, quadrupeds, and fish.

CARDUCHI, the Kord country; Kurdistan.

CARDUUS, sp.

Tez'ki, ... CHIN. Shiu-ki, CHIN. Shuh-tan, ... TA-ki, ... A plant of China. C. nutans, L., Gul-ba-bawdaw, flowers large, rich crimson; used medicinally to purify the blood. — Voigt; Powell, i. 356.

CAREI, a people mentioned by Ptolemy, who inhabited the southern part of Tinnevelly. Karei, in Tamil, means 'the shrive.'

CARELA, BENG. Monomordica charantia.

CARERTA, BENG. Monocotyle. See Chelonia.

CAREX, a genus of plants belonging to the natural order Cyperaceae. Several species grow on the sea-shores and near the rivers of India. C. Indica, Wildle, is a native of Nepal. C. Moorcrofti and Falce, a running wiry sedge in Tibet, binds the sand like the C. arenaria of the British coasts. — Hooker, Hist. Jour. ii. p. 155.

CAREY, Dr. W., a celebrated missionary at Serampore. He landed in Calcutta on the 11th November 1793. He was the son of a parish clerk. He joined Messrs. Ward and Marshman at Serampore on the 10th January 1800. His whole life was passed in the translation of the Scriptures into the languages of India; his whole career was marked with a passionate desire to reveal Christ to men who knew him not. His strong natural benevolence had been intensified by deep piety. 'I do not know,' says Wilberforce, 'a finer instance of the moral sublimes, than that a poor cobbler working in his stall should conceive the idea of converting the Hindus to Christianity, yet such was Dr. Carey.'

He founded the Agri-Horticultural Society of Bengal in 1820. He advertised that a meeting would be held in Serampore, but at the hour appointed only himself and two brother missionaries were present. But he voted himself into the chair; the proceedings were published, with the secretary and treasurer's names, and the society began. He was author of State of Agriculture in Dinajpore, in As. Res. vol. vi. Geographical Notices of Serampore, As. Jl. 1835, ii. 85. — Tr. of a Hindu.

Flowers—Vakumbi; Fruit—Gugisara, Kuhni, HIND.

This large tree grows in most parts of British India, Burma, and Tenassserim, and also in N. Australia and Queensland. It rises to 20 feet. Dr. M'Clelland says that in Pegu the timber is large, the wood red and equivalent to mahogany, and there forms the chief material of which the carts of the country are made; Dr. Mason adding that it is a useful timber for house-building; and Dr. Brandis mentions that it is used for gun stocks, house posts, planks, etc. A cubic foot of the Pegu wood weighs 55 lbs. It sells in Pegu at 18 annas per cubic foot. Dr. Gibson tells us that it is not much used on the Bombay side, but that the timber stands the action of water well. As it is generally crooked, he thinks it merits trial for the crooks of boats, corners of carriages, etc. In Ceylon it is used for the axles of bullock carts and in buildings. Its fibrous bark is used as matches for matchlocks, guns, etc.; and in Bengal, according to Capt. MacDonald, the scant clothing of the Byrangi and other Hindus affecting peculiart sanctity, is made of the fibrous bark of this tree. The bark is astringent, and in Ceylon used in tanning, and medicinally. Its large greenish flowers are given by Hindus after childbirth.

581
CARHARAS.

Carya sphærica, Roxb., is almost identical with C. arborescens. It grows in the Northern Circars, in the mountains at Chittagong, and at Calcutta. Its dark serves as cordage, and is used as a slow match for guns. It has large greenish-white flowers, with a few deep red filaments.—Roxb. ii. 686.

CARHARAS, in the Konkan. There were human sacrifices here to Renuka Devi.

CARIAR. HIND. Gloriosissima superba.

CARICAL or Karikal, a small settlement belonging to France, between Tranquebar and Nagore.

CARICA PAPAYA. Linn. Papaw tree.

This plant, one of the Papayaceae, is found throughout India, and grows without much care. The fruit is gathered in a green state, is dressed as curry and in tarts, and when ripe it is used as a dessert. Its dark-coloured seeds taste like the watercress. The fruit is large and oblong, suspended upon the leafless part of the trunk, like the jack-fruit; the surface when ripe is a pale orange yellow. A milky juice exudes on incision from the rind; and the rind and seeds are deemed in the Mauritius a pleasant vermifuge. Tough meat, rubbed with this juice, becomes tender, without any injurious property being communicated to it. The flesh of animals fed on the leaves and seeds is said also to be remarkably tender, but this seems unlikely. And in Bengal, Mahomedan table servants use the juice with the view of softening beef-steaks and old fowls. The leaves are used by the negroes in washing linen, as a substitute for soap. Pulp of the fruit is eaten with pepper and salt. Juice of the pulp removes freckles.—Roxb. iii. 824.

CARICATURE PLANT, or face plant, Justicia pietà. The white portions on its green leaves present caricatures of the human face. Graptophyllum hortense of the Indian Archipelago is also so called from the curious variegation of its leaves. CARIM CORAIL, Maleal. Justicia obliquum. Carin-gala, Pontedera vaginialis. Carin-pana, Borassus flabelliformis. Carim-tumba, Anisomeles Malabaricae.

CARIMON, twosmall islands, Greatland Little, off the Malay coast. They command the entrance to the Straits of Malacca. — Horsburgh.

CARINARIA, a genus of Gasteropod mollusces, in Asiatic seas. C. vitrea, C. fragilis, C. Mediterraena, and C. cymbium, are recorded. The shells of this genus are known to collectors under the names of Venus' Slipper and the Glass Nautilus. C. vitrea, Lamarck; has a beautiful transparent vitreous shell.

CARI NUCHI. TAM. Gendarussa vulgaris.

CARIRAM. MAEAL. Styrchnos nux vomica.

Sushunas, Argela, | .... ..

A large thorny bush, cultivated for its fruits, but grows abundantly wild in the Kangra and the Kotah jungles, and in March and April fills the air with the fragrance of its blossom; also grows wild in most parts of the Dekhan, bearing a dark blue-coloured berry when ripe; and this is sometimes eaten by Europeans, and in the green state is made into tarts, jellies, and pickles; the jelly is considered inferior to none made of other Indian fruits. The fruit is about the size of a large olive, and when ripe is black, and has a very pleasant taste, somewhat like a damson. This species is a marked exception to the generally poisonous nature of the Apocynaceae family.—Roxb. 1687; Mason; Dr. Stewart; Capt. Macdonald.

CARISSA DIFFUSA. Roxb.

Gau. | HIND. Kurumalik, SANSE.
Barana, Carna, | Waa-kalim, TEL.
Mardal, | San Kurunda, URIA.

This shrub is a native of the Ganjam district, and from thence northward to the mouth of the Hoogly, and common throughout the Panjab. Its small white or pink flowers about April perfume the air around. The wood is used for comb, in turnery, etc., and as fuel. A Kangra authority states that the very old wood gets quite black and fragrant, and is sold at a high price as Aggar, or Ud-i-Hind,—Roxb. i. 689; Dr. Stewart.

CARIYAN-SARAI, in Persia and India, a halting-place for travellers, generally a house with many apartments, either opening into an open quadrangle or to the outside road. It is from karwan (caravan), a cortege, and sarai, a rest-house; the chausum of the Tainul people, and dharma or sarai of N. India. See Sarai.

CARI-VILLANDI. MAEAL. Smilax ovalifolia.

CARLI-CAYES, in the Western Ghats, near the Bhor ghat. The wonderful galleries and colossal elephants of its caves are dug out of solid trap. See Architecture; Buddhism; Caves; Karli.

CARLUDOVICA PALMATA, a tree of Panama. Panama hats are made of its leaves; they are made in Veraguas, Western Panama, and Ecuador, and are worn in the W. Indies and Central America. It might be introduced into India.

CARMA. SANSK. The name of one of the Kanda or general headings of the Vedas. This chapter relates to works; the other-two, Gnyana and Upashana, relate to faith and worship. See Vidya.

CARMEL, a small range of hills extending six or eight miles inland in a S.E. direction from the
CARMINATIVE.

The following are chiefly used medicinally and for culinary purposes:

Pimpinella anisum, common anise.
Bilolia anisatum, star anise. 
Jadran khatai. 
Anise nobilis, elbow anise. 
Baboon. 
Lavandula vera, lavender.
Ruta graveolens and other sp., rue. 
Sulub. 
Amropogon irawancusa. 
Anethum graveolens, dill.

Darchine.
Juniperus sabina, sawine.
Ocimum basilicum, basil. 
Tului.
Rosmarinus officinalis, rosemary.
Moringa pterygosperma, suhunjana.
Mentha piperita, peppermint.
... pulegium, pennyroyal.
... vulgaris, spearmint. 
Puldina.
Anomum cardamomum. 
Elachee.
Origamum jamaica, marjoram.
Sassafras officinale, sassafras.

CARMINE. A beautiful pigment prepared from cochineal, discovered accidentally by a Franciscan monk of Pisa, who, having formed an extract of cochineal with salt of tartar, for the purpose of employing it as a medicine, obtained a fine red precipitate on the addition of an acid. Homberg, in 1656, published a method for preparing it. The makers in some of the principal towns of Europe succeed in preparing different varieties of it of greater or less purity and lustre. Many of their processes are kept secret; and although the chemistry of the art is well understood, yet there are certain details of manipulation, and an empirical knowledge of the effects of temperature, doubtless acquired after long experience and many failures, which confer on the carmines of some makers a greater lustre than on those of others. The use of carmine has of late years been extended to the manufacture of superfine red inks, of artificial flowers, and to silk-dyeing. Carmine is the finest red colour which the painter possesses. It is chiefly used in miniature painting and in water colours. It is made in large quantities in Paris. Carmine is one of those colours called lakes, a term applied to certain colouring substances which behave like acids, and combine by precipitation with a white earthy basis, usually alumina. Carmine is the richest and purest portion of the colouring matter of cochineal, isolated in the manner here alluded to. Various imitations of carmine are prepared for the use of those who exhibit rouge on their cheeks. French Carmine is superior to that of English manufacture, and the superiority is said to depend on the influence of light on its formation and precipitation; the clear sky of the south of France being more favourable for the process than the more hazy atmosphere of England. — Tomlinson.

CARNALINA, a tree of S. America, Havana, and Mexico, which should be introduced into India. Humboldt and Murichi have described it as the tree of life. Cattle eat the heart of the young tree, and at its full growth the succulent is obtained from it. Its fruit is also nourishing. But its chief product is the wax which covers the surface of its young leaves, in the form of a glutinous powder. When melted by heat, it cannot be distinguished from the wax of the honeycomb. — Muricius.

CARNATIC, an ancient town and table-land in Southern India, above the Eastern and Western Ghats, known as the Talaghat; to this region, though the people speak Carnarese, the name is now never applied, but it is now given to the country below the Eastern Ghats, or Paeon Ghat. Its ancient kingdoms were the Pandya, Chera, Chola, and Calinga. In B.C. 75 an expedition left the eastern side of the Peninsula, from ancient Calinga, and formed a colony in Java. The Pandya dynasty ruled in parts of the south of the Carnatic, with varying fortunes, from the 4th or 3rd centuries B.C. At present it is a province on the Coromandel coast, about 500 miles long from north to south, and averaging about sixty miles broad. From the 10th to the 18th centuries, it was overrun by Mahrattas, Mahomelan, French, and British soldiery. Sabut Oollah was ruler of the Carnatic from 1710 to 1732, and was succeeded by his nephew, Ali Dost. Ali Dost was killed in battle against the Mahrattas, and was succeeded by his son, Sufdar Ali. Of his two daughters, one married Chunda Sahib. Chunda Sahib seized on Trinchipiopol in 1736, but the place was taken by the Mahrattas, and Chunda Sahib was made prisoner, and lingered for eight years in prison, where he was murdered by the raja of Tanjore. Sufdar Ali was assassinated by his brother-in-law, Murtzza Ali, leaving a minor son; but this youth also was assassinated, while Anwar-ud-Din was his guardian, and Anwar-ud-Din succeeded to the throne as Nawab of the Carnatic. During the conflicts for supremacy in Hyderabad and the Carnatic, between the French and British, naval and land battles were fought at Damakcherry near Madras, at Amboor on the Pennar river, near Gingee, at Valconda on the Aril, at Cauveryjuck, at Vieravandi Bahr, at the Golden Rock, Sugar Rock of Trinchipiopol, at Wandelwash, also off Negapatam, Tranquer, and at Fort St. David, Anwar-ud-Din, when about eighty years old, fought and fell at the battle of Amboor, in 1749; his son, Mahomed Ali, fled to Trinchipiopol, but he was acknowledged by the treaty of Paris in 1763. From that time till his death in 1795, the Carnatic was occasionally under his rule, and at times under the civil and military administration of the British. In 1795 he was succeeded by his eldest son, Umdat-ul-Umra, who died in 1801, when the British put aside Umdat-ul-Umra's son, and placed his nephew, Azim-ud-Dowlah, on the throne. The British, in 1856, on the demise of Mahomed Ghous, grandson of Azim-ud-Dowlah, finally abolished the titular nawab, from which followed long efforts to seat the second son of Azim-ud-Dowlah. The people of the Carnatic are of the Dravidian stock, and speak the Tamil and Telugu languages. — Malleson's French in India.

CARNESE, quartzose minerals so called, be-
cause some kinds are of a flesh colour, from carnia, Latin, though others are white. In Japan they are found in vast quantities; and they are also collected in the province of Gujarat, at Cambay. Many of the antique genus are engraved in carnelian, and it is now much used for seals. Carnelian is very common in Burma, and has been found at Moopoos and Mergui. One of its Burman names means "fowl's blood."—See Cambay Stones.

CAR-NICOBAR, the most northerly of the Nicobar islands. See Nicobar.

CARNIVAL. This name for the Roman Saturnalia is derived from the sun-god Carneus, the Celtic Apollo, whose shrines were on the coast of Brittany; and one monument remains at Carnac, sacred to the manes of the warriors and of the sun-god. The character of this festival was entirely oriental, and accompanied with the licentiousness which belonged to the celebration of the powers of nature. Even now, although Christianity has banished the grosser forms, it Partakes more of a pagan than a Christian ceremony.—Tod's Rajasthan, p. 547.

CARNIVORA, an order of the mammals constituting flesh-eating animals, beasts of prey. They include the genera felis, hyaena, cuon, canis, vulpes, and others in the families Ursidae, Mustelidae, Felidae, Viverridae, and Canidae. The lion and the leopard occur in Asia and Africa, the tiger in Asia only. See Mammalia.

CARNIVOROUS PLANTS are found in both hemispheres. The Drosera rotundifolia or sun-dew is one. When an insect alights on its central disc, it is instantly entangled by the viscid secretion there, and the surrounding tentacles after a time become ultimately charged on air sides, and the insect is digested, D. Anglica, D. intermedia, D. capensia, D. spathulata, D. lunata, D. filiformis, D. trinervis, D. heterophylla, and D. binata. Dionaea muscipula, or Venus' flytrap, Aldrovanda vesiculosa, Droserophyllum Lusitanicum, Roridula dentata, Byblis gigantea, have similar functions, as also Finguiquela vulgaris, P. grandiflora, P. Lusitanica, with Utricularia vulgaris, U. neglecta, U. clandestina, U. montana, U. velumbifolia, amethystina, Griffithii, cærulea, orbiculata, multicaulina, Darling-tonia Californica, Sarracenia purpurea, and S. flava, with Heliamphora nutans.

CAROB TREE, or St. John's Bread, Ceratonia siliquea, of south Europe and the Levant. Its legumes are used for cattle-feeding. The seed is the original of the Jews' carat.

CAROLINA PADDY. The rice seed was originally taken from India to North America, and its cultivation has been so successful in Carolina, one of the United States, as to have led to its being re-imported into India as seed.

CAROLINAS, an extensive chain of islands which stretch nearly east through the middle of the Pacific Ocean, betwixt the parallels of lat. 7° to 10° N.

CARON OIL of Chittagong. The crooked tree from which this is obtained, grows in wet places near fresh water, very common in the sides of ditches which surround native dwellings. The seed is bean-shaped, and produced in a flat pod; the pods grow several together. The flower is pink and white, of the shape of a bean flower or blossom. The oil is used for burning in native lamps, and in large quantities for boiling with dammer to soften it for the seams and bottoms of ships. It is also often used by native practitioners for the cure of itch. A maund of seeds costs Rs. 1–8, and the extraction of the oil by heat necessitates 8 annas; the oil produced amounts to 62 seers per maund.—Local Committee, Chittagong.

CAROKUVA. TAM. Zipyphus trinervus. CAROONUCHI. TAM. Gendarussa vulgaris. CAROOR, in long. 78° 9’ E., and lat. 10° 50’ N., 50 miles from Trichinopoly, on the bank of the Cauvery, has a strong fortress. It was the capital of the ancient Chera kings. See Carnatic.

CAROXYLIN GRIFFITII. Moq. Salsola Griffithii. | Lagkame, Khar. | HIND. A Central Panjab plant, furnishes by lixiviation some of the saji or carbonate of soda of commerce.

—Stewart. CARP, or the genus Cyprinus of fishes. The gold carp of China is the Puntius (cyprinus) auratus, Linn. In India carps are habitual fish-eaters.

CARPENTER BEE, Xylocoa tenniscapta, West. Another species found in Ceylon is the X. latipes, Drury.—Tennent's Ceylon, p. 418. See Bee; Beetle; Insect; Xylocoa.

CARPENTERS are one of the five Hindu artisan castes of India, and wear the poitu or zonar. They claim to be Brahman, and worship chiefly Visvakarma, the artificer of the Hindu gods. Those of Travancore follow the law of descent by the aunts. See Hindu; Poitu; Polyandry.

CARPETS. Galim, Zuli, | Akab. | Prangmadani, MALAY. Tapten, | DUT. | Kalaas, Xatibaf. Gitterer, | Germ. | Putsch. Tapis, | Fr. | Kowru, Kilimi. | RTS. Teppiche, | Tappendt; | HIND. | Tapetes. Tappeti, | Fr. | Jam-kalam, | TAM. | Tappetti, | Moli, | Sancanae, | TEL. Carpets, either of cotton, silk, or wool, are employed in the eastern countries, from the south of India to Turkey in Europe, for domestic use, for praying on, and for occasions of state. The carpets employed by the ancients are thought to have been of the nature of tapestry, and used for covering couches rather than floors. True carpets seem to have been early employed in Persia; and those called Turkish were probably originally of Persian manufacture, whence the manufacture might have been introduced into Turkey, and where, as well as among the many Turkoman tribes and in Northern Africa, it is still practised. The Persians still remain unrivalled in the happy combination of colour and pattern for which their carpets have long been distinguished, whereas the most varied hues and deepest tints are brought into close approximation, and, far from offending the eye, please by their striking, because harmonious, contrasts. The places in India where a regular manufacture and trade are carried on, are Jubbulpur, Barcelly, Lahore, Merut, Rungpur, Benares, Mirzapur, Allahabad, and Gorakhpur in Bengal; North Arcot, Tanjore, Eilore, and Malabar in the Madras Presidency; and also at Mysore, Bangalore, Warangal, Bellary, Masulipatam, as well as at Shikarpur, Khurpur, and Hyderabad in Sind. Those of Bengal commend themselves by extraordinary cheapness; they are extensively used throughout India, and also somewhat largely exported. In point of texture and workmanship, however, the rugs from Eilore, Tanjore, and Mysore, though they are comparatively much dearer, are greatly preferred.
Kermanshah has a manufacture which adds much to the wealth of its province; none can be more rich, soft, and beautiful. Persian carpets are made also at Meshed, in the Turkoman country, and in Khorasan, and are justly celebrated for the beauty of the patterns, the fineness of the wool, and the durability of the colours—vegetable dyes—amongst others, a green not made elsewhere, conjectured to be saffron and indigo. Some of them fetch high prices in the country itself, as £6 or £8 for one of two yards square. The finest are made at Sena, and there is a famous manufacture carried on at Ferahoun, near Teheran. Carpets of any size can be made there. The finest carpets of all used to be made at Herat; and one in the Chahal Minar at Isfahan was 140 feet long and 70 feet wide. Large numbers were formerly exported to England through Trebizond, and they were sold nearly as cheap in London as in Persia, owing probably to the course of trade. Persian and Turkey carpets are most esteemed.

Eastern carpets have attained great popularity in Europe since the middle of the 19th century, but it has not led to any very general diffusion of real knowledge about them. The ordinary buyer knows nothing about them, except their names, which he roughly distinguishes as Turkey, Indian, and Persian carpets. The expert is, of course, a good deal more exact than this; but even his knowledge is, as yet, vague and confused. The most exquisite products of the loom were formerly destined for the adornment of the holy Kaaba, or some scarcely less venerated shrine. Sometimes the whole interior of a mosque, such as that at Meshed Ali, was hung with beautiful carpets; and the Mihrab, or niche towards Mecca, was always a favourite object for such ornamentation, which in this case corresponds to the altar-hangings of Europe. Mats of a less costly nature were spread on the floor; and it is recorded that in 1012 A.D. the mosque of El-Hakim at Cairo was strewn with 36,000 ells of carpeting, at a cost of 5000 dinars, whilst the Azhar required 13,000 ells of striped mats a year. The Kaba at Mecca was covered with hangings in the "days of ignorance" before Islam. Richard the Lion-hearted of the Crusades, from the Yemen, or a white Chinese silk carpet, covered the shrine; and later on the famous white and gold fabric of the Copts, or heavy violet or plush carpets from all parts of the East, were employed in the decoration of the Mecca temple. The rulers of the Mahomedan world vied with each other in presenting the richest covers to the Kaba; the very Mongol Khans of Persia sent gorgeous hangings; and we read of a cover studded with gold and pearls and precious stones to the value of 250,000 gold pieces. Difficult as it is to classify the designs of eastern carpets with any precision, they may roughly be divided into two classes, the floral and the geometrical; and that of these the former is the design affected by the higher and Aryan races, the latter the design of the lower and Turanian. The old woman whom Vambery saw in Central Asia, tracing the pattern of the carpet before her for the girls to follow, is the original designer of the Turkoman and Mongolian races; while the native Indian and Persian work is found in lovely conventionalized flowers and leaves, the 'tree of life' and other symbols. There is always, however, a difficulty of distinguishing between the carpet work of one district and another, from the prevailing

custom of pilgrimages in the East. Every pilgrim brings his carpet with him to Mecca, or Kerbela, or Kairwan,—he may take more than one, for an offering, or for sale,—and ultimately these find their way, for nothing or for nominal prices, to the priests and their hangers-on, who re-sell them for exorbitant sums as relics to the outgoing pilgrims. Thus carpets of every style and character pass from hand to hand, and, coming from southern India, make their way to Smyrna or Tashkend, the promiscuous dispersion becoming one of the chief secondary causes of the cosmopolitan character of Saracen art, and of its diffusion over so vast an area, and at the same time serving to make the origin of that art almost hopelessly obscure.

In Northern Africa, it is only in Kairwan that the genuine Tunisian carpets are now manufactured. In all other parts of the regency European designs have been adopted, with the inevitable result of destroying all that was quaint and original, and substituting vulgar and egregious patterns. The old Moorish style of working in iron has thus far escaped contamination, and large Saracen locks and giant keys, charmingly ornamented, may still be procured at Kairwan, among the various sorts of weaving that bear the name of Persian carpet-work, has always held the first place. We read of the Susanjird carpets in the palace of the Abbasi khilifs of Bagdad in the tenth century; and the nobles of the East were emulous of obtaining pieces of this fine work for the floors of their scarcely less magnificent residences. In the sale of the carpets of the Fatimite khilifs in 1067, a carpet fetched a thousand dinars—at a time when dinars weighed more than the present half-sovereign; and a Mameluke prince of the fourteenth century gave 70,000 pieces of silver for a silk carpet wrought with gold. Susanjird work was also highly prized in Europe. Byzantine palaces were found to need these rich carpets as much as the mansions of Bagdad; and the merchants were given carte-blanche as to the price they paid for their commissions. Such luxuries were only for the very rich. Susanjird carpets appear always to have been confined to the houses of the great or the houses of God, which are next chosen to honour; but the anarchy which came of the Tartar invasions affected the art of weaving in a disastrous manner. Tamerlane, though his exploits were embroidered on the old tapestry which the Persian ambassador brought to Philip III. of Spain, was a chief destroyer of the skill which depicted him. Whatever the origin of the name, Susanjird designates a loom embroidery which, though it may be of various kinds, possesses a distinct character of its own. Susanjird may be knotted (like plush) or plaied (like Gobelin work), or it may combine both methods; but its essential characteristic is flat relief. The combination of the knotting and plaishing (which was not done as it is at the present day) gave the work a peculiar character. The Susanjird carpet has the effect of a picture; the embroidery is like painting; and the whole impression is soft and delicate. The subjects represented are either figures or conventional ornaments; and the figures include, not merely animals, but maps and plans of towns, like mediaeval work 'cum historiar' or 'a ymages.' The ornamental work is chiefly derived from the vegetable world, and corresponds to the European designation 'a arbrea.'
CARPETS.

In Persian art the treatment is essentially symbolic. The lion or the eagle is represented as the symbol of power or rule, and is, indeed, on a gold border in the Victoria & Albert Museum the figures are explained by the Arabic word for dominion, and another piece has 'sultan' under a lion's figure. A descending eagle signifies bad luck, but a flying or standing eagle means good luck; while the unicorn welcomes the advent of a good prince. Hounds and leopards for hunting occur in Persian patterns, and stand for fame or increasing honour. More interesting are the ornamental designs derived from trees and flowers,—the embroidery 'a arbres.' Sir George Birdwood remarks that the great source of the majority of Persian carpet patterns is the tree of life, the straight trunk with long regular parallel horizontal branches terminating in buds, which pervades all eastern and much western decorative art. Sometimes on Persian rugs the entire tree is represented, but generally it would be past all recognition but for small representations of it within the larger. In Yarkand carpets, however, it is seen filling the whole centre of the carpet, stark and stiff, as if cut out of metal. In Persian art, and in Indian art derived from Persian, the tree becomes a beautiful flowering plant or simple sprig of flowers; but in Hindu art it remains in its hard architectural form, as seen in temple lamps, and the models in brass and copper of the sacred fig as the tree of life. It is extremely curious to trace the history of the tree of life (and the tree of healing, for there are two kinds in Persian decoration) through its various stages, and to find its head in the knop and flower, or cone and flowerhead of the Persian tapistry; as well as the copper and silver repoussé designs of Chinese and Egyptian wall-paintings, on Indian monuments, Cashmere shawls and Italian brocades; in the Greek honey-suckle and palmette scroll, and the Renaissance shell; and the tongue and dart, egg and tongue patterns in classical mouldings. The persistence of the tree of life, or the pattern formed from its head, in eastern and western decorative art, is very remarkable, and, it should be added, very admirable. That the Tapisserie de Haut Lisse was derived from the East seems beyond a doubt. At the end of the twelfth century the Paris statutes make mention of 'tapisiers sarrazinois,' in contrast to 'fabricans de tapis nostre'; and in 1302 we hear for the first time of an 'autre manière de tapissier que l'on appelle ouvriers en haute lisse.' It was probably about the time of the Second Crusade that this oriental high-warp tapistry found its way into France.

Printed calices of large size and suitable patterns are used for covering the floors in India; but the most common carpets employed there are made of cotton, called saltarajnis. These are of different colours, usually blue and white, in red or orange stripes, squares, or stars; some are of large size, and well suited for halls and tents, being thick and strong in texture, the two surfaces alike, smooth, and without pile. They are manufactured in different parts of India, at Murshidabad, Rangpur, Agra, etc., and at many places in the Madras Presidency. Another kind of cotton carpet is that with a pile of cotton, and similar in appearance to a Turkey carpet, manufactured at Sasseram—white, with a centre and border in blue; and they are made also in the Hyderabad country with every variety of coloured pattern. Cotton carpets for tents are made at Cumbum, Rajamundry, and other parts, the price being under one rupee the square yard. They are generally in broad stripes of red and shades of blue. Small carpets of this description are produced in almost every district, and are used for sleeping on. They are somewhat less in price in proportion than the larger ones. Carpets of a small description, woven with wool, in stripes on a stout cotton web, are made at about the same cost.

Silk is another material of which carpets are made in the East; and the pile, being of silk, imparts both softness and richness to the surface, while the colours are clear and brilliant. They are beautiful as specimens of variety in pattern, brilliancy in colouring, as well as of pleasing harmony in the whole. Silk carpets of small size, are made in Tanjore, Hyderabad, and Khyrpur.

Woollen carpets, of large size, and of beautiful and well-coloured oriental pattern, are made at Mirzapur, Gorakhpur, Bangalore, Vellore, and other parts of Madras. Mirzapur is most famous in India for its carpets, which are frequently sold in Britain as Turkey carpets. The woollen rugs from Ellore are admired for their general characteristics of oriental pattern and colouring; and these, as well as the large carpets from Mirzapur, all in the same style, are well adapted for sale in Europe. At the Madras Exhibition of 1857, there was a large display of carpets and rugs, viz. 1. The imitation Axminster or close-nap woven carpet; 2. The short velvet pile or tapestry carpet and woollen rug; 3. The long velvet pile or imitation Turkey carpet; 4. Ogee Axminster carpets. Of these Axminster carpets, there were some very good specimens of close-nap carpets from Warangal, the colours clear and bright, but a sameness in the patterns. The carpets were strong, soft, and very close in the weaving. The only one for which Warangal is famed is Persian carpets, which are made there of all sizes, and of worsted, cotton, or even of silk. The weavers are all Mahomedans, and are congregated principally at Mutwara, although there are a few looms within the Warangal fort. The weavers are drunken, turbulent, and ignorant, possessing no capital, and dissipating in excess the little money they may procure on accomplishing a piece of work. Carpets, chiefly of a small size, about two yards long and a little more than a yard in breadth, are made for the Hyderabad market, money being advanced to the weavers by the dealers there. A worsted carpet of this size and shape costs at Warangal from 23½ to 2½ rupees. A cotton carpet there is twice the price of a worsted one. A silk one is very highly priced. A common trick among these weavers is to substitute hemp for worsted.

Of the velvet pile carpets, some large and creditable specimens from Ellore were closely woven, bright and harmonious in colour, and the patterns more varied than those from any other locality. Some of the rugs from Tanjore were also very tasteful.—(Madras Exhibition Juries' Reports). At Iyempetlah in Tanjore they make very handsome carpets of silk.

The rugs and carpets produced at Ellore vary in price from 2½ to 4 or 5 rupees a yard. They are of dyed wool upon a cotton web. The colours are not so bright as those given in Europe. Commoner descriptions, of the size
CARPETS.

of small hearth-rugs, are exported thence to England and Persia.

Dr. Walker (As. Jo. 113) gives the following description of carpet-weaving at Hummmenda, which is generally applicable:—The carpet loom is nothing more than the common native loom, placed vertically instead of horizontally. The warp is of thick, strong cotton twist, being arranged by no wafting mill, but by one of the workmen going round and round two stakes fixed in the ground, and dropping the thread at each as he passes. In the loom it is kept on the stretch by two strong billets of wood, the threads being attached by separate loops of cotton fixed to a bamboo, which is elevated or depressed at the will of the weaver. The worsted is held in the left hand, and a crescent-shaped knife in the right, the fingers of both being left free. The inner thread of the warp is then seized, the worsted wound round the outer, crossed on itself, and the extremities drawn out, by which it is made to descend in the form of an open figure of eight to be snipped by the curved knife. It is superfluous to say that this is the work of an instant. When the pattern is new or difficult, the order and position of the worsted threads is changed by a reader in a kind of rhyme. On a row being completed, the warp, in the shape of a cotton thread, dyed dark brown by the bark of the Swietenia febrifuga, is forced down by means of an iron-toothed comb, in form something like an adze. The whole is completed by cutting the worsted to its proper length by large scissors held steadily against the warp. Infant labour is employed and preferred in Warangal carpet-weaving; it being averred that their more limber finger-joints are best fitted for the finer parts of the work. Dried sprigs of tulsi (Ocimum sanctum) and bunches of Lepidagathis Indica are attached to the loom frames. The workmen say that these make their labour go on more carefully. Twelve different woods are used for the wool batten, and some are from indigo; the yellows and the sulphur yellow from boiling the sulphur yellow in water impregnated with carbonate of soda, in which a little turmeric has been mixed. The deepest yellow is produced by dipping the same in the potash ley. The reds are all produced by lac dye dissolved by tamarind juice, with sulphate of alumina and potash as a mordant. The depth of colour depends in three cases upon the original black, brown, or white colour of the wool; in the fourth, on the length of time the last description of wool was allowed to remain in the dye. The greens are produced by immersion in indigo, and then in pulas or turmeric; their degrees also depend on the original colour of the wool. Bengal indigo is always preferred to the home manufactured by the worsted dyers. Cotton carpeting is prepared in the same way as the woollen. As a general rule, the lighter worsteds wear the longest. The reds are produced by using the wool batten, and some structural agent seems to be employed in preparing the wool. If the weavers would wash the wools thoroughly with soap, both before and after dyeing, the carpets would probably be far more durable.

At Ellore the wool is cleaned and spun. The former is a rather complicated process, but on its proper performance depends the possibility of afterwards spinning the thread without the hair starting out too much,—which is sure to be the case if very hot water is used,—and the thorough fixing of the dye. When the sheep is sheared, the wool contains a large amount of dirt and grease, sometimes as much as 50 per cent. of the whole weight, and this must be entirely removed before anything else can be done. Steeping in water, hot and cold, washing with soaps and various acids, fumigation, are the plans usually adopted; but the Ellore people keep the process a secret. After this the wool is thoroughly beaten out by filling it with a line of gut stretched on a bow. This turns the matted, coarse substance cut from the sheep into a beautifully soft wool. The spinning is carried on in the ordinary manner of India. After the spinning comes the dyeing, which is not shown to strangers, and from that the thread is taken straight to the weavers. Ellore carpets are made on upright looms, the operators sitting on the ground, their legs in a hole or trench in front of the workroom, not, as in the Gobelin tapestry, behind it. The warp thread is either of hemp, cotton, or wool. In carpets intended for Europe, hempen twine is invariably used; while for India, cotton is sometimes preferred. The woollen warp is mostly confined to the small rugs made up for native consumption. The wool, or cross thread that holds down each successive line of wool, is either hemp or cotton. The warp is always white, the weft frequently coloured. Each little tuft of wool is twisted round two threads of the warp, and thus, as it were, knotted. It is then cut off with a knife to the length of about 3/4ths of an inch. When one line (horizontal) of the tuft has been completed, the weft is passed through and beaten firmly down on it by means of an iron comb. The whole line is then trimmed down to the proper length with a pair of scissors. And so the carpet proceeds, bit by bit, and line by line, till completed. Some patterns are far easier to work than others, and the value of the carpet varies accordingly. A good workman does 1/3 feet in breadth by 6 inches in length from 7 A.M. to 4 P.M. From two to three annas a day is about the sum on which a fair workman can reckon.

The Indian cotton carpets most commonly met with are blue, red, and white. Some few, made of cotton and silk for wealthy people, are extremely beautiful. The rugs made in Bengal vary in length from 3 to 3 1/2 feet, their average width being 1 1/2 feet, and their value from 1 rupee to 1 rupee 10 annas. The rugs from Ellore, Tanjore, and Mysore are made of various sizes, and are valued from 2 to 4 rupees each. Those from Shikarpur and Khyrpur, as well as from Hyderabad (Sind), are of a lighter texture, but excellent workmanship; their width is generally uniform, but in length and consequent cost they vary from 2 to 5 rupees each. The employment of rugs throughout India is most extensive, it is impossible to form an estimate of the annual value of this manufacture, as only the small portion exported is entered in the official records, and as no steps have hitherto been taken to ascertain the local trade.

The finest articles of this description, however, are the silk rugs from Tanjore and Mysore, the blending of colours and workmanship being excellent. They are made of all sizes, even up to squares of ten feet; but, being too costly for
general adoption, this manufacture is very limited. Were the patterns and disposition of colour in the native articles better known in Europe, many useful lessons might be learned from them. Woollen carpets are rarely used by Hindus, and the manufacture is seemingly entirely confined to Mahbaban.

The Shahabad is a cotton carpet entirely made of cotton. They are used by every European or native throughout India; and the annual manufacture is consequently very considerable, especially in Bengal, where they form a large and important branch of inland trade. They are of all sizes, from that of the largest carpet to the smallest rug, but generally of one and the same pattern throughout India, the only difference being the colour. Blue and white and red and white stripes constitute the prevalent patterns; but, in some, one colour of darker and lighter hues is employed. In Meerut, Bareilly, and Patna, new patterns have of late been tried, but though preferred by the Europeans, are not so by natives, who like the striped patterns, because they wear better in dunny use, and do not lose the freshness of colour by wearing. The principal localities where shatranjis are manufactured are Agra, Bareilly, Patna, Shahabad, Birbhum, and Bardwan. Those manufactured at Agra are considered the best, and the value of its annual production is about £10,000.

The small ones are valued from 3s. to 15s., and the larger ones (carpet size) from £1, 10s. to £4, the price in many cases being regulated by weight. The Shahabad cotton rugs are almost invariably striped. They are cool and pleasant. The smaller kinds are used as quilts for beds. The manufacturers, called in this district Kellehum Bap, are almost invariably Mahomedans. The two local seats of manufacture in Shahabad are Bubboah and Sasseram. In the former place, from 10,000 to 12,000 rupees' worth are yearly manufactured and sold, and in the latter from 30,000 to 40,000 rupees.

Dhurri is the name of cotton carpets generally made for sale, and are of four kinds, 6 yards long and 2 yards broad, thick and strong, of any colour, and are sold at from 6 rupees to 6 rupees 8 annas. A small kind, used as quilts, weigh from two to three pounds each, and are 1½ to 1½ yards broad by about 2 yards long; they sell at from 14 annas to 1 rupee 8 annas each, according to thickness and quality. The haunthassica is a name of the better kind of carpet, and often displays much taste in the arrangement of the striped colours. It is made of any size to fit any room, and is always sold by weight. The price varies, according to quality, from 1 rupee 4 annas to 1 rupee 12 annas, and sometimes as high as 2 rupees 4 annas per seer. It is sold in all the fairs, and in all the large cities around, such as Patna, Ghashipur, Daudnguur, Gyah, etc. No merchant's or banker's shop or rich native's reception room is complete without these being spread. This is the kind generally used by Europeans for their drawing and public rooms. The small kind of carpet is made for use in zamin-dari and other small cutcheries, and is much used from its portability. It is from 3 to 4 yards long and from 1½ to 2 yards broad, and sells at from 3 to 4 rupees each carpet. It is generally made from five colours, from which cause it obtains the name of dhurri panch rangha.

Galicha carpets, manufactured in Sasseram, are almost always woollen, of florid but neat patterns, in imitation of the Persian carpet. They are used to a considerable extent by the rich natives in their zannas, but by Europeans also. The size usually manufactured is 2 yards long by 1 yard broad, and they sell at from 2 rupees to 4 rupees 8 annas per carpet. The European manufacturer could not compete with these as to price and actual value, as the wool costs but little in India, and the native dyers answer admirably for the purpose; while also the coarse local wools, which would not pay for exportation, answer for carpet work. The colours are harmonious, and there is but little doubt that it would pay any enterprising merchant to export these to Europe. The annual manufacture at present in Sasseram is about 10,000 to 12,000 rupees.

Another kind, in imitation of the above, but wholly of cotton, is also made; prices nearly the same. The patterns are pretty, but they rapidly become spoiled by dirt and dust. They are invariably made of only two colours, blue and white. (Ornamental carpets of this breed), with a woollen and sometimes with a silk pen, are made up in Multan, Peshawur, Amirissar, Bahawulpur, and Kashmir. Those of Multan are perhaps most celebrated. Those of Ellore and other parts of the Northern Circars are largely sold for use and for export.

The carpets from Cocanada are greatly admired; the ground is white. A floral scroll of blue, red, yellow, and brown divide them into regular geometrical spaces like a tesselated pavement; a flowery cone being inlaid in each white space, and the rows of cones thus formed are alternately coloured red, blue, yellow, and brown. The design is Greek in its simplicity; and in its warmth and glow of colour perfectly oriental, charming the attention, 'caught by each colour till it's own.'

India produces also velvet carpets embroidered with gold, at Benares and Murshidabad. Costly articles of this kind were contributed to the Great Exhibition of London by the Queen. These rich fabrics are of fine velvet, embroidered with bullion gold. Maharaja Gulab Singh contributed to the Great Exhibition of 1851 a magnificent manufacture of pure silk, nearly an inch thick in the pile, showing to perfection the dyes and the harmonious arrangement of the native artists. In every square foot there were said to be contained ten thousand ties or knots of silk.

In the colouring of the carpets of India, full Indian red, broken by flowers or conventional leaves, in which orange predominates, forms a leading feature. A cool, low blue, a green of similar gravity of hue, and soft, creamy white, complete the palette of the Indian designer of these fabrics. Some of the British carpet-dealers had changes effected in this old Indian system. Some white in borders was actually bleached, and one or two garish combinations introduced. Colours have been intensified and made flatly uniform, instead of broken and slightly varying as the masses of red and other colours are left by the native weavers. Linen backs have been introduced to meet the orders of some of the British dealers, and complaints of the wearing qualities followed. Both English and French dealers have bad changes, more or less important, introduced
into these oriental designs to suit the bad taste of their buyers,—in all such cases, with losses of the exquisite harmony of the native arrangements of form and colour.

Oriental colouring in textile fabrics seems to result from a gift to the various races that produce them. The native designers proceed in accordance with immemorial traditions, and with a certainty that resembles instinct. Of all artistic powers, that of colour, in its highest harmonies, is the most difficult to teach. Though general principles can be imparted by scientific rules, the power of colouring beautifully is undoubtedly one rarely attained. It seems to prevail in races as a special gift. It exists where the knowledge of form is unknown. It accompanies an unconscious sympathy with nature, and seems more allied with instinct than demonstrable by science. Many actually savage nations colour their cloths or wrappers and mats harmoniously, though absolutely devoid of social or mental cultivation. And, on the other hand, as nations have progressed in scientific attainments, the love of colour, in dress certainly, in other ways generally, is diminished. Europe may cultivate the study of colour, and understand its laws; but in textiles of all kinds, from carpets to gossamer muslins and gold and silver tissues, the traditional taste of oriental nations remains unattainable by Europeans. And of European nations those most old-fashioned, least changed from the rude ages of the past, retain the greatest enjoyment and feeling of colour.

If the civilised nations of Europe do not equal the less advanced and even the savage races in their appreciation of colours, they are even less happy in their application of designs; and in Cashmere and throughout India much injury has been occasioned to the manufacturers, alike to their skill and to their profits, by European purchasers inducing them to undertake designs from Europe. The deep tints of native Indian and oriental dyes generally are at once the aspiration and despair of artistic European dyers; and the beautiful elaboration in colour and design, as shown in the work of the weavers of Persia, Turkomania, Kirman, Cashmere, and British India, can only be injured by interference. The workmen know that for the coarser wool of the Panjah, Sind, Baluchistan, and British India, the fine designs of Persia, or the designs of the dense-piled carpets of Turkomania and Kirman, are equally unsuitable, and that only their own bold patterns will be with advantage used.—Madras Exhiz. Jrib. Rep.; Dr. Watson's Report; Mr. J. Rohde, MSS; Colonel C. Davidson in Report of Hyderabad Committee; Baron Clement A. de Bode; Bokhara and its Audir, p. 224; General Ed. Ferrier's Journal, p. 26; Sir George Birdwood, Memo, 29th Sept. 1879; do. Handewiek Paris Exhibition, 1878; Porter's Travels, ii. pp. 167-201; Die Persische Nadelmalerei Suriatschid, ein Beitrag zur Entwicklungs-Geschichte der Tapisserie de Haute Lisse, von Dr. Joseph Karabacek.

CARPILUS, a genus of crabs of the E. Indies, the Cancer of Linnæus. C. convexus, Edwards, is a crab of the Red Sea; C. corallinus, Leach, and C. maculatus, Leach, the latter the blood-spotted crab, are both of Asiatic seas.

CARPINI. Johannes Carpini, a Franciscan friar, was sent, a.d. 1247, by Pope Clement IV. to the Tartar camp on the Volga. Carpini travelled through Bohemia, Silesia, and Poland, and on through the vast regions then known under the name of Comania, and now as the country of the Don Cossacks, watered by the Donjeger, the Don, the Volga, and the Yark, until he at last came to the standing camp of 'Duke Bathys' (Butou, grandson of Chingiz Khan), which afterwards grew into the city of Sarai or Sara, on the Volga. From here he was sent on to the imperial court, where he arrived by way of Lake Balkash at the moment when Kuyuk was being elected to the Great Khanship of the Tartars, in succession to his father Oteki or Okkodai Khan, son of Chingiz Khan. On his return journey, passing rapidly through the camps of 'Duke Bathys' and 'Duke Correna,' who guarded the Tartar frontier in Europe from the nations of the west, he reached Kiev in Russia within eight months of leaving the imperial court of Kuyuk Khan. He was the first traveller into Mongolia whose narrative we possess.

This tree is found in Nepāl and the Indus valley between the Tampur and Sungnam, on an elevation of 5500 and 6000 feet. Wood esteemed by carpenters. C. cordata, C. crosa, C. laxiflora, and C. japonica, Blume, occur in Japan.—Cleghorn, Panjab Report, p. 64; Stewart.

CARPOBALSAMUM, an inferior quality of opobalsamum, obtained by expression from the fruits of Balsamodendron Berryanum.—Kuath.

CARPODACUS ERYTHRINUS, a rare bird in the N.E. of Europe, is a common winter visitant over the greater part of India.

CARPOO COONGILLUM. Tele. Black dammer.

CARPOORAWALLI. Tele. Lavandula cataro.

CARPOORUM. TAM., Tel. Camphor.

CARPOO ULANDOO. TAM. Black variety of Phaseolus max.

CARTOPHAGA, a genus of birds of the family Columbidae. C. luctuosus, a fine cream-colored pigeon of Colomby; C. japonica, one of the mourning pigeons; many of both sexes are furnished with a large, round, fleshy caruncle on the bill at the base of the forehead; this is said to be present during the breeding season only.—Macgillivray, Voyage, i. p. 244.

CARR, MAJOR M. W., of the Madras army, author of Telugu Proverbs. He perished with all in a steamer, in a cyclone on the W. coast of the Peninsula in the beginning of 1869.

CARRAGAGNA. Hwang-tsing, CHN. Carrageen moss or Irish moss, Chondrus crispus, Linph, and C. manniillulosus, Grec., from the west of Ireland. Used for cattle-feeding and dietary purposes.

CARRAY EILLOO. TAM. Guizotia oleifera.

CARRAY KEERAY. TAM. Wecbera tetrandra.

CARRABODHUM. TAM. Aloe.

CARRAGEE of goods and persons, in Southern and Eastem Asia, continues from remote ages of the most varied kind, being by conveyances, man, and quadrupeds. The sledge seems to have been the first kind of conveyance in use. A sledge is sculptured on the temple of Luxor at Thebes, resembling that in use by the
CARROT, Daucus carota.

The *Araba* of the Turks has its sides of lattice work to admit the air. The *Jutka* is similar to the eka. In India with the palaquin, etc., and in China and Japan with forms of the sedan chair, men have been employed as carriers from the most ancient times, but in India and China largely as bearers of burdens. The camel, the mule, the horse, the bullock, the buffalo, yak, and the donkey, have been employed in Egypt, Central and Southern Asia, from prehistoric times for riding, carriage, for burdens, and for ploughing. The hybrids between the female and male yak and the bull or cow carry from two to three maunds; they are sure-footed, hardy, and docile, and are used also for riding in the snows.

In the highest parts of the N.W. Himalayas, sheep and goats are most used. The sheep carry from 10 to 16 lbs., the goats from 12 to 24 lbs.; their day's journey is about five miles, to give them time to browse the pasture, which is their sole food. They are used to carry the borax from Tibet in packs (karabaj) slung over their backs.

During the march upon Kâbul, Yakub Khan made over to the British transport service sixty-two magnificent hill ponies, capable of carrying four maunds each = 336 lbs. Camels rarely cover the ground at a greater speed than one and a half to two miles an hour, consequently in an enemy's country the troops must be continually halted in order not to leave their baggage in the rear unprotected. The men and animals, even over the shortest marches, kept under arms all day; and when anything over fifteen miles has to be done, the camp cannot be formed until darkness has set in. Mules or ponies keep up with the troops, and the line does not extend to so great a length. Even the longest marches can be performed in the earlier part of the day. The karafs that come down every year to India in immense numbers, march for two days—perhaps at the rate of 20 to 30 miles—and halt for one good day's grazing. See Camell.

CARRION CROW, Corvus corone of Europe, Afghanistan, Japan (apud Temminck), is replaced in India by C. culminatus.

CARROT, Daucus carota.

The red and yellow carrots are cultivated all over India as a vegetable. The hibisp fruit forms the basis of the vermillion pad used by the Chinese as their ordinary red pigment for stamping purposes. Its fruits are recommended in chronic diarrhoea.

CARRUWA PUTTAY. Tam. Cinnamon.

CARTER, HENRY JOHN, M.D.

CARTER, HENRY JOHN, M.D., a medical officer of the Bombay army, a large contributor to current literature in the Tr. Med. Phys. Soc., Bombay, No. 8; Medical Gazette, 1839; Jour. Bomb. As. Soc. Ann. and Mag. He wrote on the Prevalence of Intermittent Fever among the troops at Hyderabud in Sind during the autumn of 1846; Beriberi among the Marines of the Indian Navy; Rupture of the Heart; Case of Poisoning by Opium, and Passage of Mud into the Bronchi in Drowning; Medical History of the

Coast of Arabia, Modern and Ancient; Description of the Ruins of El Bellad on the S.E. Coast of Arabia.—Trans. Geog. Soc. Bomb. vii. p. 225; Journ. Royal Geog. Soc. xvi. part ii. p. 187.

CARPATHUS was built b.c. 813 or 814. The Carthaginians were a Semitic race. Their descendants are supposed to be the Moors who occupy the north of Africa; lowlanders, traders, and dwellers in cities; little idle men who grow fat from indolence; avaricious, perfidious, cowardly, cringing, and insolent. See Semitic Races.

CARPATHIUS OXYACANTHA. Bieb.

Abundant in many of the more arid tracts of the Panjab. The seeds are eaten parched, either alone or with wheat, or are ground and mixed with wheat flour for bread, as also are those of C. (or Onobroma) Persicus. The oil extracted from the seeds is burned in lamps, used in food, and medicinally.—J. L. Stewart, M.D.

CARPATHIUS TINCTORIIUS. Safflower. Crocus Indicus, Rump.

Usfar, Arab.; Kamalottara, Sansk.; Kajreha, Beng.; Kusumbha, Tam.; Hoon, Egy.; Agnisikha, Tel.; Bastard saffron, Eng.; Kusumbha chheetu, Hind.

Kusum, Hind.

The safflower is grown very abundantly all over India, Burma, and China, and is very largely used in dyeing. The plant is propagated by seed sown in drills at 1½ feet distance from each other. The young plants appear in about a month, and after the second month are hooded and thinned, each plant being left a foot from the other. The richer the land, the larger the proportion of colouring matter afforded by the flower. On the opening of the flowers, they are rapidly gathered without being allowed to expand fully. They are then dried in the shade with great care. The produce of Paterghanta and Belispore is considered, in the London market, as the best that is exported from India. The Dacea safflower ranks next to that of China, which is reputed to be of a superior quality. Safflower is widely grown on the banks of the Irawadi and Salwim. Its flowers furnish the best yellow dye in the country, and, mixed with other ingredients, they are used to dye red, and to give a variety of tints, and in dyeing pink and scarlet.

This plant yields six or seven distinct shades of red, the palest pink or piyazi gulabi (pink), gulabi surkh (rose colour), fuli or gul-i-shaftalu (deep-red). In combination with harsingbar flowers (Nyctanthus arbor-tristis), it yields soneri or golden orange, naranji, deep orange, and sharbatli, salmon-colour; and with turmeric (haldi, zard chob), it gives a splendid scarlet, gul-i-anar, and other tints; again, if combined with indigo, Prussian blue, etc., a series of beautiful purples, known as lajawardi, uda, nafarmani, sosani, kasni (a delicate mauve), falsai, kokai, and the deep-purple baingli. All these tints are more or less beautiful, but scarcely one of them will stand washing.

The yellow principle is worthless as a dye. It is soluble in water, is removed by washing, and thrown away as the first step in the preparation of the valuable red product. The red dye is an acid resinous substance of superb colour, insoluble in water and in acid solutions, little soluble in alcohol, and not at all in ether. It is dissolved freely by aqueous alkaline solutions, which it neutralizes. Its salts (carthamates) are crystallizable, and quite colourless; acids precipitate the carthameric acids from solutions of these salts. To obtain it on a large scale, after the separation of the yellow matter, the dried flowers are treated by a solution of carbonate of soda, and lemon juice added; the carthameric acid precipitate is collected by subsidence, washed, and carefully dried at a gentle heat. The most lovely tints are imparted by this dye to silk and cotton; rouge is a mixture of the dry carthameric acid and finely powdered talc. The pink saucers used for giving a flesh tint to silk are prepared from this dye, with a small portion of soda. 8 oz. of the prepared petals and 2 oz. carbonate of soda are acted on by 2 gallons of water. 1 lb. of prepared chalk are added, and the colour precipitated upon this by adding the carthameric acid.

The Chinese carni-rouge is a carthamite of soda, colourless when rubbed on, but by the salt being decomposed by the acetic acid secreted by the skin itself, the carthamite acid separates in the most perfect rosy tint which can be imagined. The seeds yield abundance of fixed oil, which is used as an external application in paralytic affections, and for bad ulcers; and small seeds are reckoned by the Vytrians amongst their laxative medicines. The dye of the ‘Kong-pha,’ a variety of safflower or Carithamus tinctorius which grows in China, is held in high esteem by the Chinese, and is used in dying the red and scarlet silks and crates which are so common in the country, and so much and
CARVING.

It is conspicuously displayed in the elaborate details of the sandal-wood boxes from the Malabar coast, and is also shown in the beauty of the figures and buildings in the pith-like stems of the marsh-plant called shola, the Æschynomene aspera. In the latter, all the elaborate detail of the richly ornamented Hindu architecture of the south of India is carefully brought out. For this work only two tools seem to be employed,—one a large and heavy knife, and one with a fine sharp cutting edge. Besides these, cocoanut shells and gourds are carved and made into cups, vases, and snuff-boxes; also the kernel of the cocoanut is variously cut, for making garlands for state occasions. The natives of India also display skill and neatness, as well as habitual taste, in their work-boxes, etc., of ivory, horn, or porcupine-quill, ebony, and sandal-wood, their fans and umbrellas, chouries, and khus-kius or other baskets, hookah-snakes, imitation fruits and flowers, toys and puzzles.

The skill is remarkable with which the unyielding substance of the hard, thick chank shell is converted into necklaces for men and into bracelets for women. The manufacture of shell bracelets is one of the indigenous arts of Bengal, in which the Sankari caste at Baccæ excel. The chanks of which they are made are the large species of Turbinella, from six to seven inches long, and of a pure white colour. They are imported into Calcutta from Rammud and South India, opposite to Ceylon, and from the Maldiv Islands. The ivory for the Chinese carvers reaches China principally from Cochín-China and Africa, via Bombay, and always finds a ready sale at Canton; the largest and best tusks weigh from 16 to 25 pounds each, decreasing to five or six pounds. The cuttings and fragments also form an article of trade, as the workmen can employ the smallest pieces. Bones and horns, especially the long horns of buffaloes, are in China worked into handles, buttons, etc. Rhinoceros' horns are brought from Burma, from Sumatra, and from Africa through Bombay; they are highly valued by the Chinese, from a notion that cups made from them sweat whenever a poisonous mixture is poured into them. A large horn sometimes sells as high as 300 dollars; but those that come from Africa do not usually rate above 30 or 40 dollars each. The principal use of these horns is in medicine and for amulets, for only one good cup can be carved from the end of each horn; and consequently the parings and fragments are all preserved. The hard teeth of the walrus, laminant, and other cetaceous animals, also form articles of import into China from the Pacific, under the designation of sea-horse teeth; they weigh one or two pounds a piece, and the ivory is nearly as compact, though not so white, as that of the elephant. The delicate carving of Chinese workmen is well known, and has often been described; many specimens of it are annually sent abroad. Few products of their skill are more remarkable than the balls containing twelve spheres cut out one within another; but the manner of cutting them is simple. A piece of ivory or wood is first made perfectly globular, and then several conical holes are bored into it in such a manner that their apices all meet at the centre, which is usually hollowed out an inch or less after the holes are bored. A long crooked tool is then inserted in one of the conical holes, so

justly admired by foreigners of every nation. Large quantities are annually produced in the Che-chiang province near Ningpo.—Powell's Handbook, p. 457; Ains. Mat. Ind. p. 195; O'Shaughnessy, p. 411; Mrs. Mason, M'Clelland.

CARVING or Kartika, in Hindu astronomy the seventh Hindu solar month, when the sun is in the sign Tula, answering to the Tamil Arpēsi. In the southern parts of the Peninsula the Tamil month Kartica is the eighth of the solar year. Lastly, Kartica is also the eighth lunar month of the luni-solar year. This month is peculiarly sacred to Lakshmi, the goddess of prosperity, the June and August of the Romans. The 13th is called the Dhanurtes, or thirteenth day of wealth, when gold and silver coin are worshipped, as the representatives of the goddess, by her votaries of all classes, but especially by the mercantile classes. On the 14th all anoint with oil, and make libations thereof to Yama, the judge of departed spirits. Worship (puja) is performed to the lamp, which represents the god of the lower regions, and is thence called Yamadipa, the lamp of Yama; and on this day partial illuminations take place.—Tod; Warren; Kala Sanhita; Cole, Myth. Hind. p. 379.

CARUM CARU. Linn. Caraway.

C. gracile, Bh. | C. nigrum, Rogyle.
Curvija, | ... ARAB. | GUNYAN, HIND. OF LAD.
Carvi, F. tr. | Umba, | PANJ.
Jira siyah, | ... HIND.

Carum carui and C. gracile, if distinct, both grow in profusion in many of the more arid tracts on the Sutlej, Chenab, etc., in Kashmir, and in Western Tibet, from 9000 to 14,500 feet.—Dr. J. L. Stewart.

CARVING.

Carving in wood, horn, and ivory must have been practised in India from very early times, for the idols which the people worship, and for caIico-printing, for which they have long used wood-blocks. They are fond of carving on many of their ordinary utensils, as spinning-wheels, etc. Their skill is shown in carving the blackwood and ebony furnitures of Bombay and Madras, especially in the elegance of the patterns of the backs of the chairs and sofas, in the sideboards and bookcases. Carvings in ivory of different parts of India are much to be admired, whether for the size or the minuteness, for the elaborateness of detail, or for the truth of representation. Among these the ivory carvings of Berhampore are conspicuous. A set of chessmen from India, at the Exhibition of 1851, carved from the drawings in Layard's 1 Nineveh, 1 were excellent representations of what could only have been seen in the above work, and showed that they were capable of doing new things when required; their representations of an elephant and other animals were true to nature. The carvings in the same material in a state chair sent from Travancore were greatly admired; and for the truth of representation on a minute scale, where an elephant was enclosed in the shell of a pea, chouries or fly-flappers from Calicut, where the ivory or sandal-wood was cut into long hair-like threads, were also specimens of their mechanical skill. Their skill in wood-carving

592
Bent at the end and stoppered on the shaft that it
cuts the ivory at the same distance from the
surface when its edge is applied to the inside of
the cone. By successively cutting a little on the
insides of each conical hole, their incisions meet,
and a sphere is at last detached, which is now
turned over and its faces one after another
brought opposite the largest hole and firmly
secured by wedges in the other holes, while its
surfaces are smoothed and carved. When the
central sphere is done, a similar knife, somewhat
larger, is again introduced into the holes, and
another sphere detached and smoothed in the
same way, and then another, until the whole are
completed, each being polished and carved before
the next outer one is commenced. It has been
proposed by some that these curious toys were
made of hemlock, nicely luted together, and
they have been boiled in oil for hours in order to
separate them and solve the mystery of their con-
struction. Fans and card-cases are carved of
wood, ivory, and mother-of-pearl in alto-relievo,
with an elaborateness which shows the great skill
and patience of the workman, and at the same
time his bad taste in drawing, the figures, houses,
trees, and other objects being grouped in violation
of all propriety and perspective. Beautiful orna-
ments are made by carving roots of plants,
branches, gnarled knots, etc., into fantastic
groups of birds or animals, the artist taking
advantage of the natural form of his materials.
Models of pagodas, boats, and houses are also
entirely constructed of ivory, even to representing
the ornamental roofs, the men working at the oat,
and women looking from the balconies. Baskets
of elegant shape are woven from ivory splints;
and the shopmen at Canton exhibit a variety of
objects, paper knives, chessmen, counters, combs,
etc., exceeding in finish and delicacy the same
kind of work found anywhere else in the world.
The most elaborate coat of arms, or complicated
cypher, will also be imitated by these skilful
carvers. The national taste prefers this style of
carving on plane surfaces; it is seen on the walls
of houses and granite slabs of fences, the wood-
work of boats and shops, and on articles of
furniture. Some of it is pretty; but the dispro-
portion and cramped position of the figures
detract from its beauty. Their porcelain is
good. The ivory carvings, ebony and other hard-
wood ornaments, and the bronzes, are all ex-
quisitely worked; the value attached to them in
England varying from £4 to £5. Burmese
carpenters carve in a rough but bold style, and
find employment principally in carving for the
exteriors of monasteries.—Williams' Middle King-
dom, ii. pp. 141, 148; Yule's Embassy, p. 69;
Blume's Malay Archipelago.
CARWAR or Sedabigahar, a sheltered seaport
on the western coast of the Peninsula of India.

CATYOCAR BUTYROSUM. C. meiferum. | Pekoe butyros.
The souaria, sawarow, or surwaha tree of
Guiana and Demerara. It yields the sawarow
nut. It might be brought to India with benefit
to the country.

CATYODAPHNE DENSIFLORA. Blume.
Kiteja of JAVA. A tree sixty to eighty feet high;
leaves gracefully aromatic, used in infusion like
tea against spasms of the bowels, and in puerperal
convulsions.—O'Shaughnessy, p. 547.
ing 18 or 20 feet in length, and from 10 to 12 across; from their fibre, the kuttu fibre of commerce, ropes of great strength, brushes, brooms, caps, and similar articles are manufactured; the woolly material found on the petals is used as oakum for caulking ships. In Ceylon the black fibre from the leaf-stalks is manufactured into ropes of great strength and durability, and is used for tying wild elephants. The Rodyahas, a forest race among the Kandyans, make this rope generally with considerable skill. The fibre is much used by the natives for making fishing lines and bowstrings; it is very strong, and resists water for some time, but is liable to snap if suddenly bent or knotted. It resembles black horse-hair, and might be employed similarly. Dr. Gibson says it is one of the most useful trees in the country; and he had heard that the farm of this tree, throughout the single district of Yellapore in Soopah, yielded Rs. 30,000 per annum.—_Dr._

Wight, _Gibson, Rozb., Royle, Hooker, Marsden, and Ainslie;_ Mr. Mendis; Captain Macdonald; _M. E. J. R.; Seenman; Mr. Low; Mr. Ondatjee, _Veg. Prod. of Ceylon._

CAS. HIND. Saccharum spontaneum.

CASEA-CASA. TAM., Tel. Poppy seed.

CASEA CHITTY, of Ceylon, author of the Tamil Plutarch, containing a history of the lives of the poets of Southern India in a chronological arrangement.

CASEA-ELLE. TAM. Leaves of Menecylon tinetorum.

CASANDHI. HIND. Cassia sophora.

CASARA-KAIA. Tel. Cucumin tuberosa; C. canabina.

CASARCA, a genus of swimming birds of India; there are several species. In _C. cana_, _Gm._, under the tail-coverts are paler, and the black on either side of them at base of _C. rutile_, is, in _C. cana_, replaced by dusky, minutely freckled with whitish. _C. rutile_, the Brahman goose, is met with above Sukkur. The male is a fine-looking bird, and measures about 29 inches; the general colour of the plumage is rufous, with brilliant green on the wing-coverts. It is shy and wary. See Chakwa.

CASEARIA CANGEZA. Wall.

Samyda canizia, _Buch._ Ana varia, _... Maleal._

A large tree growing in Assam and Bengal, very bitter. Its leaves are used in baths, and the pulp of its fruit as a diuretic. The _Casearia_ genus is of the order Sauridaeae. The species are found in the Himalaya, S. India, Assam, Ceylon, Penang. Voigt (p. 78) mentions six species, shrubs or small trees of _N. India_; and Thwaites mentions two moderate-sized trees of Ceylon.—C. coriacea and _C. champion._

Casearia pentandra, tha-byal-yvet-kya, Burmese, found in the Pegu district, but scarce. Timber strong and close-grained, adapted for fancy work and cabinet-making.—_Dr. McClelland._

Casearia tomentosa, _Rozb., D. C., chilah, chilla, Hindustani_, a small tree of Kangra, the Panjaur, Jaffna, and Sigre. It is not uncommon in the Svalzik region at from 3000 to 3000 feet, up to near the Indus. The timber is whitish, soft, and brittle, and is only used for small woodwork by natives; but is said to furnish good fuel. In some places the fruit is used for poisonous fish.

Casearia elliptica, bhogara, MAHE, klaare maram, TAM., in Coimbatore, a large shrub. On the Bombay side it is a small tree, not uncommon near the ghats. The wood is smooth, fine-grained, and yellow-coloured, but from its small size can only serve as an ornamental wood.—_Dr._ _Wight, J. L. Stewart, and _Gibson._

Casearia esculentia. _Rozb._

Jiru kanell, _... Maleal._ Konda prasara, _... Tel._ Konda janguru, _... Tel._

A large shrub, growing in the mountains of the Northern Circars. Its leaves are eaten by the people, and its roots are employed by the hill people as a purgative.—_Useful Plants._

Casearia ovata, _Rozb._, _Pods kali- meses._

Telugu, in a large tree of the Godavery; has wood of a light colour, hard, does not warp, and is worthy of attention. Fruit used to poison fish.

—_Captains Beddome, Macdonald._

Casearia varians. _Thw._

C. coriacea. _Thw._ | C. championi. _Thw._

This is a lofty tree, very common in all the Western Ghats forests and in Ceylon, and it grows to a very large size in the dense moist forests at 2000 to 3000 feet elevation. _C. coriacea,_ _Thw._, a form with very coriaceous leaves, is very common on the higher ranges of the Animally, 6000 to 7000 feet elevation, and on the Ceylon mountains at the higher altitudes. In drying, the leaves turn very black on the upper side.—_Thwaites,_ p. 19; _Beddome, P. Syl., part xviii. p. 208._

Casearia Zeylanica. _Thw._

C. ovata, Wild. _... W. & L.-wareka._ _Singh._

A middle-sized tree of the hotter parts of Ceylon, very common up to an elevation of 1500 feet.—_Thw._ _Enl. P. Ceylon._

CASEGAI, a wandering tribe in the south of Persia, between Shiraz and Darab.

CASH or Kas, in the old Madras currency, a small coin of which 10 = 1 dodie, now valued as 2 pice, and 80 cash going to a fanam; 45 fanams being equal to 1 star pagoda. According to the old Madras system, accounts were kept in star pagodas, fanams, and kas.

_8 kas = 1 fanam._

336 _k _= 42 (silver) fanams = 1 pagoda.

The E.I. Company reckoned 12 fanams to the rupee, and three and a half fanams to the pagoda. But the bazar exchange fluctuated between 35 and 45 silver fanams per pagoda; fanams were also coined in a base gold.

Copper 1, 5, 10, and 20 kas pieces were coined in England, by contract, for Madras, so lately as 1797. The 20 kas was also called 'dodo' and fanas. The star pagoda weighed 52-56 grains, and was nineteen one-fifth carats fine. It was therefore intrinsically worth 7s. 5d./d. sterling, but it was commonly valued at 8a. Many varieties of the pagoda used to circulate on the Coromandel coast, but since 1833 they have been only obtainable when sought for.

In 1811 a coinage from Spanish dollars took place, consisting of double rupees, rupees, halves, and quarters; and pieces one, two, three and five fanams; the rupee weighed 1567 grains. A silver coinage of half and quarter pagodas of dollar fineness, also then took place; the half pagoda weighed 320-73 grains troy, and was equal to 1½ arco rupees. By a proclamation of 7th January 1818, the silver rupee of 180 grains was constituted the standard coin, and all accounts and public engagements were ordered to be converted at the exchange of 350 rupees per 100 pagodas.
CASHMERE.

The proportion between the old and new currency
then became $1\frac{1}{2}$ rupees per pound, and in copper
75 paisa old currency equals 14 paisa new currency.

Kas may be a corruption of the Sanskrit word
Karsha, which is mentioned in Colebrooke's Essay
on Indian Weights, as the same with the word
pan. A karsha, or 80 raktika (rati) of copper,
is called a pana or karsha-pana. It is now the
eightieth part of a pan; but the simple word is
all that can be identified as having survived the
times of the change of system.

In Britain, 'cash' has come to mean ready money,
also copper or silver money. In India it
is still, along with the cowrie, used to indicate a
small sum.

CASH. Chin. A Chinese coin about eight to
a halfpenny. In 1872, 1700 cash were exchanged
for a tael of silver, and nearly four taels go to a
pound sterling. In China, a cash of iron is the
520th part of a dollar, and it is a saying, 'For as
many beads make the necklace, so many cash
make a cobang,' a gold coin equal to four dollars
and a third.—Edken.

CASH, the ancestors of the Chasdim or
Chalybes of the mountainous territory in Central
Armenia, a little to the north of Erzerum. The
Sabaean followers of Cash are to be distinguished
from those descendants of Sham who at a later
time occupied part of the mountains of Assyria.
See Chaldan.

CASH BALANCES, a financial term of the
Government of India for the balances in their
several treasuries. They have ranged between
thirteen kror rupees in the years 1870 to 1880;
but anything below thirteen kror is considered unsafe.

CASHCUTTEE. — Gambier.

CASHEF or Kashef of the Mahomedans
of Kashmir, the grandfather of Kasaya, who drained
the valley. See Kashmir.

CASHEW NUT TREE, Anacardium occidentale,
yields several useful products. One edible part is
the swollen, pear-shaped stalk (peduncle) which
supports the nut. The kernel also is eatable when
roasted.

Cashew Apple Oil is powerfully vesicating; and
it is obtained from the pericarp of the cashew apple.
It resembles in its properties the acrid oil obtained
from the marking nut, Semecarpus anacardium.

Cashew Gum. The trunk and branches, on being
wounded during the ascent of the sap, yield a
transparent gum similar in appearance to gum-
arabic, for which it is a good substitute. This
gum is somewhat sticky, and is particularly adapted
for use where the depredations of insects require
to be guarded against.

Cashew Nut.

Hidi i jali baddan, Beng. Jambu-mont, Mal.
Catsjoomoor, Dut. Nozes d'acaj, Poir.
Noix d'acajous, Fr. Nueces d'acaj, Sp.
Aka jumussa, Ger. Mundri Kotte, Tam.
Caju, Guz, Hind. Munta mamidi vitu, Tel.
Aka, Sr. 

Cashew nuts are kidney-shaped, attached to the
under part of the fruit; they are articles of food,
and an ingredient in chocolate.

Cashew Nut Oil.

Kaju ka tel, Hind. Munta mamidi nuna, Tel.
Mundri cotay yennai, Tam.

A light yellow, sweet-tasted, and edible oil
obtained from the nut of this tree by roasting. It
is in every respect equal, if not indeed superior,
to either olive or almond oil. It is very seldom
prepared, the nuts being used as a table fruit.—
M. E. J. R. See Gunn; Oil; Rosin.

CASHGAR, Khoten, Turfan, and Yarkand,
according to Lassen, the old original inhabitants
of these places, and of the adjacent highlands, are the
Tajak, who speak Persian, and are all agriculturists.
The Swedish chroniclers bring the Swedes from
Cashgar, and the affinity between the Saxon
language and Kachchak is great.—Bunaeu; Tod.
See Kashgar.

CASHMERE. The Cashmere territory at present
prehends Jammu, Cashmere, Kishwar, Zanzak,
Ladakh, and Balti. A chronicle exists which
was composed in a.D. 1125, but gives a general
historical account of Cashmere from B.C. 1182.
The Abissares chief, who with rich presents con-
ciliated Alexander as he approached the Indus, is
supposed to have ruled about Cashmere. The
rajas of Cashmere of the line of Kuru in the
nart race, were worshippers of the Naga or
Snake. The early chronology of Cashmere is full
of doubts, though Professor Wilson, Captain
Troyer, and Major Cunningham all coincide in
regard to the proper period of the initial date of
the Naga dynasty. The line is taken from the raja Tarangini, which commences with an account
of the desiccation of the valley by Kayaspa muni,
supposed to allude to the Deluge. Cashmere was
colonized by Kayaspa B.C. 2666. There were many
dynasties of Cashmere—kings of the Kaurava race,
1296 years, with one of whom, Gondera, authentic
history commenced in B.C. 2448. Lava, in 1709
B.C., was the Loo of Mahomedan historians.

Surendra, B.C. 1600, was contemporary of Bahan of
Persia.

The Gonderiya dynasty, 1013 years, or 378 years after
adjustment.

The Aditya dynasty, 192 years.

The Gonderiya line restored, 592 years, or 433
adjusted.

The Naga or Karkota dynasty, 260 years 5 months.

The Utpal dynasty, 84 years 5 months.

The Bhota dynasty.

The Mahomedan kings.

Cashmere was annexed to the Moghul empire
under Akbar in 1586 A.D., but it has since been
ruled from Afghanistan by the Durani and
Barakzai chiefs; was taken from them in 1619 by
Ranjit Singh, and is now held by a Dogra Rajput,
chief of Jammu. After the Sutlej campaign, the
new treaty of Lahore, dated 9th March 1846, left
the British Government in possession of the country,
hill and plain, between the rivers Beas and Sutlej,
and of the hill country between the Beas and the
Indus, including the provinces of Cashmere and
Hazarat. The British Government conferred on
raja Gulab Singh, territories on the hills, and
recognised his independence. Gulab Singh began
life as a horseman in a troop commanded by
Jemadar Khosheil Singh, then the favourite
chamberlain of Ranjit Singh. He soon raised
himself to an independent command, in which he
distinguished himself by making prisoner Agar
Khan, chief of Kajoori. For this service the
principality of Jammu was conferred on his
family, and Gulab Singh took up his residence in
Jammu, whence he soon extended his authority
over his Rajput neighbours, and eventually into
Ladakh. He took an important part in the negoti-
tiations which followed the battle of Sobraon. A
CASMERE.

Separate treaty (No. cxxiv.) was concluded with him at Amritsar on 16th March 1846, which put him in possession of all the hill country and its dependencies between the Indus and the Ravi, including Chamba, and excluding Lahour, on payment of 75 lakhs of rupees, and in exchange for the Ciss-Ravi portion of Chamba. By a subsequent arrangement in 1847, Chamba came again entirely under the British Government. In 1857, maharaja Gulab Singh died, and was succeeded by his son, Ruubir Singh, to whom the right of adoption was guaranteed to the maharaja by a sumud.

The general level of the valley of Cashmere is about 5500 feet above the sea, but at the Water lake and gardens of Srinagar it is 5146 feet, in lat. 34° 40' and long. 74° 48'.

Cashmere has always been subject to earthquakes. The great bulk of the people profess Mahomedanism; but they are of Aryan descent, of the Hindu stock, and all classes are remarkable for their physical symmetry. The chief town, Srinagar, on both banks of the Jhelum, has 40,000 people. Islamabad, on the Jhelum, is a seat of the shawl manufacture. The fruits which attain maturity are the apple, pear, quince, peach, apricot, plum, almond, pomegranate, mulberry, walnut, hazel nut, pistachio, and melon. The 'gilla' cherry is indigenus, and is cultivated in orchards. The 'bullace, Prunnus insititia, is found nowhere else in a wild state. The vine is extensively cultivated. In 1878-79 the British Indian trade with Cashmere amounted to Rs. 81,61,169, viz. imports, Rs. 55,85,369; and exports, Rs. 25,75,800. — Elphin. Coulbul, p. 506; Princep's Antiquities, by Thomas; Cleghorn, Punjab Report, p. 171; Aitchison's Treaties, etc.

CASMHERE, a very beautiful woolen fabric, formerly manufactured solely in the kingdom of Cashmere, but now in other towns, in the form of shawls, coats, scarfs. The manufacture of Cashmere shawls was long peculiar to that province. Formerly the shawls were exquisitely woven, with unrivalled elegance and claineness of design, softness and finish in quality, arrangement of colours and use of dyes, which the finest Paisley and French shawls did not approach. The exquisite shawls of Cashmere became rarer and rarer every year, and their place has been usurped by hand-embroidered fabrics of lower value, with more showy and more vulgar patterns. In the Punjab and in Dehli, of late years, workmen have commenced to embroider Cashmere cloths and net with floss silk and braid, but solely for sale to Europeans, who wear them as tunics, jackets, scarfs, and the like. In the hand-worked Cashmere shawls, as also in the Dehli work, wooden needles of hard wood are used, slightly charred, with a hole in the centre of the needle to receive the yarn. Cashmere weavers have settled at Amritsar and Jellapur and other places, and have flourished. The great Panjab mart for Cashmere is Amritsar. The largest import of is pashmina goods, consisting of shawls, needle-worked goods (amlikar), embroidered chogas, etc., and plain pashmina cloth.—M. E. J. R.; Dr. Watson. See Shawls; Wool.

CASPIAN, the Hindu name of Benares, a city which lies in 25° 18' 31" of N. lat., and according to Hindu geography, 4° 37' E. of Lanca. See Benares.

CASPIAN SEA. A large salt-water inland sea of Central Asia, lying between lat. 36° 55' and 47° 30' N., and long. 46° 48' and 55° 25' E., 730 miles long, 150 to 270 miles broad, with an area of 140,000 square miles. The chief affluents are the Atrak, Gurkan, Kidz-Ozan, Kuma, Kur-Terek, Ural, and Volga; but there are nearly a hundred torrents besides. It has no outlets and no tides. It has valuable fisheries of sturgeon and other large fish; sterlet, pozoarte, perch. It has twice been surveyed, and once declared to be 814 feet below the Black Sea, but at another time only 384 feet. It is known to the Mahomedans as the Daria-i-Kulsum, also Daria-i-Haseleta Khan, and Daria Khirz, and by the Armenians as the Sis, by the Georgians Sjava, and by the Russians Gualenskii. According to Strabo (lib. xi.), all the tribes east of the Caspian were called Scythic. The Dahan were next the sea; the Massa-gete, and Saece more eastward; but every tribe had a particular name. All were nomadie; but of these nomades the best known are the Asi, the Pasiani, Tachari, Seccarandi, who took Bactria from the Greeks. The Saece made irruptions in Asia, similar to those of the Cimmerians, and possessed themselves of Bactria and the best district of Armenia, called after them Saceae.

The whole of the N. part of the barren highlands on the E. coast is inhabited by Kirghiz Kazzaks, that to the S. by the Turkoman and Khivali, all of them in tents, carrying on the coasting trade. About 80 ships, called showtes (Razhiva, Aslam), trade from port to port. The waters give employment to about 10,000 fishermen; yield abundance of fish, classed as red fish, which includes the beluga, sevringa, and sturgeon, yielding isinglass, and made into caviare; white fish, such as the salmon trout, bastard beluga, sterlet, carp or susan, soudak, and sillure; the third class have the general names chistia and riba or kooaya. The sturgeon fishery alone yields 2,000,000 rubles annually. The take in 1828 was 43,035 sturgeons, 653,164 sevringas, 23,069 belugas, also 8335 soudak, and 98,584 seals. Canals connect this sea with the Baltic.

The first attempt to open a trade route from the Caspian eastward was made by Antony Jenkinson, Queen Elizabeth's envoy to Shah Tahmasp of Persia. In 1557 he travelled through Russia to Bokhara, returning by the Caspian and the Volga in 1560. From the king of Shirvan he obtained leave to establish a factory at that place. In 1579 Christopher Burroughs traded in a ship of his own building across the Caspian to Baku, but the ship got stranded in the ice, and his cargo of raw silk was carried in a boat to Astracan. After 160 years, in 1738, Mr. John Elton, who had been employed by the Russians on the Orenburg frontier, sailed from Astracan with a cargo of goods for the Persian market. He reached Enzeli, the port of Resht, in May 1739, and, proceeding to Resht itself, exchanged his English broadcloth for raw silk. He got leave to trade in Persia, and to plant a factory at Meshid, with a branch at Resht. Returning to Persia with a large cargo of broadcloth, he entered the service of Nadir Shah, and undertook to build for him a fleet capable of protecting the Persian shores of the Caspian. The Averse, carrying twenty three-pounders, was the first-fruits of Elton's energy and resourcefulness. But Russian jealousy brought
CASSIA-CASSA.

The new-born English trade in the Cassian to an untimely end in 1746. Two English vessels had to be sold at a great loss to Russian merchants in Astracan, and soon afterwards Elton himself was murdered in Ghilan during the anarchy which followed on the death of Nadir Shah in 1747. Among those who had embarked in the Cassian trade, was Jonas Hanway, who fell on one occasion into the hands of the Kajar chief, Muhammad Husain, ancestor of the present Shah of Persia. He escaped with the loss of his property in Astrabad, and obtained from Nadir Shah an order for the payment of all his losses. But Hanway soon went home, to write a charming account of his travels and a life of Nadir Shah. By the treaty of Gulistan between Russia and Persia in 1813, no Persian man-of-war was thereforeforth allowed to navigate the Cassian.

CASSIA-CASSA. Tel. Poppy-seed.

CASSAREEP, the concentrated juice of the bitter cassava, forms the basis of the West India dish pepper-pot. Meat placed in it is preserved longer than by any other process of cooking.

CASSAVA. The sweet cassava is Manihot utilissima, Roxb. The bitter cassava, or tapioca plant, is M. utilissima, Pers.

Cassava flour or meal, from which Cassava bread is made, is obtained from the M. api, the sweet Cassava, the Jatropha manihot, Linn., by grating the root, expressing the juice by pressure, and then drying the residual cake and pounding it. It is called Monasache by the French.

Cassava stalk, called also Tapioca, is prepared from the starch of M. utilissima, the bitter Cassava, by washing and granulating on hot plates, by which the concretions are formed, as seen in commerce.—Hogg; Birdwood; Von Mueller.

CASSIA OIL OF Moulmein. Out of this oil dammer is made, and a kind of torch, used by the poor classes instead of a lamp.—Local Committee.

CASSIA, a genus of plants belonging to the natural order Fabaceae of Lindley; 24 species belong to the East Indies, and 35 have been grown near Calcutta. Important products are obtained from species of this genus. It has been unable to distinguish the three kinds of senna from C. elongata, C. lanceolata, and C. acutifolia, and these were all included by him in his C. officinalis.

CASSIA ABSUS. Linn.

Senna absus, Roxb., Fl. Ind.

Akakalis. . . . Gil. Chukuddi patta, . . . Tel.
Chusunik. . . . Pers. . . . The small biennial or triennial is extremely common; the powdered seeds are used as an application in cases of chronic ophthalmia.—Royle.

CASSIA ACUTIFOLIA. Delilie, Even., Eberm. C. lanceolata, Forsk.

This grows in Arabia and N. Africa. Dr. Royle remarks that C. elongata, C. lanceolata, and this plant seem the same. Dr. O'Shanghnessy observes that this species furnishes the bulk of the senna consumed for medicinal purposes in Europe, and called Tinnevelly and Alexandrian. It is much adulterated with the leaves of Cynanchum arghel, Tephrosia apolline, and Coriaria myrtifolia.

CASSIA BUDS.

Mai za lee gye, . . . Pako g ling-gang, . . .
Comically call. . . . Sinu avis, . . . Tel.

It is a stunted shrub, pretty only when in gaudy yellow flower. The fresh leaves, bruised and mixed with lime-juice, are valuable in ringworm. The fresh leaves, bruised and rubbed upon the eruption, in many cases remove it. The whole plant is used by the Tamils as a remedy in venereal, in poisoned bites, and as a general tonic. An ointment prepared from its fresh leaves is almost a specific in ringworm.—Beeng. Pharr.

CASSIA AUGUSTIFOLIA, Vahl., of N. Africa and S.W. Asia, perennial, but also cultivated. Yields the Meeca, the Bombay, and some of the Tinnevelly senna.—Mueller.

CASSIA AURICULATA. L., Roxb., W. and A. Senna auriculata, Roxb.

Mayhari. . . . Sansk. Tangedu chette, . . . Tel.

Grows abundantly in the sterile tracts of the Madras Presidency, and in all parts of the Dekhan. In China the bark is used for tanning, and the stems to make native tooth-brushes; with the bark a soft and durable leather may be turned out. It is perhaps the best of the indigenous astringents of Southern India for this purpose. All parts of the plant have much astringency, and seem to possess no other property. In the south of Ceylon its leaves are infused as a substitute for tea. In China it is eaten as a vegetable. It is twigs are held in the hand, or applied to the head, for the coolness they impart.—O'Sh. p. 109.

CASSIA BERRIES, or Dalchini berries, are produced in the Nuggur districts of Mysore from the same plant as the cassia buds. The berries are an article of trade in the Nuggur division of Mysore.—Dr. J. Kirkpatrick; Rohde, MSS.

CASSIA BICAPSULARIS. Linn.

A shrub of the West Indies and South America, domesticated in India.

CASSIA BUDS.

Cassia buds are the immature fruits of a species of cassia or Cinnamomum, a native of Cochin-China; and an inferior kind of cassia buds, known as Lavungga-pu, is found in Malabar. The genera or species that afford it are as yet undetermined. The cassia buds of China, Yueh-Kwei-tze, are used to bear the immature flowers of Cinnamomum Malabathrum and of C. aromaticum. They are collected in Kiang-nan and Cheh-kiang and Kwang-si, and are used as a spice. They are packed with the bark, and exported to India and Europe. Cassia buds are now being largely exported from the western coast of India. It is a spice growing in favour, but still less known than it deserves.—Simmonds; M. E. J. R.; Cleg-horn.
CASSIA ELONGATA.  

Cassia Elongata. Lam., Lisane.  
C. lanceolata, Royle. | C. senna, Roxb., H. B.  
C. officinalis, Gurtin., Rozb. | Senna officinalis, F. Fl. Ind.  
Suna mukhi, | ARAB., HIND.  

This senna plant, or Tinnevelly senna, is found in many parts of India; and the general opinion is that the plant is indigenous, but others believe it to be only naturalized, and are of opinion that this is identical with the Cassia lanceolata of Forskal. Dr. Royle cultivated this plant at Sabarunpur, Dr. Gibson near Poona, Dr. Wight near Madras, Mr. Hughes near Tinnevelly, and Dr. Burns noticed it near Kaira. The plants in these situations yield a drug quite equal in value to the best senna. Dr. Royle remarks that C. elongata, C. lanceolata, and C. acutifolia seem the same. The senna of commerce is obtained from several plants, viz:—  
1. Cassia officinalis, called Bombay senna, also Suna mukhi.  
Cassia lanceolata, Forskal. | Senna Meece Lohaje, C. media.  
Cultivated in Arabia and Northern India.  
The three following plants, a, b, c, seem the same, viz:—  
(a) Cassia elongata, Indian senna, Tinnevelly senna.  
Cassia lanceolata, Royle. | Cassia officinalis, Gurtin.  
Sona-pat, ... BENG. Nelapoona, ... TAM.  
Suna mukhi, Nil. Nela tangedu, ... MALAY.  
veri, ... TAM.  
Cultivated by Dr. Royle at Sabarunpur, Dr. Gibson near Poona, Dr. Wight near Madras, Mr. Hughes near Tinnevelly, and noticed by Dr. Burns near Kaira.  
(b) Cassia lanceolata, Autor, Alexandrian senna.  
C. acutifolia, Hegye, Nee, Eber.  
This grows in the valley of the desert south of Syene.  
(c) Cassia acutifolia, Deville, Eacen, Eberm., Bombay senna. Grows in Arabia and Africa.  
2. Cassia ovata, Merat.  
Cassia Ethiopian, Guit. | Senna of Tripoli.  
| Sene de Tripoli.  
Grows in Nubia and Fezzan.  
3. Cassia Forskalia.  
C. lanceolata, Forsk., Lind., | C. lignestria, Batka.  
Suna, ... ARAB.  
Grows in the valley of Fatme.  
CASSIA FLORIDA. Vahl., W. and A.  
Senna Sumatreta, Rozb. Fl. Ind. ii. p. 347.  
May-za-lee, ... BARM. Manje konna, ... TAM.  
Waa, ... SINGH.  

This medium-sized tree is common in a wild state in the jungles quite at the south of the Madras Presidency and in Ceylon, also as a planted tree in avenues, topes, gardens, etc. It is of rapid growth, and ornamental. The trunk is pretty straight, and covered with olive-coloured bark. The wood is of a yellowish-brown colour, sometimes beautifully marked with irregular black streaks, close-grained, hard, and durable, but not stiff; works kindly, with a smooth surface, and stands a good polish. A cubic foot unseasoned weighs 68 to 70 lbs., and when seasoned, 58 lbs.; and its specific gravity is .928. It is well adapted for furniture, but seems to be little known or used in the Madras Presidency. In Burma it is used for mallets, helves, and walking-sticks. In Ceylon it is principally used for fuel for the locomotives; and it is said to have as good calorific  

powers as any wood known in the island.—Dr. Brandia and Mason; Colonel Beddome, Fl. Syl.  
CASSIA FORSKALII.  
C. lanceolata, Lind. | C. lignestria, Batka.

Cassia, an aromatic bark, is mentioned in Exodus xxx. 24, Ps. xlv. 8, and Ezek. xxvii. 19, under the words kiddah and ketolie. Dr. Wight was of opinion that coarse barks of the cinnamon tree, which could not be passed as true cinnamon, are classed as cassia. The Chinese cassia is from Cinnamomum aromaticum, Nees al Eacen, and C. Zeylanicum. Dr. Royle (p. 542) conceives as to the Chinese cassia being one of the producing plants, but adds that there are several distinct sources. At present this bark is produced in Java, on the Malabar coast, in the south of China, and in Cochin-China. Pereira’s Materia Medica says:—  

‘1. China Cassia-lignea, sometimes called China cinnamon, is the best kind. It is usually imported from Singapore, rarely from Canton direct. Mr. Reeves says vast quantities of both cassia buds and cassia-lignea are annually brought to Canton.
CASSIA OBOVATA.

from the province of Kwang-si, whose principal city (Kwei-sin-tu), literally the city of the forest (or grove) of cassia trees, derives its name from the forests of cassia around it.

The Chinese themselves use a much thicker bark (which they call Gun Kwei-pi), unfit for the European market, but they esteem it so highly as to pay nearly ten dollars per pound for it. A very fine quality is occasionally met with, and commands the enormous price of 100 dollars per catty (one pound and three-quarters). A specimen of it furnished by Mr. Reeves is straight, semi-cylindrical, eleven inches long, rather more than an inch wide, and about one-sixth or one-eighth of an inch thick. Externally it is warted, and covered with crustaceous lichens. Internally it is deep brown; its odour and flavour are those of cassia. Mr. Reeves also mentioned that the best cassia-liginea is cut in the third or fourth moon, the second sort in the sixth or seventh moon.

2. Malabar Cassia-liginea is brought from Bombay; it is thicker and coarser than that of China, and is more subject to foul-packing; hence each bundle requires a separate inspection. It may, perhaps, be coarse cinnamon, for Dr. Wright states that the bark of the older branches of the genuine cinnamon plant is exported from the Malabar coast as cassia.

3. Manilla Cassia-liginea is usually sold in bond for continual consumption. He had received a sample of bark ticketed “Cassia vera from Manilla,” the epidermis from which was imperfectly removed.

4. Mauritius Cassia-liginea is occasionally met with.

The Kwei-pi, Juh-Kwei, Kwan-Kwei, and Tang-Kwei of China are the products of species of Cinnamonum. The Juh-Kwei, or fleshly cassia, is exceedingly pungent and spicy, and its price is quadruple that of the Kwei-pi, or skinny cassia. — Royle, p. 542; Harris, Nat. Hist. of Bible; Has-sall’s Food and its Adulterations; Smith.

CASSIA OBOVATA. Merat.

Cassia Ethiopica, Guibourt. | Senna of Tripoli.

Senna de Tripoli.

Grows in Nubia and Fezzan; one of the species yielding the senna of commerce.

CASSIA OBTUSA. Roxb., W. and A., W. Fc.

Cassia obtusa, Wall. | Senna obtusa, Roxb.

C. Burmanni, Wall., Wight. | Nela tangua. | Tel.

It is indigenous in Mysore, Egypt, Suez, Nubia, and Central Africa. The leaves furnish the Aleppo and Italian drug. C. obtusa is common on the dry uncultivated lands of Mysore. Aleppo senna has obvolute very blunt leaflets and curved pods, with a very slight covering of down. The flowers are pale yellow.—O’Shaughnessy, p. 307.

CASSIA OBTUSIFOLIA.

According to Dr. Irvine (Gen. Med. Top. p. 131), the seed of this plant is used in medicine. The plant is scarce about Ajmir; is prescribed to cleanse the blood, in an entire state. When the seeds are pounded and then swallowed, vomiting is produced. The leaves of the young plant are eaten as a vegetable; are also applied in itch cases. — It is very common in the Dakhun. Goats and sheep are fond of the seed; one seer of the seed costs one pice.—Irvine.

CASSIA SOPHORA.

CASSIA OCCIDENTALIS. L., W. and A.

Senna occidentalis, Roxb. | Cassia xilifera, Roxb.

Cassia sophora, Wall.

Paya vera. | Mal. | Kashanda, Kasinda, Tel.

Common in Bengal; smell very offensive, used in cutaneous maladies, and also aperient. Roxburgh gives it no native name. Mr. Mason has occasionally noticed it in Tenasserim, in native cultivation for medicinal uses. It was originally introduced into India from the West Indies.—Mason. O’Sh. p. 300.

CASSIA OFFICINALIS. Gar., Royle.

C. media, Royle. | C. lanceolata, Royle.

Senna medicine Lohaje, Royle. | C. afzelii, Heuyn, Nees.

Senna officinalis, Roxb. | Eburn., Delille, Esen.

Dr. Royle remarks that C. elongata, C. lanceolata, and C. afzelii seem the same plants. He describes C. officinalis as cultivated in Arabia and Northern India, and, with the C. afzelii, known in commerce as Bombay senna, Sona mukhi. The C. elongata, known as Tinnevelly senna, was cultivated at Selluramur, Poona, near Madras, near Tinnevelly and Kaira, and C. lanceolata as growing in the valleys of the desert south of Syene, and known as the Alexandrian senna. —See Cassia.

CASSIA OIL, volatile oil of cassia bark.

Cassia bark yields a pale yellow volatile oil, the finer kind of which differs but little in its properties from that of cinnamon, for which it is generally substituted; it has a specific gravity of 1.051 (1.95). The best is manufactured in China, where the wood, bark, leaves, and oil are all in request. The cassia oil is rated at 150 dollars per kilo; and the trade in this article reached about 250,000 dollars (Simmonds, p. 396). When pure, its pale wine-yellow colour does not deepen with age. It has in a remarkable degree the cassia odour and taste. Cassia oil is imported into Bombay from China; and in Surat the oil is expressed from both China and Malabar cassia. The latter kind, which is of a dirty-brown colour, is chiefly exported to the Persian and Arabian Gulfs, Zanzibar, etc., under the name of Koolfa-ka-tel.—Paulkner.

CASSIA ROXBURGHII. D. C., W. and A.

This is a small or middling-sized tree, very common in a wild state in the South Arcont, Trichinopoly, Tanjore, and Tinnevelly districts. It is extensively planted in gardens for ornamental purposes, and is to be seen in most compounds at Madras. When in flower it is exceedingly beautiful; it is also wild in Ceylon. The wood is close-grained, hard, and durable, works smoothly, and stands a good polish. When fresh it is deep rose-coloured, but eventually turns reddish-brown. A cubic foot unseasoned weighs 78-80 lbs., and when seasoned 63 lbs.; and its specific gravity is 1-006. It is well adapted for articles of turnery, such as wheels of axe-handles and handles of instruments.—Beddome, Fl. Sylte. p. 180.

CASSIA SOPHORA. Linna. W. and A.

C. esculental, Roxb. in E. I. M. | C. coromandeliana, Jacq. c. torosa, Curr. | C. sophorodes, Collin. | Senna sophora, Roxb. | S. esculental, Roxb. \( \frac{1}{2} \) Rheelde.
Kalkasunda, Beng. 
Kalkashilla, SANS. 
Round-podded cassia, Eng. 
Brihathitara, HIND. 
Pomam tagara, MALAY. 

Grows in Bengal, Assam, Ceylon, Malay Peninsula, Peninsulas of India, and Moluccas. Its leaves are eaten in curries; bruised, powdered, and mixed with honey, are applied to ringworm and ulcers. The bark is given in infusion in diabetes.—R. Brown.

CASSIA SUMATRANA. M'Clelland.
Ma-za-lee, BURM. 
Bombay blackwood, Eng. 

This tree grows in the central province of Ceylon, where a cubic foot of its wood weighs 57 lbs., and it is said to last 50 years. It is there used for furniture and house-building. It is plentiful throughout the Haine, Pegu, and Toungoo forests, and is very plentiful especially on the Mazalee Chong, the name of which is derived from this tree. It is used in house-building. It affords a very strong wood like ebony.—M'Clelland; Mr. Mendis; Cat. Cat. 1862.

CASSIA TORA. Linn.
Oval-leaved fetid cassia.

Cassin obtusifolia, BURM., IND. 
C. foetida, Salieh. 
C. gallinaria, C. Gallad.

Kukul, ARAB. 
Daw-khy-vaali, BURM. 
Kiiueh-ming, CHIN. 
Te-aau-kiiueh-ming, 
Chakunda, HIND. 

The seeds—Kiiueh-ming-faz, CHIN.

Common all over the plains of India, and, in Tenasserim, it is one of the most abundant weeds. Its leaves are fetid, mucilaginous, and gently aperient. They are much used for adulterating senna, and in various external applications. The seeds, ground with sour butter-milk, are used with excellent effect in itch eruptions; and they are used in preparing a blue dye, generally fixed by lime-water. The root, rubbed to a pulp with lime-juice, has almost specific powers in the cure of ringworm.—O'Shaugh. p. 309; Rozb. ii. 340.

CASSIS, a genus of shells; many species occur in the E. Indies. C. rufa, the great red shield shell of the Maldives, is brought as tribute to Ceylon, and is re-exported to Italy for the manufacture of cameos.—Tenent's Ceylon.

CASSOWARY BIRD. See Casuarius; Emu.

CASSIYA FILFORMIS. Linn., Rozb.

The leaves are put into butter-milk as seasoners, and are chiefly in use amongst the Brahmans in the southern parts of the Peninsula.—Ainslie.

CASTACALA. SANSK. 
A division of time equal to the 2340th part of a vicaia.—Warren.

CASTANEA, a genus of plants of the natural order Euphorbiaceae. C. Chinesis, C. Indica, C. Roxburghii, C. triboleoides, C. venosa, inhabiting the colder parts of S.E. Asia. Dr. Mason says an indigenous chestnut tree grows in Burma on the uplands, which yields abundantly, and whose fruit is sold in the bazaar; but they will not compare with the French chestnuts, nor even with the American chincapin. Two species are cultivated on the China hills. One somewhat like the Spanish, produces fruit quite equal, if not superior, to Spanish chestnut. The other is a delicious little kind, bearing fruit about the size and form of the common hazel-nut. Large quantities of both kinds were procured by Fortune, and sent on to India in Ward's cases, and many hundreds of plants reached India. The Chinese chestnut may now be considered naturalized on the hills of India, and in a few years will no doubt make its appearance in the markets amongst other fruits.—Fortune's Residence, Mason, Voigt.

CASTANEA INDICA. Roxb. Theet kha, BUMERE. A tree of Nepal and the Himalaya, of Chittagong, Khasya, Rangoon, Pegu, and Toungoo. The edible nut, Nikiri, HIND., is compared to indifferent filberts; the wood is red, and equivalent to mahogany.—Dr. Royle, p. 345, M'Clel., Mason, Voigt, p. 276, O'Sh. p. 607.

CASTANEA MARTABANICA. Mason. 
Theet kha, Zi-tham, BURM. | Nome of . . . TAVOY. 

This tree of Moumein and Martaban grows all down to the sea-shore of Tenasserim. The fruit is eaten like chestnuts.—Mason; Cal. Cat. Ez. 

CASTANEA TRIBULOIDES. Lindley. 
Wet-theet-ka, BUMERE. A tree of the Nepal and Khassia hills, and of Burma.

CASTANOSPERMUM AUSTRALE. Moreton Bay chestnut. Has been introduced into India from Australia. It is of rapid growth; rises to 100 feet high. Its wood is used for cask staves. It is indigenous in Moreton Bay. Some of its pods are 10 inches long and 8 round. They contain several seeds, in size and colour resembling horse-chestnuts, but in flavour between a Spanish chestnut and a fresh-opened bean, with a slight degree of bitterness. The natives roast them and soak them in water, to prepare them for food.—J. Backhouse, Visit to Moreton Bay, Australia.

CASTE. 

CASTE is a term obtained from the English cast, and that from the Portuguese or Spanish Casta, a breed, race, lineage, or class. It is applied to the separate sections of the Hindu races, who now usually employ the word Jat or Zat, meaning birth or descent, though the Sanskrit term Varna, meaning colour, has been in use from the most ancient times till now. Caste is the first institution of Hindu society which forces itself upon the attention of the stranger. Bumen says that the system of caste seems to have become completely formed B.C. 3000, during the formation of the kingdom of Puri; and, he adds, was in full force when the Code of Menu was composed. In the Vedic hymns nothing appears of a priesthood, properly so called. In some, Brahmans officiate, but are evidently subject to the Kshatriya, as chaplains to the noblemen. The allusion to castes is very vague, as when the five classes of beings are mentioned, which may mean the four castes of Aryans and a fifth of the barbarians. But there is one hymn in the Veda, known as the Purusha Saktika, which represents the Brahman as superior, though it does not correspond with the legend on the subject in its later form. It is given in Dr. Muir's Sanskrit Texts (p. 7), and is a mystical description of existences from original being, under the similitude of a sacrifice or as a mental sacrifice.

Sir Henry Elliot says that about the 6th and 7th centuries the divisions of castes were secular, not religious. In former times, he says, the four classes existed equally amongst the Buddhists
and Hindus of India, as they do at this day amongst the Buddhists of Ceylon, and amongst the Jains of the Peninsula, in whose temples even Brahman priests may be found officiating.

A minute division of labour is a very marked feature in Hindu civilisation. Every employment is apportioned to a separate class. This minuteness of appointment is generally the result of a very far advanced stage of society, but seems to have obtained among the Hindus from very early times. The Brahman, Sakta, Vaisya, Sudra, and Shudra, with four great divisions are recognised,—the Brahman, or learned; the Kshatriya, or warrior; the Vaisya, or merchant; and the Sudra, or labourer,—all others being Vhilecha. But in practice, at the present day, the minute differences of race, of native country, of avocation, and of religion, are sufficient to form differences of castes, in most of which no man may lawfully eat with any individual of any other caste, or partake of food cooked by him, or marry into another caste family; but he may be his friend, his master, his servant, his partner. As a rule, it may be said that the Aryan or "twice-born" castes adhere most closely to the ethical principle of division; the "once-born" or distinctly non-Aryan to the same principle, but profoundly modified by the concurrent principle of employment; while the mixed progeny of the two are almost entirely classified in modern times according to their occupation.

The Brahmans are usually divided into ten great septs, according to their locality,—five on the north, and five on the south of the Vindhya range. But the minor distinctions are innumerable. Thus the first of the five northern septs, the Saraswata, in the Panjab, consist of 469 classes. Mr. Sherring enumerates 1886 separate Brahmanical tribes.

Their sectarian religious views are now also sources of separation. In the physiological worship of the Hindus, for instance, while two classes of sectarians, the Saiva and the Lingaet, worship the form of the lingam, another set of sectarians, the Sakta, worship the yoni, in accordance with the doctrine of the Tantras. The Saiva are divided into two classes, the Dakshinachari, or right-hand Saiva, and the Vama chara, or left-hand Saiva. The right-hand worship is public, and addressed to the goddesses usually adored, but especially to the forms of Durga, Bhawani, and Parvati, also to Lakshmi and Mahalakshmi, and others. But in the worship of the left-hand divisions, the Tantraika impersonations of Durga as Deva, Kali, Sama, etc., or a living woman representing the Sakta, the worship is private, and said to be impure, and is said to have the most numerous followers. The Vira Saiva, who are known as the Jangam, also as the Lingaet or Linghadari, from always wearing the lingam, and who are very numerous in the Cenarese-speaking tract, ought not, according to the tenets of their sect, to have any caste distinctions; but they are the most bigoted of all the Hindu sects, and their caste distinctions are those of trade and avocation, and are rigidly adhered to. Among the Jains, whose religion consists principally in the practice of austerities, and in avoiding to destroy life, caste restrictions are not proscribed; nevertheless they too retain the practice of caste divisions, and the Saraswata practise many usages common to other Hindus.

CASTE.

The distinction of right and left hand castes is peculiar to the south of India. It is supposed by Professor Wilson to be of modern origin, and to have been introduced at Conjeevaram as a part of civil policy to divide the people and destroy their power. But Sir Walter Elliot is of opinion that the separation into right and left hand castes had its origin in the violent conversion of the ancient races from Buddhism to Hinduism; and he has been shown a figure of Buddha, which the artisan caste worship, that appears to worship Visvakarma, but the bulk seem to recognize Siva as their supreme deity. They all bury their dead, and in a sitting posture, like that of Buddha, sitting, with the head of the corpse close to the surface, and looking to the north; and their dislike to Brahmans is intense. In Southern India, the goldsmiths strenuously resisted the rule of the Brahmans, and for ages claimed to be the true spiritual guides, styling themselves Acharyas, 'religious teachers,' and wearing the sacred thread. The Dattas, a sept of the Kayasth or writer caste, formally renounced the position assigned to them in the Brahmanical classification of Hindu society. They claimed to rank next to the Brahmans, and thus above all the other castes. They failed; but a native author states that one of their body, within the memory of men still living, maintained his title, and wore the sacred thread of the pure 'twice-born.' In the Peninsula, caste had certainly nothing to do with religion, but related solely to race. Amongst the Tamiil people the right and left hand sections appear. The Idan-kai or Idan-gai are the left-hand caste, and the Valan-gai are the right-hand caste; and, according to Professor Wilson, the names and appellations of Right-hand castes vary in different parts of peninsular India, but are usually supposed to be eighteen in number. He names them—

1. Banjiga or trader.
2. Okhila or cultivator.
3. Jotiophana or oil-maker, employing one bulllock.
4. Raval or dyer, or calico printer.
5. Ladaru, Mahomedan traders and artificers.
10. Kumhar, potters.
11. Agasa, washermen.
12. Kota, fishermen employed as palanquin-bearers.
13. Padma Silalaya, weaver.
15. Uparanu, a tusk-digger.
16. Chitragra, a painter.
17. Golla, a cowherd.
18. Wquara, or Parvan, or Pari, who is the champion for the right-hand caste, as is the Madaga or Sakoli for the left-hand caste.

The Left-hand castes—

Edagai; Edagai kula:  [Idangai; Idam; Idakai, Edakalya, . . . KARN. ] TAM.

1. Panchala or artisans.
   a. Kammaraimu, blacksmiths.
   b. Baliga, carpenters.
   c. Kaumbar, braziers.
   d. Kallurtiga, stone cutters.
   e. Akasale, goldsmiths.
2. Berisetti, traders.
3. Devangada, weavers.
5. Gollur, money-carriers.
7. Beda, hunter, fowlers.
8. Madiga, tanners, curriers, and shoemakers.
CASTE.

The right and the left hand sections are known in the Bellary district as the Davachary and Dowang. Their enmity has been a constant source of anxiety to the police of the Madras districts.

The artisans intermarry and eat together, and all wear the zolar. They claim to be a prior Brahman race,—and learned Europeans recognise their claim. The intermarriages of castes in ancient times, and the descendants of illegitimate children, have been known as mixed castes, the Varna sanka, to whom Menn allotted suitable avocations. The ancient marriage code recognised as lawful unions of men of higher castes with females from any of the lower ones, and their offspring had a quite different social status from the progeny of illicit conceptions. In bygone times, individuals and even races have been raised to castes of higher rank, and others have been lowered. There have been occasions of rulers of the Dehkan and of Hindustan raising great numbers to the rank of Brahmans, others to the rank of Kshatriya; and many of the races now ranked as Sudra Hindus have been comparatively recent converts. Other instances are known of Brahmans as individuals and clans being degraded. In Bengal, the Ahir, Kunbi, Lohar, Mali, Tumboli, Kumar, Hajam, and Kihar are considered the clean. The Vellathoden of Travancore are said to be descendants of a Brahman who was seen to wash and starch a friend's cloth, and was in consequence thrown out of caste. Clothes washed by them are, however, received into pagodas. The ancestors of the Urolli parisha Musinmar of Travancore, who accepted gifts of land from Panisu Rana; the ancestors of another subdivision, who countenanced the murder of Bhutany Pandi Perumal, a sovereign of Malabar; and the ancestors of the villagers of Panniyar, who offered insult to the idol Varada, an object of worship of other Brahmans,—all of these have lost their castes; and although claiming still to be Brahmans, they cannot associate on equal terms, cannot eat nor intermarry with other Brahmans. There are religious mendicants who accept alms from certain castes. The caste ideas of ceremonial uncleanness are very peculiar. A Hindu visitor to a European house changes all his clothes, and uses the secretions of the cow on his return home from the visit; or, on being visited by a European, has the floor spread with fresh cow-dung. Every workman is clean in his own trade; but no Hindu will use any article of earthenware which a Whiclea has polluted by his touch; all earthen vessels are immediately broken, and brass or copper utensils are scoured with sand to free them from impurity. There are places where water is given to the natives as they walk along the road. Small brass pots are kept for the caste people, but there is no pot kept for the Pariah. So, if a Pariah wish to quench his thirst at some of these water pandals, a long hollow bamboo is provided, one end of which the thirsty man holds. Water is then poured down the tube, and he has to catch the water in his mouth after it leaves the tube. He is not allowed to put his lips close to the bamboo, for fear of defilement.

If a Jain come into contact with an outcaste, he, like the Hindu, touches fire or water to purify himself; if he have occasion to receive anything from a Pariah, he causes the Pariah to set it down on the ground, and purifies it with fire or water before he takes it up. Even shepherds and Koli incur pollution by touching the Dher race, which they remove in a similar manner. In the course of evidence before a criminal court in Gujerat, in August 1853, a Koli said, 'The shepherds Bhugwen and Rado came to me, and said they had both touched Dhers, and become impure, and asked me to give them fire. I took a lighted coal out of my hookah, and each of them touched his forehead with it. I threw it down, and they then took my hookah and smoked.' In other words, they were then purified, otherwise he could not have given them his hookah. This is a very ancient Asiatic purificatory rite. Isaiah (vii. 6, and 7) says: "Woe is me, . . . I am a man of unclean lips. . . . Then flew one of the seraphim unto me, having a live coal in his hand, . . . and he laid it upon my mouth, and said, Lo! this hath touched thy lips, and thine iniquity is taken away, and thy sin purged.' If a Sudra Hindu ask a drink of a Brahman, it will be given in a brass vessel, but from a distance, the Brahman stretching forwards and placing the pot between. It is returned similarly, but before receiving it back, water is poured over to purify it. So one of the helot races can enter the house of a Hindu, but he will stand at a distance and shout out his message. These are all illustrations of the usual operation of caste in India, which has held its own in the religions, social, and political changes of 3000 years. Since railways and steamboats have been running, and the educational system of the British has equalized all classes, much of the dread of caste defilement has disappeared, but it is still the prominent feature in everyday Hindu life.

All the great Hindu reformers have proclaimed the brotherhood of man, and have denounced castes, but their followers are only free amongst themselves.

A line in the Mahabharat is—

"Na Viseho'sti varnanam;\nBrahman idam jagat,\nBrahmano jvarakham hi;\nKarmabhir varnata'm gatam:

'There is no distinction of castes; the whole of this world is Brahmanical, as originally created by Brahma. It is only in consequence of men's actions that it has come into a state of caste divisions.'—Grose, p. 502; Forbes Rosamala, or Hindu Annals; Wilson's Glossary; Sir H. Elliot's Supplementary Glossary; Sir Walter Elliot in Ethnological Society's Journal.

CASTILLOA ELASTICA and C. Markhamiana of S. America, introduced into India in 1876 by Mr. Cross and Mr. Markham, are valuable caoutchoue plants.—Perwe. Bark.

CASTING OF METALS in S.E. Asia is very largely practised, and the processes are of great simplicity. The workmen generally prepare a mould in wax, which is embedded in moist clays, which, after being dried in the sun, is heated in the fire, the wax run out, and the metal run in. A much better plan, where accuracy is required, as in casting a brass nut or box for a large screw, is to cast the model in lead, and, having bedded it in clay, it may, when the mould is dry, be melted and run out, and the metal run in. Wax models allow the moulds to shrink in drying, and the thread of a screw-box so formed of course does not correspond. In Manblam, much ingenuity

CASTING OF METALS.
is displayed in the mode of casting articles of this kind in hollow network, etc. A core is made of plastic clay, all carefully shaped to the internal form of the fish or other object to be imitated. This core is then baked and indurated. On this, the pattern designed to be formed is painted with clean beeswax. This done, and the wax having cooled, it becomes tolerably hard. Soft clay is moulded over all. The whole is then baked, the heating indurating the outer coating of clay, but softening the wax, which all runs out of the mould, leaving empty the space occupied by it. The mould being sufficiently dried, the molten brass is then poured into the empty space, and, when cool, the clay is broken away, when the figured casting is seen. These are untouched after the casting, excepting on the smooth and flat surfaces, which are roughly filed.—Mr. Rohde, MSS.; Cal. Cat. Ex. 1862.

CASTOR.

A concrete substance obtained from two small glands in the beaver, Castor fiber, of both sexes. The 'glands' consist of two oval pyreform sacs of unequal size, which open into the preputial groove by two large orifices. Those of the adult animal are at least three inches in length, sometimes five. Those of the female are somewhat less developed. In the living animal the castoreum is an almost fluid unctuous substance of a strong penetrating and even fetid odour; when dried, the sacs have a dark-brown colour and wrinkled appearance. Both American and Russian castoreum are known to commerce, and are imported into India. In Eastern medicine, castoreum is supposed to affect especially the uterus, and is given also in hysteria and apoplexy; it was formerly used in European practice. A kind of castor is also obtained from the civet cat in the Archipelago. Hai-kau-shin, the Chinese name, means sea-dog kidney, and the kidney of a dog is often substituted.—O’Sh. p. 614; Smith; Moquin Tandon.

CASTOR and POLLEX. Their representatives in the Hindu mythology are the Aswini Kumara. See Aswin; Hridyu; Saraswati.

CASTOR-OIL.

Castor-oil is obtained by expression from the seeds of the Ricinus communis or Palma christi, which grows in all the warmer countries of the world. It is often described as 'cold-drawn castor-oil,' which is understood to express that the oil has been obtained without the aid of heat; and hot-drawn castor-oil when the seed is subjected to slight dry heat, and then pressed; but it may be doubted if any of the castor-oils of commerce are ever expressed from the seeds without prior dry, or subsequent water, heating. There are, however, two varieties of the castor-oil plant grown in India, the large and the small, and the mode of obtaining their respective oils may perhaps vary in different districts. One mode of obtaining the oil is to separate the seeds from the husks by children throwing them against a wall, then to bruise them by tying them up and beating them in a grass mat. In this state they are put into a boiler and boiled until all the oil is separated, which floats at the top, and the refuse sinks to the bottom; it is then skimmed off, and put away for use. The purest oil is said to be obtained by crushing the seeds in horse-hair bags by the action of heavy iron beaters; as the oil oozes out, it is caught in troughs, and conveyed to receivers, whence it is bottled for use. Castor-oil is used medicinally, also for lamps in the East Indies; and the Chinese are said to have some mode of depriving it of its medicinal properties, so as to render it suitable for culinary purposes. The plant is very extensively propagated by the Karens, to obtain the seeds to mix with their dyes, and fix their colours. The oil obtained from the large-seeded variety is sometimes drawn cold, and its straw-coloured specimens are scarcely distinguishable in quality from the oil of the small-seeded variety. It is, however, more usually extracted by heat, and is known as the common castor-oil of the bazar. The roasting process gives it a deeper red colour and an empyreumatic odour. The price of this oil varies in different parts of the country from Rs. 1.10 to Rs. 3.13.6 per maund of 25 lbs. As with other coloured substances, filtering and light soon decolorise the coloured castor-oil. The best filtering material is animal charcoal, and the sun's rays finally remove all shade of colour.

Castor-oil seeds, Pi-ma-tsz, CHINESE, crushed, are applied externally in Chinese medicine in a great multitude of diseases.—Rohde, MSS.; Cal. Cat. Ex. 1862.

CASTRO. Don Juan de Castro, captain in the fleet, and author of the history, of Don Stephano de Gama, which in 1540 sailed from Goa to Suez, with the intention of burning the Turkish galleys there.

CASTURI-MUNJIL. TAM. Curcuma zedoaria, CASUARINA POMANDIRA, Tha-byai-ywet-kyi, BURMESE, is found in the Pegu districts, but scarce. Timber strong and close-grained.Wood white-coloured, adapted for fancy work and cabinet-making.—M'Clelland.

CASUARINA. Several species of this genus of trees grow in India,—distyla, equestifolia, modillora, nuricata, and torulosa, and in Australia, as C. Deeaniana, C. quadrivalvis or Australian oak, C. torulosa or forest oak, C. paludosa or swamp oak or fir, and C. suberosa or cork-bark oak, from the peculiar appearance of its bark. Others, as the C. distyla, C. Fraseriana, C. glauca, are from their resemblance also called firs. The Madagascan name is Filao. The wood of some species is extremely hard, and used by the Pacific islanders for war-clubs. Whilst every other kind of vegetable and meat was eaten with the fingers, cannibal food was touched only with forks, generally made of the wood of the Nokomoko (Casuarina equestifolia, Forks,) or the vesi (Afzeja bijugia, A. Gray), bearing curious, often obscene names, and having three or four long prongs. The reason given for this deviation from the general mode of eating was a widely-spread belief, that fingers which have touched bokola are
apt to generate cutaneous diseases when coming in contact with the tender skin of children.

Kayu aru, the C. littorea, is often termed a bastard pine, and as such gave name to the Isle of Pines discovered by Captain Cook. By the Malays it is usually called Kayu chamara, from the resemblance of its branches to the ornamental cow-tails of Upper India. It delights in a low sandy soil, and is ever the first that springs up from land reclinued by the sea. In Australia there occur aberrant species. — C. Bennett; Von Mueller; Galton’s Vacation Tourists, p. 268.

CASUARINA EQUISIFOLIA. Forst.
Sary ka jarar, . . . Dek. Aruan tree, ANGOLO-MALAY.
Beef wood. . . . Eng. Iron-wood of the S. SEA IS.
Fir tree, . . . Chouk maram, . . . TAM.
Filao of MADAGASCAR. Serva chettu, . . . Tel.

This tree was introduced into India about the beginning of the nineteenth century, and grows freely, ripening its seed in great abundance. In general appearance it much resembles the larch fir. It grows in 10 years to the height of about 30 feet, generally very straight, and, where the main shoot is broken or lopped off, throws out secondary shoots readily, which are usually erect. It thrives best in sandy tracts along the sea-shore. The wood is very hard, is reddish in colour, and in density and appearance it somewhat resembles Trincomaloe. It bears a great strain, is well adapted for posts, and is said to bear submersion in water very well. The bark contains tannin, and a brown dye was extracted from it by M. Jules l’Epiné of Pondicherry. It is a favourite avenue tree, and, if kept stunted, forms a beautiful hedge. It has been very extensively planted in various parts of the Madras Presidency, on the coast and inland, but the larvae of a large species of Aceta has caused much injury to plantations near Madras. It appeared suddenly in September 1867. The larvae burrow in the sand in subterranean passages, and from the night emerge from the sand and crawl up the young trees, generally biting off the young graceful Tamarix, and it burrows in Tahiti to provide a levy for soap.—M. E. J. R.

CASUARINA MURICATA. Ruzib. Fir tree.
C. littorea, Rumpa, . . . C. littoralis, Saliéh.
H’en-roo; . . . BURN. Haria, . . . HIND?.
Tiean pine; Beef-wood. . . . Kayu aru, . . . MALAY.

This is grown in all parts of the Dekhan, where it was introduced about 1830. It is a native of Chittagong, is the only species indigenous to the Tenasserim coast, and has been diffused over Bengal. In Tenasserim, it is found only in the loose sandy soil of the seaboard, and never inland. In general outline it resembles the pine, but it is of a more slender figure, and more elegant in appearance. Growing eighty feet high, and spreading out, without a leaf of covering; its numerous fine-knotted branches, mantled with brilliant green, and hanging in drooping bunches, or floating out lightly upon the breeze like long skeins of green silk, adorn it with the most graceful appearance, and stand it in the most desirable trees for embellishing a Tenasserim park. Trunk 3½ feet in circumference 4 feet above the ground. The wood is very hard and durable; and the Tahitians in their war days chose it for the manufacture of their ingeniously carved war-clubs; hence they termed it the club-wood. They also fashioned fishing-hooks from its roots. It is imported into the United States in considerable quantities, for various purposes where a hard, heavy wood is required. The natives of Tenasserim call it by the same name as the pine. — Drs. Ruzib. iii. p. 59; Ridell and Mason.

CASUARUS, the cassowary, a genus of great birds belonging to the section Struthionidae. Three species are known,—C. galarena, a native of Ceram, C. Australia, inhabiting the Cape York district of Australia, and C. Bennettii, whose domicile is New Britain. The Malay name is Suwari, from which the European one is taken.

Casuarius galusus inhabits the island of Ceram only, and, like the cockatoos, crown pigeons, and birds of paradise, was made known to the inhabitants of the west through the Malay and Javanese, who have immemorially carried on a trade with the country of the Papuans. It is a stout, strong bird, standing five or six feet high, and covered with long hair-like feathers. Its head has a large horny casque or helmet.

Casuarius Bennettii, Gould, is the cassowary of the island of New Britain, near to New Guinea, where it is called Mooruk. The height of the bird is three feet to the top of the back, and five feet when standing erect. Its colour is rufous, mixed with black on the back and hinder portions of the body, and raven black about the neck and breast. The loose wavy skin of the neck is beautifully coloured with iridescent tints of bluish purple, pink, and an occasional shady green, quite different from the red and purple caruncles of the Casuarius galusus. The feet and legs, which are very large and strong, are of a pale ash colour. This bird also differs from the C. galusus in having a horny plate instead of a helmet-like protuberance on the top of the head; which callous plate has the character of and resembles mother-of-pearl darkened with blacklead. The form of the bill differs considerably from that of the emu, Dromaius Nova Hollandiae, being narrower, larger, and more curved, and in having a black or leathery case at the base. Behind the plate of the head is a small tuft of black hair-like feathers, which are continued in greater or less abundance along most parts of the neck. The eye is about the same size as that of the emu, and is of a dirty pale yellowish-green colour. The bird appeared to Dr. Bennett to approximate more nearly to the emu than to the cassowary, and to form the link between these species. In its bearing and style of walking it resembles the former, throwing the head forward, and only becoming perfectly erect when running; it also very much resembles the apertyx in its body, in the style of the motion, and in its attitudes. Its bill presents a great deal the character of that of a rull; it utters a peculiar chirping whistling sound, but also a loud one resembling that of the word Mooruk, whence, no doubt, is derived its native name. The male is selfish and easily irritated. It kicks always in front, its legs sometimes reaching as high as a man’s waist.

Casuarius galusus, Gould, the helmeted cassowary of Ceram, is so called from the horny helmet which surmounts the head. Its rudimentary wings consist of five long bristles like blunt porcupine quills. It runs swiftly with a bounding motion. It feeds on fruits, birds’ eggs, insects, crustacea, and tender herbage. It is a stout and strong bird, standing five or six feet high, and covered with long, coarse black hair-like feathers.

604
CATAIARACTS.

Cataracts. Kami, Sair-ul-Balad Dr. no they but in but in seven. — Crawford's Dictionary, p. 84; London Athenæum, Dec. 12, 1857, p. 1551; Wallace, ii. p. 86; Dr. Bennett in a letter dated Sydney, 10th Sept. 1857; G. Bennett, p. 260.

CASVINI, the name in history of Zacaria ibn Mahomed ibn Mahomed al-Kousi al-Kazvini. He wrote the Ajaib-al-Makhlikat, or the Wonders of Creation, in the Arabic tongue. It treats of natural history, of the qualities of animals, vegetables, and minerals, as also of waters, aerial spirits, fairies, genii, and talismans; but all with a view to confute the Jewish rabbins. His work is much esteemed by Mahomedans. It has been translated out of Arabic into the Turkish language, and also into Persian. There seems to have been another Casvini, who is the person meant by Abd-al-Latif, author of the book called Lubb at Tawarik. He is cited by Golins in his Notes on Alfargani, pp. 4, 8, and 22. — History of Genizah Cat., p. 418.

Cats are found throughout the south and east of Asia. The name of the wild cat in many languages seems to be related to pass. The Persian is Puschak; Afghan, Pischik. Even the Kurd keeps his Psik, the Lithuanian is attached to his domestic Piije, and the Turk has a kindly feeling for the Puschik. They are mentioned in a Sanskrit writing 2000 years old, and there are figures of them on the monuments of Egypt of a much prior age. Mummy cats have been identified with the Felis chaus, and with F. caligulata, F. babastes, both still found in Egypt, wild and domesticated. No mention of the cat occurs in the Bible, or in any Assyrian record. Even in India Professor Max Müller is quoted as saying that it was but recently known as a domestic animal. Its Sanskrit name is Mārjāra, from a root meaning to clean, from the creature's habit of licking herself at her toilet. Her mousing habits were well known to the Romans, and even to the Etruscans, as shown by antique gems and even wall-paintings. The mouse-killer domesticated among the Greeks, called γαλάζιo, described by Aristocles, has been shown by Professor Rolleston to have been our white-breasted martin (Martes foina). The γαλάζιo δρυία o ετερι was a polecat, a foumart, larger, and a great lover of honey as well as a killer of birds. Pallas, Temminck, and Blyth believe that the domestic cats are descendants of several wild species which readily intermingle. F. sylvestris is wild in Scotland. F. lybica is the wild cat of Algiers; in S. Africa, F. cafra is wild. In India are four wild species, of which F. chaus has a lynx-like tail. F. ornata or torquata occurs at Hansi, and its home is on Central Asia. In the Isle of Man cats are taillose, and have long hind legs. The domestic Creole cat of Antigua is small, with an elongated head, and that of Paraguay, also small, has a lanky body. In the Malay Archipelago, Siam, Pegu, and Burma, all the cats have truncated tails with a joint at the end. In China a breed has drooping ears. The long silky-furred Angora cats are annually brought to India for sale from Afghanistan, with caravans of camels, even so far as Calcutta. These animals are currently known as 'Persian cats'; but Mountstuart Elphinstone remarks that they are exported in great numbers from Afghanistan but are not numerous in Persia, since once sought after by the Persians. Irwin also notices that they are bred in Kâbul and some parts of Turkestan, and very improperly called "Persian," for very few are found in Persia, and not exported. The Kabulis call this cat baruk or burak, and they encourage the growth of its long hair by washing it with soap and combing it. It is supposed to be the descendant of the F. manul of middle Asia. It breeds freely with Indian cats. There is a wild cat in Borneo. In Australia there was no feline animal, no apes, monkeys, cats, tigers, wolves, bears, or hyenas; no deer or antelopes, sheep or oxen; and no elephant, horse, squirrel, or rabbit; but it has marsupials only, kangaroos, opossums, and the duck-billed platypus. In Europe, cats play a considerable part in folk-lore; they appear and disappear unexpectedly, they haunt the paths of the night, and they are the only friends of old women with a repulse for necromancy. Whittington, so long the hero of a popular nursery-tale of England, is rivalled by the story of the Florentine Messer Ansaldo degli Ormanni. In a letter of Conte Lorenzo Magalotti in the Scelta di Lettere Familiari, published by Nardini, London 1802 (p. 139), are described his two cats, 'due bellissimi gatti, un maschio, una femmina,' which soon relieved the king of an island (Canaria), on which he had been cast by a violent tempest, from the plague of mice, and he was recompensed 'con richissimo doni.' — Earl, p. 233; Darwin's Animals and Plants; Sair-al-Balad in Osweley's Tr. i. 171.

CATABENI, an ancient mercantile race, who made Okelis their seaport. See Okelis. CATALAPTA BUNGEE. Smith. Ts'in, Hia, Chin. A large timber tree of China. Its wood is used for chestmen, chess tables, and weighing-scales frames. Formerly in China its leaves were worn as an ornament at the beginning of autumn. C. syringifolia, Sinus, a timber tree of Japan, of Ohio, and the Mississippi. Its wood used similarly to that of C. bungei. — Smith.

CATTALLIKAI. TAM. Capparis hoorida.

CATAMARAN. ANGLO-TAM. The Kattay maray of the Tamil people. A boat-shaped raft on which the natives of the Coromandel coast, for fishing, etc., cross the surf that continuously washes their shores. It is composed of three logs of wood pointed in front, made still more prow-form by wedge-like sharpened timber, and widening to the stern. The catamaran rides lightly on the sea, and rises to an ordinary surf, but is overwhelmed and tossed and rolled about by a great breaker, and the natives usually dive away to avoid the advancing angry mass of water. See Boat.

CATAKAPPA. MALEAL. Terminalia catappa.

CATARACTS. Of these there are several in India. Where the river Shirewari falls into the Gulf of Arabia it is about one-fourth of a mile in width, and in the rainy season some thirty feet in depth. This immense body of water rushes
down a rocky slope for 300 feet at an angle of 45°, at the bottom of which it makes a perpendicular plunge of 850 feet into a black and dismal abyss, with noise like the loudest thunder. The whole descent is therefore 1150 feet, or several times that of Niagara; but the volume of water in the latter is somewhat larger than in the former. The principal cataracts or waterfalls in India are near Simorrit, in Rohilkhand; at Gokak, on the Gupurtaks; on the Gairasappa, where from top of fall to surface of basin is 688 feet, and the depth of basin is 300 feet=1188 feet, and from 300 to 600 feet across during the rains; Yena, in Maha-baleswar, 600 feet; Cauvery, 370 and 460 feet; cataracts of Subnurake, Chutia Nagpur, and Hurroli Ghat,—the falls 15, 20, and 400 feet respectively, about 500 feet across.—Cur. of Sc.; Buist's Cat.

Several astringent extracts prepared from the woods, barks, and fruits of various plants are known as catechu, euch, terra japonica, and gambier. They form articles of commerce, and are employed in tanning and dyeing. That called kut or kotech by the natives of the East, and euch andterra japonica in commerce, is an extract prepared by cutting into chips the inner brown-coloured wood of the Acaea catechu, and making a decoction, which is afterwards evaporated to a proper consistence. The extract from the Uncaria gambier is also known in the market as euch, as also is the extract from the nuts of the Areca catechu. At the Madras Exhibition of 1855, catechu was shown in the form of—1. Coarse flat cakes. This substance is covered on both sides with puddle husks. 2. Large flat cakes from the Northern Division, varying in colour from brick dust to dull yellow. 3. Round balls of a dark brown colour, the size of a small orange, from Mangalore, where a large manufacturer takes place. These sorts appeared to vary only in shape. The manufacturers from the Acaea catechu work in Burma, Canara, the western Dehkan, Behar, and Northern India. They move to different parts of the country in different seasons, erect temporary huts in the jungles, and, selecting trees fit for their purpose, cut the inner wood into small chips. These they put into small earthen pots, which are arrayed in a double row along a fireplace built of mud; water is then poured in until the whole are covered. After a considerable portion has boiled away, the clear liquor is strained into one of the neighbouring pots, and a fresh supply of material is put into the first, and the operation repeated until the extract in the general receiver is of sufficient consistence to be poured into clay moulds, which are generally of a quadrangular form. Before the extract is quite dry, it is placed in cloths, strewed over with the ashes of cow-dung, cut into small lumps, and again exposed to the sun. This catechu is usually of a blood-red colour, and is considered there to be of the best quality.

Catechu has long been employed in India for tanning skins. Its tanning properties are stated to be so great that skins are tanned by it in five days; but the leather is light, spongy, permeable to water, and of a dark reddish-fawn colour. The light-coloured variety of catechu produces a softer leather than that tanned with euch. Catechu produces but little of the deposit of bloom which is yielded by oak-bark, valonta, and divi. A pound of catechu is said to be sufficient for the production of about a pound of leather. Bombay catechu or euch is the richer in tannin; it is of a dark brownish-red colour, internally as well as externally, and of sp. gr. 1:38. Bengal catechu or terr is of a light-brown colour internally; its sp. gr. is 1:28. It has also been used in India to give a brown dye to cotton, and has been very extensively employed in the calico-printing works of Britain. The salts of copper, with sal-ammoniac, cause catechu to yield a bronze colour, which is very permanent. The proto-mururate of tin produces with it a yellowish-brown. A fine deep bronze hue is also produced from catechu by the perchoride of tin, with an addition of nitrate of copper. Acetate of alumina gives a brown, and nitrate of iron a dark-brown. For dyeing a golden coffee-brown, catechu has an entirely super-seded madder, one pound of it being equivalent to six pounds of that root.

A catechu prepared from the nuts of the Areca catechu is used solely as a masticatory. The nuts, however, yield two astringent preparations, both of which are known as catechu, and both of a very inferior quality. The preparations are respectively called, in Tamil, Katha kamb and Kashi katti; in Telugu, Kansi; and in the Dekhan, Khra katha and Acha katha. Katha kambu is chewed with the betel leaf; the latter, Kashi katti, is used medicinally. For preparing this substance, the nuts are taken as they come from the tree, and boiled for some hours in an iron vessel. They are then taken out, and the remaining water is inapsissated by continual boiling. This process furnishes kasan, or the most astrin gent terra japonica. After the nuts are dried, they are put into a fresh quantity of water and boiled again; and this water being inapsissated, like the former, yields the best or dearest kind of catechu. Sir H. Davy, in analyzing the dark and pale catechu, or the Bombay and Bengal, as they were called, obtained in 200 parts from

| Inso | Tannin. Extract. Muelage. residuum. | Dark catechu, 100 | 65 | 35 | 11
| Pale do. | 97 | 73 | 16 | 11 |

When of good quality, catechu is a more powerful astringent than kino. Catechu is much used in medicine as an astringent and tonic, being usually given in combination with aromatic and early substances.—Simmonds; Malcolm's Tr. i. 187; M'Clell. Repts.; Med. Eph. Jur. Rep.; O'Sh. Disp. p. 302; Royle; Mat. Med., p. 351; Faulk.; Kerr. Med. Obs. and Inquiries., v.; Hamil. Mysore, i.ii. See Acaea catechu; Areca catechu; Uncaria gambier.

CATERPILLAR. Uskul, Arab.; Chasil, Heb. Some Ceylon caterpillars sting. A greenish one, that occupies the Thespasia populnea (Suriya, Singh), at a certain stage in its growth descends by a silken thread, and hurries away. The moth of this is supposed to be a Bombyx, near Onesto-
CATGUT.

Two pounds weight of the fruit yield eight ounces of the concrete pulp, which forms an article of commerce. Its bark is used in tannin. The bark of the root is a strong purge.—Dr. Wight, Gibson, Irvine, Roxb. ii. p. 333, Stewart, Thompson, and Browdts; Mr. Rohde; Powell.

CATHARTOCARPUS JAVANICUS. Pers.

The Cassia Javanica, or horse cassia, is a native of Java and the Moluccas, with legumes above two feet in length, containing a black cathartic pulp, used in India as a veterinary medicine.—Eng. Cyc.

CATHARTOCARPUS NODOSUS. Roxb.

Cassia nodosa, Buch. | Guu-thei-ni, | Bumb.

Remarkable for its large pink-coloured flowers. It is highly esteemed in Bengal, and is found in the Tavoy forests.—Mason; Voigt.

CATHARTOCARPUS ROXBURGHII. D.C.

A highly ornamental tree, in form much resembling the weeping ash. It is a native of Ceylon and of the south of India, frequent in the jungle between Trichinopoly and Dindigul, and is found in Indian gardens. The wood is hard, and handsomely marked.—Roxb. ii. p. 338.

CATHAY, a name of Western China.

CATHI or Catti, the Katheri of Diodorus Siculus, are supposed to be the race which so manfully opposed Alexander. They were then located about Multan, at this period occupied by the Langa race. A portion of them gave their name to Kattyawar, in the Saurashtra peninsula. The Cathi claim descent from the Balla, an additional proof of northern origin, and strengthening their right to the epithet of the hards, Lords of Multan and Tatta. At the time of Alexander's advance they were confined to the country near the Panjnad, and their own traditions fix their emigration from the south-east part of the valley of the Indus about the eighth century. Colonel Tod describes the genuine Cathi as of a fine manly form, open countenance, and independent gait. Captain M'Murdo says, a character possessed of more energy than a Cathi does not exist. With an athletic frame, their height often exceeds six feet. They have light hair and blue eyes, evidence of a Scythian origin. Burns describes the Cathi (or Katti) as a tall, stout, and handsome race. They live in scattered villages, and move their houses from place to place, rearing immense herds of buffaloes and camels, but scarcely ever descending to cultivate the soil. Their habits are likewise predatory.—History of the Panjab, i. pp. 38, 39; Travels in Western India, p. 306; Tod's Rajputan, ii. p. 246.

CATODON, a genus of mammalia, one of the Cetacea. The species known are C. colneti, C. macrocephalus, C. polyccephus, and C. australis. The last is a sperm whale of the ocean near Australia. It is about 35 feet long.

CAT'S EYE.

Cats' eye is chiefly found in Ceylon, but also obtained from Quilon and Cochin, and in the neighborhood of Madras; also in Burma. Cat's eye is not much valued in India. It is a transparent quartz full of minute fibres of asbestos, and is cut in a highly convex form. It is of a yellow hue, slightly tinged with green, and is often set in rings. In the Moultewin market a small one
CAUCASUS.

In the middle of the 19th century, a severe cattle plague carried off vast quantities of cattle in Europe, and shortly after a similar plague in India carried off great numbers. The characteristic symptoms were dropping, cold ears, hair standing on end, frequent weak pulse, running at the eyes and nose, scanty high-coloured urine and purging, terminating in a bloody flux. As the disease advanced the body became covered with pustules, the disease generally proving fatal in a few days; but when the membranes of the brain were affected, the animal died in a few hours with the symptoms of apoplexy.

The bullock and the cow are not of equal value in India. In the parts of the country where the one sex is particularly valuable, the other sex may be of small value. The excellence of the Marwar bullock for draught is proverbial, but we never hear of the Marwar cows' milk. The male of the Gujerat buffalo was esteemed so little, that in the early part of the 19th century they were for the greater part not even reared. The males of the Mahoo breed were said to be so fierce as to be useless except for reproduction.—L. The male buffalo of the Surat breed is of great size and weight. The milch buffalo of Surat is of great value. Lands bordering upon hills are of comparatively greater value to cattle graziers, over plain districts which are put under the plough. In these the working cattle fall off miserably in the three concluding months of the fair season. There is no grazing; and were it not for the purchased food they get in the house, they would die.

CATTRA-BANGHA. Sansk. Aristolochia bracteata.

CATTU. Maleal. Wild or uncultivated; hence Cattu-Carn, Cinnamonum iners; Cattu-Casturi, Aebelmoscus moschatus, Cattu-Casturi, Aebelmoscus moschatus, Cattu-Eupla, Terminalia bellierische, Cattu-Paera, Phausolus rostratus, Cattu-Sirangam, Vernonias anthelmintica, Cattu-Tirpali, Chavies Roxburghi.

CATTY or Kati. Malay. In the Eastern Archipelago and China, a weight equal to 1 lb. or 16 talle; 10 sable equal to one liang; 16 liang make one catty. 100 catty are equal to 1 pikul, 133 lbs.—Wls.

CATTU KAMRIGA RAKTA, dragon's blood.

CATTUS SPLICIFLORUS. Linn. Analypa hispida. | Watia tali, Maleal.

A plant of Travancore; its flowers are given in diarrhoea in the form of decoction or as a conserve, and its leaves are boiled up with green tobacco leaf and infusion of rice, and applied to inveterate ulcers.

CAUA-THENTHI. Hind. Chitora ternatea.

CAUBUL, a town in Afghanistan, in long. 69° 12' E., and lat. 34° 7' N. See Kabul.

CAUCASIAN, a term applied by ethnologists to a race of which the European is the type, also to a class of languages. In the Caucasian race, there is a fine forehead, high brow and nose, long beard, tall, lithe, powerful frame, and light colour of skin.

CAUCASUS. The main chain of the Caucasus crosses obliquely, from north-east to south-west, the great isthmus which lies between the Black Sea and the Caspian, separating Europe from Asia. The chain extends on a line of more than 1000
miles from the neighbourhood of Anapa, at the entrance of the Sea of Azof, almost in a straight line to Baku and the peninsula of Apsheron jutting out into the Caspian. The crest averages a height of about 11,000 feet. The valleys on both sides are steep and narrow, and the Terek pass, 7977 feet. The principal range boasts the gigantic Elburz, 17,746 feet, and Kasibeck, 16,546 feet. The heads of these two celebrated mountains are almost always obscured with clouds; and the snow-line on them is 11,000 feet, and cereals grow up to 7000 feet.

The whole of the Caucasian region consists of the old territories of Daghestan and Circassia, north of the main chain, and of the old kingdom of Georgia on the south, to which Russia added at various epochs the Armenian districts of Erivan, Elisavetpol, and Alexandropol, and more lately those of Kars and Batoum. The Caucasus is of importance to Russia as the channel through which her trade can be carried to all parts of Central and Southern Asia, her commercial enterprise rather outstripping than following close her territorial aggrandizement. The Caucasus is like a great wedge thrust between Persia and Asiatic Turkey. It is the highway which is to lead the merchandise as well as the arms of Russia to the shores of the Persian Gulf and the Indian Ocean, sooner than any of her roads or railroads across the Ural, via Perm or Orenburg,—sooner than her almost exclusive navigation of the Caspian Sea.

The whole of the Caucasian regions is ruled by a Russian lieutenant, residing at Tiflis. It is divided into 12 governments or provinces, exclusive of Kars and Batoum. It has, in round numbers, an area of half a million square kilometres, with a population of 5,000,000. In Tiflis, the capital, out of 104,000 there are at least 20 races of men. Russians muster 90,829; but the Armenians outnumber them by 5787. Next come 22,152 Georgians of various tribes; and the rest is made up of Turks, Persians, Turks, Jews, Assyrians, and Circassians, besides various mountain tribes deemed indigenous, the Ossets, Ingush, Aisors, Khefsurs, Leseleighs, etc., with 2741 Poles, 2135 Germans, 257 French, 163 Italians, 52 English. With respect to creeds, 52,392 Russians and Georgians belong to the orthodox or Greek-Russian Church; 36,000 are Gregorian Armenians; 871 Armenian Catholics, with 36988ther Roman Catholics; 2177 Lutherans, 1276 Jews, and 4338 Mahomedans. Petroleum, in enormous subterranean lakes and reservoirs, underlies the Caucasian region from sea to sea. It is largely found beneath the steppes both north and south of the mountain chain. At Baku, at its southern end, on the Caspian, naphtha bursts forth in copious springs, sending up tall liquid columns not unlike the geysers of Iceland.—*M. Gregorov. Persia; Wheelers Hist. of India; Pont. Trans.*

**CAULIFLOWER.** Brassica oleracea, var. An excellent vegetable. In the Dekhan the seed should be sown at the latter end of August. Removing the plants occasionally, prevents their quick growth. In England the market gardeners seldom water cauliflower, and once in four days is amply sufficient in the Dekhan; no injury will accrue even if watered less frequently. In India, white broccoli is often taken for the cauliflower. Broccoli, both red and white, should be cultivated in the same manner as cauliflower.—Riddell.

**CAUVERY.**

CAUTLEY, Sir Proby Thos., K.C.B., entered the Bengal Artillery in 1819. He was employed in the field during the years 1820 and 1821, in the reduction of numerous forts in the kingdom of Ootth. In 1825 and 1826 he served at the siege of Bhartpur. He was subsequently employed as a civil engineer on the eastern Jumna Canal in the N.W. Provinces, and was the projector and the executor of the great Ganges Canal Works, which were opened 8th April 1854. He carried on extensive researches, in conjunction with Dr. Falconer, in the fossil remains in the Siwalik hills, and he presented to the British Museum an extensive collection of fossil mammalia from the Panjub. He wrote on a submerged city, 20 feet under ground, near Behut, in the Doab, Bl. As. Tr. 1854; On Fossil Quadruman, ibid.; Use of Wells, etc., in Foundations, as practised in the Northern Doab; Structure of the Sevallick Hills; Notice of a Fossil Monkey from the Sevallick Hills; Letter from Lally to the Himalayas; Description of Sivalherum giganticum, the Fossil Crocodile, Giraffe, Ghurial, Hippopotamus, Camel, Tiger, and Bear; Gold Washings in the Goomti River, in the Sevallick Hills, between the Jumna and Sutlej Rivers; On a New Species of Snake; Mastodontia dentirotes; Mastodons of Sevallicks; Manufacture of Tar in the Sevallick Hills; Panchukhi or Corn Mill; Dam Sluices; Remarks on the Fortress of Aligrur; Caramans Bridge. On leaving Calcutta for Europe, he was honoured with a salute from the batteries of Fort William, and was favourably noticed in the Government Gazette.—*Gleanings of Soc. Beng. As. S. Tr. 1854; Parlys Military Repository, Lond.; Geol. Soc. Tr. 1840.*

CAUVERY, the Chaberos of Ptolemy, a river of the Peninsula of India, which rises in the mountains of Coorg, 50 miles from Mangalore, in lat. 12° 25' N., and long. 75° 35' E., and, after an easterly course of 472 miles, it discharges into the Bay of Bengal, receiving the Magmuru, 40 miles; Bhawani, 120 miles; Noyel, 95 miles; Seringapatam, Trichinopoly, Tanjore, and Tranquebar on its banks. It passes through and from Mysore to the coast; at Trichinopoly it forms the island of Siringam; and a mound at Coiladdy prevents the junction of the two forks of the Cavery and Culerun, and the stream is led into numerous large irrigating channels that are conducted all through Tanjore. The largest of these are the Vettar, the Vellar, and Arselar, all of which enter the Bay of Bengal. Navigable for craft through the low country during the inundation. A waterfall occurs in its course. It is deemed by the Hindus a sacred river, and is called by them the Dakshini Gang, or Southern Ganges. At its source, at Tala Kavori and at Blanga mandir, where it receives its first tributary from the adjacent Hindu temples which are largely frequented by pilgrims in the Tulemas (October to November).

The Cavery drains an area of about 28,000 square miles. The area of its delta is 2760 square miles, and its irrigation system supplies about 835,208 acres, yielding a revenue of Rs. 35,30,336. Its delta has the largest area of artificial irrigation in the Madras Presidency. About 10 miles west of Trichinopoly, the Agunda Cauvery divides at the head of the island of Seringah into two branches, the Culerun and the Cauvery. Colonel Sim and
CAUVERYPAK.

Sir Arthur Cotton, about 1834-6, constructed a weir across the Cauvery, which has given great benefits to the people of Tanjore. The head of the Cauvery branch is 1500 feet wide, and the bed level is regulated by a dam. After a course of 16 or 17 miles, the Cauvery bifurcates into two principal streams, called the Cauvery and the Vennar, which irrigate nearly equal areas, and which give off numerous branches, and regulating works have been constructed at all the bifurcations. Prior to British rule, the native princes had connected the Cauvery with the Cauvery the east end of the island of Srirangam, about 20 miles from the upper Cauvery anicut, and across this channel they had constructed the Grand Anicut. In the northern delta, the whole of the distribution of water has been artificially carried out by canals, but in the Cauvery delta the principal distribution has been effected naturally by the numerous branches thrown off by the Cauvery and Vennar. The chief work left to be done by the British was to render the water supply more reliable, and this was secured by the Upper Anicut in 1836, at an expenditure of Rs. 1,88,000.

CAUVERYPAK, a place midway between Con- jeveram and Arcot. Clive gained a battle here in February 1752, and the place surrendered to him.

CAVA or Kava, also called Ava pepper, is from the Macropiper methysticum of the Pacific. Its root produces a stimulating liquor. See Ava.

CAYAGNARI. Major Sir Pierre Louis Napoleon Cavagnari, K.C.B., son of General Adolphe Cavagnari, of a noble Parmese family. He entered the service of the E. I. Company as 'direct cadet,' and served with the 1st Bengal Fusiliers in the Ouddh campaign of 1858-59, also with the 3d Gurkhas throughout the Ambala campaign of 1863, and the Hazara campaign of 1868. He received the Victoria Cross, for the daring capture of a band of murderers in connection with the Swat Canal outrage in December 1876, near the English fort of Abazia, where many workmen were killed. He accompanied Sir Neville Chamberlain on a mission to the Amir Sher Ali, and was in advance with a small body of the escort, when he was stopped by the Afghans at Ali Musjid, and compelled to turn back, an incident which was the immediate cause of the Second Afghan War. He accompanied General Sir Samuel Browne as Political Officer, and at the termination of the campaign was appointed Plenipotentiary, and in that capacity negotiated the peace with Yakub Khan at Ghazni. He and his guard were killed at Kabul, which led to the re-occupation of Kabul, Kandahar, and Ghazni.

CAYATUM PILLOO. Tam. Andropogon schoenanthus.

CAVE. Ghur, Arab, Pers.; Koo, Burmese. Chambered rocks occur in many parts of Afghanistan, also in a mountain S. of the Deo Hissar, near Singlah, and are probably of Buddhist origin. The small chambers were intended for the abode of the ascetics of the sect. There are some fine remains of this class in the upper valley of the Urganb. At Karaftu, in the Suj Bolak district of Azarbijan, is a series of ancient caves. There are numerous chambered rocks at Banian; and the Afridi tribe in the Khaibar pass live in chambered rocks.

CAVE TEMPLES.

CAVE TEMPLES and monasteries of India consist of stupendous excavations and monolithic structures, made for religious and monastic purposes. There are in India at least 1000 distinct caves. Some are opposite Prome in Burma; there are a few in the Madras Presidency; about 900 in the Bombay Presidency; several in the Hyder- abad Dominions; also in Orissa, in Behar, in Malwa, in the valley of the Indus, among the mountains of Baluchistan, Afghanistan, and Bamiyan. In Western India alone, including the Nizam's dominions, there are at least thirty series of cave-temples which have been examined by Europeans. Cave inscriptions discovered are seventeen in number, viz. six about 15 miles from Gya, in Bahar, viz. three in the hill of Barabar, three in the hill of Nagarjuni, nine in the hill of Khandagiri, in Cuttack, and two in Rangar in Sirigupa.

The Cave Temples in the southern part of India are classed by Mr. Ferguson into—

(a) The vihara or monastery caves, which consist of (1) natural caverns or caves slightly improved by art. These are the most ancient, and are found appropriated to religious purposes in Behar and Cuttack. Next (2) a verandah opening behind into cells for the abode of priests, as in Cuttack, and in the oldest vihara caves at Ajanta. The third (3) has an enlarged hall supported on pillars. The most splendid caves are those of Ajanta, though the Dherwara at Ellora is also fine, and there are some good specimens at Salsette and Junnar.

(b) Buddhist chaitya caves form the second class. These are the temples or churches of the series, and one or more of them are attached to every set of caves in Western India, though none exist on the eastern side. Unlike the vihara, all these caves have the same plan and arrangement, and the Karli cave is the most perfect in India. All these consist of an external porch or music gallery, an internal gallery over the entrance, a central aisle which may be called a nave, roofed by a plain waggon vault, and a semi-dome terminating the nave, under the centre of which always stands a dagbopa or chaitya. In the oldest temples, the dagbopa consists of a plain central drum, surmounted by a hemispherical dome crowned by a Tee, which supported the umbrella of state of wood or stone. These two classes comprehend all the Buddhist caves in India.

(c) The third class consists of Brahmanical caves properly so called. The finest specimens are at Ellora and Elephanta, though some good ones exist also on the island of Salsette, and at Mahabalipur. In form many of them are copies of and in good degree resemble the Brahmanic temples. They have not been appropriated from the Buddhists, as the arrangement of the pillars and position of the sanctuary are different. They are never surrounded by cells, as all vihara are; and their walls are invariably covered or meant to be covered with sculpture, while the vihara are almost as invariably decorated by painting, except the sanctuary. The subjects of the sculpture of course always set the question at rest.

(d) The fourth class consists of rock-cut models of structural and Brahmanical temples. To this class belong the far-famed Kailas at Ellora, the Saivite temple at Dhumar, and the laths at Mahabalipur. This last is cut out of isolated blocks of granite, but the rest stand in pits.
CAVE TEMPLES.

The Indra Subba group at Ellora should perhaps form a fifth.

(c) The fifth or true Jaina caves occur at Khandagiri in Cuttack, and in the southern parts of India, but are few and insignificant. In the rock of Gwalior Fort there are cut in the rock a number of colossal figures, some 30 to 40 feet high, of one of the thirthankara, some sitting, some standing. Their dates are about the 10th or 12th century before Christ.

The greater number of the viharas seem to have been grouped around structural tope. Their façades are generally perfect. Nine-tenths occur in S.W. India, in the Bombay Presidency, with a group in Behar, another in Cuttack, one at Mahabalipur, and two or three in the Punjab and Afghanistan. Asoka, B.C. 250, excavated the first of these in Behar, at Rajagriha, and till the 8th century they continued to be excavated by Buddhists, Hindus, and Jains. It is in Behar that the oldest caves have been found, in the neighbourhod of Rajagriha, which was the capital of Bengal at the advent of Buddha; and one, a slightly improved natural cave, the Satapanni, is said to be that in front of which the first conversation was held B.C. 543.

The most interesting group is at Barabar, 16 miles N. of Gaya. An inscription on the Karma Chopa cave there, records its excavation in the 19th year of Asoka (B.C. 245). Another, called Suddanana or Nigope, bears an inscription by Asoka in the 12th year of his reign. The Lomas Rishi is an interesting cave, as also is the Milkmaid's cave, which is probably the most modern, as it was excavated by Dasaratha, grandson of Asoka. Their dates appear to range from B.C. 260 to 200. The rock in which they are excavated is a hard, close-grained granite.

Chaitiya halls have also been excavated in several of the rocks of Western India. The oldest of these has been excavated at Bhaja, four miles south of the great Karli cave in the Bhor Ghat. It is supposed to have been before the Christian era. Another group is to be seen at Beda, 10 or 11 miles south of Karli, which has two pillars with capitals, surmounted by horses and elephants, and more like the Persepolitan than any others in India. A third chaitiya cave is at Nasik, and an inscription over its doorway states that it was the gift of a citizen of Nasik, in the reign of Krishna, one of the Andhrabritya kings, who reigned just before the Christian era. Another inscription under the pillars states it to have been excavated in honour of Badrakara, supposed to have been the fifth king of the Sunga dynasty, B.C. 129.

Karli, on the road between Bombay and Poona, has the largest, finest, and most complete of the chaitiya caves. Inscriptions ascribe its excavation to the Maharaja Bhatti or Deva Bhatti, who reigned B.C. 78.

There are four chaitiya caves in the Ajunta group. The oldest and lowest down, No. 9, is 45 feet by 23 feet in width. The next, No. 10, higher up, is 94 ft by 41½ feet internally. A third is cave No. 19, and in it Buddha in all his attitudes is introduced everywhere. Hitherto in all sculptures mortal men and women had been absent, and Buddhism was a pure theism or atheism, but at the date of this cave Buddhism has become changed into an overwhelming idolatry.—Ferguson, p. 124.

CAVE TEMPLES.

The last chaitiya of Ajunta (No. 26) was excavated about the year A.D. 600.

At Ellora, the celebrated Visvakarma cave is a chaitiya. Its age also is about the year A.D. 600. It is 85 feet by 43 feet.

The Kenheri cave, on the island of Salsette, in Bombay harbour, is 88½ feet by 39½ feet internally, and was excavated about the early years of the 5th century, when Fa Hian was travelling in India. It is a literal and a coarse copy of the Karli cave.

At Dhammar, about halfway between Kotah and Ujjaun, are a series of about 60 or 70 caves, cut in coarse laterite conglomerate. One is a chaitiya cella, in the midst of a vihara; its date probably is the 6th century A.D.

At Khovri, not far from Dhammar, is the most modern group of Buddhist caves in India. One called Arjun's house is a highly ornamented dagoba. Inside is a cross-legged seated figure of Buddha. The only excavation here is a chaitiya hall 26 feet by 13 feet.

Some of the viharas were three or four storeys in height, and containing up to 1500 cells, as at Mahabalipur, 50 miles south of Madras, and at Nalanda, 7 miles north of the old capital of Rajagriha, and 34 miles south of Patna, at which, in the first century, Nagarjuna resided. In Hiuen Thsang's time 10,000 priests and neophytes resided here; religion and philosophy were taught from a hundred chairs, and that pilgrim resided there as a student for five years. He says there were thousands of viharas, but none equal to this. It was to Central India what Cluny and Clairvaux were to France in the middle ages. Some at least of the many viharas, as that cleared out by Captain Kittoe and Mr. Thomas, seem to have been destroyed by fire.

On the western side of India, viharas have been described at Ajunta, near Aurungabad, at Bagh on the Tapti, at Beda, Bhaja, Durasoe or Durngina, Ellora, at Hazar Kotri in the Nizam's territories, at Junir, halfway between Nasik and Poona, and at Nasitt. At Nasik are three great viharas, the oldest of that of Nahapana, A.D. 100; next, Gautamiputra, A.D. 300; and the third, Yadnyaari, A.D. 400. They are a purely Buddhist group. The façades of the first and second are richly ornamented, and were formed during the rule of the Andhrabritya dynasty. At Ellora numerous viharas are attached to the great Visvakarma chaitiya. The great vihara is known as the Dherwarah, 110 feet by 70 feet. In the sanctuaries of most of these caves are figures of Buddha. In the Das Avatara the sculptures are all Brahmanical.

In the neighborhood of Perumwar, there are monasteries of Khandagiri, Takhti-i-Bahi, Shah Dehri, and Sakri Bedel. The sculptures and architecture are highly classical,—Tonic pillars, Corinthian capitals; and some antiquaries regard them as acquired from the Bactrian Greeks, while others attribute them to western influence after the age of Constantine. There are many figures of Buddha, and numerous other figures with nimbus or glories or circular discs at the backs of their heads; they are on the base of the altars or stupas, on the walls and in the cells.

The Brahmanical caves of India were excavated after those of the Buddhist and Jains. The more prominent are as follow:—

1. Saiva cave at Aihole, in the Kalalgi district, S. of Bijapur, A.D. 500 to 560.
CAVE TEMPLES.

2. Pahari caves, one Saiva and two Vaishnava, A.D. 550-579.
6. Rameswara cave at Ellora.
11. Elephanta, Jogeswari, and Mandapeshvari caves near Bombay, A.D. 725-775.
12. Patur in Bera, Budheswara, near Ajunta, Patna in Kandesh, and caves near Satara, A.D. 700-800.

The Beher caves are in the neighbourhood of Rajgir, near Asoka's rock. The Milkmaid's and Brahman Girl's cave have inscriptions in the Lat character. They are of about 200 B.C., and are the most ancient caves of India. The Nagarjunni cave and Haft Khanchi or Satghur group are situated in the southern arm of the hill at some little distance from the Brahman Girl and Milkmaid's cave. Another group is the neighbouring Karna chappaur and Lomas Rishi cave.

The caves of Udayagiri and Khandagiri hill, about 20 miles from Cuttack, and 5 from Bhuvaswara, are next in antiquity to those of Beher. They are built on the hills of Udayagiri and Khandagiri. The former are Buddhist and the older; the latter, probably, are Jain. Many of the inscriptions are in the Lat character, and this gives their age as anterior to the Christian era. The frieze sculpture in the Ganesa gumpa is superior to any in India, and resembles that of the Sanchi tope at Bhiila. In it there are no gods, no figures of different sizes, nor any extravagance. On the Buddhist caves here, there are no figures of Buddha, or any images. In a Jain temple in Khandagiri, the twenty-four thirhankara, with their female energies, are sculptured.

The Ajanta are the most complete series of Buddhist caves in India, without any mixture of Brahmanism, and contain types of all the rest. They are in a ravine in the ghat south of the Tapti. At Bang, also in a ravine or small valley in the ghat, on the north side of the valley of the Tapti, are three ancient Buddhist caves.

Those of Kavi is not so extensive as the Ajanta, but still purely Buddhist, and containing the largest and finest chaitya cave in India. Karli is about halfway between Poona and Bombay on the right-hand side of the valley as you proceed towards the sea.

The Salsette or Kenheri caves in the island of Salsette are also purely Buddhist, but very inferior to the former. The Kenheri caves are excavated in a hill situated in the midst of an immense tract of forest country, and Mr. Ferguson supposed their date about the 9th and 10th century of the Christian era. The monastic system of the Buddhists has its finest illustration in the series of dormitories, chapels, halls, and temples at Kenheri.

Dhummar, about 40 miles south-east from Nemmich, but close to Chundivass, contains Buddhist caves with a Brahmanical rock temple behind.

The Ellora caves are excavated in a porphyritic greenstone or amygdaloid. The Kailas at Ellora is a wonderful work of art—a small hill cut into a temple. The caves of Elephanta overlook the harbour of Bombay. The Elephanta caves are cut in a harder rock than those at Ellora. Those of Dhummar and Ellora contain a strong admixture of Brahmanism, and those of Elephanta are entirely Brahmanical, though perhaps of the same age as those of Ellora.

The Orissa cave temples are in two isolated hills of sandstone rock, about 20 miles from Cuttack, and 5 from Bhuvaswara. The oldest are in the hill called Udayagiri, the more modern in that portion called Khandagiri. They became Jain about the 10th or 11th century, and at the close of the 18th century a Jain temple was erected in Khandagiri hill. The oldest cave is called Hatthi Gumpa. The Aswatama rock near by has on it a copy of Asoka's edicts; and there is another at Askar, near the N. end of the Chilka lake. They are supposed to have been excavated about the time of Asoka. Another natural cave is stated in an inscription to be that of Chulakarma; and others the Pawan Garbha, Jodev Garbha, the Ganasa, Ananta Garbha, and the Rani Gumpa. In the last-named the sculptures represent hunting scenes, fighting, dancing, drinking, and love-making. The sole emblem which can be regarded as Buddhist are the swastika, the trisul, and shield.—Fergusson, pp. 105, 152, 143; Fergusson and Borges, pp. 408, 484; Cunningham's Archaeological Report.

CAVARE.

Cavial; Caviar, • Fr. Ikra, • Rus. Kaviar, • Ger. Caviario, • It., Sp. Cavials, • Tr.

Caviare, a substance prepared in Russia, consisting of the salted roes of large fish. The best, which is made from the roe of the sturgeon caught in the Volga, in the neighbourhood of Astracan, appears to consist entirely of the eggs. It is packed in small kegs, and exported; but the inferior sort is made into the form of dry cakes. It is highly esteemed in Russia, and also forms an article of considerable export,—30,000 barrels having been exported from Astracan in a single season. The manufacture consists in separating the roe from its membranes, then washing in vinegar or white wine, and drying by spreading it out on a board in the air. Salt is then well rubbed in, and it is next put in a bag and the liquor pressed out. It is then packed in kegs for sale. During the three annual seasons of fasting in Russia, the consumption of caviare is very great, as it is also in Italy during the fasts of the church. It is eaten on bread, with oil and lemon juice or vinegar. Professor Rawlinson says caviare was known to the Greeks as Tarichos anta-kaion. The sturgeon of the Borysthenes, according to Herodotus, were called Antaecei.—Tomlinson, 354.

CWA-ARANG. MALAY. A light brown or pale brown coloured wood of Penang, from a very large tree; used for furniture and ornamental work.—Frith. (Qa. Kayu arang.)

CAWNSEE, from Kani, Kairn, Tam., Tel. In Outack, a hand's-breadth. In the south of the Peninsula of India, a land measure. At Madras the standard cawnee is 24 mani or grounds, each
of 2400 square feet. The cedare is therefore 57,600 square feet = 1-322 of an English acre. Another measurement, however, makes it somewhat less than an acre. The cawnpore, in several districts in the Madras Presidency, is subdivided into 1000s; and in the re-survey of the southern districts of Madras, the decimal subdivision of the acre has been authorized.—Wilson.

CAYENNE or Cawnpur, a large cantonment and town in the Allahabad division, situated on the right bank of the Ganges, in lat. 26° 29' 15" N., and long. 80° 29' 45" E., and 580 feet above the sea. Its civil population is about 122,000, and is 650 miles square in area. It gives its name to the district of Cawnpur in the N.W. Provinces of India, in the Doab, a great alluvial plain between the Ganges and the Jumna. The district is bounded on the N.E. by the Ganges, on the S.W. by the Jumna, on the N.W. by Etawa and Farrakhabad, and on the S.E. by Futtehpur, and extends between lat. 25° 55' and 27° N., and long. 79° 34' and 80° 37' E. A small colony of Chinese settled in Cawnpur, and introduced a manufacture of leather, for which the town was long famous. During the mutiny of the Bengal army, on the 26th June 1857 Cawnpur capitulated to the rebels under Dandhu Punt Nana Rao, under promise of safe escort, but the garrison, under General Wheeler, were all destroyed; and on the 15th and 16th July, all their wives and children were destroyed and thrown into a dry well. In and above the well at the entrenchment, and in the well of the slaughter-house, lay the bones of no less than 20 civilians, military, and female children, of the town, 400 cows, and their wives, and musicians, besides infants. If to these be added the Futteghur party and those who perished outside the entrenchments, there were not less than a thousand Christians, the majority of whom were murdered in cold blood by order of Nana Rao. Seven Christian men, including Delafosse and Thomson, twelve women and six faithful natives, who entered the entrenchment, alone ultimately escaped. Nineteen Christians and five children, who remained in Cawnpur, escaped by aid of the natives, besides a few drummers. Nana Rao seems to have died in the forests of Nepal. Cawnpur was retaken by General Havelock on the 17th July 1857. On the 15th July General Havelock fought the battles of Aung and Pandu Nadi; on the next day took Cawnpur by storm; on the 17th and 18th recovered the city; and on the 19th took and destroyed Nana Rao's palace at Bitchur. On the 27th November the Gwalior mutineers and others took possession, but Lord Clyde retook it next evening, and on the 6th December he routed them with great loss. The district was pacified after the fall of Kalpi in May 1858. The district is essentially Hindu. Of the total population, 1,156,055 in 1872, the Brahmans, Rajputs, and Banyas numbered 313,278 souls; the Kayasth, 15,169; the Ahir, 113,053; the Kurmi, 58,359; the Chamar, 122,923; the Mahomedans of the Sunni sect being only 64,797 souls.—Imp. Gaz.

CAYENNE PEPPER.

The powder of the dried pods of different species of capiciun, used as a stimulating condiment. See Capsicum.

CAY-HAUNG. CHIN. Gossypium Indicum.

CAYLEY, Dr. HENRY, a British medical officer who entered the service in January 1857. In May was detailed to take Leb to Laharkhal as a Political Agent, in the territories of the Mahara of Kashmir, to protect and encourage commercial intercourse through Laharkhal between India and Central Asia, and watch political events in Central Asia and Eastern Turkestan.

CAZI, a Mahomedan judge, religious and civil.

CEDAR, the sarawat of Arabia, is a commercial term given to the woods of several distinct kinds of forest trees, the timbers of which are distinguished as red and white cedar, Barbados and Bermuda cedar, cedar of Lebanon, pencil cedar, bastard cedar, etc. Among the cedars of Lebanon, so often noticed in Scripture, is usually supposed to be Pinus cedrus, called Cedrus Libanus, or cedar of Lebanon. The lofty decidua, a native of the Himalayas, with fragrant and almost imperishable wood, and often called the Indian cedar, has been sometimes referred to the genus Pinus, and sometimes to Abies, Cedrus, or Larix, with the specific name of deodara; and Dr. Hooker is of opinion that the deodar and the cedar of Lebanon are identical. The cedar wood of Scripture is supposed to be the sandarac tree, Thuja articulata. The woods of several of the conifers are called cedars. In India, the term bastard cedar is applied to the Guanazama tomentosa; and the Iymnicodium excelsum, Chickassia tabularis, and Cedrela toona are all called cedars. In New South Wales the term white cedar is applied to Melia azedarach, and red cedar to that of Flindersia Australis. In China, a kind of cedar, probably a cyrpress, called Nau-nah, or southern wood, which resists time and insects, is considered peculiarly valuable, and is especially reserved for imperial use and buildings; and the cedar wood of Japan, according to Thunberg, is a species of cyrress. The cedar of Guiana is the wood of Ixia altissima. The white wood or white tun of Jamaica is Bignonia excelsum. The word 'cedar,' in the United States, is applied to various genera of the pine family. The white cedar of the southern swamps is a cyrress; the wood of Juniperus Virginiana is called red or pencil cedar, that of J. Bermudiana is called Bermuda cedar, and that of J. Barbadesis is called Barbadoes cedar, while the juniper of the north of Spain and south of France and of the Levant is from J. oxycedrus. The white cedar of North America, a less valuable wood than the red cedar, is yielded by Cupressus thyoides. The cedar of New Zealand is Hartighsa spectabilis. The cedar of the Amazon is from the Cedrela odorata of Von Martius. Under the term cedar, Colonel Frith described a reddish-coloured wood of Paichat, specific gravity 0.907, as a large tree, wood aromatic and used for furniture; and under the name of cedar-root he mentioned a very
aromatic wood, used for ornamental furniture in Pulpahat. These two are possibly from the Cedrela toona. The wood of the cedar of Lebanon, as now met with, is not in much esteem, but the people of the Cedrus deodara of the Himalayas really possesses all the good qualities for which those of Lebanon were prized. Specimens of the wood of the Indian cedar, Cedrus deodara, and of the cypress, Cupressus torulosa, from the Himalayas, were shown by Dr. Royle at the Exhibition of 1851; the former has been introduced into England as a beautiful ornamental tree, but appears to promise well as a useful timber tree, as the wood works well and freely. The bastard cedar are woods of Cedrela toona, Roxb., and of Guazuma tomentosa, Kunth; and the Gaon cedar is the Cupressus Lusitanica.—Funcken; Dr. Hooker; Holtzapfl; M'culloch; Williams' Middle Kingdom, p. 275; Burton's City of the Salt Lake; Harris, Nat. Hist. of Bible.

CEDRELA. A district under the Madras Presidency, in the centre of the Peninsula, now apportioned into the Bellary, Cuddapah, and Kurnool collectorates. This tract of country belonged to the Mysore sovereign Tipu, and after his death fell to the share of the Hyderabud state. Shortly afterwards, under the treaty of 1803, this share was ceded to the British on their undertaking to provide a subsidiary force of about ten thousand soldiers. Their numbers in 1868 did not exceed 5000, stationed at Secunderabad, six miles from Hyderabad, in the Dehkan. There is one large military cantonment at Bellary, and a saanatorium, 37 miles distant, at Ramnadur. The people of the district are partly Canarese, partly Teling, the linguistic boundary being a little east and south of Bellary. The minerals are iron ore, lead, antimony, manganese, diamonds, alum, muriate of soda, natron or native soda, saltpetre, gun-flints, and marble. The same term is applied to the districts ceded in 1801 by the Nawab Vizir of Oudh, which now form the eastern portion of the N.W. Provinces, and include Allahabad, Azimgahr, Farrakhabad, Etawa, Gorakhpur.—Newbolt.

CEDRELACEE, the toon-tree tribe of plants, comprising the genera Cedrela, Chickassia, Chloroxylon, Plindesoria, Soy手法, and Swietenia; several species of these grow in the East Indies. Besides the species of Cedrela below, Kurz names Cedrela multijuga of Pegu.

CEDRELA ODORATA. Macfadgen. Chun-sha, Chu-pi, Hwang-ch'nun, Chiao-pi, Chun. A timber tree of China; Its wood resembles mahogany, and is used in cabinet work. The bark of the trunk and root and the fruit are used internally as an astringent. The tender spring leaves are eaten, and the silkworm is fed upon them, and also on the leaves of the ailanthus. The leaves are mixed with those of the catalpa, and made into a wash as a remedy for baldness, and they are taken internally as an antiscorbutic. The timber is particularly recommended for wainscoting rooms, and for chests and the inside work of clothes presses and drawers, from the circumstance that vermin are not known to breed in it, and for splitting into shingles to cover houses. They are very durable.—Macfad.; Smith.

CEDRELA SERRATA. Roeyle. Hill toon, . . . Eng. Drava, Dsiwi, . . . Panj. Tuni. Hindi. Drab, Dimri, . . . This tree is found in most of the valleys of the

N.W. Himalaya, in Kulu, Kanawar, the Murree Hills, Kangra, and Kaghian, from 4000 to 8000 feet above the sea, up to near the Indus. Its wood is of very red, and has a strong fetid smell when fresh; it is lighter and of more open texture than C. toona, for which it is often sold. It stands water well, is well suited for bridges, and is made into sieves. A cubic foot weighs 31 lbs.—Dr. Cleghorn, Panj. Rept.; Stewart, Panj. Plants; Powell, Handbook.

CEDRERA SINENSIS. A. de Jussieu. An elegant tree of Europe and China; wood like that of Cedrela toona, Roxb., used for cigar boxes.—Mueller.

CEDREA TOONA. Roxb. Toon. C. hexandra, Wall. in Roxb.

This large and valuable tree grows at the foot of the Himalayas, and to the south, in Bengal and both Peninsulas of India, in varying abundance. Abundant 25 miles north-east of Travandrum; it is found in the Mysore and Salem jungles in large quantities; also along the crest of the ghats from Travancore to Goa. In Coibatore it is a valuable timber tree of large size. In the races of S. Konkan and Lower Canara, the tree is more common. It grows abundantly in some of the deep ravines in western Kandesh, and it grows in the ravines of the Konkan. At the Tumbar river, in East Nepal, Dr. Hooker measured a toon tree (Cedrella) 30 feet in girth at five feet above the ground. The wood is a choice one for cabinet purposes, but is not used for any others, except for house beams when it is invariably in sufficient quantity. It is called bastard cedar from an aromatic resin exuding from it, resembling that of the American cedar. It is often sold in Madras under the common name of Chittagong wood, and is the most valuable of the woods known by that commercial name,—the true Chittagong wood, however, being Chiccrassia tabularis. Cedrela toona has an erect trunk of great height and size, with smooth grey bark. The flowers are very numerous, small, white, and fragrant, like honey. The seeds are numerous, inbricated, winged. It seems probable that the trees known commercially as toon are at least different species; but the woods sold under this name are all red-coloured, of varying hues. The Gunner Mahalimbo wood, said to be this tree, and to be too highly common, is described as not liable to be attacked by insects, and is on that account used for making boxes, etc. The fruit and bark are used medicinally in fever and rheumatism. The bark is powerfully astringent, but not bitter; native physicians use it in conjunction with the powdered nut of the Cessalpinia bonducella, an intense bitter. M. Nees von Esenbeck has published an account of some experiments on the bark, which indicated the existence of a resinous astringent, a brown astringent matter, and a gummy brown extractive matter resembling amin. The bark was used in Java by Blume in epidemic fevers, diarrhous, and other complaints. Horsfield gave it in dysentery, but only in the last stage, when inflammatory symptoms had disappeared. Its flowers, in conjunction with
safflower, are used by the inhabitants of Mysore for dyeing the beautiful red colour called there Gul-i-nari. A cubic foot weighs 28-41 lbs.—Drs. Roxburgh, i. 635, Hooker, Mason, Gibson, Cleghorn, Stewart; Bedilome; Voigt; Powell.

CEDRUS DEODARA. Lambert. Decodar. 

Pinnus deodara, Roxb.

Cedrus deodora is a magnificent tree growing on the mountains of Keula, Nepal, and Tibet, up to heights of 7000 and 12,000 feet; as also in the woods of Almorah, at Kullu, Kangra, and Kughan. The resinous wood is very durable, lasting from 200 to 400 years. The tract in the Sutlej valley producing deodara lies between long, 77° 59' and 78° 31' E., and lat. 31° 23'/ and 31° 40' N. (Panj. Rep. p. 4). The deodora is not abundant in Hazaar (except in Kughan), and is becoming scarce. Dr. Cleghorn only observed it on the north side of the Mohchpra range, towards the Jhelum, and sparingly on Tandian. Mr. Strong measured a deodora tree in the deodora forest at Nachar after falling. 122 feet long, the butt end girth 14 feet 6 inches, and the top 12 feet 4 inches; another standing about 150 feet high, girth at bottom 18 feet 4 inches. Some he measured 26 feet in girth. The average, taking the whole forest, is not less than 15 feet girth at bottom. The trees are full of turpentine. Cedrus deodora timber is very useful for railway purposes, and 12,000 tons were sent down the Chemah in one year. Decodaria was abundant in Bussahir. In the territories of Maudi and Sukhet, and in the hill states of Koti, Kamharsen, and Bagi, which overlook the Lower Sutlej, all the good cedar trees (Kela) have of late years been removed from within three miles of the river; but the interior hills of Bussahir are extensively clothed with the finest deodara, particularly on the upper parts of the northern slopes, commencing at Nachar, and terminating near the Hangarang ridge, which forms the northern limit of this beautiful tree, and indeed of all arboreous vegetation, except birch and junipers. In travelling along the Hindustan and Tibet road, many cedars may be seen 20 feet in girth, and 100 to 130 feet in height. It is supposed to be identical with the cedar of Lebanon. Its wood is fragrant, of a reddish-yellow colour, highly resinous and inflammable; very durable; yields valuable timber, not subject to warp. The natives of the hills venerate the groves surrounding their temples and religiously conserve them, whilst to the State the wood is of the greatest importance for house and bridge building.—Eng. Cyclop.; Clegh. Rept. on Panj.; Kela and Kangra, pp. 4 to 190; Hook. Him. Journ. ii. p. 41; Hodgson's Nagasaki, pp. 342-3; Royle's Ill. Him. Bot. p. 350; Powell: Gamble.

CEDRUS LIBANI. Barr. Cedar of Lebanon, a native of Lebanon and Taurus; attains to 60 or 100 feet in height. The largest in the latter part of the 19th century measured thirty feet in diameter, and covered a circumference of about 120 feet. Their number has gradually been diminishing. In 1550 Bellon reckoned 30. In 1600 only 24 remained. In 1650 only 23. In 1700, 16; and in 1800, 7; and these seven trees are perhaps the sole witnesses from biblical times. The cones of the deodora are identical with those of the cedar of Lebanon; the deodora has generally longer and more pale bluish leaves and weeping branches, but these characters seem to be unusually developed in English gardens; for several persons, well acquainted with the deodora at Simla, when asked to point it out in the Kew Gardens, have indicated the cedar of Lebanon, and when shown the deodora, declared that they never saw that plant in the Himalaya. C. Atlantica, Manetti, is the Atlas cedar.—Hooker's Him. Journ. p. 41.

CELEBAS, the name of a cicada (Celedabra peloranta) of the tribe of Cletidae, spindle trees. The English name is derived from the Latin inadeo, to sing, a male maleus of the vesicule compact wood. In India the genera of this order are Celebas, Elodea, Anomoeus, Kurrinha, and Micrortis, with the sub-orders Hippocrates and Trigonice. Celebasa spinosa, Boyle, is a thorny shrub.

CELAERUS EEMARGINATUS. Willde. Chneenn chintoo, Tel. This shrub, which grows on the Coromandel coast, makes good fences and fuel.—Roxb. i. 622.

A scrubby, crooked shrub, found on the Coromandel coast and in barren hills, chiefly of the Dukhan. The wood, hard and durable, is sought after as a choice dunnage for roof tiles, said to last for forty years, a duration greatly exceeding that of any other dunnage material.—Roxb. i. 621; Gibson; Voigt: Rohde.

A large scrambling shrub, grows in most parts of India. The red seeds are given to cattle, and are officinal, being considered hot, and administered for rheumatism. The leaves also are officinal; and a deep scarlet-coloured oil, obtained by expression from the seeds, is rubbed externally and given internally in rheumatism. The oleum nigrum, an empyreumatic black oily fluid, is obtained by the destructive distillation of the seeds, but it does not differ in any sensible degree from the empyreumatic product of the distillation of the common fixed oils, containing naphthas and other carburets of hydrogen. Large quantities would doubtless yield paraffin and creosote. The seeds have a hot biting taste; and the oleum nigrum obtained from them was at one time largely employed in Herberi. In Ajmir the seed is imported from Marwar and Godwar; is there considered sudorific, and generally heating, and is swallowed whole in rheumatism. It is used in horse meals.—O'Sh. p. 271; Gen. Med. Top. p. 146; Dr. J. L. Stewart; Malcolmson, p. 312; Gamble.

CELEBES is called by the natives Wugi. It is an island in the Eastern Archipelago. In configuration it has been compared to a star-fish, from which the radiating limbs on one side have been removed; and this very singular form also distinguishes Gilolo, an island not far distant from the island to the eastward. Celebes occupies the centre of the tropical zone, and lies in the Molucca sea. It is
CELEBES.

composed of four peninsulas, with an area of 3578 miles. Its coast presents a great number of bays, gulfs, and capes of eccentric outline. The surface is lofty, with considerable hills, and towards the north are several active volcanoes. Some of the mountains rise 7000 feet above the level of the sea, usually with round or flat tops. Along the borders of the sea are wide plains covered with verdure; and beautiful valleys, some of which enclose magnificent basins of limpid water, raised on a smooth plateau, encircled by a rim of low hills. Thick forests cover the hills and large tracts of the level country with oak, maple, sycamores, cedars, teak trees, and the umbrella tree. These southern prongs form the Gulf of Boni, which stretches three degrees northward into the centre of the island. Its entrance is about 80 miles wide, but narrows to 30 miles, till at its head it again expands to 45 miles. Celebes, on its eastern coast, is fronted by islands; and many islands are scattered over the bays of Tolo and Tominie, or Gunong Tella. Celebes, on its north coast, is in general high, bold land. Its extreme point is called Cape Coffin; and the whole of the islands that stretch from it to Menado Bay are sometimes called Banca islands. The tongue of land in the north of Celebes, known administratively under the name of the Dutch Residency of Menado, comprehends all the northern extent of the island, from the bay of Palos in the west to the cape of Talabo in the east, and comprises the great bay or arm of the sea of Gunong Tella, which stretches in a westerly direction between the two peninsulas. The Residency of Menado includes under its jurisdiction the whole federative states of Minahassa; the small kingdom of the northern coast; also the very extensive districts in the west part of the peninsula, where Government exercise sway, besides the islands of Sangir and Talaut to the north, as well as the lesser island of the west coast and the large gulf of Tomini. In 1842 its population was estimated about 150,000 souls, exclusive of the Alfaras race. In 1881 it was 379,795.

In the S.W. Peninsula, two languages are spoken, the Mangkasa or Mangkasara (which gives its name to the Netherland capital Macassar), and the Wurung or Bugi, which originally was particularly limited to the coast of the Gulf of Boni. North of Macassar, in the most western part of the island, is another people, the Mandilar, who speak a third language. On the island of Buton, which may be regarded as a part of the Peninsula east of the Gulf of Boni, a fourth tongue is spoken. In the northern Peninsula are the people speaking the Gorontalo and the Menado languages (Bikmore, p. 97). Minahassa is in the northern extremity of Celebes. In the interior are a people whom the coast tribes call Turaju, who are said to be cannibals and head-hunters (Bikmore). Macassar is the most notorious place in the Eastern Archipelago for the Bugi people to run amok. It is in fact the national mode of committing suicide amongst the natives of Celebes, and is therefore the fashionable mode of escaping difficulties. Ten or twenty persons are sometimes killed and wounded at one of the amok. Stabbing and killing all he meets, the amok runner is at last overpowered, and dies in all the excitement of battle. It is a delirious intoxication, a temporary madness, absorbing every thought and action (Wallace, i. p. 174). Macassar men is a common name of the Bugi race. The Macassar people were taught Mahomedanism in the early part of the 16th century, but the Portuguese arrived A.D. 1525, and they embraced Christianity (Bikmore, p. 99). The Bugi are now the great navigators and traders and the most enterprising race of the Eastern Archipelago. In the beginning of the western monsoon they go in great numbers to the Aru islands, which is the principal rendezvous for the people of Ceram, Goram, the Ki islands, Tenimber, Baba, and the adjacent coast of New Guinea, a distance from Macassar of upwards of 1000 miles. They carry English calicoes, cotton goods of their own manufacture, Chinese gongs, and arrack; and the return cargoes are tortoiseshell, mother-of-pearl shell, pearls, birds of paradise, and trepang, the Malay term for all the kinds of holothuriae or sea-cucumbers. Of trepang alone about 14,000 pikuls are yearly shipped from Macassar, of the value of 600,000 dollars, or £150,000. It is estimated that the annual value of goods carried by the Bugi to the Aru islands from Macassar alone is 80,000 dollars, or 200,000 guilders; and of those taken to the Aru group from other places, 20,000 dollars, or 50,000 guilders.—Bikmore, 101.

The people of Minahassa differ much from all the other people in the Archipelago. They are of a light brown or yellow tint, often approaching the fairness of a European, of a rather short stature, stout, and well made, of an open and pleasing countenance, with the usual long, straight, jet black hair of the Malays, but disfigured, as age advances, with projecting cheek-bones. The coast people, where there has been intermixture, are coarse; but in inland villages, where the race is pure, both men and women are remarkably handsome. They are quiet and gentle, submissive to authority, and are easily induced to learn and adopt the habits of civilised life; they seem capable of acquiring a considerable amount of intellectual education, and they are clever mechanics. Since 1822, from the introduction of coffee planting and a settled government, the people, though still speaking different tongues, have become the best clothed, best housed, best fed, and best educated in the Archipelago. Much of this has been due to the tractable nature of this people, for near Menado is a race called Banter, strong, but intractable, who have hitherto resisted all efforts to improve them. Some of the less civilised tribes have semi-Papuan features and hair, while in some villages the true Celebes or Bugi physiognomy prevails. The plateau of Tondano is chiefly inhabited by people nearly as white as the Chinese, and with very pleasing semi-European features. The people of Sian and Sangir much resemble these, and Mr. Wallace believes them probably to be immigrants from some of the islands of north Polynesia. The Papuan type will represent the remnant of the aborigines. The languages contain a Celebes-Malay element and a Papuan element, the latter along with some radical elements. These derived from the Sian and Sangir islands further north, and therefore probably derived from the Philippine Islands.

Celebes has iron, tin, and copper. It has about 16 species of land mammals, and about 191 species of birds, 94 of which are peculiar to it. Professor Bikmore says (p. 378) gold in great quantities occurs over all the northern peninsula.
CELEBRY.  

from the Minhassa south to the isthmus of Palas. Livistonia rotundifolia is supposed by Mr. Wallace to be the fan-palm, and the people make water buckets and baskets of the leaf. Celebes has the Carpophaga lucrosa, a fine green-coloured pigeon, also the Coracias Temminckii, and Phainopephus callirhynex, one of the finest known cucokos. Its bill is of a brilliant yellow, red, and black. Of Ophidera radiana, the largest of our species, several of these are to be met with in Celebes. Aceripit turritatus, a beautiful hawk with a great number of large round white spots on the tail; Strix Rosenbergii and S. Javanica, the latter in all the islands up to Lombok. Phlegenes tristigmatis is the ground dove of Celebes. The Maleo, or Megacephalon rubripes, deposits its eggs in the loose sand of the sea-beach, in holes just above high-water mark; the female lays one large egg, which she covers over and returns to the forest; but many birds lay in the same hole. A dozen eggs are often found together. One egg fills an ordinary tea-cup, from 4 to 4½ inches long, and 2¼ to 2½ wide. They are very good to eat, and much sought after. The hen-bird takes no further care of the eggs, which the young bird breaks through about the 18th day, and runs at once to the forest. Each hen lays six or eight eggs in a season of two or three months. Cittura cynotus, the forest king-fisher. Meropogon Forssteni (C. geometra) is a fruit pigeon of North Celebes. Buceros cassidix, the great horn bill of Celebes. Trichoglossus ornatus, a beautiful brush-tongued parrakeet. Corvus adunca, a rare black and white crow. Anon depressicornis (Sapi utan, Malay) is the wild cow of Celebes; it is smaller than other wild cattle, and is found in the mountains. Cynopithecus cristatus, the black baboon monkey. Tachyria zarinda, a rare butterfly, with cinnaabar red wings. Idea tondana, a semi-transparent butterfly of Celebes. Papilio androcles, one of the largest and rarest of swallowed-tailed butterflies. Cincelida heros and C. gloriosa also occur, the latter of a rich velvety green colour. — Quarterly Review, No. 222; Bikmore's Travels, pp. 101-378; Crawford's Dictionary, i. p. 243; St. John's Indian Archipelago, i. p. 351; Wallace's Malay Archipelago; Horsburgh; Temminck, Coup d'Essai sur les Possessions Neerlandaises, iii. p. 68; Journal Ind. As. 1800, p. 764; Jameson's Ed. Journ. 1822, p. 402.

Kuk'in,  ❙ CHIN. ❙ Ye-kin-tai,  ❙  

Celery is a hardy biennial found wild in various parts of Europe, in the southern hemisphere, and in California, by the side of ditches near the sea, where the water is brackish. It is rank and coarse, but by cultivation it is transformed into a sweet and wholesome esculent. When the plants grow in moist ground they are poisonous. The cultivated plant grows best in a rich, well-drained soil. The process of excluding the light, by covering the stems with earth, also tends to render the poison, peculiar to the wild plant, inert. The seeds are sold in every Indian bazar, and used as stimulants by the native practitioners. The roots are also employed in medicine. The essential oil, dissolved in a strong spirit, gives an essence a drop of which will communicate a strong and fine flavour of celery to a tureen of soup. Celeriac is a variety of celery, and managed similarly; root

used for stews.—Riddell; Jaffrey; O'Shaunessy, p. 357.

CELIBACY is the rule with all the Buddhist priesthood, with the gurus of most sects of Hindus, also with the men and women of the Manthow sect; the Phoongyes, Talapoinis, Lammas, and nuns of the Buddhists; the Jain priesthood also are celibates, as also since the 15th century all the priesthood of the Romish Christians. The sheriff families of Mecca affect marrying female slaves, thereby showing the intense pride which finds no Arab noble enough for them. Others take to wife Bedouin girls; their blood, therefore, is by no means pure. The worst feature of their system is the forced celibacy of their daughters; they are never married into any but Sheriff families; consequently they often die in spinsterhood. The effects of this custom are most pernicious, for though celibacy exists in the East, it is by no means synonymous with chastity. Here it springs from a morbid sense of honour, and arose, it is popularly said, from an affront taken by a Sheriff against his daughter's husband. But all Arabs condemnable the practice. —Burton's Mecca, iii. p. 33.

CELOSIA ALIBIDA. Linn.  

Booroonde,  ❙ SANSK. ❙ Gurung kura,  ❙ Tel.  

Pannay keeay,  ❙ TAM.  

This potted plant is of the order Amanran-taees. Booroondie (i. pp. 678-9) mentions C. argentea, C. cerina, C. comosa, and C. cristata. C. cerina, drooping cockscomb, is cultivated as a flower.—Irv.

Both white and yellow varieties are cultivated in gardens. The Hindu, Telugu, and Burman names signify cockscomb, like the English.—Mason.

CELSIA COROMANDELIANA. Vahl. Kuk-shima. A garden weed in India, growing in waste places in the Dekhan, on the banks of rivers, and near still waters. The insipid juice of the leaves is given in dysenter, acting as a sedative and astringent.—Drury.

CELT.  

CELT implements of manufacture, agriculture, and for domestic purposes, used by ancient prehistoric races of the world. They have been discovered in Europe and India. Mr. Allan Hume, C.B., discovered many in Hindustan, and Colonel Meadows Taylor others at Lingsagur in the Mesopotamian district. The implements of flint or chalcedony. Mr. W. Theobold and Captain Fryer found eis or stone weapons in the country extending upwards of 200 miles east of the Toris river, and
CELTIS.

acumulated at Karo in Kirwee. Dr. Mason found them in Burmah almost identical with those found in Europe. The celt chipping or hewing stone, the thunderbolt, the coin de foudre, hierro de tonerre, the Tripoli steen of the Germans, may have been the moon-stones of Brittany, a hatchet, axe, chisel, adze, or wedge. They are numerous in the Channel Islands. These found in the Karnatic are of fibrolite, those of the Swiss lakes are of jade. The natives of Kirwee have adorned some of the celt's with a dab of red paste as Siva. Most of the Andamanese stone chips seem to be arrow-heads for shooting fish, or intended to be used with the fingers in dividing fish and flesh. Flint and chert chippings have been discovered at Kaleyur, Jubbulpur, and Kuttura. Polished celt's occur in Central India. Cores have been found near the Indus, and flakes and cores near Jubbulpur.

CELTIS, a genus of plants belonging to the Ulmaceae. C. australis and C. cananis are the Barka, Huria, of Kaghun. C. dysosyoxylon, Thw., the Gurana gase of the Singhalese, is a small tree which grows up to 5000 feet in the Central Provinces.—Cleghorn's Report; Thw. Zeyl. p. 267.

CELTIS AUSTRALIS, the lotus tree of N. Africa, S. Europe, and S. Asia, ascends the Himalaya to 9000 feet. It attains a height of 50 feet, and lives to a thousand years. Berries edible, wood hard and dense, suited forturnery and carving. The stem-wood is fine-grained, easily cleat, and of a splendid yellow tinge. The branch-wood is excellent for whip-sticks.—Von Mueller.

Fruit—Kangal mirth, Inarba, Hind.

This fine tree is common, wild, from 2500 to 8000 feet in the Panjab Himalaya, and occurs in Trans-Indus down to 1500 feet; and Dr. Griffith says it is cultivated in Afghanistan. It attains 167 feet in girth; and trees of seven or eight feet are not uncommon. Its timber is white, light, soft, weak, and subject to the attacks of insects. It is chiefly used for farmer's work, charcoal and fuel. Dr. Bellows mentions that in the Peshawur valley it is often made into charms to keep off the evil eye from man and beast, and Dr. Cleghorn states that its bark is used for sandal.—Dr. Bellows; J. L. Stewart, M.D., p. 209; Cleghorn.

CELTIS ERIOCARPAR, a nettle tree, koo of the Panjab, is found in the Subile valley between Ram-pur and Sungnam, at an elevation of 6000 feet. Bark and its shoes.—Cleghorn.

CELTIS NEPALENSIS. Planche. Baktar, Tago, of the Trans-Indus and Panjab. Dr. Stewart found it in parts of the Jhelum basin and Trans-Indus at about 2500 to 3500 feet. The Pathans are said to use its tough wood for churn-sticks—Dr. J. L. Stewart.

A tree which is pretty common all over India, and in Kuhl is planted in avenues. Dr. Buchanan Hamilton says the under bark of this tree, like that of the West India kind, consisting of numerous reticulated fibres, forms a kind of natural cloth, used by the Garo (Lin. Trans. xvii. p. 209) as a kind of rug. The Garo make several such cloths of different colours from various barks. The Garo who eerste in the plains, generally buy some small ends of cloths from the Bengalis, to attend the hants (fairs) in, not as clothing to protect them from wind and weather.—Roxb. ii. 65; Royte, Bif. Pl. 317; Cleghorn; Kulha, 80.

CELTIS TRINERIA. Roxb., iii. 65. C. Roxbighri, Planche. This good-sized tree grows in Eastern Bengal, is met with on the Eastern Ghats of the Madras Presidency, Golconda hills near Vizagapatam, at 3000 feet elevation; also on the Bombay Ghats. CELTIS WIGHTII. Wight, Ic. Not uncommon in the hot, drier parts of Ceylon.—Th. Zeyl.

CEMENT.

Lime, septarian, dolomite, magnesite, gypsum, and other substances are used in manufacturing cements. The shell lime of Soooolorpet is a pure carbonate of lime. The kankar or nodular limestone of India are more durable, though not so white. Septarian, or Parker's cement stones, accompany the strata of blue and white potter's clay and kaolin that are so common in the Madras Presidency. The best hydraulic septarian occur at Away near Madras, at Bangalore and Chingleput. A very fine hydraulic cement on the banks of the Godavery was extensively used in the construction of the Godavery and Kistna anicut. A very good hydraulic limestone occurs along with the blue slate of Cuddapah, and the dolomites of the Ceded Districts and the Northern Circars make good cements. The magnesite of Salem, Bangalore, and Vizagapatnam acquires great hardness of surface, but is deficient in adhesiveness. It possesses some good hydraulic properties, but has disappointed the expectations at first formed of its usefulness.

The ordinary Indian cement is lime in its various forms; a cement capable of bearing a pressure of 650 to 1000 pounds and upwards is produced from ordinary kankar, combined with a certain proportion of pure limestone. Kankar is a limestone mostly nodular, always fresh-water and recent,—in most cases in the act of being formed under our eyes. It is sometimes found in thick stratified beds like the travertine near Rome, and seems in this case to have been formed by calcareous springs; more generally it is met with in clay or alluvial soil, in the shape of small pieces from the size of peas or filberts to that of the hand. In the blue clay which stretches along the Indian shores it is found in vast abundance, generally assuming the most fantastic forms; indeed, it abounds in every rice field and open soil all over the country. The more recent varieties seem to be formed by the agency of the rains; when the earth abounds with vegetation, the tepid waters are charged with fixed air, and dissolve the lime prevailing in the soil everywhere around, the mineral being again thrown down as the advancing season dispels the excess of gas. It in this state absorbs the clayey matter around, and cements it into kankar. This is collected by the lime-burner, placed with firewood in small-sized conical kilns, and burnt in the usual way. It contains 72 of carbonate of lime, 16 of sand, and 11 of clay and oxide of iron. Mixed with half its weight of river sand, it makes an excellent mortar; burnt in pieces of a cube
inch or so in size, and then powdered without slaking, it forms a first-rate water cement, setting in a few minutes, and becoming as hard as stone. At Poonah the finer varieties of kankur are burnt with charcoal, in neat kilns 2½ feet high and in diameter at the base. These hold about a cubic foot of material, or about 36 lbs. of charcoal and kankur in equal parts. When burnt, it is slaked and then made up into bricks, which are sold in the bazar for the purpose of whitewashing. The finer kinds of lime and cement on the Coromandel coast are made from shells. A piece of ground about ten feet square is laid down even, and floored over with clay; an upright pole is placed at each end of this, and then, as the chips are thrown on, long back-stays spread between the poles, which are steadied with strings. On the floor a bed of shells and rice-chaff alternately, about ten inches thick and eight feet by six, is spread neatly out. Some firewood is placed along the windward side of this, and when the sea breeze sets in the wood is kindled. As the heat extends to leeward, and the shells become calcined, the lime-burners draw off the fore-parts of them with a stick, and so soon as they have cooled on the floor sufficiently to allow them to be handled, they are placed in a scoop basket, and the dirt and epidermis winnowed from them. The shells, now white and pearly, are next thrown into a small-sized vat partially filled with water; here they for some time boil from the effects of the heat and slaking. The whole in a short time settles down into a fine semi-fluid mass, which is taken out and slightly dried, and is now ready for use. A good hydraulic cement is formed of this fine clay of Malwa and shallower. But these, or similar, bricks seem to have been employed as cement in Babylon. The works of salt and bitumen even yet around Hit, give most a singular appearance to the country; and the most learned geographers are of opinion that the town of Hit is the Is of Herodotus, whence the Babylonians drew the bitumen in which they set their bricks. All over the East an exceedingly hard cement, which they use as mortar and to form the lining of baths and reservoirs, is made with equal parts of wood ashes, thoroughly sifted, and powdered lime, and by others with two parts of lime to one of ashes, but in either case these materials are well mixed. Water is then poured upon them, and they are well kneaded, after which the mass is beaten for six days by two men with large sticks, uninterruptedly, except at night; when it becomes a little solid on one side, it is turned over and beaten on the other, care being taken to moisten it if necessary, lest it should become too dry. When thus well mixed, it is folded and turned, and beaten again and again till the sixth day, when it is ready for use. In building, this cement is laid between the bricks, which are tightly pressed upon each other; for lining it is laid upon the surface that is to be covered, and spread with a flat and polished flint, for it must not be touched with the hand, as it would burn. Three layers are put on successively, and the third is washed over with oil, but of what kind is immaterial; when it is dry, nothing can equal the beauty and solidity of this cement, which is called "saroj." There is another description, called "saroj maghrebi," but it is not so much used; this is composed of one-third of hot lime, one of sifted sand, and one of pounded brick.—Ferrier, Hist. of Afghan., pp. 296-9; Skinner's Overland Journey, ii. p. 113; Dr. Bist in Bombay Times.

CENTAUREA, a genus of hermit crabs in moluscs. C. clypeata, Edw., Asiatic seas; C. rugosa, Indian Ocean; C. spinosa, Asiatic seas; C. perlata, South Seas.

CENSUS. A rough census of the population, called 'Khanm-shumari,' was always made under the Indian princes. The dislike to a census in the East appears to arise from the necessity of mentioning their women, also a vague fear that Government is plotting some mischief against them, and an unreasoning aversion to assist in rousing divine wrath by what they consider such a display of pride as that of numbering the people. Since the year 1867, the British Indian Government has had a census of several provinces, followed in 1871-72 and 1881 by a general census of all India. That of 1881 was estimated to cost twenty lakhs = 2,000,000.

Centaurea is a genus of ornamental flowering plants common in India. The flowers are fragrant, and of different shades of colour—purple, blue, yellow, white, red, brown, etc. C. atropurpurea is the sweet sultan. C. Behmen root is brought from Kabul, and is used in special diseases as a bitter tonic and purgative. The red kind, Behmen or Behmen surkh, is said by some to be the root of the Salvia lasiades.—Porell, i. 355.

CENTETES ILIGER. Smth.

Wei; Withania. | Ten-ree or Tend-ree, Exo.

Several species of this genus of mammals are said to occur in China. The bristles are made into brushes.—Smith.

CENTIPEDES are very common in the East Indies two to six inches long. They are generally supposed to be poisonous, but such is not the case.

CENTRAL ASIA is a term used differently by geographers, ethnologists, and politicians; by the last of these it is usually applied to the region intervening between Russia in Asia on the north, and Persia and Afghanistan on the south, and lying to the west of Chinese Tartary, its chief western boundary being the Caspian Sea. The Russians often restrict the term Central Asia to the second great division of the Central Asiatic highlands of their Asiatic possessions, which is mainly comprised within the Aralo-Caspian depression. The vast plateau of Central Asia proper has on its east the lofty table-land of the Bolor mountains, which form the western boundary of Chinese Turkestan and Dzungaria, and the former Irtysh; the northern boundary is Western Siberia, and Afghanistan lies south-east. The northern half of Central Asia consists of the Kirghiz desert, which is mountainous and rugged on the east, and full of saline steppes on the west. In the midst of the southern half lies the Sea of Aral, on the western side of which, up to the Caspian Sea on the west, there stretches a broad tract of desert. But on its eastern side is a fertile tract, watered by the Syr Darya and Amu Darya, the Jaxartes and the Oxus, and it is in this fertile tract that the conquists of Russia were made between 1864 and 1868. After long years spent in fortifying posts, in 1864 Russia made a sudden irrigation into the upper valley of the Jaxartes, and took three forts of Khokand, viz. Aoulletta, Turkestan,
The water-parting between the Upper Amu Darya and Indus basins.

The range seems to run north-west and south-east, between the Kashgar and the Karakorum, at a mean elevation of 20,000 feet, culminating in Mount Tagharma (Taghalma), 25,500 feet.

The Trans-Alai, seen by Kostenko in 1876, he describes as an alpine chain 10,000 to 12,000 feet high, forming the northern boundary of the Pamir, which stretches thence southwards, and which is crossed in every direction by ridges, all rising above the snow-line, and dividing it into a number of upland plains. The whole region is destitute of trees and shrubs, and even the grass grows only in isolated patches along the banks of the streams.

The great Central Asiatic plateau consists of several distinct sections, grouped round the central basin of the Tarim, which is little over 1600 feet above sea-level. South of it the land rises in successive stages from 3000 to 6000, 10,000, and 15,000 feet, the probable mean altitude of the Tibetan plateau. Above this vast table-land the intersecting ranges attain altitudes of from 20,000 to 25,000 feet, culminating in the southern scarp of the Himalaya, with peaks ranging from 26,000 to 29,000 feet. North of the Tarim basin, also, the land rises in terraces of 5000, 6000, and 15,000 feet, here culminating with the Tengri-Khan (25,000), central and highest point of the Tian Shan. Beyond the Tian Shan the ground again falls gradually to about 1500 feet in the Zangarayan depression (Tian Shan Pe-lu), north of which it attains a height of 7000 or 8000 feet in the Kobdo plateau. This elevation is maintained in North Mongolia eastwards to the head waters of the Amur, but in the central parts of the Gobi desert stretches from Lob Nor at a mean height of about 3000 feet to the Khingan range.

Lastly, the closed basin of the Koko Nor, between the Nan Shan and Burkhun Buddha ranges, stands at an altitude of not less than 10,500 feet above sea-level.

Central Asia has a hardy pastoral dwelling in the mountain region, with its vast upland downs well suited for summer pasture, partly denuded of the original inhabitants and in part composed of the many races who have swept through the country. At the foot of the mountains, in tracts of surpassing fertility, Uzbak, Turk, Bokharian, Kalnuk, Kirghiz, Kazak, Tajik, Sart, Russians, Ouigur, Manchu, Chinese, Armenian, and Indians dwell in the well-watered plains. Beyond these, in every direction, are the pathless lands, which have been tenanted by pastoral nomades ever since the earth was peopled. They have dark complexions, and dark colour of hair. The Mongol race is represented by the Kalnuk, who have dark hair, olive complexions, oblique eyes, flat faces, high cheek-bones, thin lips, and fat noses. The remaining races, such as the Mongolo-Turk and those of Turkno-Finnish extraction, present a strange mixture of types and shades of complexion. One remark among them fair men, with a regular Roman nose. Generally speaking, however, in the physical appearance of these tribes, there is observable a mixture of the Caucasian race with the Mongolian.

Its people are from two distinct sources, viz. the
settled races, descendants of Semitic and Iranian conquerors from the south; and the races who have been occupying the country from prehistoric times, and are in their habits the same as they were 2000 years ago.

I. TURK STOCK.

Uzbeks, viz. Kungrad, Naiman, Kipchak, Jalair, Andijan, in Bokhara, Farghana, and Khiva,

2,000,000

Kara Kalpak, viz. Baymakli, Khanbilek, Achamayli, Ingakli, Shaku, and Ontoturk, mainly on the south and south-east shores of the Aral,

50,000

Kathly Kulp, viz. Great Horde (Ulu-Yuz), Middle Horde (Urtu-Yuz), Little Horde (Kachi-Yuz), Inner Horde (Bukeyeskoyaya), in the steppes between Lake Balkhash and Lower Volga;

2,750,000

Kara Kirghiz (Buruts), of Tian Shan and Pamir;

400,000

Turkcomans, viz. Tekke, Goklan, Ynom; Sarik; Salor, Kara-Ali, Eli; Ersari, Chaudor of Ust-Urt, Khwarezm, Daman-i-Koh and left bank of Oxus;

600,000

II. IRANIC STOCK.

Tajiks, Sar, Persians, in Khiva, Bokhara, and Farghana;

1,000,000

III. GALICHA STOCK.

Maghians, Khant, Falgar, Mache, Fang; Yagnaub and Karateghin in Farghana, Zar-afshan, Karateghin highlands and Upper Oxus valleys;

250,000

The Turko-Tartarie race stretches from the Polar Sea to the Hindu Kush, and from the interior of China to the shores of the Danube. Vambery divides the Turks who from east to west occupy this extent, into Burut, Kara-Kirghiz black, or pure Kirghiz, properly Kazak, Kara Kalpak, Turkoman, Uzbak. The name by which Vambery designates these people is Turko-Tartars, from amongst whom came the warrior peoples known in the west as the Hun, the Avar, the Utigur, the Kutrigur, and Khazar. But the manner of living, the customs and physical conditions as then described, of the Tartar tribes whose arms reached from the Jaxartes to the heart of Rome and Gaul, have much resemblance to those of the present inhabitants of Turkestan and the people of Central Asia, particularly the nomadic tribes, in their social habits the same as they were two thousand years ago. In the tent of many a nomad chief a similar life is observable as that described by Priscus as prevailing at the court of the king of the Huns. Attila, Chengiz Khan, and Timur in historical characters resemble each other; and Vambery is of opinion that energy and good fortune could now almost produce on the banks of the Oxus and Jaxartes one of those warriors whose soldiers, like an avalanche carrying everything before it, would increase to hundreds of thousands, and would appear as a new example of God's scourge, if the powerful barriers of our civilisation, which has a great influence in the East, did not stop the way.

The Turk, wherever met with, is ever heavy and lethargic in his mind and body, but in his resolves firm and steadfast, not from principle, but from apathy and aversion to change. And it is from these characteristics that his appearance is earnest and solemn,—a profound seriousness, a marble, cold expression of countenance, with a great inclination to pomp and magnificence. An Uzbak or Turkoman has a proud bearing, as if possessed with a self-consciousness of greatness and power. The Osmanli Turk's love of independence is boundless. He considers himself born to rule, and that hunting and war alone are worthy of him, and husbandry is considered ignominious. In Central Asia, agriculture is exclusively in the hands of the Persian shoemakers, commerce and business are with the Tajak, Hindu, and Turk. The Turk is intellectually the inferior of the Iranian and Semitic nations. This defect is noticed by other nations, who apply the terms Turkulik (Turkdom), Kabalik (absurdity), and Yogunlik (thickness), Sadelik (simpleness); and with these qualities, as the Osmanli is easily taken in by the Armenian, Greek, and Arab, the Turk is as easily so by the Tajak and Hindu. In transactions the Turk are regarded as possessing more honesty, frankness, and confidence, plainness, simplicity, and uprightness. Compared with the Persians, the Turk is a faithful servant, attached soldier, and upright man. They are more brave, persevering, and love more to rule than any other Asiatic people. They are unpolished, wild, and uncultivated, but seldom cruel out of malice. They crave riches, but only to expend them. They exact much labour from their subordinates, but protect and deal liberally with them. The Turk is immodest and uncivilised, and, like other Jaws, distinguishes for hospitality. The Burut is the wildest and most savage and most superstitious of them, but less malicious than the Kirghiz and Turkoman. The Burut has not wholly abandoned shamanism, and knows little of Islam.

The Kazak Kirghiz are less brave and warlike, though readily engaging in a pillaging expedition. They form the bulk of the Turkish nomades, and are for the most part devoted to a wandering life. In very few instances have they settled.

The Kara Kalpak are considered dull and foolish. They are even less warlike than the Kirghiz. They have seldom appeared as conquerors, and are even less employed as mercenaries. They are largely occupied as cattle-breeders, and they are active, benevolent, and faithful.

Many of the Turkoman dwell in a half-settled state along the left bank of the Oxus as far as Char Kiyuni, and make their living by trade, amongst the races of Central Asia as the most restless adventurers. Throughout the whole globe it would be difficult to find a second nation with such a restless spirit and untameable licentiousness as these children of the desert. To rob, to plunder, to make slaves, is to the Turkoman honourable. They are always poor, and are dirty andavaricious. Their country is the wildest and most savage, where even keeping a few cattle gives only a scanty income.

The Uzbak are honest, upright, with much Turkish open-heartedness, and are proud of their education, and represent all the best side of the natural character of the Turks.

The nomad races of High Asia are so essentially predatory, that, according to Abai Ghazi (p. 106), they have a proverb, 'Atang yortin jan Chapa'—if the enemy attack thy father's tent, join him and share the plunder. The people are chiefly gathered about the fertile tracts. Merv, destroyed in 1784 by the Amir of Bokhara, is now a mere collection of mud huts. Khiva, in 1874, had only 5000 inhabitants. Urganji is near it. Bokhara, in 1830, had 140,000 inhabitants, but in 1889 only 7000, of
whom two-thirds are Tajaks; the loss of water from the Zor-aslan is the cause of its decay. Samar- can, on the other hand, has risen from 8000 in 1834 to 30,000 in 1880.

The double-humped camel belongs properly to high Central Asia south of the Gobi desert, and would even appear still to exist there in a state of nature. Its western boundary, where bred, seems to be among the Kazak (or Cossack), north of Bokhara. Lieutenant Wood, of Sir A. Burnes' party, who explored the Oxus to its source in the S. of Kol lake in Panir, in Wakhan, learned that it is bred only among the Kirghiz of Panir and Khokand. Burnes remarks that the Bactrian camel, which has two humps, abounds in Turkestan; they are bred by the Kazak of the desert north of Bokhara. In its proper and more elevated habitat, this animal is employed together with the yak, as observed in an easterly direction by MM. Huc and Gabet.—Porter's Travels, i. p. 112; Fortnightly Review, 1868; Dr. Jackson in Transactions of the Beng. As. Soc. iii. ; Russions in Central Asia, Captain Valnikhoun and M. Venmukh; Malcolm's Persia, i. p. 20; Stealler's Narrative; Vambery, Sketches in Central Asia, pp. 283-312; Vambery, Bokhara, p. 247; Asia, by Mr. Keane and Sir Richard Temple.

CENTRAL INDIA is the designation for a geographical and political division of British India. It is a table-land of uneven surface, from 1500 to 2500 feet above the sea, bounded by the Aravalli mountains on the west, by those of the Vindhya on the south, supported on the cast by a lower range in Bundelkhand, and sloping gradually on the north-east into the basin of the Ganges. It is a diversified but fertile tract. The Patar or plateau is about 700 miles long. Its breadth varies very much, greatest from Amjherra to Ajmir, 250 miles; from Mhow to Mokundurra, 150 miles; at Sagar and Dumooh, 75 miles; afterwards very narrow. It is highest towards S. and W.; average of Udaipur, 2000 feet; Malwa, 1500 to 2000; Bhopal, 2000; Bundelkhand, about 1000; Shahabad, 700; plain of Ajmir, 2000; Udaipur town, 24° 57', 73° 49', 2064. It slopes to N. into the Banganga river flowing in that direction; gradual fall also to the valley of the Chambal river, where it rises to Malwa; Mhow, 2019 feet; Dhar, 1908; Indore, 1998; crest of Jaum ghat, 2328; Ujjain, 1698; Adiyagurh, 1340; Amjherra, 1890; Sagar, 1940; Rhotasagarh, 700; Sonar river, at source, 1900. From the Vindhya range the surface has a generally gradual but in some places abrupt descent, as at Mokundurra and the Bindyachal hills, where the rivers occasionally fall over the brow in cascades. Shahabad district is very rocky and uneven.

This region is ruled by about 131 princes and chiefs,—Rajput, Bhil, Mahomedan, Maharatta, and Brahman,—over subject races of non-Aryan, Scythic, Aryan, Arab, Afghan, and Persian and Moghol descent, over Hindus, Baghel, Bhil, Gond, Gujar, in S. Maor, Meja, Rajput, and cultivating tribes of Kumbi, Kurni, and Mali. Their political relations with British India are superintended by the Central Indian Agency stationed at Indore, with subordinate agencies for Baghelkhand, the Bhil, Bhopal, Guna, Gwalior, Indore, and Western Malwa. The states and chiefships in Central India form a political, and are in a natural, division of British India, and include an area of 83,600 square miles, and a population of about eight millions.

The people of Rewa are indentol and untrustworthy, and they and the country generally are certainly far less civilised than the neighbouring state and people of Bundelkhand. The country and people vary greatly in their character. Nothing can be a greater contrast than the desolate wilds and jungles of the Western Satpura hills and parts of the country extending from them to the Vindhyas, with their savage inhabitants, the Bhil, tribe, who abhor field, or indeed any other manual labour, and the adjoining richly-cultivated plains of Malwa, extending, with occasional intervening tracts of hill and jungle, from the Mytho on the west to Bhillasa on the east, a stretch of close on 200 miles, and from the crest of the line of the Vindhyas to Munderissore and Oumutwarra, a distance of from 100 to 120 miles, and populated by a thrifty agricultural people. This is succeeded by the more hilly and jungly land of Oumutwarra, Serrone, and Kechiwarra, with their scanty population. Northwards towards Gwalior, the country becomes more open, except on the wild border tracts of Kotah of Bundelkhand, till we come to the carefully cultivated plain of Gwalior, stretching for a distance of 140 miles between the Chambal, Patwa, and Son rivers. A vast portion of Bundelkhand is hilly and unproductive, forming the northern slope of the table-land of the Vindhyas, but the scenery is strikingly grand (Ann. Ind. Adm. xi. p. 341). Raja Rama, Baghel, protected Humayun's wife, mother of the emperor Akbar. The Baghel are of the Solunki rajput race. The four agricultura, or fire-bom Rajput tribes, the Chahuan, Solunki, Powar or Pranwar, and the Purihar, are now mainly found in the tract from Ujjain to Rewa, near Beares. And Mount Abu is asserted to have been the place of their miraculous birth or appearance.

Though widely different in other respects, there is one characteristic common to the Baghel of Rewa, the Bundel of Bundelkhand, and the Rajput of Gwalior and Malwa,—a dislike to labour or serve away from their homes, so that they do not generally take an active part in the business of tillimg the soil, such being, as a rule, left to servile classes. They are throughout the territory generally regarded as the local heads of society or of the village communities to which they belong, and many of them possess much influence amongst those around them as the representatives of the ancient families of the respective clans. In Malwa the principal trade maris are Indore, Bhopal, Ujjain, Munderissore, Rutlam, Dhar, Jowra, Augur, Kewag, Shoojavulpur, and Bhillasa. Opium chiefly is sold in Rewa; its chief is of the Baghel race. Tin and copper are found in Udaipur.—Treaties, Engagements, and Sumnads; Tod's Rajtan; Pioneer; Ann. Ind. Adm. xi. pp. 312, 333.

CENTRAL PROVINCES form an administrable portion of British India, lying between lat. 20° 17' E. and 24° 27' N., and long. 7° 49' E. to 17° E. During Lord Canning's rule, the provinces of Nagpur and of Sanogor and Nerbudda were united under a Commissioner. They consist of perhaps the grandest plateau on the face of the globe, more than half of it covered by the densest jungle, where the wild beast finds its lair and the Gond savage a precarious subsistence. For revenue purposes it has been arranged into the four dis-
CENTRAL PROVINCES.

districts of Nagpur, Jubbulpur, Nerabadla, and Chhattisgarh.

The Nagpur province and the Saugor and Nerbadda territories occupy almost all the old territorial division of Gondwana.

Saugor and Dumoh districts are on the Vindhyah table-land.

Mandla, Jubbulpur, Narsinghbad and part of Newar are in the Nerbadda valley.

Baitool, Chhindwara, Seoni, and Balaghat are on the Satpura table-land.

Nagpur, Warda, Bhondara, and Chanda are on the Nagpur plain, in the valleys of the Warda and Wainganga.

Rajpur and Bilaspur are on the Chhattisgarh plain, and Sumbulpor is in the valley of the Mahanadi.

Upper Godavery is on the left bank of that river.

The plateau is in the very centre of the Peninsula. From it, as from a focus, radiates great rivers. To the north flow the Son into the Ganges, the Cane, the Betwa, and the Chambal into the Jumna. To the west are the Tapti and Ner badla, and to the east the Wainganga, Warda, and Peinganga, which join the Godavery. What the K<Integer>u Lam mountains are to the river system of Central Asia, and the Himalaya to Northern India, that is the Mahadeo range to the Dehkan. To the east of Bhandara and parts of the Chanda districts is an irregular expanse of water, the largest portion at Nawagan being 17 miles in circumference, with a depth in places of 90 feet, and many Hindu temples have been erected at the scenic spots. On this wide table-land there is soil of surpassing fertility; its woods are inexhaustible; and it has coal, iron, precious stones, and gold. Here all the emigrants of Great Britain for the next decade might settle and grow rich. The area is 112,912 square miles, of which 47,299 are unculturable, and in 1868 about half of the remainder was under cultivation.

Between the Census of 1872 and 1881, the population increased in the districts from 8,173,924 to 9,583,791, an increase of 1,604,967; and in the Pedutary States from 1,049,710 to 1,709,720, an increase of 660,010; or a total increase of just twenty-five per cent.

The Native States are—

In 1872 the non- Aryan tribes numbered 2,014,751, of whom 1,669,835 inhabited British territory.

Most of the Gond chiefs have a Rajput ancestry mixed with aboriginal blood.

The Satpura plateau runs nearly east and west for 600 miles. It is the true barrier between Northern and Southern India, and is the line on which the settlers from Hindustan met the emigrants from the Dehkan and Maharashtra, each of them pressing into the richer parts of the great natural fastnesses of the mountain range. The Satpura mountain range, extending from Rajpilah to Asirgarh, is a belt of mountainous country 40 or 50 miles in breadth, with an average height of 2000 feet.

In Gondwana there are now only two millions of aborigines, one of the total population of nine millions. The remaining seven millions almost amount to a microcosm of the people in India, and justice is administered in the Central Provinces in five different languages, viz. Urdu, Hindi, Maharati, Uriya, and Telugu. In round numbers, the seven millions may be thus classified:—1½ millions speak Maharati; 1½ do speak Uriya; 4 do. speak Hindi.

Dr. W. W. Hunter gives the following as the languages peculiar to Central India:—

Ho (Kol)... Mandala... Kolami... Khond. | Kol (Sing... Rajmahali... Madi... Savara. | Gondi... Madi... Galaba. | Santal... Gayeti... Kuri... Yerukala. | Bhumij... Rutlik... Keikadi... Chentam. |}

Kolarian tribes occupy the broad belt of hilly country that runs almost continuously across India from the Satpura tracts to the Kurku settlements. The Santal in the east, and the Kurku in the west, speak a language substantially the same.

The Central Provinces Kolarian tribes are:

Bhil... Byga... Kol... Nahr? | Bibilala... Dhangar... Kurku... Aguria? | Bhunjah... Guiba... Mahito... Goli? | Bhumia... Kwar... Manji... Source? | Binjarw.

The aboriginal Dravidian tribes are:

Gond... Huha. | Bhatta Gond... Khond. | Dhunwar? | Durweh... "... Ko. | Mare... "... Maria or Gotsawar. | Punke.

Other occupants of the Central Provinces are:

with a sprinkling of Rajpute, Brahmanas, and Mahomedians in almost every district.

In the extreme west in Nimar are the Bhil. From thence, going to the north-east, we find along the Satpura range the Kurku and Gond,—the Kurku belonging to the Kolarian family, and the Gond to the Dravidian.

The Kurku are not numerous, and are chiefly to be found in the hilly part of the Ichhugnabad, and the adjoining northern part of the Chinswara district. In these localities they meet with the Gond, and a few Kurku are also found in Baitool.

The Gond are numerous in the plateau district of Son and in the south of Jubbulpur, and they are found also in the hilly parts of Jubbulpur.

The Gond, Byga, and Kol form a large section of the population of Mandla, and the Gond and Byga are also in the hilly parts of Balaghat south of Mandla.

The Oor ya occupy entirely the Sumbulpor district.

The Khond dwell in the country surrounding the Oor ya in Sumbulpor and to the south.

The Hindu races are numerous in Raipur and Belaspur, but a number of Gonds are scattered about, and the Gond are numerous in the wild parts of Nagpur and Chanda, and on the Panchita and Godavery river the Maharatta and Telung races meet.

The Maharrahs proper, consisting chiefly of Maharatta, Brahman, and Kumib, scarcely exceed half a million in number, but, owing to the pro-
CEPHALOPODA.

The Ctenophora, or comb-jellies, is a group of marine and freshwater animals, characterized by a radial symmetry and a transparent, jelly-like body. They lack true internal organs and have a scolex at the front end that is used for attachment and feeding.

The species are distributed worldwide, with the majority found in the oceanic regions. They are primarily known for their ability to change color and shape, which they use for camouflage and communication.

The Ctenophora are not closely related to the echinoderms, the group to which the sea urchins and starfish belong, but rather to the jellyfish, which are also members of the Cnidaria phylum. This group includes other well-known marine animals such as corals and sea anemones.

The comb jellies are found in both the oceanic and freshwater environments. They are often found in the plankton, where they feed on small organisms such as bacteria and phytoplankton.

One of the most interesting aspects of the comb jellies is their ability to change color and shape to blend in with their surroundings. This ability is known as chameleon coloration and is used by the animals to avoid predation and to capture prey.

Another unique feature of the comb jellies is their ability to regenerate lost body parts. When a comb jelly is attacked, it can regrow lost body parts, including its entire body. This ability is known as regenerative capacity and is also found in other marine animals such as the sea stars.

The comb jellies are not only interesting for their unique features, but they also play an important role in the marine ecosystem. They are an important source of food for many larger marine animals, and their presence can help to control the population of other organisms in the ocean.

One of the most well-known species of comb jellies is the lion's mane jellyfish, which is commonly found in the North Atlantic Ocean. It is known for its large size and distinctive appearance, with tentacles that can grow up to 40 feet long.

In conclusion, the Ctenophora, or comb-jellies, are a fascinating group of marine animals with unique features and a significant role in the marine ecosystem. Their ability to change color and shape, regenerate lost body parts, and control the population of other organisms make them an important species to study and appreciate.
rock of Southern India are numerous about Oota-
too and Trichinopoly.

CERAMIC AND BUT

CERAMOTAXUS DRUPACEA. Siebold and
Zuccarini. A splendid yew tree of China and
Japan, hardy, and rising to 60 feet. C. Fortunei,
Hooker, is a variety. C. pedunculata occurs in
China.—Von Mueller.

CERAMBYX VATICa, or Sal grub, burrows in
the wood of that tree, and is sought for by the
woodeckers. See Insects.

CERAMIC MANUFACTURES. The manu-
facture of porcelain, earthenware, etc., is an
art which has for hundreds of years been per-
fected by the Chinese and Japanese, and has also
been acquired to some extent by the Asiatic races
who have embraced Mahomedanism. But the
Hindu races, though making many beautiful
models in clays, have never finished off their work
by costly glazing. Their action in this matter
has been owing to their views as to ceremonial
imparity, which necessitates the destruction of
earthenware from many ideal pollutions; and as
to break up or throw away valuable porcelain
would be ruinous, they use largely coppered
brass utensils, which can be purified by fire or
water, and common unglazed clay-ware of little
money value, which can be thrown away. Urns
of elongated shapes have been discovered in
ancient Chaldea; and in British India, fine speci-
mens of common earthenware, ancient funereal,
domestic, and cooking vessels, are dug out of
the old tombs in the districts of Coimbatore
and South Arcot. This kind of pottery has
been found in many parts of India in tombs
usually arranged in circles, each tomb being
built of six slabs of stone, and occasionally sur-
mounted by large mounds of loose stones and
earth. They have been thought to resemble the
Druidical tombs of England, and are supposed to
be of great antiquity, there being no records of
them extant. The pottery found in them usually
consists of tall narrow cinerary urns of 18 or 20
inches in length, with three or four clumsy feet
four inches in length, and of a variety of round,
ovoid, and flattened shapes of different shapes and
sizes, some having apparently been used for cook-
ing and others as drinking vessels. The tall urns
usually contain burnt human bones, teeth, and
ornaments of brass or copper; they are made of
a coarse clay, which have not been finished with
care. Some of the flattened oval and rounded
vessels are made of a fine dense clay that has been
carefully prepared; the surfaces are variously
ornamented with wavy or crossed lines of red and
yellow, carefully painted. The pottery appears
also to have been smeared, and it resembles the
poterie antique vernissée et lustree figured by
M. Brongniart. There is great purity of form in
most of the vessels, which resemble the Etruscan
in the precision of the curves and in the angles at
which the different surfaces meet. The art of
pottery appears to have deteriorated in India since
these articles were made, and one branch of it,
viz. the making or thin glazing on the surface,
is rarely practised. Nearly all the porcelain used
in India by Mahomedans and Christians is imported
from China and Great Britain.

In Egypt, the pyramids of Abu Rowash, which
may very well date from the so-called second
dynasty of Manetho, are surrounded by heaps of
broken vessels. Beside this, the pottery made at

CERAMIC MANUFACTURES.

Thing Thao in China, in 2255 B.C., is modern.
Some made of earthenware, finely glazed with
a tawny or grey colour, and bearing the names of
such old kings as Cheop, Chephren, and others of
the pyramid-building dynasties, are not at all
common. The potter's wheel is said to have been
first used in Japan by a priest named Giyogi, a
native of Izumi, in 724 of the Christian era; and
it is stated that the art of making pure porcelain
was introduced into Japan about A.D. 1513.
The rarity of pottery all over Europe after
the fall of the Western Empire is a curious fact.
The practice of making encaustic tiles, which became
one of the most beautiful of medieval arts, betrays
a revival; and by the beginning of the 8th cen-
tury the Moorish wares of Spain had become
famous. It is from a offshoot of the Moorish
manufactories in the Balearic Islands that Ma-
joiera or Majoreca ware gave its name to all kinds
of glazed pottery. German stoneware, much of
it very beautiful, reached perfection towards the
end of the 16th century: but simultaneously the
great centre of pottery, China, wares, was
beaten by Helvénia do Rigaud, a widow of noble
family, in her castle of Oiron. Only about sixty-
seven specimens remain; but it has been decept-
ively imitated of late years.

M. Janvier asserts that the very first porcelain
made in Europe was in Venice, there being in the
archives a letter, dated 1470, from Ulculo da
Bologna, that seems conclusively to prove this
fact. This art was, however, lost, to be revived
again in France about 1659. The porcelain was
what is known as 'soft,'—that is, the materials
from which the paste, or body, was mixed, were
not thoroughly fused together. In 1709, Böttcher,
a German, after repeated failures, succeeded in
producing true hard paste at Meissen, near Dres-
den. It was not for nearly a century that hard
paste penetrated to Great Britain; but in 1800,
Josiah Spode created, or rather perfected, what was
practically a new ware, the bone phosphate porce-
lain, the only kind now made in England. The
English porcelain of this soft cream-colour, very
agreeable to the eye, and very suitable for decora-
tion. Nearly all the ordinary kiln colours can be
used on it, and beautiful wares of all kinds are
made. In Britain, before the 18th century, pottery
was rarely used; the people ate from wooden trenchers, and drank from horn cups, up
to the earlier years of the 19th century.

Earthenware or Common Pottery.—There are
three distinct branches of this manufacture in
India, which, though similar in their manipulation,
are different in their results. The most common
kind is the red porous earthenware used for pots
and cooking vessels, the black used for similar
purposes, and the fine white which resembles some
of the biscuit earthenware of Europe.
The red porous earthenware of India differs
very materially in quality according to the locality
from which the clay is selected; some are made
of a composed of coarse earthy loam, which has very
little tenacity, and yields a brittle kind of pottery,
either susceptible of much finish, nor of being
glazed. Most of the pottery of India is of this
description; it is made on a curious principle,
which is unknown in other countries, but which
has probably been followed for many centuries in
India. The Indian potter's wheel is of the simplest
kind. It is a horizontal fly-wheel, the frame of
CERAMIC MANUFACTURES.

wood, the rim heavily laden with clay, two or three feet in diameter, weight 60 to 80 pounds, and is put in rotation by the potter's hand, assisted by a stick; once set spinning, it revolves for from five or seven minutes with a perfectly steady and nearly true motion. The mass of clay to be moulded is placed on the centre of the wheel, and the potter squares before it on the ground. This machine has doubtless several defects, but it answers its purpose perfectly. The vessels, which are mostly of a round form, are thrown thick in the neck and upper parts or sides. They are cut off the wheel, and left open in the bottom, with vertical sides; they are then allowed to harden a little in the necks, and as soon as they will bear to be handled, the sides are thinned out by beating with a flat mallet upon a rounded stone or very hard round piece of wood held inside the vessel which is turned about and benton till it is closed. This is a very tedious and unsatisfactory mode of working, and the only recommendation is, that it makes a thin, light vessel, but at a great sacrifice of time. From ten to twenty-eight of these is a good day's work, while a skilful European thrower will turn out 800 in the same time. Good samples of this quality of earthenware are made at Travancore from a fine smooth micaceous loam, and the general forms are good, though heavy. A finer description of this ware is made at Hyderabad, from a tough, smooth plastic clay, and the articles are remarkable for elegance of form and extreme lightness of throwing. Some of the vessels are ornamented with gold leaf and coloured lac varnishes; others are made in imitation of Boder ware; some are painted white on a red ground; a few glazed and coloured with a soft lead glaze, composed of 24 parts Moordar Sing or litharge, 3 parts Ghar ka pat'har, and 1 part copper. Sandoor, or the red oxide of lead, may be substituted for the litharge. The Ghar ka pat'har should be well burnt, slaked in cold water, and afterwards reduced to a fine powder, and mixed with the litharge. The copper is mixed with its weight of finely-powdered sulphur, and heated in a crucible till a green scale has formed on it; it is then finely powdered, and mixed with the Ghar ka pat'har and litharge. The whole is again heated, and reduced to a fine powder once more. A small quantity of this powder is well mixed with wheat starch, and kneaded well for some time; water is then added, and it is strained through a fine cloth, and the glaze is gently rubbed in with the hand, after which the pottery is baked. This process of glazing pottery is very similar to that practised in Italy, Germany, and some parts of England, where paving tiles, green flower-pots, and common red earthenware are manufactured. The Ghar ka pat'har is probably either white felspar or pegmatite, a variety of granite very abundant in Southern India, and composed of three parts felspar and about one part of quartz; but at the bangle works at Loonar lake the stone used is chalcedony. The clay which is employed is probably more refractory than the common red clays of India, most of which begin to lose their shape or to become spongy at the temperature of melting such glazes. The native furnace is simply an excavation in the ground of variable depth, in which the ware is placed layer by layer, with dry reeds, straw, etc., and all are burnt together. This rude system must of course give way to the European method, for the construction of all the superior kinds of vessels.

Black Earthenware. In most instances is the red pottery blackened by the simple process of damping or checking the fire when it is beginning to decline, and thus throwing a great deal of smoke amongst the wares when the heat is not sufficiently intense to burn it off. A better and stronger kind of black earthenware is manufactured at Bangalore from a fine dense clay that contains both manganese and iron. This approaches the black stoneware of Egypt, and is strong and sonorous when struck.

White Earthenware.—Light and elegant goblets, butter pots and vases, are made at Arcot. This branch of the art is conducted with more care and cleanliness, attention being paid to the sifting of the materials and to the orienting and finishing of the articles. The material selected is a decaying white granite resembling the Cornish stone of England or the granua of Germany. This is carefully washed and decanted to free it from sand or impurities; it is then allowed to subside, the water is poured off, and the soft clay is collected on a clean cloth and laid on a heap of white wood ashes to dry; a small percentage of alkali is thus absorbed through the cloth, and is incorporated through the mass by kneading. This decayed white granite is the true Kao-lin or porcelain earth of China and Europe. It is particularly abundant in India, and occurs in beds of enormous extent, and of every variety of colour. It possesses the valuable qualities of combining with a large percentage of silica, felspar, baryta, or other stony bodies, and of resisting the most intense heats; but in India it is employed alone, and produces a soft, brittle, porous ware, which is not susceptible of being well glazed. Numerous attempts have been made to glaze this description of pottery, but the glaze crazes or cracks all over the surface, and allows water to penetrate to the body. The reason is that the Kao-lins require flint, felspar, or stone to open them, and exposure to a long-continued and steady heat before they are thoroughly burnt in the biscuit state. They also require a hard fritt or porcelain glaze, which cannot be prepared without expensive machinery. The firing also involves a great consumption of fuel, as the heat must be kept up steadily for 40 or 60 hours.

In China, the districts of Ping-le and Kot-kow in the province of Kiang-si are the most noted for their plastic clays of all the eighteen provinces of China. Very excellent plastic clays are also found in Wy-chow, in the province of Ngan-huy; the clays are soft, smooth, and, with one exception, uniform in point of colour. The excepted clay alluded to is streaked or veined, and is preferred by many potters. Kin-tie-ching, a town near Ping-le and Kot-kow, from the most ancient times has been pre-eminent for its china-ware factories. The clays are classed as Kao-lin and Pe-tun-tse. The Pe-tun-tse is taken from the quarries to the pounding mills, and then thoroughly crushed in large mortars, by means of pestles moved by water-wheels. It is then thrown into a pond and well mixed with the water. The heavier parts fall to the bottom, but the cream-coloured liquid on the top is drawn off into another basin, where it is well stirred by labourers who walk about in it. The heavier parts that sink
CERAM LAUT. A cluster of islets are lying off the south-eastern extremity of the large island of Seran or Ceram. They produce tortoiseshell, mother-of-pearl shell, beche de mer, wild cinnamon, wild nutmegs, and birds of paradise. Ceram Laut is the most westerly and the largest of the range of small islands which extend 15 or 18 miles eastward. Ceram Laut means Ceram lying to seaward. The islands are low. Ceram Laut is the great place to which the Bugi carried the Papuan slaves stolen from New Guinea. Ceram Laut and Goram are seldom visited by Europeans. The natives of the Ceram Laut islands repair chiefly to the northern coast of Papua, or the island of New Guinea, from which they are distant only about a day's sail, to procure the various articles of produce we have mentioned, that part of this vast island being called by the Bugi, Papua Nothing. Mother-of-pearl shells are, however, procured by the Bugi themselves in greater quantities at the Aru islands.

CERASTIUM CORDIFOLIUM. Robx. A herbaceous annual of Bengal. C. Indicum, W. and A., is chickweed. C. dichotomum and C. vulgatum also occur.

CERASUS, a genus of plants of the natural order Amygdalaceae, which are arranged into the true cherries, the bird cherries, and the cherry laurels. Wallis and Roxburgh mention C. Nepalensis of Nepal and Kamaon, C. piddum of the Himalaya, and C. triloba of China. Dr. Clegborn mentions the Gilas, Kashmir cherry, as from one variety of cerasus, and Aro ballu, the Kâbul cherry, as from another variety, both grown in gardens of the N.W. Himalaya. Griffith mentioned that there is in the Tenasserim Provinces one species of the almond tribe which abounds in prussic acid. C. caucasia, the cherry tree of Europe, the Himalaya, Caucasus, etc., in Kashmir is called Aloo baloo. The kernel of this fruit contains the elements of hydrocyanic acid, and is accordingly much used for communicating its peculiar flavour to brandy and liqueurs. C. Japonica is a native of Japan, but long known in English gardens as the double dwarf almond. It is one of the most beautiful flowers that appear in the month of March. C. cerasus, or the cherry laurel of Trebizond and Afghanistan, is cultivated in Europe. The distilled water of the leaves is much used in Europe as a vehicle for ointments and other anodyne medicines, in doses up to one ounce.—O. Sh. p. 827. See Cinnamomum.

This is found in the Sutlej valley between Rampur and Sunamganj, at an elevation of 7000 to 627
CERASUS PSEUDO-CERASUS.

10,000 feet about Simla. It grows to a large size.

CERASUS PSEUDO-CERASUS, the Ying-tau or Chinese cherry, is met with in Kiang-nan, Hu-peh, and Honan; but there seem to be several varieties, some of which have been introduced into England. It has a bright red fruit.—Smith.

CERASUS PUDDUM. Wattle.

Prunus puddum, Lindley.

This is found in the Sutlej valley between Rampur and Sungnam, at an elevation of 3000 to 7000 feet. Occurs in Kaghan as far as the Indus; also in Kamaon. It is a sacred tree among the Hindus. The bark is called pudmank, and used in medicine by the natives, as it is also in America.—Cleg. Panj. pp. 65, 81.

CERASUS SERRULATA, the fine-toothed cherry, is a native of China. C. Nipalensis, Ser., is a small tree of Nepal and Kamaon. C. triflora, Walt., is a shrub of Nepal and China.

CERASUS VULGARIS, common cherry.

Prunus cerasus, Linn.

Yuh-li. | CHIN. | Gila. | PANJ.

This grows in China; is found wild in the woods of Asia Minor, where it acquires a very large size. Dr. Royle considers the cherry to be wild in Kashmir.—Eng. Cyc. p. 826.

CERATONIA SILIQUA. W. Carob tree.

The carob tree was introduced into the Saha-runpur gardens, and has been tried at Madhopur and other places in the Panjub, as at Lahore, and succeeds fairly. A thick, pulpy, flat, brown, curved pod contains hard red seeds resembling those of the tamarind, embedded in red fibrous pulp. Used by the natives in coughs attended with much expectoration. The pods are used for food, both for men and horses, along the coasts of the Mediterranean, and are said to improve the voice of singers. The seed of this tree is the original of the carat of jewellers.—Powell, Hand- book, i. p. 342; Spruy's Suggest. p. 54; Ainslie.

CERATOPETALUM APETALUM, the coachwood, leather-jacket, and light-wood of New Zealand and Australia, is abundant about the Illawara district. It grows to 45 and 50 feet high and 6 feet round. Its wood is soft, fine-grained, light, and has a agreeable fragrance. It is valued for cabinet work and coach-building, but will not bear exposure to wet. C. gunniferum, the chiropterae tree, is used by the Australian colonists, is used for decoration at Christmas times. It is wild near Sydney; grows straight to 15 or 30 feet in height.—G. Bennett.

CERATOPHORA STODDARTII, a lizard of the Kandykan hills, remarkable for having no external ear. It acquired its generic name from the curious horn-like process on the extremity of the nose. This horn, as it is found in mature males of ten inches in length, is five lines long, conical, pointed, and slightly curved up.—Tennent.

CERATOPTERINA, a group of fishes, in which occur—

CERATOSTEMA. Roxb. A genus of plants. Roxburgh described C. vaccinacea, Roxb., and C. variegata, Roxb., the jalamoot of Bengal, both of them shrubs. The latter is a native of mountain forests near Chittagong, Sylhet, and on the Garo hills, where it blossoms during the cool season, when its numerous, most beautiful, large, variegated, rosy flowers are highly ornamental; the seed ripens in July.—Roxb. ii. p. 413.

CERBERA, a genus of plants belonging to the natural order Apocynaceae. Dr. Roxburgh described C. fruticosa, C. odallam, Gurt., and C. maculatum, Willde. C. tanghin, the tanghin tree, was formerly used in Madagascar for the trial by ordeal. C. thevetia is a large shrub with leaves like the oleander, and bell-shaped yellow flowers. Its milk is poisonous, bark bitter and purgative, also said to be powerfully febrifuge, two grains being affirmed to be equal to a common dose of cinchona. According to Royle, perfectly naturalized in India.—O'Sh. p. 446; Riddell.

CERBERA MANGHAS. Linn.

C. lactaria, Buch. | C. quaternifolia, Roxb.

Kulouca, | BURM. | Kaner zard, | PERS. | Pili karbir, | HIND.

This tree grows in Pegu, Tenasserim, Tayoy, Penang, Singapore, Java, Moluccas, and the adjacent islands, in wet situations. Its fruit is used very extensively by the Burmese, to make an oil which they burn in their lamps and use to anoint their heads. The kernels are described as emetic and purgative. The leaves are said to be used in Java as a substitute for senna, and the bark is said to possess purgative properties.—Roxb.; Voigt; Mason; Eng. Cyc.

CERBERA ODALLAM. Gurt. Odallam tree.

Cerbera manghas, Sims. | Tanghinia odallam, Don. Odallam, | MAREL. | Kat-arali, | TAM.

Common on the western coast of India, Maldives, and Laccadives. Wood white and spongy. Nut narcotic and poisonous. The green fruit is employed to kill dogs.—Roxb. i. p. 692.

CERBURA, in the mythology of the Hindus, a varied-coloured dog, one of the dogs of Yama. He has a second dog, called Syama, or black. Cerburn is undoubtedly the Cerberus of the Greeks. Cerburn has other names, all meaning spotted, but it is also called Tri-sira or three-headed. See Yama.

CERCOTRICHAS, a genus of birds in India, known as bulbulis, C. erythropherus, C. Luzonensis, C. macrourus. See Bulbul.

CEREAL GRAINS. CEREALS of several kinds are cultivated for food. The seeds of all the grain crops, those that are eaten as food are capable by cultivation of becoming superior. The value of grains, generally speaking, is directly as the size of the carpus, and inversely as the thickness of the pericarp. When the grain abounds in persperm, it is heavy; when the envelope is thick, the grain is, on the contrary, light, thus:—

100 seeds of wheat weighed 450 grains.

100 " barley " 385 "

100 " rye " 260 "

100 " oats " 250 "

The chemical composition of the grain influences materially the quality of the resulting bread. If the gluten be too fat, no fermentation takes place in the dough; if the gluten be in excess, the bread is heavy and acid. Wheat flour may be considered the type of all that is suitable for alimentary.
purposes, and in the degree of deviation from this standard consists the inferiority of the other grains. The grains or ears of nearly all the cereal grains are subject to diseases resulting from attacks of certain species of fungi, animalcules, and insects. The liability of the seeds of grasses to parasitic infection is explained by the large amount of nitrogenized matter contained in them, and to their softness of texture; and some of the diseases occasion the greatest injury to the agriculturist. Little is known as to the native countries of the cereal grains. The prevalence of particular grains in the earth's zones and continents, has resulted not alone from climate, but has been determined by the civilisation, industry, and traffic of the people, and often by historical events. Without cultivation, all the cereals degenerate. As they now exist, they seem to have been greatly improved from their natural state. Wheat has five, six, or seven distinct species, barley three, and oats two, three, or four. In the south and east of Asia, the following grains belonging to the grasses (Paniaceae or Graminaceae) are the more largely cultivated:—

Rajputs, Goori seems to be the analogue of Ceres, and on the festival of the Alabera, or Muhurat ka Shikar, they hunt, slay, and eat the wild boar.

CERES, a genus of the Caucteae. About twenty species introduced into India. Many of the species produce beautiful flowers. The stems are angled and jointed; the blossoms open in the evening or during the night, and die away towards the morning. C. flagelliformis, S. America, which grows in Asia and Africa, is the creeping cerasus; C. grandiflorus, Mill, is the night flowering cerasus. C. hexagonus, Linn.; C. senilis, the old man's torch thistle; C. speciosissimus, C. triangularis, Linn., and C. truncatus, occur.—Voigt.

CERIOPSIS CANDOLLEANA. Arnot. Chowrie or Kiree, SIND. A tree of Sind. Wood used for building boats and barges; makes useful keels. The barks of Ceriops candolleana and Rhizophora mucronata are much used in Sind in tanning.

CERIOPSIS ROXBURGHIANUS. Arnot. Rhizophora decandra, R. | Bruguiera decandra, Gr. Garan, . . . . . BENG. | Ka-by-ain, . . . . . BURM. Grows on all the coasts of tropical Asia. Wood dark reddish, hard, and durable; flowers large, white, and sweet-scented. The bark is used in India for dyeing.—Voigt; Malcolm.

CERIOPHIS MELANOCEPHALIA and C. satyra, Argus pheasants.

CERITHIADÆ, the Corite family of molluscs, comprising several genera, mostly recent. CERNE, the name given by the Portuguese to the island of Mauritius on its discovery. Subsequently, while in the possession of the French, it was called l'Ile de France, the Isle of France.

CEROPEgia, a genus of plants of the nat. ord. Asclepiaceæ. They are creepers and trailing plants. C. Arnottiana, Wight, is the Oo-ta-lung of the Burmana. C. bullosa, esculenta, lucida, juncea, Lushii, elegans, Stephanotis, stelpeia-formis, and tuberosa occur in India. C. bulbosa, Roxb., occurs in many places, and every part of it is eaten by the natives. Its roots are of the size of a small apple, and when fresh taste like a turnip.

CEROPEGA ESculenta. Edgeworth. Galat, Panu. In Multan its acid leaves and tubers are used as a vegetable.—Dr. J. L. Stewart.

CEROPEGIA JUNCEA. Roxb. A twining plant; grows all over India. It is succulent, with an agreeable acid taste, and is much eaten as a salad by the people.—Mr. B. Brown.

CEROPEGIA TUBEROSA. Roxb.

C. candelabrum, R. Bach-chali-manda, Pulla manda, . . . Tel. The word manda is applied to several species of ceropegia.—Voigt.

CEROSTERNA GLADIATOR, a longicorn beetle of India. It eats the bark of casuarina trees.

CEROXYLON ANDICOLA, or wax-palm, a native of the Andes of Columbia, of immense height, often attaining 150 to 180 feet in its length. From fissures in the trunk there flows spontaneously a liquid of great waxy substance, containing two-thirds of resin and one-third of wax identical with that formed by the bee. Melted with a little water, this wax makes excellent tapers. Its introduction into India merits attention.—C. australi, Martins, is of Juan Fernandez; C. Kloptockia, Martins, of Venezuela.—O'Sh. p. 641; Von Mueller.
CERVIDE.

Spotted deer of the Sunderbuns. It inhabits the eastern and northern shores of Bengal and Hindustan, and the Sunderbuns. It inhabits reedy marshes and the islands of great rivers, never entering the mountains or forests. The tail is short, with no caudal disc and no heavy mane.

(f) Ruia equina, Curv., Ham. Smith.

Ruia equina, Raphis, C. equina, Curv.
Ruia hippelaphus, Elliot, Cat.
Ruia etam of the people of Sumatra.
Ruia etam, Malaysian.
Ruia kumbang, Malay.
Ruia kumbang, Eland or elk of Dutch sportmen.

It inhabits the Dekhan, S. Maharashtra country, Sumatra, Borneo, and Banka. It is of a pale brown colour. Considering the similarity of colours and size of C. equina, hippelaphus, and Aristotelis, Mr. Elliot is probably right in considering all three as varieties of the great Indian stag, described by Aristotelis under the designation of *Hippalaphus.* Ruia and C. Peroni, Curv. (Cervus du Timor), may probably be added as a fourth variety.

(g) Ruia hippelaphus, Curv.

Cervus hippelaphus, Curv. C. Temorensis, Muller.
C. mulleasi, de Graaf.

It inhabits the great forests of India, Bengal, Sumatra, and Java. It is about the size of the common stag. In winter is of a greyish-brown, and in summer it is of a brighter and more golden brown. The crown is pale yellow, and the tail is brown, terminated by rather long hair, which is rough and hard; and all about the head and neck and cheeks grows long, like a mane and beard.

(b) Ruia Aristotelis, Curv., Grey, Samber.

Cervus Aristotelis, Curv. C. heterocerus, Hodgson.
C. bengalensis, Schinz.

It inhabits the great forests of India. It is not gregarious, and runs and drops its horns in spring. Mr. Hodgson describes four varieties of this deer.

(2) Ruia dimorphae, spotted rusa.

Gower, ... HIND, ... HIND.

Occupy the sal forests of India. Colour of a red brown.

(j) Ruia Peroni, the smaller rusa; inhabits Timor, Lombok, Bawian, and Ternate.

(k) Ruia Philipinus.

Cervus Marianus, Curv.

The Philippine rusa.

Cervus de Philippines of Desmarest.

(l) Ruia lepitha, the Sundevall rusa, a native of Java, scarcely as large as a roebuck.

(m) Axis maculatus, Ham. Smith, Gray.

Axis is described by Erzeleben, Cervus nimipalpebra, apud Gmelin. Cervus exilis, Elliot.
C. pseudaxius, Gervais.

Axis maculatus.
Russ bunga, Malay of Peninsular India.

Spotted deer of India.
Chitra, ... Sansk.
Chital deer of Hodgson and Elliott.

630
Inhabits India, the Malay Peninsula. In size and form it resembles the fallow-deer, and at the shoulder its height is two feet six or seven inches. The ground colour of the skin is at all times a rich fawn spotted with white, but is nearly black along the back and snow-white below. It has a white longitudinal line on the flanks. It lives near water in the jungles; feeds at night. It is timid, indolent, and gentle; is easily domesticated, and propagates in captivity. It is the spotted deer of Indian sportmen. The skin and horns of this graceful deer are articles of commerce. In the years 1851 to 1855 Liverpool imported about 700 skins and 20,000 horns a year. They are not so generally distributed as the sambur, but in many districts are far more plentiful. They go in herds of from six to sixty. So many as six have been killed by one gun during the brief cool stalking hours of the morning and evening. A. porcinus, Cuv., is the hog-deer of Jordan.

This animal does not seem to differ in any respect from the kijang of the Eastern Islands. A young male of this species is of a deep chestnut colour, which becomes browner as the animal grows older. It obtains its Canarese name from its habit of frequenting the kans or natural forest gardens.

Inhabits Ceylon, India, and Assam. Its legs are shorter than those of the axis; it has no black dorsal streak, and no white streak on the haunches. Horns generally short, with short snage. They live in herds on the plains, and do not ascend mountains.

Cervus punilis of H. Smith is supposed to be a variety, and Cervus dodur of Royle is supposed to be a distinct species.

It inhabits Sumatra, Banka, Borneo, and Java. Its height at the shoulders is about 2 feet 2 inches. On its face are two rough raised folds of skin, marking it with the letter V, the point below; colour, reddish brown or a light brown; belly and front of thighs, pure white. In Java it occupies districts with long grass, and the Sacciarum (Holeus) spicatum (alia-alang, Jav.), and Phyllanthus emblica are its favourite food; but Hibiscus, Grewia, Urena, and other malvaceous plants are eaten by it. It is inoffensive and confineable. The points of its horns are turned forwards; it is about the size of the antelope, which, with the exception of the horns, it resembles in general appearance.—Lowe's Sarawak, p. 76.

bones of the neck are so compressed as to leave the animal without the appearance of a neck. Some of them eat plants, or are phytophagous; some are zoophagous, or animal-eaters. Seven new species of cetaceans have recently been described from the Bay of Bengal, six of the family Delphinidae, the seventh belonging to the sperm whales Physoideridae, to be called Physieter (Euphyso-
tetes) sinmus. Professor Owen described the follow-
ing species from collections made mostly near Vizagapatam by Sir Walter Elliot.—Delphinus fusio-
formis, D. godama, lentiginous, D. maculinen-
ter, and D. pomegera; also Phocaena brevirostra, and Physyter sinmus. The Cetacea are divided by naturalists into two great families, the Balaenidae or whales, the Delphinidae or porpoises.

Whales.
(a) Balaena mysticetus, the Right Whale. B. Groenlandica, Linn. | B. Rondoletti, Willoughby. B. vulgaris, Brisson.
Right whale, ... ENG. Var. a. Nord kapper whale. Whalebone whale, ..., Var. b. Rock-nosed whale.
Southern whalebone whale of Nunn. Var. c. capper whale.
Inhabits the South Seas; and multitudes were seen by Sir James Ross in very high latitudes. It is of a uniform black colour. (b) Balaena japonica, the Japan whale, inhabits the coast of Japan, which it visits periodically. Its skin is covered with barnacles. (c) Balaena antarctica. B. antipodarum, G. New Zealand whale. Inhabits the New Zealand ocean.

Finners.
(f) Balaenoptera Indica, Blyth, is the Indian fin whale. B. boops, L., the great roqural, and B. musculus, L., the lesser roqural, are both found in European seas. (g) Megaptera kuzina, the kuzina. It inhabits the Japanese seas. (h) Physalis Iwasi, the Japan finner. It is very rare. In 1760, one 25 feet long was cast ashore at Kii. (i) Physalis antarcticus, G. An inhabitant of the Falkland Islands. (l) Physalis australis, the southern finner, inhabits the seas of the Falkland Islands.

Sperm Whales, Physoidericae.
Its principal food are the septide or cuttle-fish, but it swallow small fishes. (m) Cetodon Colneti, the Mexican sperm whale, is an inhabitant of the North Pacific, the South Seas, and the equatorial oceans. (n) Cetodon polycephalus, South Sea sperm whale. The cachalot or sperm whale inhabits the Southern Ocean. (o) Cetodon kogia, Gray, taken near the Cape of Good Hope. It has a short head, and is supposed to be the young of C. polycephalus. (p) Balaena Linki, has been taken off the coasts of Australia, where it represents the white whale B. catodon, Cetodon macrocephalus. (q) Physieter sinmus, Owen; Euphysoetes sinmus, a new species. (r) Globiocephalus Indicus, Blyth; the Indian C'ang whale. In 1852 a saol (schule or school of sailors) was carried by a current into the salt water lake near Calcutta.

Delphin, Dolphins.
(a) Neomeris phaxenoides, Gray. Delphinus melas, Ternua. A dolphin of the Indian Ocean. (b) Phocaena communis. Phocaena Rondoletti, Will. | Delphinus phocaena, Linn. Common porpoise, or porpessa. (c) Grampus sakamata, Schlep. Sakam kuzia, ... JAPAN. Found off the coast of Japan. (d) Grampus Sieboldii. Naiso gata, ... JAPAN. A native of the coasts of Japan. (e) Grampus macrorhynchas, black fish of the South Sea whalers; it inhabits the South Seas. (f) Delphinapterus Peroni, right whale porpoise of whales. It is found on the Brazil bank, off the coasts of New Guinea, and the higher southern latitudes. It lives in large schools, and its flesh is esteemed a delicacy. It is black; but the beak, the pectoral fins, and under part of the body are white. (g) Delphinus.—Seafaring people call the species of this genus bottle-nose, bottle-head, flounder-head, grampus, porpoise, porpessa, or porpus, sometimes even whale, and give the name of dolphin to the Coryphena, a scemaborid fish which changes colour when dying. There are several species of Delphinus:—
(h) Delphinus Heavisidii, the hastated dolphin, inhabits the South Sea and Cape of Good Hope. (i) Delphinus obscurus, the dusky dolphin, inhabits the Southern Ocean and Cape of Good Hope. (j) Delphinus abusalam inhabits the Red Sea. (k) Delphinus eupropia inhabits the Pacific Ocean and Chili. (l) Delphinus Nova Zealandiae, the New Zealand dolphin. Blyth. New Zealand and Cape Gable. (m) Delphinus Forsteri, Forster's dolphin, inhabits the Pacific Ocean between New Caledonia and Norfolk Island. (n) Delphinus sao inhabits Madagascar. (o) Delphinus longirostris, the Cape dolphin, inhabits the seas about the Cape of Good Hope and the Southern Ocean. (p) Delphinus perriger, Elliot, Blyth, the black dolphin, Bay of Bengal. (q) Delphinus plumbeus, Dussamier, the plum-
bean dolphin of the Malabar coast. (r) Steno attenuatus, Gray. (s) Steno Malayanus.
CEYLON.

Dolphinus plumbeus, Duck, Cur.
Dolphinus Malayanus, Lesson upon Cav.
Dolphin venus roux of Paris Museum.

Inhabits the Malabar coast and coasts of Penang. It is numerous, and rather heavy in its movements, but is rarely captured, except by chance in the stake-nets. It eats small fishes, Clupea and Gephyrinus celestins, Cur.

(f) Steno frontatus inhabits the Indian Ocean and the Pacific.

(vi) Planisata Gaertnica.

D. rostratus, Shaw.

Delphinus, Shawensis, Blainville.

Planisata, Pliny. Sou-sou, Ceylon.
Dauphinedu Gange, T. Cuv. Susa, Buffon.

Inhabits the Ganges and Irrawadi.

(vii) Planisata Indi, Blyth, the purpoise of the Indus, larger and more robust than P. Gaertnica.

(viii) Halicore dugong.

Trichebus dugong, Gmel. Dugungus Indicus, Ham. Indian Dugong, Eng. Le dugong des Indes, Fr.

Inhabits the shallows of the Indian Ocean and about Ceylon, where the water is not more than two or three fathoms deep. It does not appear to frequent the land or the fresh water. Its fluke is delicate. The dugong was noticed as occurring in Ceylon by the early Arab sailors, by Magasthenes (Frgm. lix.) and Zelian, and subsequently by the Portuguese. It is this creature which has given rise to the tales about mermaids which have till the present day occupied the world, and doubtless had their origin in the tales of the Arab sailors. They are phytophagous or plant-eaters.

CETONIIDE, or rose chafers, a family of the Coleoptera. These and Buprestidae, or metallic beetles, are the largest and most brilliant of the Coleoptera.

CETRARIA ISLANDICA. Aca. Iceland moos. It is chemically allied to starch; it swells in water, and when boiled becomes gelatinous.

CEYLON is called by the Hindus, Lanka. Sinhal-diva, its local name, was corrupted into Serendiva or Serendip by the Arabian mariners; and it is still known amongst the Mahomedians by the last name. The Arabs, however, in addition to Serendip, call it also Sinkul. To the ancients it was known as Tam-ba-pani, from which came the name Taprobane used by Milton when he wrote of—

'The Asia kings and Parthian among these:
From India and the golden Chersonese,
And utmost Indian isle Taprobane,
Dusk faces with white silken turbans wreathed.'

The chronicles of the island extend in an unbroken series to 543 B.C. From the Honourable George Turnour's epitome of the sovereigns of Ceylon, it is observed that ancient history commenced with Vijaya, B.C. 543; and the last king of Kandy was Sri Vikrama Raja Singha, who was, in 1798, deposed by the British, and died in captivity at Vellore on the 30th January 1832. Mr. Turnour gives the following fixed points in the chronological history of Ceylon events:

B.C. 543. The landing of Vijaya, in the year of Buddhism's death.
307. The mission from Dharm Asoka to establish Buddhism in Ceylon.
104. Conquest of Ceylon by the Mahabars.
90. Founding of Abhaya girl by Wala Gaurabah.

A.D. 209. Date of the Vaitulya heresy, in Vaivahara reign.
222. Revival of dito in the reign of Golu Abhna.
301. Death of Mahi Sena.
545. Another revival of the Vaitulya heresy, in Ambakira's reign.
1153. Accession of Prakrama Baha.
1290. Accession of Salassa Mallawa.
1266. Accession of Pandita Prakrama, Baha III.
1347. Accession of Bhuvanika, Baha IV.

The first authentic account of Ceylon or Taprobane is given by Onsticules, the Macedonian admiral, who lived B.C. 329 or 330. Didorius Siculus, B.C. 44, gives an account of it; Strabo also mentions it; and Dionysius, who flourished A.D. 36, confirms former accounts, and alludes to its elephants. Sinbad also speaks of it in a volume, perhaps a compilation and in part a romance, as does Abdoor Razak; and still more recently Ribeiro also gives a notice of it.

In the reign of Claudius Caesar, a Roman publican, who farmed the custom duties of the Red Sea, was driven from Arabia by storms on to Ceylon, where he found a flourishing kingdom and an enlightened sovereign, whom he persuaded to send an embassy of four vessels to Rome, by way of the Red Sea, for the purpose of negotiating a commercial treaty. Ceylon is famed in the literature of India as the scene of Rama's exploits, and as a place to which Asoka sent a mission. In A.D. 1153, a Singhalese monarch fitted out a fleet of five hundred ships to resent an insult offered to his ambassador. Ceylon seems to have been subjected to frequent invasions from Southern India, immediately before and after Christ. Ceylon was occupied by the Portuguese in 1596, was taken possession of by the Dutch in 1658. In 1782 the British took possession of Trincomalee, but Admiral Suffren recaptured it. In August 1795 the British again took Trincomalee, and in February 1796 they took Colombo, but in 1803 and 1804 they met with reverses. In 1814-15 General Brownrigg invaded Kandy, and on the 2d March 1815 the British assumed the sovereignty of the lowlands. But a serious outbreak occurred in 1817, which required the troops for a year, and in 1818 the king of Kandy was taken prisoner to Vellore, where he died in 1832.

The island lies between lat. 5° 55' and 9° 51' N., and long. 79° 41' 40" and 81° 54' 50" E. Its extreme length from north to south, from Point Palmyra to Dondera Head, is 2714 miles; its greatest width 1574 miles, from Colombo on the west coast to Sangeman Kande on the east; and its area, including its dependent islands, 25,742 square miles, or about 1-6th smaller than Ireland. Its circumference is about 900 miles, giving a superficial area of nearly 24,000 square miles. The mountain system in the south has an area of 4212 miles, and the following are the most remarkable heights:

<table>
<thead>
<tr>
<th>Mountain</th>
<th>Height</th>

</tbody>
</table>

Like the Peninsula of India, it has a belt of low land of varying breadth, consisting of tertiary strata, running round its coast. Numerous lagoons exist on the east coast, at Nilla voeli, Baticola, etc. Adam's Bridge, between Ceylon and Rammad,
consists of several ledges of conglomerate and sandstone, hard at the surface, and growing coarse and soft as it descends, till it rests on a bank of sand, apparently accumulated by the influence of the currents at the change of the monsoons. The Mahavelli Ganga river has its source near Adam's Peak, and, after a course of 200 miles, enters the Bay of Bengal at Trincomalee. The Kalani Ganga and Kali Ganga are on the western coast, and the Walawya Ganga on the south-east. A rich and well-watered plain runs between Colombo and Galle, covered with cocanut, bread-fruit, and jack-fruits trees.

The census of 1871 showed the total population to be 2,406,000, in the proportion of 1,286,000 males and 1,120,000 females. Pure Singhalese, 1,670,000; Tamils, about 542,000; Moormen (of Arab descent), 160,000; these three classes making up 2,372,000, leaving only 34,000 for all other races. Malays (Mahomedians by religion as well as the Moormen) make up 6800; all other pure Asiatic or African races—including Afghan, Armenian, Bengali, Burmese, Kafir, Chinese, Maharatta, Parsee, Rajput, Sikh—comprise a few thousands more; and European descendants of the Dutch, Portuguese, English, etc., make up not more than 10,000; while pure Europeans, including English, Scotch, Irish, and a few Germans, French, etc., number, exclusive of the military, about 4500.

The numbers of the religious denominations of the inhabitants of Ceylon may be thus stated:—

Buddhist, 1,520,575; Saivite, 564,414; Roman Catholic, 182,613; Mahomedan, 171,542; Episcopalian, 24,756; Wesleyan, 6071; Presbyterian, 3101; Baptist, 1478. Of the entire population, one in 723 is insane, one in 160 is deaf and dumb, and one in 357 is blind.

The Tamils of Ceylon belong to the same race as the Tamils of Southern India, and have been on the island for centuries, chiefly in the N.E. portion of the island; and the two towns to which they chiefly resort are Jaffna and Trincomalee. Their main occupation is agricultural. Tamil coolie labourers come over in large numbers from the continent during the coffee season.

The Singhalese proper range themselves under the heads of Kandians, low-country Singhales, and Rhodia. The Kandians inhabit the hill country, and are a hardy, robust race, never till recently intermixing with their low-country brethren. Their language is made up of three component parts,—Elu (or Singhalese pure), the Pali, and the Sanskrit. They possess an extensive literature, and their religion is Buddhism. The low-country Singhales are Buddhists, Roman Catholics, or Protestants. Among the Kandians, and them only, a form of polyandry is prevalent, and the wife has the possession of all brothers. The children call the eldest brother father. A man can bring in another, not a relation, to have joint nuptial rights with himself; indeed, the first husband can so introduce as many as the wife will consent to receive as husbands. In Kandy, in the Beena marriage, the husband goes to reside in the wife's house, and the woman shares the family inheritance with her brothers. The husband, in this marriage, can be dismissed summarily by the family of the wife. In the Deega, a more respectable form of marriage, the wife leaves her own house for that of her husband, forfeits all claim on the property of her parents, but acquires some claim on that of her husband, and the wife cannot obtain divorce, unless with the full consent of the husband. Divorces are constantly sought for by women on trivial pretences. A child born within nine months of the divorce, must be maintained by the husband. Sirr (Ceylon) says the principal castes are four, viz. the Surya Vansa or Royal race, which has two divisions, viz. Gos Wans, cultivators, the most numerous in the island, and to it belong the nobles, chiefs, priests, and nearly all the government servants, and (2) the Nille Makevaya, or shepherds, form the second division of the Surya.

Brachmam Vansa, descendants of Brahmanas.

Wiepa Vansa, cultivators and shepherds.

Shoodra Vansa has 60 subdivisions.
The Rhedia race is regarded as unclean; very numerous; forbidden to approach a temple, or any of the higher castes.

The Gataroo is an outcaste race.

Burger is the name applied to those of mixed European and native origin. One race in Ceylon wear their hair, which is long and luxuriant, dressed like a woman's, with one or two very large tortoiseshell combs fastened in it, which, to a European eye, imparts a peculiarly unmanly look to the wearer. The dresses of women differ little from that of men, but they mostly wear a kind of bodice with long sleeves. An aversion to carrying the heaviest burden prevails in Ceylon, and the poorest tradesman or servant generally employs a coolie to carry a bundle which a European gentleman would take in his hand.

The vegetable productions of Ceylon are coffee, cinnamon, coir, sugar, rice, tobacco, cotton, cocoa, areca nuts, cocoanuts, cardamoms, pepper, rice, arrowroot, maize, manioca, arrack, cocoanut oil, essential oils of cinnamon, citronella, and lemon grass, dye-wood, ebony and other furniture woods. The sugar-cane was brought to Ceylon from the Mauritius by a merchant of Colombo about 1832. European settlers have largely engaged in coffee planting. This latterly became less remunerative, and tea, cocoana, cinchona, and the Liberian coffee were introduced. At the end of 1880, about 5400 acres were under cacao. In 1880 the export of cinchona bark was 1,161,980 lbs., valued at Rs. 12,00,000. The mineral and animal products are precious stones, pearls, ivory, and chink shells. Precious stones are found in the flat country around Ballansgodde, S.E. of Ratnapura, on the western plains between Adam's Peak and the sea; at Neureella, in Oovar, at Kandy, at Matelle in the Central Provinces, and at Kurnel near Colombo, at Matura, and in the beds of the rivers eastward towards the ancient Mahagam; but the chief gem district is in the plains at the foot of the stupendous hills of Safragam. The ruby, amethyst, topaz, sapphire, and cinnamon stone, are found in great abundance, but not emeralds. Spinell, chrysoberyl and corundum are also found. Sapphires, red, purple, yellow, blue, white, and star-stone, are met with at Matura and Safragam, and rubies and sapphires in the neighbourhood of Avisavelli, and on the Neureellapatan. The corundum of Battagama is frequently found in large six-sided prisms, and is commonly of a brown colour, from which it is called by the natives Curundu gallo, cinnamon stone; occasionally it is to be met with

634
partially or entirely covered with a black crust, which is merely the stone with an unusual propor-
tion of iron. In the beds of the rivers south and
cast of the mountain chain in Ceylon, the sands are so rich in comminuted fragments of mica,
quartz, sapphire, ruby, and jacinth, as in some
places to be used by lapidaries in polishing the
softer stones, and seeing elephants' grinders into
plates. Dr. Gygax considered the original matrix
of these rubies to be a stratum of decomposed
grey granite at Ylima Pohura on the south-eastern
decline of the Pettigallo Kanda. Corundum is
very plentiful at Battagamana, on the banks of
the river Agiri Kandura. The great bulk of the
gems, however, come from Ratnapura, which
means the city of gems. Ceylon affords all the
varieties of quartz, as rock-crystal, amethyst,
rose-quartz, cat's eye, and prase. Rock-crystal
occurs in abundance, both massive and crystallized,
of various colours, good quality, and in large
masses. Amethyst also is pretty abundant; very
beautiful specimens are found in the alluvion,
derived from the decomposition of gneiss and
granite in the mountains and the Seven Korals.
Adularia is very abundant in some parts of the
interior, particularly in the neighbourhood of
Kandy, where it is occasionally the predominating
ingredient of the rock. Ceylon produces the finest
cat's eyes in the world,—indeed, the only kind that
is highly esteemed, and that bring a high price.
The best specimens have been found in the granitic
alluvion of Safframag and Matura. Prase is of
rare occurrence amongst the pebbles on the shore
of Trincomalee. Belonging to the schorl family
are topaz and schorl. The topaz commonly passes
under the name of the 'white or water sapphire.'
It is generally white, or bluish or yellowish
white; it is commonly much water worn, perfect
crystals of it being very rare. It occurs in many
places in the alluvion of granitic rock.
The zircon family is richer in Ceylon than in
any other part of the world. It is found in the
districts of Matura and Safframag, and is most
abundant near the town of Kandy. Matura diamond
is the name applied to its finest variety by the dealers
in gems. Besides the two well-established species,
common zircon and hyacinth, there is a third,
massive, opaque, and uncrystallized, and of a dark
brown colour. Specimens of it from Safframag
weigh two or three ounces. The yellow varieties
of zircon are sold by the natives as a peculiar kind
of topaz,—the green as tourmalines, the hyacinth
red as inferior rubies, and the very light grey as
imperfect diamonds. All the varieties are found
in the beds of rivers, or in alluvial ground,
which, both in Safframag and Matura, is of the
same kind.

For the ruby, Ceylon has been long celebrated.
Four species of it, viz. spinell, sapphire, corundum,
and chrysoberyl occur. In gneiss or granitic
rock, spinell is comparatively rare. Ceylon has many animals—elephants, buffaloes,
chameleons, deer, tigers, leopards, hyaenas, black
partridge, red-legged partridge, peafowl, jungle-
fowl, quail, snipe, ducks, widgeon, teal, golden
and other kinds of plover, a great variety of
pigeons, innumerable snakes, and the crocodile;
but it is free of the tiger, wolf, hyaena, and cheeta.
Elephants are now only found in the thickly
wooded forests. In one mode of snaring them,
CHABUK. Hind. A; also, in Chinese, the camellia.

CHABUR. Hind., Port. Tea; also, in Chinese, the camellia.

CHABUR, or, following the Persian pronunciation, Tsab, an Arab tribe who occupy the lower part of Mesopotamia. They are a tall, martial race, strong-limbed and muscular, active and healthy. At Baron de Bode's visit they extended on the north as far as the territories of Shushter and Ram Hormuz, eastwards to Behbahan; and, including Hindlyan in their possessions, they spread south along the head of the Persian Gulf; on the west they do not extend beyond Haniza. They became known to the British in the latter part of the eighteenth century, in consequence of their piratical exploits on the Persian Gulf, and their having captured some British vessels sailing in those latitudes. —De Bode, ii. pp. 110–122.

CHABAI MALAY. Species of capiscum; Chabai Java, Chavica Roxburghii, long pepper; Chabai of Lombok, Capsicum frutescens; Chabai sabrang, a species of capiscum.

CHABANAH. Hind. The name given to all parched cereals and pulses,—from Chabuna, Hind., to chew,—because eaten alone.

CHABAQ. Hind. Salicornia bracteata? also root of the black pepper vine.

CHABERIS of Petnelly, the river Cuavy.

CHABUK. Hind. A; hence Chabak-sowar, a jockey, literally a whip-rider.

CHABUKCHURI. Hind. Hiphtage madabolta.

CHABUTRA. Hind. A raised platform, a dais or terrace; a flat masonry platform or edging to a well, etc., for sitting on.

CHACH is the name of the great plain to the east of the Indus, immediately opposite to Ohind, which may have been named after the Brahman dynasty of Ohind, as the Banar plain was named after raja Banar. The Brahman dynasty of Sind was also established by a Chach in A.D. 641; and this date corresponds with the period of the expulsion of the Brahman dynasty from Chichito, or Jajhoti, by the Chandels of Khajura. Several places on the Indus were named after the Chach dynasty.—Chachpur, Chachar, Chachgaon, Chach, Chach was a Brahman who usurped the kingdom of the Rai dynasty of Sind. He was a contemporary of the Shahram or Shahrear, and he is supposed to have invented the game of chess. He seems to have reigned about A.H. 2, and to have been succeeded by his brother. The Rai dynasty had ruled from Kashmir and Kanouj to Makran and the port of Dahal on the shores of the sea of Oman, and from Surat to Kandahar and the Sulimana range. The commencement of this dynasty has not been ascertained, but in the time of Rai Diwaj the capital was Alor. He was a powerful chief, who contracted alliances with the rulers of India. He was succeeded by his son, Rai Shhars I. Rai Shhars was the celebrated son of Rai Shhars, and the next was Shhars II., who reigned 42 years, and was killed in battle. After Sahasi II., a Brahman dynasty succeeded. Their reign seems to have extended to 137 years, and to A.D. 479.—Elliot; Cunningham's Ancient Geog. of India, p. 55.

CHACHEON or Chachiyon. Hind. Rhododendron arboresum.

CHACH-NAMAH, also called the Tarikh-i-Hindo-o-Sind, is a Persian translation from an old Arabic history, made about A.D. 1216 (A.H. 613) by Mahomed, then residing at Uch in Sind. The ancient Arabic seems to have been written before A.D. 753. It is largely drawn upon by Nizam-ud-din, Fersish, Mir Masum, and others. The Chachnamah Persian work is descriptive of the Arab conquest of Sind. The Arab occupation of Sind was only temporary. On their retreat, the territory reverted to the rule of native princes, and was practically independent until its absorption into the Moghul empire during the reign of Akbar, in A.D. 1592, for the successes of Mahmud of Ghazni made no permanent impression on them. —Elliot's Hist. of India, p. 9.

CHACHI. Hind. Myrsine Africana.

CHACHUNDI or Chichundi. Hind. The shrew or musk rat, species of Sorex. S. eurulseos, S. Indicus, and many others.

CHACKLER. ANGLO-TAM. A Tanner, a shoemaker; properly, Chakkili.

CHACRA. Hind. A wheel, a circle, a cycle of years; a weapon of a circular form often placed in the hands of the Hindu gods. Rasi chaera, the zodiac. Varahaspati chaers, the cycle of 60 years. Nachatra chaera, the sphere of the fixed stars. Prachara, an epicycle on which the degrees of precessional variation are counted. Chacaradhari, or wielder of the discus, the most ancient weapon of the Indo-Gotie race. A name of Krishna.—Warren, Kola Somhita.

CHADACHRY. Tam. A small tree of Palghat; wood of a light-brown colour, used for buildings and carts.—Colonel Frith.

CHADACULA. Tam., Tel. Dammer, resin; Vateria Indica.

CHADR. Hind. A sheet, a dam, a sheet of sheet iron, a scarf. Phul ki chadar, a flower sheet spread on graves.

CHADARGHAT, the site of the Residency of Hyderabad, on the left bank of the Musa river, which is there dammed. It has been irregularly built over, but contains many Christian families, and many wealthy Hindoos and Mahomedan residents, bankers, and merchants.

CHADUR KUL, a lake 110 miles N.W. by N. of Kanouj, 11,300 feet above the sea. It was visited by Captain Trotter in 1873.

CHLEROHYLLUM SATIVUM. Lam. Anthirrhinus cerfeolium, Hoffmann.

The chervil, a good culinary herb.—Von Mueller.

CHLETODON. This genus belongs to the Squamipennes, which includes the Chletodontes and other curious fishes, as the coachmen, the horsemen, and others.

Chletodon aranesis, the Gal handak, a singular and much-admired fish, about 3 inches long; has a delicate and white flesh, greatly esteemed.

Chletodon praetextatus, Cantor. Like other species of this and the neighbouring genera, the present expires immediately when removed from its element. It appears to be allied to C. reticulatus and C. lunula, Cuv. and Val.

Chletodon rostrata, the bearded and rosseted Chletodon of the fresh-water rivers of India, when it sees a fly alighting on any of the plants which overhang the shallow water, approaches the place cautiously, till directly beneath the object of its attack. Then, placing itself in an oblique direction, with its mouth and eyes beneath the surface, it remains a moment
immovable, and, taking aim like a first-rate rifleman, darts at the insect a drop of water from its tubular snout, but without showing its month above the surface, from which only the drop seems to rise—and that with such effect, that though at the distance of four, five, or six feet, it very seldom fails to bring its prey into the water. Another small East Indian fish, the Toxotes jackson, catches its food by a similar dexterous display of archery. Mr. Hommel, governor of the hospital at Batavia, first noticed the habits of the Chetodon rostrata.—Wood's Zoography; Cantor.

CHAGA, also Chaga-laga. Tel. Sanssevieria Zeylanica, Rosacea.

CHAGDA or Chackradah is an abyss said, in Hindu fable, to have been made by the chariot-wheel of Bhrigar. The legend points to an antiquity which is not borne out by any old vestiges or ancient population. The place is at best a mart, or outlet, for the agricultural produce of the neighbouring districts, being crowded with warehouses.—Trs. of a Hindu.

CHAGHTAI, a Turki race to which Biber belonged. He spoke and wrote in Chaghtai Turki, which continued in use at the court of Delhi until a late period. There were two races, two languages, and two religious sects at that court,—the nobles of Iran and Turan, Persia, and Turkistan, the former of the Shiah persuasion, who spoke Persian, the latter Sunni Mahomedans, who spoke Turki; and in the latter days of the empire the contentions between the two races were a source of its weakness. Tod says (Rajasthan, i. pp. 6, 60, 322) Chaghtai are the Sakatla of the Hindu Puranas, from Sakadwipa, changed by the Greeks to Scythia. The political limits of the great Getic nation in the time of Cyrus, six centuries before Christ, were little circumscribed on the rise of Timur. At this period (A.D. 1330) the kingdom of Chaghtai was bounded on the west by the Dhaasht-i-Kapchak, and on the south by the Jaxartes or Jihon, on which river the Getic khan, like Tomyris, had his capital. Kojend, Tashkand, Otorar, Cyropolis, and the most northern of the Alexandria cities were within the bounds of Chaghtai at this period. There were two races, two languages, and two religions, the former of the Shiah persuasion, the latter of the Sunni sect. Chaghtai on the throne of Transoxiana from 1222 to 1362. As the Chaghtai dynasty drew to its close in Eastern Turkestan, the priestly element began to increase. In 1678, Galdan Khan, sovereign of the Eleeuth or Kalmuk tribes of Dzungaria, established the kohjaks of the White Mountain. But, after a century of disensions, in 1757 the Chinese brought the Turkestan states under their rule. We are to contrast the literary and commercial developments of the Chaghtai princes with those of their contemporaries of Europe, the balance of lore would be found on the side of the Asiatics, even though Elizabeth and Henry iv. of France were in the scale. Amongst the princes from the Jaxartes are historians, poets, astronomers, founders of systems of government and religion, warriors, and great captains, who claim our respect and admiration. Tod says (Rajasthan, i. pp. 6, 60, 322) Perrier's Afghans, p. 423; Vaux, pp. 157-159.

CHAGOS ARCHIPELAGO, a group of islands belonging to Great Britain, and a dependency of the Mauritius, about 250 miles S. by W. from the southernmost of the Maldives islands. They are rented in kind to persons of French extraction; the population, 564 in number, chiefly Negro.

Pigs are abundant, and poultry plentiful. They were surveyed in 1786 by Lieutenant Archibald Blair, and in 1837 by Captain Moresby. Diego Garcia, called Great Chagos island, extends from lat. 7° 13' to 7° 26' S., and its centre is in long. 72° 24' E. The Great Chagos bank occupies the centre of the Archipelago. The other islands are the Six Islands or Egmont islands, Dungeness, or Dungeness, Eagle island, the Three Brothers, Nelson island, Peros Banhos, and Solomon islands. The Chagos, Laccadive, and Maldives Archipelago are groups of atolls and madreporic reefs, low coral islands, densely clothed with coconut trees. The Maldives have upwards of 1000 islands and reefs. The Laccadives are seventeen in number. The Chagos group has some ordinary atolls, some annular reefs rising to the surface, but without any islands on them, and some atoll-formed banks neither quite or nearly submerged. The Chagos bank is a half-drowned atoll.—Darwin.

CHAGUL. HIND. A leather vessel for carrying water to a journey.

CHAH. PERS. A well. Hence chah, belonging to a well, or lands irrigated from wells. Many places have this as a distinctive appellation.

CHAHAL. PERS. Forty. Hence Chahlum, the forty days of uncleanness after childbirth.

Chahal Dakhtar, a halting-place in the valley of the Murghab, 60 miles N. of Herat on the left bank of the Khushk river; has a shrine to the memory of 40 virgins who were carried off by Turkomans.

Chalah Minar. See Kermanollah.

Chahal Sitan, a palace at Ashraf in Persian Mazandaran, built by Shah Abbas. It has a beautiful enclosed garden. Here Shah Abbas in 1627 received Sir Dodmore Colt, the English ambassador.

Chahal Sitan, a palace at Isfahan, in the middle of an immense square (Morier).

Chahal Sitan, Lithium pyrogyne, the stone tower in Mount Meru.

Chahal-Wasti, or captain of forty, amongst the Nasiri, a nomadic race who occupy the Tolito and Hotoki countries in summer, and the Daman or skirts of the Suliman range in winter. In their migrations, they appoint a chahal-wasti, or captain of forty, and a director-general. See Afghan; Nasiri.

Chahal Tan is a cave on the Kabil road, between Chardeh and the city of Kabil, accessible only by a narrow aperture. It is believed that if a person enter it he will be unable to squeeze himself out, unless pure and free from sin. It is therefore not much visited (MacGregor, pp. 212-13). Masson says (i. p. 85) there are many places of pilgrimage (ziarat) called Chahal tan, and that Kabil has one near Argandi.

Chahal Tan is the loftiest mountain in Baluchistan, its highest peak being 12,000 feet. It forms the western boundary of the valley of Quetta or Shawal.—Pottinger; Postans; Masson; Cook; MacGregor, p. 110, iv. p. 3.

CHAIH. HIND. A small masonry tank, used by soap-boilers.

CHAIHILL. CHAHIR. A Rajput tribe in Hissar, of which the greater part is now converted to
Mahomedans. There are a few in the Hissar district and on the borders of Bikar. Though Mahomedans, they nevertheless retain charge of the tomb of Goga Chauhan, a Hindu prince now esteemed a saint.—*Edith; Wilson.*

**CHAITHANYA.**

A tree of Akyab; grows to a moderate size, and is plentiful in Ramree and Sandoway districts. Used in house-building. (Qu. Is this *Coriaria myxa*?)—*Col. Cat. 1862.*

**CHAHYUMAN,** the Chauhan Rajput tribe.

**CHAI. ARAB. Tea.**

**CHAILA. MALEAL. Oldenlandia umbellata.**

**CHAIBAR.** Many of the Arabian tribes had been converted by the Jews who fled from the destruction of Jerusalem by Titus. Chaibar was their principal city in Arabia; it was taken by Mahomed a.d. 623-7. Chaibar was in the neighbourhood of Medina; they were removed into Syria by Omar. Hira also was the residence of a Christian prince, who had reigned there 600 years before he was conquered by the Mahomedans.

**CHAILE. HIND.** A tree of Chutia Nagpur, furnishing a hard, white, grey timber.—*Col. Cat.*

**CHAIN.** low caste races in N. India.

**CHAI NU. HIND. Panicea pilotum.**

**Chait, a Hindu month (March-April), commences when the sun enters into Pisces.*

**Chait of Sikkim (borrowed from Tibet) is a square pedestal, surmounted with a hemisphere, the convex end down, and terminated with a cone, crescent, and disc. These are erected as tombs to lamas, and in memory of illustrious people, and are venerated accordingly, the people always passing them from right to left, often repeating the invocation, 'Om mani padmi harm.'—*Journal of the Asiatic Society of Bengal,* No. 29, p. 427.

**CHAITANYA, a Hindu religious reformer.** He was born a.d. 1485. His father was a Brahman, who had come from Srihatta, Syihet, or Tibet, and settled at Nadiya, where Chaitanya was born. In his early youth he married the daughter of a celebrated sect; but in 1469, when twenty-four years of age, he seems to have abandoned the world and domestic life, and, after long journeying, repaired to Cuttack in Orissa, where for twelve years he laboured to extend the worship of Jagannath at Purii, and devoted the rest of his life to the propagation of his views, aided by Adwaitananad and Nityanand, two men of domestic habits. The age in which he was born had been preceded by one of great religious reforms and innovations. There had been Ramananda, who had revived the ascetic movement; and Kabir, who set aside alike the Hindu Shasters and the Koran, and preached a universal religion. In Bengal, Buddhism had maintained its supremacy up to the 10th century. On the accession of the Sena princes, Saivism gained the ascendancy, and predominated in the land. Under coalition with Saktaism, the worship of the emblems of the energy of man and the fruitfulness of woman, it had degenerated to the very licentious creed of the Tantra-Shastras, which culminated in the worst forms of libertinism about the time of Chaitanya. Two thousand years before, a greater reformer had viewed with disgust and a relenting heart the bloody rites and sacrifices of the Vedic Yagya, and to reform the abuses Buddha had promulgated the doctrine of non-creality to animals. In like manner, the baccchanalian orgies of the Tantrika, and their worship of a nudity exposed female, had provoked the abhorrence of Chaitanya, and roused his energy to remove the deep blots upon the national character. He commenced his labours by holding meetings of his immediate friends at the house of Sri Bhasa. His labours lasted through six years, when he retracted him from the Nityananda propaganda. Having visited the Nityananda; and it is to Nityananda that the origin of the Gosi is owing. Chaitanya was brought up in the faith of a Vaishnava, but his opinion took a great tinge from the doctrines of his two immediate predecessors. From his early childhood Chaitanya gave signs of an eccentric disposition, but he possessed a very superior intellect, and the purest morals. He had also a very affectionate heart, and simple, winning manners. From 1509, when Chaitanya, styled Nemi, formally renounced the world by embracing the life of an ascetic, he wandered from place to place, travelled to Gour, proceeded to Benares, visited Vindraban and Puri, teaching his sentimental theology, making numerous converts, and devoting all his energy, time, and life to the fulfilment of his mission. His peregrinations lasted for six years, at the end of which he returned to Nilchah near Jagannath, and, settling there, passed twelve years in an uninterrupted worship of that divinity. He became afflicted with epileptic seizures, which received the name of Pran Prapal. While still in the prime of life, however, he was afflicted with hallucinations and benific visions, and in that state of mental derangement he disappeared in a.d. 1527, supposed to have drowned himself at Nilchah or Cuttack, where he had resided, adding energy and repute to the worship of Jagannath. It was a main part of Chaitanya's doctrine to abolish all caste distinctions amongst his followers, and that they should bestow implicit faith with incessant devotion, which he termed Bhakti. All persons of all castes and occupations are admitted to the sect from the conviction that all are equally capable of feeling the sentiments of faith and devotion. His doctrine was essentially the worship of Krishna as an incarnation or avatar of Vishnu; and his sect worship Krishna as Parmatma, or Supreme Spirit, prior to all worlds, and alike the cause and substance of creation. In his capacity of creator, preserver, and destroyer, he is Brahman, Vishnu, and Siva; and in the endless divisions of his substance or energy, he is all that ever was or will be. Besides these manifestations of himself, he has, for various purposes, assumed specific shapes as incarnations or avatars,—as asana or portions, as anansa or portions of portions, and so on ad infinitum. His principal appearance, and in fact his actual sensible manifestation, was as Krishna, and in this capacity the sect believe he again was present as Chaitanya, who is worshipped as the deity, as are the other forms of the same god, particularly as Gopal the cowherd, or Gopi Nath, the lord of the milkmaids of Vindraban (Bindran); his asa or spirit. His disciples form the largest sect in British India, numbering nine or ten millions, and to be found in every village of Bengal. The date of his birth has also been given as a.d. 1479, also 1485 and 1486, and those of his death 1527 and 1534, at Nilchal or Cuttack. All castes are admitted into Chaitanya's fraternity, and, once admitted, are associated with
on equal terms by all the brethren. His predecessors, Ramman and Kabir, had taken low caste men for their disciples. But he scrupled not to permit even Mahomedans to enter his fold; and two of his most eminent followers, Rupa and Sanatana, were originally Mahomedans, ministers in the court of Gour.

The Gosi marry; most of the Banya of Bengal follow their tenets, but their doctrines are held in little esteem. They are regarded as gurus or teachers, and no scandal has arisen from them. The Gosi observe none of the Hindu festivals except those of Krishna; but the anniversaries of the deaths of their founders are observed as such. They do not, says Mr. Ward, reject the mythology, or the ceremonies of the Hindus, but they believe that those of Hari (Krishna) only are necessary. On the death of their festivals, the initiation invocation, or some sectarian exclamations, may be heard resounding through the streets of Calcutta: Hari, Krishna; Hari, Krishna; Krishna, Krishna; Hari Hari; Hari; Ram; Hari, Ram; Ram, Ram, Hari, Hari.—Calcutta Rec.: Cole, Myth. Hind. 240.

CHAITANYA-CHANDRODAYA, the Rise of the Moon of Chaitanya, a drama in ten acts, by Kani-karna-putra.—Dawson.

CHAITI, spring or Rabi harvest. The gudi padva ceremony, or flying of paper kites, is held as the new year, on the new moon of Chaitra, about the 5th April.

CHAITRYA, written variously Kashatrya, Chettri. Amongst the Aryan Hindus the Chaitrya was a warrior branch taking social rank after the Hindu Brahmans. Menu, writing of their duties, says: "To defend the people, to give alms, to sacrifice, to read the Vedas, to shun the allurements of sexual gratification, are in a few words the duties of a Chaitrya." How this soldier branch broke up is extremely obscure; but it is generally supposed that none of the races now in India can trace their lineage to that tribe of Aryans, though some of the Rajput families doubtless belong to them. Their quarrels amongst themselves seem to have led to their own destruction. There seem to have been two branches of the Chaitrya tribe, the Solar, who traced up to Ikshawu, and the Lunar, who traced up to Budha, who married Ha or Ella, daughter of Ikshawu. These martial Chaitryas do not appear to have adopted Brahmanism readily; and the Brahmans, to overcome them, consecrated by fire on Mount Abu a warrior body, who still remain, and are known as the four Agnicala Rajput tribes. A common spelling of the word is Kashatrya.—Warren's Kola Sanhita; Tod's Rajastan, i. p. 37. See Hindu; Suryavansa.

CHAITYA. Sansk. From Cht, a funeral pile, a heap of objects worshipped by the Buddhists, as a tree, an altar, a temple, as well as any monument raised on the site of a funeral pile, as a mound or pillar; and is probably applicable both to the Buddhist chodden, or offering to the deity, and the dugunget, a bone or relic receptacle, but is used by the Jains and Buddhists to indicate a temple containing a chaitya. In Nepal and Tibet, and in Buddhism Sanskrit literature, the word is applied to the model of a stupa placed in the temples, and to which the term dagoba has been applied. These chaityas or dagobas are an essential feature of chapels or temples constructed solely for purposes of worship, and to which the term chaitya caves has been proposed to be applied. The later forms have a pradakshana, or passage for circumambulation. The stupa or chaitya of Indian Buddhism are supposed to have been erected subsequent to the cave temples and viharas or monasteries. The chaitya of the Buddhists is the ch'ihatra of the Brahmins. One chaitya at Sanchi is structural, but all the others known, in number 20 or 30, are cut in the rock. Seemingly the aisle which surrounded the ape could be lighted from the exterior. The ancient stupa were originally meant as receptacles of either the Buddhas, or the Bodhisattwas and the kings who encouraged the propagation of the Buddhist faith. The chalot or chorten of Tibet are similar to the stupa. They consist of a cylindrical vase, and have a cupola over them. They serve as relic repositories, remains of revered human, sacred writings. But they are principally offering receptacles, and no Tibetan passes by without depositing some offering or oblation.—Hardy's Eastern Monachism, p. 43; Cunningham's Bhilas Topes; Ferg. and Burg. Cave Temples of India.

CHAJ. Hind. A winnowing basket.

CHAJJAN, a fibre recently come into use at Lahore, owing to the rise in the price of other fibres. It can be purchased in Lahore at from £8 to £10 a ton.

CHAK, a portion of land divided off, an arrondissement.

CHAK of Sutlej, Hordeo hexachiston.

CHAK. Beng. Chowk, Hind. A market-place or square.

CHAK or Jag. Bhot occupants of the central part of northern Tibet. Mr. Hodgson supposed them a mixed people, engaged in predatory pursuits.

CHAK, a circle or marked-off plot; a wheel of a cart; any wheel; a potter's wheel.

CHAK or Chuk. Hind. An extract, very sour, eaten in Ajmire to give appetite and promote digestion. It is probably the extract of chuka or sorrel. One tola is sold for one anna.—Gen. Med. Top. p. 132.

CHAKAN, also Chakan tubanna. Beng. Celts orientalis.

CHAKAR. Hind. A servant; hence Chakari, service; generally, however, duplicated, as nonkri chakri.—Elliot. Chakran, in Bengal, land set apart to provide funds for the village office-bearers.

CHAKKI. Cis-Sutlej. A pan for receiving sugar-cane juice when boiled.

CHAKKA R, in Malabar, a class of out-caste Brahmanas.—Wilson.

CHAKKAN, also Chakkala. Hind. An oil-press.

CHAKKLI. Hind. A small mill.

CHAKKILI. Tam, Mal. A carrier, a tanner; shoemaker, the village shoemaker, known to Europeans as a chuckler. The Chakkili is one of the non-Aryan races of India.—Wilson.

CHAKLA. Beng. Hind. A large division of a country, comprehending several parganas. Shah Jahan, about A.D. 1772, divided Bengal into 13 chakla. The chakladar is the superintendent of a province.

CHAKLA. Hind. A stone slab for grinding on; also a pastry roller and board.

CHAKMAK. Hind. Flint. In Tamil, chakimukuli.

CHAKOLTI. Hind. A light, pale, yellow-coloured wood, not strong. Plentiful in the
Santal jungles from Ranibahal to Nonihaut for 35 miles. Furniture, tables, palkis, venetians, and doors are made from this wood.—Cal. Engineer’s Journal, July 1860.

CHAKKOOLYA. Beng. Hemionitis cordifolia.

CHAKKOONDA. Beng. Cassia tora.

CHAKOKON SEEDS, seeds of Cordia myxa. An ointment prepared from them is an excellent application for ringworm.

CHAKOR. A small coin; a country cart, a hackery.

CHAKRA. A small class of Rajputs in Ghazipur.—Wilson.

CHAKWAN. Hind. A weed which grows common in mango groves in the N.W. Provinces, and used as a pot herb.

CHAL. Hind. Manners, customs, commonly duplicated into Chal Chan, or use and wont. The chal of the Hindu, like the mores of the Romans, or costume of modern Italy, is significant alike of the mental and external habit. In the moral point of view, it is the path chalked out for him by the sages of antiquity; in the personal, it is that which custom has rendered immutable. Kya boora chal chalta,—In what a bad path does he march? says the moralist. Bap, Dada, chal chhora,—He abandoned the usages of his ancestors, says the stickler for custom. Nek-chal, good, and bad-chal, bad habits.—Tod’s Rajasthan.

CHALA. Hind. Cicer aritinum.

CHALA CARNA, written Chila carma. This Hindu astronomical term means the true distance of a planet from the earth, in contradistinction to its mean distance, or the radius of the Caasha or deferent. See Carma.

CHALAI of Kaghan, Juniperus excelsa; J. arborea, pencil cedar. See Charai.

CHALAN. Hind. A permit, any invoice; a pass, a list. Chalaoni, current coin.—Edict.

CHALAN BII, a large marsh in the Rajahsheel district of Bengal, about 21 miles long and 10 miles broad. It is said to give rise to outbreaks of cholera.—Imp. Gaz.

CHALAPACHAI. Tel. Indigofora enneaphylla, L.

CHALAR. Hind. The Persian wheel of a common well transferred to the bank of a canal, margin of a jil, or high bank of a river.

CHALAVADI. A small delicately perfumed variety of Chalava, common in the S. Indian trade. The flowers are used for perfume and soap. See Chalava.

Musa paradisiaca, L.; a small delicate kind of plantain. Perhaps Chakra should be read Sakka, ‘sweet.’

CHAKRAM. Sansk. A wheel. It is now sacred to Vishnu. Chakrakam, a brass stamp; the discus of Vishnu stamped hot on his followers’ arm. Chakrastambha, a pillar supporting a chakra.

CHAKRA VAKA. Sansk. Ruddy goose; the birds are supposed to be separated through the night. See Chakwa; Casarea rutila.

CHAKRAVARTA. Sansk. A paramount sovereign, an emperor. Literally, one on whom the discus of Vishnu abides. A few sovereigns in ancient times laid claim to this title, but it is now heard of only as the tribal name of a Brahman family in Bengal, under the altered form of Chuckerbutty. In Buddhism it means a universal emperor, endowed with supernatural powers; but it was in use long prior to the advancement of Buddhism. The Empress Victoria is a Chakravarti.—Hardy’s Eastern Monachism, p. 435.

CHAKRAVARTI KURA. Chakrawarti. Tel. Chakravarti Kura.

CHAKOR. Beng. Also Chaktrak, Kuk, Chakrakudu, Tel. An oilman. Chakri. Hind. A disc or flat circular piece of skin, also a disc of leather used on the axle-boxes of carriage wheels.

CHAKWAEN. Tel. Chakwaen.↑

CHAKWA. Tel. Chakwa.↑

CHAKRA. Hindu. The discus of the god Vishnu, resembling a wheel or quoit; a sort of missile weapon, whirled round the middle finger, and used as a weapon of war. The chakra, in Hinduism, is mythologically described as a circular mass of fire, darting flame in all directions, which, thrown by the gods, slays the wicked, and then returns to the hand from which it is thrown. The Sikh Akali used to have several of them on their conical caps. They fly with great rapidity, and strike hard, but with most uncertain aim. They are expensive, and are almost useless weapons.

CHAKRA, or district of Kuru-Kahetra, is also called Dharma-Kahetra, or the ‘holy land,’ which is Hwen Thsang’s ‘champ du bonheur.’ In his time the circle of pilgrimage was limited to 200 li, equivalent to 20 kos.—Cunningham’s Indo, p. 382.

CHAKRA. Hind. A small coin; a country cart, a hackery.

CHAKRA-KELI ARITI or Aritiel. Tel. Chakrakam, a brass stamp; the discus of Vishnu stamped hot on his followers’ arm. Chakrastambha, a pillar supporting a chakra.

CHAKRA VAKA. Sansk. Ruddy goose; the birds are supposed to be separated through the night. See Chakwa; Casarea rutila.

CHAKRAVARTA. Sansk. A paramount sovereign, an emperor. Literally, one on whom the discus of Vishnu abides. A few sovereigns in ancient times laid claim to this title, but it is now heard of only as the tribal name of a Brahman family in Bengal, under the altered form of Chuckerbutty. CHAKRA. Hind. A small coin; a country cart, a hackery.
The Chaldea, the Chaldean Dagon, who first instructed men in the elements of civilisation, in the rudiments of art, science, and letters, and laid the germs of the civilisation which in after time bore such rich fruit in the schools of Babylon and Nineveh. This contact, in the midst of western Asiatic culture, was the seed of three of the most ancient cities of the Chaldaean empire. In the immediate neighbourhood of the Shat-el-Hiie, which leaves the Tigris at Kut Amarah, and enters the Euphrates near Gommerick, after a winding south-westerly course through marshes of the Afaqij district, are to be found, on the north bank, the mounds of Warka and Niffer, which mark the sites of the ruins of Erech and Kalneh, cities of Nimrud; and M. de Sarzec brought to light the ruins of another city contemporaneous with the cities of the mighty hunter's kingdom. On the west bank of the Euphrates, at Tel Mughlir and at Rata, are the ruins of cities closely connected with Semiitie and Biblical traditions, the former being the site of Ur, the birthplace of Abraham, while Chaldesian tradition locates the 'garden of Eden,' with its sacred tree, in the city of Erilthu, whose position corresponds with the modern town of Bozra. The evidence both of the historic records of Chaldea point to this region of southern Chaldea, the Sunni of the inscriptions, the Shinar of the Bible, as the cradle of the learning and wisdom of Chaldea.

The inscriptions of Sennacherib and Assur Bani-pal and the lines of sculptured bas-reliefs show that these marshlands were the dwelling-places of a race distinct from the Assyrians and Babylonians, and who bore many traces of being relics of the aboriginal population. During the explorations of Sir Henry Rawlinson and Mr. Loftus in these regions, some few inscriptions and bronze implements were obtained from a mound called Tel Ho, on the Shat-el-Hiie, near to the marshy shores of the Waaut lake or pool. By his exploration in this mound, M. de Sarzec has brought to light the ruins of an important edifice, either a palace or temple, which dates from the earliest days of Chaldaean monumental history, and whose builder was the king Afaddj, whom the Chaldeans call Saosducbinius, and the Orphanus of the classiees, the builder-king of Ur. In these ruins Chaldea, the Chaldean fire-worship. So impenetrable are the marshes of the Afaqij, and so little subject to external influence, that the name which more than 40 centuries ago denoted the Chaldaean Pyropolis, is still extant in the Arabised form of Zergaul, as the local name of the region in which Tel Ho is situated. From the monuments we are able to trace two types of people, whose features are transmitted to us with extreme fidelity by the primitive sculptors. The first is a beardless type, with a head, as far as we can judge from the statue, of a brachycephaline type, but with distinctly orthognathous features, and therefore with no tendency to the African Negro type. The features, as judged from the finely-carved head discovered by M. de Sarzec,
CHALDÆA.

are distinctly of the Mongoloid type, and of the Ugro-Finnic branch. This first type, again, bears a remarkable resemblance to the Elamite and Sasanian people as figured on the sculptures from Nineveh; and this ethnic similarity receives additional support from the philological agreement which is found to exist between the language of these inscriptions and those of the Turanian tribes of Elam and Media. The head found by M. de Sarzec represents the figure as wearing a close-fitting cap bound round with a decorated turban, a type of head-dress worn by the Elamites in the time of Sennacherib and his successors, and by the Tartar tribes of Central Asia. The second type of features preserved to us, is that of a bearded race with a more Caucasian type of features, with long straight hair. The type is somewhat difficult to recognise, but it is certainly distinct from the first or from the Semitic Assyrian.

Thus, in the very earliest dawn of Chaldean history, we find people of a distinctly Mongoloid or Turanian type in the oldest cities of the empire, with inscriptions written in an agglutinative dialect, and in a script bearing, as M. Terrisse de la Cooperie has shown, a curious resemblance in its commonest ideographs to the script first propagated by the Hundred Families of the Celestial Empire. An ingenious attempt has recently been made to assign a Chaldean origin to Chinese. In 1842, M. Pauthier attempted to prove the identity of the Egyptian and Chinese system of figure-writing.

The discovery of bronze figures and implements in the excavations, the former bearing inscriptions of Gudea and of other early primitive kings, show that at a very early period metallurgy had reached a considerably advanced stage among the settlers in these low, marshy regions. The city of Sergulla was, as the great fire-city, also the earliest seat of the workers in metals, who from this primitive centre supplied the surrounding cities with weapons or statues for their temples and tombs.

The elaborate network of canals which thread the plains, rendered the internal communication of Chaldaea of a highly perfect character. On the banks of these ancient canals we find the most ancient cities of the empire; and the flow of commercial intercourse which made Babylonia the chief of merchant-land, was greatly stimulated by this excellent system of trade intercourse. The Shat-el-Hie, through which the fleet of Senacherib was navigated in its expedition against the tribes on the shores of the Persian Gulf, was the grand junction canal of Southern Chaldaea; while the Yussifan canal, which crosses the upper plain of Chaldaea some 20 miles below Bagdad, was the chief artery of Upper Chaldaea or the province of Akkad. The mound of Abu Hubba marks the site of the ancient city of Sippa, the Chaldean Heliopolis, one of the dual cities of Sepharvaim. Bit Parra, the chief sun-god in Sippar, was not only the dwelling-place of the patron deity of the city, but was also the chief law court and chancery of the district, and the centre to which flowed all the commercial and fiscal transactions of the province of Akkad, or Northern Chaldaea. The excavators at Abu Hubba penetrated into the Bit Nizirti, or treasury of the temple, and within it were found stored over ten thousand inscribed tablets relating to the commercial and fiscal life of Babylonia. The bronze figures of priests in the British Museum, and the statue of the mother goddess, bearing an inscribed legend of Kurdurnabug, are both examples of the founders' art and product of the forges of Zerguhl.

Astronomy seems to have originated with them. They invented and employed a saros, or restoration period of 18 years. They latterly chose the heavenly bodies as types of the divine attributes, and in later times made them objects of adoration, particularly revering planets. They were acquainted with the precession of the equinoxes, making use of a tropical year of 365 days 5 hours 49 minutes 11 seconds (only 25 seconds too great), and a sidereal year of 663 days 6 hours and 11 minutes. They knew the art of dialling. By the saros period they were able to calculate and predict lunar eclipses, and the days on which the sun's eclipses might be expected. This period is still used by astronomers. The great centre of Chaldean mathematical learning was the city of Larsa, from the library of which came the tables of square and cubic roots. It is therefore very interesting to find that some of the tablets from this ancient city, rudely-drawn plans or geometrical figures. These tablets seem to point to a school of geometry as in existence in this ancient seat of Chaldean learning. There are already in the British Museum fragments of tablets which have come from Babylon, Calah, and Nineveh, which show that divination by geometrical figures was in use among the primitive magicians of Chaldaea.

The first metrical weight was determined by the Euphrates; for the Babylonian talent, which they originated with the mine and chisel, corresponded exactly with a Babylonian cubic foot of water at the mean temperature of that country. The talent, mine, and chisel became the monetary standard of Western Asia. They divided the circle into 360 degrees, and these again into 60 fractions of a degree; the figures reached to a hundred; yet they also had special names for 60, or a sossas, as well as for the saros or square of the sossas, and they invented the positional value of figures.

In the Chaldean mythology—

II or Ra—Ra is Chalde, II is Semitic; from II is El, Elohim, Allah—is God.

Anu, God, the Supreme.

Anata, the female of Anu, the power of Anu.

Beltis, wife of Bel Nimrud, in Chaldee called also Mulitta or Enutes. In Assyria she was called Bilit or Billa Nippata, and Bit Ana. 

Hos or Hes, god of life, the third deity of the triad. He is god of knowledge, the king of rivers, and came from the sea to teach the Babylonians. His emblems are a wade, a serpent.

Dit King, wife of Hoss.

Sin or Hurki, the first god of the second triad in the moon deity.

San or Sansi, the sun-god; in Semitic Shamus; also probably Parr, perhaps the Th ra or Fr ra of the Egyptians.

Ai, Gula, or Amanit, the female power of San. She presides over life and over fecundity. Her emblem was an eight or a six rayed star.

Vul or Iva, the god of the atmosphere, is the third deity of the second triad, moon, sun, and atmosphere—the rain-giver.

Bar, Nin or Ninip, the fish god; lord or master; the analogue of Hercules. His emblem the man-bull.

Bel Merodach, the planet Jupiter.

Zir Banit, wife of Bel Merodach.
CHALIYYA.

preparations are used in the arts and in medicine.
Black chalk, used in the arts, is a dark-coloured clay.—Royle; Funkhner; Ainslie; Smith.

CHAL KUMRA. Hind. Beninecho cerifera.
CHALIA. Hind. A thumb ring, and a great toe ring.

CHALLA MUNTA. Tel. Fluggea leuco- pyrus, Willd.

CHALM-CHI. Hind. A wasi-hand brass basin.

CHALO-DIONA. Uria. Erythrina Indica.

CHALODHA. Hind. Elesueine coracana.

CHALON. Hind. Populus eiliata.

CHALUKYA, also called Salunki, a race known as one of the four tribes of Agnecula Rajputs, the other three being the Chauhan, the Pramara, and the Purhara. The Chalukya claim to have been princes of Soor or the Ganges. They are divided into sixteen branches, viz.:

Bhagela.—Raja of Bagheeleand (capital Bandungpur), Raos of Pittapur, Theraud, and Adaluj, etc.

Bipura.—Rao of Lundawara.

Bihula, Chauhan in Mewar, styled Rao, but serving the chief of Solumbra.

Bhurta and the Kalacha.—In Baru, Tekra, and Chahir, in Jeyasurim.

Langaha.—Mahomedans about Multan.

Togra.—Mahomedans on the Punjund.

Briku.—Mahomedans on the Punjund.

Surki.—In Dokhan.

Sirwurcal.—Girnar in Saurashtra.

Raoja.—Thoda in Jeyyore.

Rankia.—Daisoon in Dewar.

Kharura.—Allote and Jawura in Malwa.

Tantia.—Chambdur; Sakunbari.

Almeteh.—No land.

Kulamor.—Gujerat.

The Chalukya once held sway in Gujerat, Kandes, Kaliuni, and Warangal.

This is the oldest ruling race of which we find satisfactory mention made in the records of the Dehkan. The inscriptions collected by Sir W. Elliot relate to four dynasties of princes, reigning over the greater portion of that part of India now denominated the Dakshina or Dehkan, but at that time Kantula-desa.

The Pallava were the dominant race in the Dehkan previous to the arrival of the Chalukya. In the reign of Trilochana Pallava, an invading army, headed by Jaya Sinha, surnamed Vijayaditya, of the Chalukya Kula, crossed the Nerbadda, but failed to secure a permanent footing, and he seems to have been killed. His queen gave birth to a posthumous son, in the house of a Brahman named Vishnu Somayaji. This son was called Raja Sinha, but afterwards assumed the royal titles of Rana Raga and Vishnu Vardhana. He successfully renewed the contest with the Pallava, and married a princess of that race. A copper sasanam of his son and successor Fulakesi, bearing date s.s. 411 or A.D. 429, is in the British Museum. From Raja Sinha's first conquest, the whole period of their rule would be about seven centuries. Raja Sinha's great-grandson, Kirtti Varma, had two sons, one of whom ruled in Kalyan, the other in Telingana, after conquering Vengapuram, the capital of Vengidesan.
CHALUKYA.

The Chalukya branch was subverted for a time in the end of the 9th or beginning of the 10th century, and the emigrant prince or his son succeeded by marriage, in A.D. 931, to the throne of Anhaltara Pattan in Gujarat, which his descendants occupied with great glory until A.D. 1145. But in A.D. 973 the dynasty of Chalukya was restored in the person of Tailapa Deva, and ruled with greater splendour than before, till its extinction in A.D. 1189 by Bijjila Deva, the founder of the Kalabhuria dynasty.

The branch in Telugana fixed their capital at Rajamahendri, the modern Narasarnadupury. They appear to have effectuated their entrance into Telugana Balaghat by the conquest of Vengi in the 6th century, and, after several changes, the dominion passed by marriage to Rajendra Chola, then the dominant sovereign of Southern India, in whose person the power of the Chola dynasty reached its height. The following were the rulers of the Chalukya dynasty of Kalyan:—

Vijayaditya III. began to reign A.D. 695. Vikramaditya II. began to reign 735.

Ayya or Kirtti Varma IV. Vijayaditya IV. Tailapa Malla II. or Vikrama-
ditya II. in A.D. 973, restored the monarchy, which had some been some time usurped by the Ratta Kula. He died A.D. 997.

Satasangara I., Irivi Bhuja-
ga Deva, A.D. 997. Vikramaditya v. began to reign about A.D. 1005.

Jaya Sinha Deva, Jagadikula Malla, about A.D. 1018. Somewar Deva I., Tailo-
ky Malla, Ahawa Malla, about A.D. 1040.

Somewar Deva II., Bhu-

bhuvana Malla, A.D. 1182, dethroned by Bijjila Deva, the last of the Kalabhuria line.

The style and titles of the Chalukya of Kalyani were Chalukya Kula, Manayunasa Gotra; Harit putra; whose royal power was the gift of Kau-
sika, nourished by the seven mothers, worshipping Swami Mahasena; having the boar signet (lanch-

hana), the gift of Bhagavan Narayana. Their insignia of royalty consisted of the Swetata Patra, the white canopy. Sanka, the conch (chank) shell. Panca Maha Saka, the martial drum. Hala Keta, the plough ensign. D'aka, the drum. Varaha lanchhana, the boar signet. Mayura Pincha, the peacock fan. Kunta, the spear or mace. Sinhasana, the throne. Makara Vanaanam, the royal arch. Kannaka-Tanam, the golden sceptre.

Their boar ensign was the most celebrated, and was the symbol invariably represented on their money and on their seals, sometimes, in the latter, accompanied by the conical, the drum, the peacock fan, or a lotus, an elephant gond (ankus), candabala, a seat or stool, the swatika cross ☧, and latterly a sword. It was from the boar on the Chalukya coin that the people of the Penin-
sula of India give the name ‘Varaha’ to the pagoda, varaha mudra, or boar stamped. Chalukya dynasty of Rajahmendri:

1. Vishnu Vardhana II., or Kuhja Vishnu Vardhana; conquered Vengi, A.D. 605.

hania IV.

13. Vijayaditya II., or Guuna Gunanka Vijayaditya; conquered Kalinga.

15. Vijayaditya III., or Kola Devara Vijaya.

16. Amma Raja I.

The country fell under the sway of Warangal. The family spread southwards into what is now known as Mysore, where they were afterwards the parent stem of the Hoysala Bella dynasty of Dwara-samudra. They seem to have been of the Aina faith, but to have subsequently adopted the Vaishnavas and Saiva forms of Hinduism. A ruined temple at Buchropuli, near Hyderabad, and temples at Hammonconchad, near Warangal, are in a style of architecture followed during Chalukya supremacy. At Warangal also are four pillars, Kirti-Stambha, which were set up by Pratupa Rudra, who had also erected the great temple at Hammonconchad.—Thomas' Princep's Antiquities; Sir W. Elliot, M. L. S. J., 1858; Elphinstone; Ferguson, Architecture, pp. 389, 731; Tod's Rajasthan, pp. 80-97. See Hoisala Bella. CHALUN of Kotgarh. Populus ciliata. CHALUNDAR. Hind. Iris Neapalisia. CHALYBEATES. There is no one district in which they have been found more frequently than another, unless the outer ranges of the Himalaya; the woods in the Neighbourhood are said often to have them. None of the Indian chalybeates are thermal; and none of those known, except that at the beautiful spot Nagconda, appear to be strong ones; there are many undescribed chalybeates in the Himalayas. One at Chamba may prove of value.

CHAMA. Tel. Colocasia antiquorum. CHAMA, a genus of the mulluscæ. C. albidæ, C. asperella, C. echinulata, C. gigas, C. graphoides, C. cryphoides, and C. unicornis occur in India. C. cryphoides (C. gigas, Linna.) is famous for its enormous size. Individuals have been known to weigh above 300 lbs. The byssus by which it adheres to rocks is so tough, that in order to procure the shell it must be cut with an axe. The animal may be eaten, but its flesh is very tough. One of the valves is sometimes used as a font for baptism in the country churches of Europe. The species are confined to the warmer seas, the Medi-
terranean being the locality of the lowest temperature, where any of them have been hitherto found. —Eng. Cyc. p. 931.
used for tinder. Its leaves, pfurah or phurra, are fabricated into baskets, fans, brushes, sieves, shoes, sandals, pouches, platters, and ropes for water-wheels. Large quantities of the stones of the fruit (which, Trana-ludus, ripens about July) are exported from Gwadar to Muscat, en route to Mocca, to be manufactured into rosaries for the pilgrims.—Stewart, Pres. Pl. p. 243; Seemann.

CHAMAI-DOOO-POO, TAM. Camomile; Antheim nobilis, Liu. 

CHAMAKHRI, HIND. Michelia champae. 

CHAMAK PATHAR, HIND. Oxide of iron, magnetic iron ore. Chamak, 'glancing.' 

CHAMALU. Tel. Opilismenus frumentacevs. 

CHAMANTI. Tel. Applied indifferently to all the cultivated kinds of chrysanthenum.

CHAMAR, a scattered race in India. In North, the Chamar race is generally said to be subdivided into seven sections, Jatooa, Kacen, Kooril, Jyswara, Jhoseea, Azimgurhea or Birhoares, and Koree or Korehhman, who do not eat together nor intermarry. The Jatooa are chiefly in the north-west, Delhi, Rohilkhand, and the Upper and part of the Central Doabs. The Kacce are in Bandelkhand and Sangor. The Kooril occupy the greater part of the Central and Lower Doabs. The Jyswara meet them in the neighbourhood of Alahasabad, and extend through Jumnpur, Mirzapur, and Benares, to the neighbourhood of Sydpur Bhitree, where they are met by the Jhooseea, who occupy Ghazipur and Behar. The Azimgurhea have their seats in Azimgur and Gorakhpur; and the Kooril or Korehrrnan in Oudh. The last are generally engaged in the occupation of weaving. Others are mentioned besides these, as the Jlattoe of Rohilkhand, the Ahurwar, Sukwar, and Dol or Central Dob; but as the Jhooseea and Jyswara have some connection with the Kuril, they may perhaps be included in that tribe. In Behar we meet also with subdivisions of Gureya, Magahi, Dushkini, Canouen, as well as the Jhooseea and Jyswara above mentioned, —all tending to show that the division into seven clans is imaginary.

The Dolur are mentioned in Steele's Summary, p. 128, as existing in the Deken along with Kutun (cobble) and Dupigurs (Dubur, maker of oil-bottles); but he does not include them amongst Chamars, of whom he enumerates the following classes: Sultunner, Marthe, Paradox, Purdees, Harahblutted, Dubali, Woje, Chour.

Chamars are a dark race, and a fair Chammar is said to be as rare an object as a black Brahman.

Kurea Brahman gur Chammar. 

In ke saath na ootriye par.

That is, 'Go not in the same boat with a black Brahman or a white Chammar, both objects being considered of evil omen.' Many of the Chammar of the Central Provinces have joined the reformed Sat-nami sect. The Chammar of Hindustan, in respect to members and avocations, are in the same position as the Parihars, Chakki, Mhar, Mhang, Hollar races of the south of the Peninsula, where the designations of tanners and leather-workers are—

Sanigar, Madiga. CAN. Madara, Madiga, Coog. 

Chammar.... HIND. Mhag. 

Mhag.... MAHR. 

| Chamari | TAM. Madiga, Madiga. | CHAKKILI. | Mhag. | MAHR. | Tel. |
The Mang or Mhang are scattered through all the north-western parts of the Indian Peninsula, in the Bombay Presidency, in Gujarat, Khandesh, the Konkan, and Kolhapur.

Tanners and leather-workers are perhaps the most humble of all the settled races in the south of India. There they dwell outside the walls of the villages. They are deemed wholly unclean. They are tanners, workers in raw hides and leather, shoe and harness makers, messengers, scavengers, and executioners. They are never horse-keepers, and only a very few have ever been known to have the ability to read or write. The race, as a rule, are of a dark, black hue, short in stature, and of very slender frame; lower limbs particularly slight, and calf and foot delicate. They still eat creatures that most races regard as unclean, and likewise eat animals which die of disease. In rural villages they perform the lowest menial offices, such as messengers and scavengers, and are paid by portions of the crops and some small privileges, but are not permitted to reside within the village walls. The Madarun and Madigaru are predial slaves, and seem identical with this race. The Madaru make baskets. In Northern India and in Bengal the Chamar race are workers in hides and leather, tanners, and shoe and harness makers, and there form the great bulk of the labourers, taking the place of the Dher and Pariah of the Peninsula. There are many sections of leather-workers throughout the Hyderabad country, and in Berar they serve as scavenger, guard, watchman, and executioner. Their signature mark is a knife. They are part of the Baluth, and, like the Pariah, are the predial slaves of the village. The Pendi Mang are athletes. The Mhang worship the leather ropes which they make. They also make cakes, which they place in the ground, and over it five stones and a lamp, and worship these. They also worship the spirits of departed men who have led evil lives. They claim the right to have food cattle and camels and horses that die of disease, but so long as villages this is disputed by the Dher or Pariah; and in the village of Dangopura, in 1866 and 1867, this point was for twenty months under litigation, the ultimate decision being in favour of the Dher. In the Northern Dekhan are the sections Mang Garoro, Hollar Mang, Dekhan Mang. The Mang Garoro are also styled ‘Pharasti’ or migrants, as they have no settled abode, but move from place to place begging; their men and women assume other clothes, and smear their foreheads with the red kuku, a mixture of turmeric and safflower. They also are conjurors and sleight-of-hand adepts, from which they have their name Garori. The men also beat the drum.

The Bandela and Kuillar Chamar is a tanner and shoemaker; Maharra Chamar, a shoemaker; Pardesi Chamar, a cobbler; Mang Chamar, who makes sandals; Mahommed Chiar, who is a bookbinder; Katai Chamar, who make shoes and sandals, and labour in the fields at seed and harvest times. The Katai are identical in personal appearance with the Chuckler (chakillii) of the very south of India. The Chamar of Aurangabad worship Mariamma and Sita. They marry when under age amongst themselves, proceeding on foot to the goddess Sita, whose shrine they circumambulate five times. The expense is about a hundred rupees. They speak Hindi. They burn their dead; but some very intelligent men at Aurangabad did not know that anything followed death.

In the great isolated plain of Ch’hattegaur, where the jungle has not even yet been thoroughly mastered by man, the Chamar, who make up some twelve per cent. of the population, are nearly all cultivators. The creed adopted by them is the ‘Satnam’ or ‘Rai Dasi,’ a branch of one of the most celebrated dissenting movements in Indian religious history. No images are allowed; it is not even lawful to approach the Supreme Being by external forms of worship, except the morning and evening invocation of his pure name (Satnam), but believers are enjoined to keep him constantly in their minds, and to show their religion by charity. Even if the creed be weak as a moral support, it is strong as a social bond; and, no longer weighed down by a sense of inferiority, the Satnam hold together, and resist all attempts from other castes to re-assert their traditional domination over them. They are good and loyal subjects; and when they have grown out of a certain instability and improvidence, which are the natural result of their long depressed condition, they will become valuable members of the community.

CHAMBA. Hind. Ehretia aspera.

CHAMABA, Chawri, or Chowri. Hind. A whisk, made sometimes of peacock’s feathers, sometimes from the tail of the yak, sometimes of the shavings of sandal-wood, of horse hair, or of grass, and used for the purpose of driving away flies, mosquitoes, and other insects. They are usually seen in the hands of the attendants of the Hindu gods. The chamar or chawri from the white bushy tail of the Tibet cow, was, in ancient India, fixed on a gold or ornamented shaft, between the ears of the horse, like the plume of the war-horse of chivalry; the banner or bannoret, with the device of the chief, rose at the back of the car; sometimes several little triangular flags were mounted on its sides. ‘The waving chawri on the steed’s broad brow points backwards motionless as a picture.’—Coleman, p. 376; Hindu Theatre, i. p. 199.

CHAMARFO of Spiti, a deep red earth used in dyeing.

CHAMAR GAUR, a division of the Gaur Rajputs, the highest class, although from their name liable to the suspicion of intercourse with Chamaras. They claim for themselves the designation Chaun-har-Gaur, from a Raja named Chaunar, or sometimes Chiman-Gaur, from a Muni called Chiman.—Wilson.

CHAMARI. MAIR. Premna integrifolia.

CHAMAR LENA, Jaina caves near Nasik.

CHAMATEE-PATEE. Beng. Papyrus deshisia.

CHALAYEN, a small section of the Gujar tribe in Panipat Bangar.—Wilson.

CHAMB. Hind.? Land that receives the drainage of higher lands, generally a heavy blackish clay.

CHAMBA is a state in the Himalaya ruled by a Rajput dynasty. It is within the government of the Panjab. It lies north of the Kangra district, between lat. 32° 10’ 30” and 33° 13’ N., and long. 75° 49’ and 77° 3’ 30” E., with an area of...
CHAMBA.

3216 square miles, and a population of 140,000, composed of Rajputs and Gaddi. The district includes the mountain valleys of all the sources of the Ravi, and a portion of the upper valley of the Chenab, between Lahlul and Kishwar. It has Kulu on its east; in the N.W. it is separated from Jammu by a chain of mountains through which the Pahalgam pass leads from Jammu to Chambara, elevated 11,000 feet. The Sahc pass, elevated 14,800 feet, leads over the range in the north, dividing Chambara from Kishwar. In 1847 a summad was given to Raja Siree Singh, assigning the Chambara territory to him and to his male heirs. In 1854 the saunatium of Dalhousie, in the Chambara territory, was made over to the British by the raja, and a summad was given to the raja conferring on him the right of adaption. Its ancient capital was Varmapura, or Barmawar, on the Budhil river, where many fine temples, and a brazen bull of life size, still exist to attest the wealth and piety of its early rulers.—Cunningham, Ancient Geo. of India, p. 141; Altechon's Treaties; Hooker f. et Th. p. 294.

CHAMBA, an idol of the Tibetans.

CHAMBA, Hind. Michelia champaca; also Prinsepia utiliss, Jasminum grandiflorum, and J. officinale.

CHAMBAGADDA, a race who occupy the Kangra valley, near the Chambar range of hills. They call themselves Rajputs, and may always be known by their peculiar conical caps, with lappets to turn down over their ears, like an English travelling cap. They are shorter and stouter and stronger than their neighbours, are sharp and able, and impose upon their less knowing neighbours. Most of the witch-finders are Chambagadgi. When Europeans first visited the Kangra valley, they would drink or eat from their hands, and had very slight notions of caste, but since their intercourse with the people of the plain they have become as bigoted as any Hindus.

CHAMBAI. MALAY. Chavica seriboo.

CHAMBAL, a tributary of the river Jumna (Jamuna), which it joins 40 miles below Etawa town as a great river. It rises in Malwa about eight or nine miles S.W. of the cantonment of Mhow, 2019 feet above the sea. — Imperial Gazetteer.

CHAMBL, Hind. Ranunculus arvensis.

CHAMBATT. Hind. Kämpferia rotunda.

CHAMBELL, Hind. Jasminum grandiflorum.

CHAMBOGUM, Tam. The most beautiful tree in appearance on the coast of Malabar; it has a very close-grained wood, and throws out rather a pleasant smell when cut. It is generally found in the forests of Travancore of about 18 inches in diameter, and from 20 to 25 feet long. It produces a small round fruit, which the natives use medicinally.—Edge, M. and C.

CHAMBOOLEE. DUKH. Buchinia Vahlill.

CHAMBRA. Hind. Artemisia Indica.

CHAMELEON, a genus of a family of reptiles of the section Squamata and order Sauria. There is but one genus, the Chameleo, or chameleon, the thirteenth of the Hebrews, of which there is one species in India, C. Zeylanicus. Also, of Ceylon and India. There are twenty-one in Madagascar, bifurcatus, cucullatus, nasutus, Parsonii, rhinoceros, and verrucosus; C. tiariss occurs in the Seychelles, and C. pardalis in Bourbon. The E. Indian species, C. Zeylanicus, has many synonyms.

CHAM GADDI. BENG. Cynopterus marginatus, Jerdon.

CHAM HARAIL. TIBETO-CHINESE. A sacred dance of the Buddhists; a masquerade of Hindu gods going in procession, after a model employed at Yung-ho-Kung in Pekin; it lasts two days.—Elkden.

CHAMI. Tel. Premna spicigera, Linn.

CHAMARI. HIND. Prunus piddatum.

CHAMAT. HIND. Desmodium tiliafolium.

CHAMKHARAK. HIND. Carpinus vininea.

CHAMLOO, one of the seven Kazzilbash tribes.

See Kazzilbash.

CHAMMA. Tel. Canavalia gladiata.

CHAMMA. HIND. Salix alba.

CHAMMAH.A. PERS. A grateful dish, made by boiling dried apricots to a consistency, with butter, seasoned with spiccs.—Masson, ii. p. 69.

CHAMNO, Khem, and Rempi, three Assyrian deities of Semitic extraction. See Ken.

CHAMOIS LEATHER.

Chamois, ... Fr. Camoscio, ... It. Samischleder, ... Ger. Semsehainu, Koshi, Rus.

A prepared skin of the chamois, or of the common goat, kid, or sheep. It is of a yellow colour, soft and pliant, and used for cleaning silver plate.

CHAMOMILE, Anthemis nobilis.

Babunuj, ... ARAB. Babune phul, ... HIND. Kan-kiah-wa, ... CHIN. gao, ... PERS. Kuhkiah-wa, ... ... CHAMENDAPU, ... TAM.

The flowers of the Anthemis nobilis. An aromatic herb, leaves used in garnishing; the flowers infused as bitters, and in fomentations. Of easy culture, raised from seed; held in estimation both in domestic and scientific medicine.

CHA-MORE, a lake in Ladhak, 15 miles long and 2½ miles broad, 15,000 feet above the sea. It is surrounded by mountains, some of which rise to 5000 feet from the water's edge.

CHAMPA, a province in the peninsula of Cambodia. Before its subjugation by the Cochinchinese, it was a considerable state, under a chief, who lived at Phanrye, lat. 11° 10' N. In the 15th century an intercourse subsisted with the Malaya and Javanese, and about the middle of the 15th century the queen of the principal sovereign of Java was a Champa princess. The people are called Loye or Loi in the Anam language, and profess a kind of Hinduism resembling the worship of Buddha or the Jains. Tradition ascribes to ancient Champa sovereignty over all the neighbouring kingdoms to the frontiers of Pegu and China.—Mouhot's Travels, i. 223; Yale, Cathay, i. p. 104; Crawford, Embasy to Siam; Dict. Ind. Islands.

CHAMPA, also Champaka. HIND. Michelia champaca. The flower is one of five with which the Hindu Kama, the god of love, ornaments his arrow. When Yasant'ha, the personified springtime, is preparing the bow and shafts for his friend,

'He bends the luscious cane, and twists the string
With bees, how sweet! but oh! how keen their sting!
He with five flowerets tips the routless darts,
Which through five senses strikes enraptured hearts.
Strong Champa, rich in odorous gold;
Warm Aner, nursed in heavenly mould;
Dry Nga-Kosur, in silver smiling;
Hot Kitiok, out dense fragming;
And last, to kindle fierce the searching flame,
Love-shaft which gods bright Bela name.'
CHAMPA CHASTI, a Hindu festival in the west of India, held about the 2d December, on the 6th of Margha shirsh-shud. It is held wherever there is a shrine of Kaudoba, as at Jijiri in the Dekhan.

CHAMPAI, a deservedly esteemed wine, named from the province of France producing it. There are two distinct classes of this wine, viz. white and red, each either still or sparkling; but there is a great variety in the flavour of the produce of different vineyards.

CHAMPAI, a tree which grows on the summit of the lofty hills north of Khatmandu; measures in height – Smith’s Nepa.

CHAMPA-KALI. HIND. Necklace.

CHAMPA-KULA. BENG. Musa sapientum.

CHAMPARAN, a district in Bengal, bounded on the north by Nepal, and at its side are the Gaukhal and the Baghmati rivers. Population in 1872, 1,140,815 souls, viz. 974,451 Hindus, 199,267 Mahomedans, 21,450 Tharu. The aborigines numbered 31,203 souls. The Tharu are an honest, industrious, Indo-Chinese race, inhabiting the malignant Terai. They utilize the hill streams for rice culture. The Maghya Dom, about 800 souls, are a nomadic tribe, inveterate thieves; the Dosadh are 60,556, and the Chamar 89,061. The Hindu and other races are—

Brahman . 65,315
Baban or military . 77,641
Brahmans . 35,102
Brahmans . 49,288
Artisan . 141,140
Rajputs . 69,578
Fishermen . 62,757
Gola . 333,413
Koeri . 82,074

The Bettin raja is a Babban. The Nuniya are salt-makers.—Imp. Gaz.

CHAMPA - ZARD - RANG. HIND. Amongst dyers, a yellow colour like the champa flower.

CHAMPHUNG, a rude tribe in Munnipur, of about 30 or 40 families, near the source of the Frawadi. See India.

CHAMPI KATTA. TEL. Broom grass.

CHAMPOOING. MALAY. A timber tree of the Archipelago, used as a furniture material at Banda.

CHAMPU, in Hindu literature, a style of composition, a mixture of prose and verse.—Ward, iv.

CHAMRA. HIND. Skins, hides, leather, parchment.

CHAMRESHI, also Sunbar. HIND. Rhododendron campanulatum.

CHAMREM. HIND. Ehretia aspera.

CHAMULI. HIND. Michelia champaca.

CHAMUNA. HIND. The edible bulbs of Cyperus bulboas and allied species.

CHAMUNDA, in Hindu mythology, as related in the Durga Mahatmya, an emanation of the goddess Durga, springing from her forehead to encounter the demons Chanda and Munda, detached to seize Durga by the sovereign of the Daitiya. Sumbha having slain the demons, she bore their heads to her parent goddess, who told her that, having slain Chanda and Munda, she should henceforth be known on earth as Chamunda. She is also termed Kali from her black colour, and Karola or Karalavadana from her hideous countenance (Hind. Theat. ii. p. 57). It is to this goddess that all human sacrifices are made by Hindus. One of the ancient Hindu dramatists, Bhava Bhutta, who flourished in the 8th century, in his drama of Malati and Madhava, has made powerful use of the Aghora in a scene in the temple of Chamunda, where the heroine of the play is decoyed in order to be sacrificed to the dread goddess Chamunda or Kali. The disciple of Aghora Ganta, the high priest who is to perform the horrible rite, by name Kalapa Kundala, is interrupted in his invocation to Chamunda by the hero Madhava, who thus describes the scene (Act V. scene 1):

‘Now wake the terrors of the place, beset
With crowding and malignant fiends. The flames
From funeral pyres scarce lessen their light,
Clogged with their flamy prey, to dissipate
The fearful gnom that bems them round.
Well, be it so. I seek, and must address them.'

How the noise,
High, shrill, and indistinct, of chattering sprites,
Communicative, fills the central ground.
Strange forms, like foxes, fit across the sky;
From the red hair of their tusk bodies darts
The amorous ray, otter from their mother’s breaths that stretch
From ear to ear, thick-set with numerous fangs,
Or eyes, or beards, or brows, the radiance streams.
And now I see the ghoul host: each stalks
On legs like palm-trees, a gaunt skeleton,
Whose limbs are bowed by starting sinew,
And scantily cased in black and shrivelled skin.
Like tall and withered trees by lightning scathed,
They move, and as amidst their sapless trunks
The mighty serpent curls, so in each mouth,
Wide yawning, lolls the vast blood-dripping tongue.
They mark my coming, and the half-chewed morsel
Falls to the howling wolf;—and now they fly.'

The belief in the horrible practices of the Aghori priesthood is thus proved to have existed at a very remote period, and doubtless refers to those more ancient and revolting rites which belonged to the aboriginal superstitions of India, antecedent to the Aryan-Hindu invasion and conquest of the country. The worshippers of Sakti of Siva, under the terrific forms of Chamunda, Chinnunvata, and Kali, are called Kerai, and represent the Aghora Ganta and Kapalika. The word Chamunda, according to Ward, is from Chari, good, and Mundu, a head. She is said to be identical with the goddess Rani.—The People of India, by J. F. Watson and John William Kaye; Leyden, Asiatic Researches ii. p. 302.

CHAMUNDIBETTA, hill of Chamundi, is a precipitous hill 2 miles S.E. of the fort of Mysore. It is 3489 feet above the sea. There is on its summit a temple at which human sacrifices were made until the time of Hyder Ali. Half-way up the flight of stairs is a well-executed colossal figure of Nandi in a recumbent attitude, hewn out of the solid rock.—Imp. Gaz.

CHAMUTLI, HIND. Michelia champaca. Tulipa stellata.

CHAMY. CAN. Panicum milaceum.

CHAMYARI. HIND. Of Murree hills, Cerasus pudum, Prunus pudum; bird cherry.

CHANA, also Chanaka. HIND. Cicer arietinum; also species of Vicia.

CHANAKYA, a Brahman of the city of Takskia, who lived B.C. 350, the early friend and subsequent counsellor of Chandragupta. The drama of Mudra Raksasa, attributed to Visakhadatta, is founded on the story of Chanakya, who is celebrated as a statesman and writer on politics. It was he who plotted against Mahapadma, the last of the Nanda dynasty, and placed Chandra-
CHANDANAVATA.

CHANDANA, an ancient name of Baroda.

CHANDANAVATA, an ancient name of Baroda.
CHANDANAYATRA.  CHANDANA-VIBHUTI.

CHANDNI.  See Tripundra.

CHANDANAYATRA or Chandniatsava.

Sansk.  The ceremony of offering sandal paste or other perfume to an idol.—Wilson.

CHANDA-NAYIKA.  Sansk.  From Chanda, furious, and Nayika, a female attendant on Durga.

CHANDAN-HAR, also Chandarmah, and Chand-bina.  Hind., are articles of female jewellery.

CHANDANNAGAR or Chandernagore, a French settlement on the banks of the Hooghly river, in lat. 22° 50' 40" N., and long. 88° 24' 50" E.  Its population in 1877 was 22,539.  It was reduced by the fire from the ships of Admiral Watson on the 23rd March 1757, while then under the governorship of M. Law.  The place became a French settlement in 1673.

CHANDA SAHIB, a relative and son-in-law of Ali Dost.  In the early part of the 18th century, from 1752 till his death in 1753, he threw himself, on the support of the French under Duplex, against the British and Muhammad Ali.  He was an able leader, and, when occupying Seringham, Law, anxious for his safety, treated with Monajee for his escape; but Monajee, on getting possession of Chanda Sahib, kept him prisoner for several years in the fort of Tanjore, and ultimately put him to death.  He was humane, generous, and brave.

CHAND BIBI, also known as Chand Sultana, wife of Ali Adal Shah of Bijapur, one of the most distinguished women that have ever appeared in India.  When the emperor Akbar sent an expedition into the Dekhan, there were four parties in the field supporting claimants to the throne of Ahmadnaggar, and this princess was acting as regent for her infant nephew, Bahadar Nizam Shah.  She appealed successfully to the belligerents to unite against the Moghuls.  Nehang, an Abyssinian, cut his way into Ahmadnaggar while the Moghuls were in the act of investing the place, and the other two joined the Bijapur army then marching against the Moghuls.  Prince Muhammad Khan and Monajee's forces were rendered useless by the counter moves of the besieged; a third mine created a wide breach, and Chaud Bibi rushed to defend it, in full armour, and a naked sword in her hand, and a veil over her face, and, after an obstinate continuance of the assault, the Moghuls withdrew in the evening, and they were afterwards bought off with the cession of Berar (February 1596, a.h. 1004).  The Moghuls had not long withdrawn, when Muhammad Khan, whom Chaud Bibi had appointed her prime minister, plotted against her authority, and called in the aid of Prince Murad.  An indecisive battle was fought on the banks of the Godavery, and Akbar sent Abul Fazl, and subsequently he himself left the Panjabs in 1598, and reached the Dekhan before the middle of 1599, and sent forward Prince Daniyal and the Khan-i-Khanan to invest Ahmadnaggar; and Chaud Bibi was negotiating a peace with them, when her mutinous solodicy burst into the female apartments, and put her to death.  In a few days the Moghuls stormed the fort, and gave no quarter to the fighting men.  Chaud Bibi is the favourite heroine of the Dekhan, and is the subject of many fabulous stories, which even Khaft Khan and Kazi Shahabud-Din perpetuate.—Elphln. pp. 459-460.

CHANDERI, a Rajput tribe spread through the N.W. Provinces.  They have many divisions, and are supposed to have come from Muhoba in Bundelkhand.  They claim to be of the Lunar race, and they give their name to the Chandeli or Chandari district.  There are four subdivisions of them in the Lower Doab, who suffix to their names the regal terms Rao, Ravat, Rao, and Rana.—Elliot; Wh. II. of I.

CHANDELI.  Hind.  A very fine cotton fabric made at Chandari, on the left bank of the Betwa, from the cotton of Amroati.  Great care is bestowed in the preparation of the thread, which is prepared so fine as even to sell for its weight in silver.  The weavers work in a dark underground room, of which the walls are kept damp to prevent dust flying about.—Elliot.

CHANDESWARI, in the Tamil country, the prototype of Durga or Kali.

CHANDI, the last day of the month Asoj, ushers in the Hindu winter (sard riv).  On this day nothing but white vestments and silver (chandi) ornaments are worn, in honour of Chandra, who gives his name to the

'Pale and common drudge 'Tweed man and man.'

An intercalary month is the mode followed by Hindus to adjust the annual seasons, their ordinary calculations being by lunar months, and such are called lunar.  On the Asoj there is a procession of all the Rajput chiefs to the Choungan, and on their return a full court is held in the great hall, which breaks up with 'obeisance to the lamp' (jote ka mohra), whose light each reverences.  When the candles are lit at home on this day, every Rajput, from the prince to the owner of a 'skin (chursa) of land,' seated on a white linen cloth, should worship his tutelary divinity, and feed the priests with sugar and milk.—Ted's Rajasthan.

CHANDIA, a Balouch tribe, some of whom are found in the Dehra Ghazi Khan district.—MacG.

CHANDI-MANDAPA, chapels in private dwellings in Bengal.  Chapels face either the west or the south, never the east nor the north.

CHANDIPAT or Chandipatha, also called Devi-Mahatmya, a Sanskrit poem of 700 verses, forming an epic of the Markandeya Purana.  It celebrates Durga's victories over the Asuras, and is daily read in the temples of that goddess.  Chanda was a name of the goddess Durga.—Dowson.

CHANDILA, Hind.  A small wafer-shaped gold or silver ornament worn by Hindu women on the forehead between the eyes; also the painted mark made by women on their forehead.  The Ratanamala says, 'Dressed in sixteen garments, a woman without a Chandia does not appear beautiful.'

CHANDNee, Hind.  Caloncoryx Roxburghii, CHANf5NY CHOWK, or Silver Street of Delhi, is a name that has become common to the principal avenue in all the great cities of Northern India.  In Calcutta, however, the street of that name is not inhabited by bankers or goldsmiths, but by stable-keepers.—Tr. of Hind. ii. p. 278.

CHANDNI.  Hind.  Silver; a white cloth spread on a carpet; a canopy.

CHANDNI, or Chaudi.  Hind.  The practice amongst Brahmins, Charans, and others, of
wounding or killing themselves, in order to extort alms or payment.—Wilson. See Chandi.

CHANDO, a caste of toddy-drawers in Ceylon. See Chandi.

CHANDOO, the extract of opium which is employed in opium-smoking, called by the Chinese Yen-kau and Shuh-yen. The opium, as exported from Calcula, is in boxes containing forty balls, each of the size of a 32 lb. cannon shot. These balls are enclosed in a husk of compressed poppy leaves, and contain a certain quantity of moist opium inside, but which in this state is unfit for smoking, for which it is prepared by four processes, in the following manner:—About three or four o'clock in the morning, fires are lighted, and, as the first process, a ball is divided into two equal halves by one man, who scoops out with his fingers the soft part inside, and throws it into an earthen dish; frequently during the operation moistening and washing his hands in another vessel, the water of which is carefully preserved, into which also is thrown the hardened poppy leaf husks, when all the removable opium is obtained.

In the second operation, the husks are boiled until all their adhering opium is dissolved, strained through a double filter of cloth and China paper. The strained fluids are then mixed with the opium that was scooped out in the first operation, and boiled down in a large iron pot to the consistence of treacle. The refuse is dried and sold to Chinese, who adulterate good opium with it; and the filter paper is used by the Chinese as an external application in affections of the lower bowels.

In the third operation, the dissolved treacle-like mass is seethed over a charcoal fire, strong and steady but not fierce temperature, during which it is worked, spread out, and again and again worked up to expel the water, but prevent it burning. When brought to the proper consistence, it is divided into half-a-dozen lots, each of which is spread like a plaster on a nearly flat iron pot, to the depth of from half to three-quarters of an inch, and then scored in all directions to allow the equal application of heat. One pot after another is then placed over the fire, turned rapidly round, and then reversed, so as to expose the opium itself to the full heat of the red fire. This is repeated three times, the time and proper heat being judged by the workman from the aroma and colour. In this part of the process the greatest delicacy is demanded, for a little more or less fire would destroy the morning's work, or 300 or more dollars' worth of opium. The head workmen in Singapore are men who have learned their trade in China, and from their great experience are paid very high wages.

The fourth operation consists in re-dissolving this fired opium in a large quantity of water, and boiling and straining it, until it be reduced to the consistence of the chandoo of the shops, the degree of tenacity being the index of its complete preparation, which is judged of by drawing it out by slips of bamboo. The quantity of chandoo obtained from the soft opium is about 75 per cent. But from the gross opium, that is, including the opium and the bark, the proportion is not more than from 50 to 54 per cent.

In this lengthened seething process, the chandoo or extract becomes less irritating and more soporific, the vegetable matter, the resin and oil, the extractive matter, being all thrown out in the refuse matter.—J. F. A. No. 1, Jan. 1848; Dr. Little; Cameron, pp. 215, 216.

CHANDO-OMAI, or moon goddess. (Qu. Chando Ammal.)

CHANDPUR, the name of many towns in India. CHANDPUR SAKUMBARI of Tantia are described by Col. Tod as desperate robbers. He saw this place fired and levelled in 1807, when the noted Karim, Pindari, was made prisoner by Sindia. It afterwards cost some British blood in 1817. Though now desolate, the walls of this fortress attest its antiquity, and it is a work that could not now be undertaken. The remains of it bring to mind those of Volterra and Cortana and other ancient cities of Tuscan,—enormous squared masses of stone, without any cement.—Tod's Rajistan, i. p. 100.

CHANDRA. Tel. Acacia sandra; Machilus odoratissimus? and Tetraandra Roxburghii. Beng., Ophioxylon serpentinum. E.

CHANDRA. Sansk. The moon, from Chad, to shine. This is a frequent affix to names, as Chandra-Prabhu, shining lord; Chandra-Raya, shining ruler; Chandra-Shekara, shining mountain peak, a name of Siva. See Amas; Chand; Graha; Haft Dhat; Uma.

CHANDRA, a son of Atri, and father of Budha by Tara. Tara was the wife of his teacher Vribhapti.

CHANDRA, in Hindu mythology, the moon. Moor tells us it is usually a male deity; sometimes, however, feminine, Chandi, and in such character is more commonly applied to Parvati or Devi, the consort or Saci of Siva, than to any other goddess. Lakshmi Devi, or simply Devi, as the consort of Vishnu is often called, occasionally coalesces with Parvati; and both, as well as Saraswati, spouse of Brahma, may be identified with the moon or Luna. Thus, in Hindu mythology, the sun and moon, being sometimes regarded as male deities, the three principal female divinities hold a similar union with their respective solar lords. According to Coleman, Chandra or Soma, the moon, is described as the male, and is painted young, beautiful, and of dazzling fairness, two-armed, and having in his hands a club and a lotus. He is usually riding on or in a cart drawn by an antelope. The moon is occasionally represented as Chandi, a female, in which character being visited by Surya, she produced a numerous family called Pulinda. In the third volume of the Asiatic Researches, this sexual change is accounted for by Colonel Wilford, who says, when the moon is in opposition to the sun, it is the god Chandra, but when in conjunction with it, the goddess Chandi, who is in that state feigned to have produced the Pulinda. The moon was also worshipped as male and female, Luna and Luna, by the Egyptians, the men in reference to it as Luna, the women as Lunus; and each sex on these occasions assuming the dress of the other. The Hindus have in their zodiac twenty-seven lunar mansions, called Nakshatra, or daily positions of the moon; and as to perfect the revolutions some odd hours are required, they have added another not included in the regular chart. These twenty-eight diurnal mansions form the zodiac, having been invented by Daksha; are personified as the daughters of the deity, and are the mythological wives of Chandra. In the chart of the
lunar mansions they are curiously represented as a horse's head, a yoni, razor, an arrow, a wheel, a bident, a house, etc. The Diit Mayores of the Rajput are the same in some respects as those amongst the Greeks and Romans, being the deities who figuratively preside over the planetary system. Their grades of bliss are therefore in unison with the eccentricity of orbit of the planet named. On this account Chandra or Indu, the moon, being a mere satellite of Ella, the earth, though probably originating the name of the Indian race, is inferior in the scale of blissful abodes to that of his son Budha or Mercury, whose heliacal appearance gave him importance even with the sons of Vaiva, the sun.—Cole, Myth. Hindu. p. 131.

CHANDRA-BIHA GA, a river formed by the junction of the Chandra and the Bhaga, and is then styled the Chenab river, the Ascension of the Greeks. In the parts of Ladakh through which the Chandra and Bhaga rivers run, on their banks the people are Bhot up to their junction; after the Hindoos. See Ladakh.

CHANDRA BHUNDA, a tribe employed in the Sunderbuns in the manufacture of salt.

CHANDRAGIRI, a town and taluk in the North Arcot district, near Madras, where the rajas of Vijayanagar resided after the defeat at Talikot, and where, in 1640, was signed the treaty granting to the E. I. Company the site for Fort St. George, Madras.—Imp. Gaz.

CHANDRA GOPAL PAL, commonly called Gopal Bhar, was the principal humorist at the court of Krishna. He was a Kümär or potter by caste, and was a native of Nadiya. Some say he was a Nápit, or of the barber caste. He was fond of music, and patronised musicians and khawaths of the Upper Provinces. He delighted in charpads and kheéls, and was a great connoisseur in matters regarding the rágas and ráginis regulating oriental music. He was a great encourager of architecture. He constructed the large building for puja in the Rajbari. It is of Gothic style of architecture, and is considered a splendid dalan. He also built a marble staircase for going down the sacred well Gyan Bapí, in Benarcs, for the benefit of the pilgrims. He was universally considered the head of Hindu society, and was the arbitrator on all questions of caste.—Calcutta Review, No. 109, p. 110.

CHANDRAGUPTA, the Sandracottus or Sandracottus of the Greeks, the founder of the Mauryan dynasty of Magadha. He was the illegitimate son of the last Nanda, by the beautiful but low caste Maya, whom he obtained the designation of Maurya. In the Mudra Rakshasa, a Sanskrit drama detailing his elevation, Chandragupta is, however, frequently named Vrihala, a term said to be equivalent to Sudra; and as Nanda himself was the son of a Sudra woman, there can be little doubt that the celebrated Maurya family were of Sudra extraction. In the early part of his career, Chandragupta led a wandering life in the Panjab (see Tournour, Introduction to the Mahawanso, p. 41, quoting the Tika or Commentary), and was probably engaged with his fellow-counymen in opposing Alexander. His chief adviser, the Brahman Chanakya, was a native of Takshasila or Taxila, the capital of the Western Panjab; and it was in that country that Chandragupta first established himself by the complete expulsion of the Greek troops left by Alexander (Justin xv. 4: 'Auctor Libertatis Sandracottus fuit'). It would appear that the Greek colonists in the Panjab had first been placed under Philip, while the civil administration of the country remained in the hands of its native princes, Taxiles and Porus. Afterwards, on the murder of Philip by the mercenary soldiers, Alexander (Anabasis, vi. 2, vii.) directed Eudemos and Taxiles to govern the country until he should send another deputy. It is probable, however, that they continued to retain the charge; for, after Alexander's death in b.c. 323, Eudemos contrived, by the treacherous assassination of king Porus by his general Eumenes, to make himself master of the country (Diodorus, xix. 5). Some few years later, in b.c. 317, he marched to the assistance of Eumenes with 3000 infantry and 5000 cavalry, and no less than 120 elephants. With this force he performed good service at the battle of Gabiene. But his continued absence gave the Indians an opportunity not to be neglected, and their liberty was fully asserted by the expulsion of the Greek troops and the slaughter of their chiefs (Justin. xv. 4: 'Praefactos ejus occiderat; again, 'Molenti deinde bellum adversus praefactos Alexandri'). Chandragupta was present when Porus was murdered. He afterwards became the leader of the national movement, which ended in his own elevation to the sovereignty of the Panjab. Justin attributes his success to the assistance of banditti (Justin. xv. 4: 'Contractis latronibus Indos ad novitatem regni solidavit'). But in this Colonel Cunningham thinks he was misled by a very natural mistake; for the Aratta, who were the dominant people of the Eastern Panjab, are never mentioned in the Mahabharata without being called robbers (Lassen, Pentapat Indica: 'Aratii, alias latrones, et Bahici latrones'). The Sanskrit name is Arashtra, the kingless, which is preserved in the Adrastae of Arrian, who places them on the Ravi. They were the republican defenders of Sangala or Sakala, a fact which points to their Sanskrit name of Arashtra, or kingless. But though their power was then confined to the eastern Panjab, the people themselves had once spread over the whole country: 'Ubi fluvii illi quivi ... ibi sedes sunt Arattorum.'—Lassen, Pentapat Indica, from the Mahabharata. They were known by the several names of Bahika, Jarritika, and Takha; of which the last would appear to have been their true appellation, for their old capital of Taxila or Takka-sila was known to the Greeks of Alexander; and the people themselves still exist in considerable numbers in the Panjab hills. The ancient extent of their power is proved by the present prevalence of their alphabetical characters, which, under the name of Takri or Takni, are now used by all the Hindus of Kashmir and the northern mountains, from Simla and Sabathu to Kābul and Bāmanī. On these grounds, Major Cunningham identifies the banditti of Justin with the Takka, or original inhabitants of the Panjab, and assigns to them the honour of delivering their native land from the thraldum of a foreign yoke. This event occurred most probably about 316 b.c., or shortly after the march of Eudemos to the assistance of Eumenes. It was followed immediately by the conquest of Gangetie India (Justin. xx. 4), and in 310 b.c. the rule of Chandragupta was acknowledged over the whole northern Peninsula, from
the Indus to the mouth of the Ganges. Authorities differ as to the length of Chandra Gupta s reign. The Mahawanso gives 34 years; the Diphawanso and the Yuvn Pirama give only 24 years. This difference may perhaps have originated in two distinct reckoning of the date of his accession, the one party counting from the death of Nanda Mahapaduna, in B.C. 325, and the other party from the conquest of India, in B.C. 315. Some assumption of this kind is clearly necessary to reconcile the different authorities, unless, indeed, we take the only alternative, of adopting the one and of rejecting the other. At this period the capital of India was Pataliputra or Palibrotha, which was situated on the Ganges, at the junction of the Erranaboas or Ahas river. The former name has been identified with the Sanskrit Hiranyabahu, an epithet which has been applied both to the Gandak and to the Sone. The latter name can only refer to the Hi-le-an of the Chinese travellers, which was to the north of the Ganges, and was there undoubtedly the Gandak. In-Ied, this river still joins the Ganges immediately opposite to Patna, that is, the city, or metropolis, as its proper name (Patna) implies; the junction of the two rivers is now known as Patna. But as there is good reason for believing that the Sone once joined the Ganges at Bakipur or Bankipur, immediately above Patna, it is quite possible that the Erranaboas may have been intended for the Sone, and the Ahas for the Gandak. According to Megasthenes, Palibrotha was 80 stadia or nearly nine miles in length, and 15 stadia or one mile and two-thirds in breadth. It was surrounded with a deep ditch, and was enclosed by lofty wooden walls, pierced with loopholes for the discharge of arrows (Arrian, Indica, x., and Strabo, xv., both quoting Megasthenes). But when Alexander s successors were at peace with each other, the great Seleucus turned his arms towards the east, with the intention of recovering the Indian provinces of Alexander, but Chandra Gupta formed an alliance with Seleucus, whose daughter he received in marriage. He also received, at his court, of Palibrotha, Megasthenes as an ambassador, and in return sent ambassadors presents with an ambassador to Seleucus Nicator to Babylon. The Hindu drama Mudra Rakshasa records the memorable political event of his usurpation. His name occurs in an inscription at Sanchi, also on one at Ujjain. Tod says he was of the Takshak race. He died c.e. 289. His successor died B.C. 261; and Asoka, the great Buddhist sovereign, the grandson of Chandra Gupta, then succeeded. Asoka had murdered his brother, whose son converted him to Buddhism, and he was crowned B.C. 289-288, at Patalipura, in the third year of his reign. Asoka engraved on rocks numerous inscriptions incalculating Buddhist doctrines, and erected, it is said, 84,000 chaityas, many of which still remain.—Bhulisa Topes, Cunningham, pp. 87-91, 141; Ibbnasa, Egypt, iii. 544; Tod, Rajasthan, ii., Cal. Review, Indische Nachrichten, May, 1887, and ii. pp. 1161, 1162, Jo. As. Soc. Ben. p. 146; Thomas Prinsep, i. pp. 61, 276; Burgess and Ferguson, pp. 190, 725; Tenants s Ceylon.

CHANDRA GUPTA II., a king of the Gupta dynasty, who a.d. 400 made gifts to the tope at Sanchi, which are recorded on the rail of that monument.—Fergusson, 32.

CHANDRA KANTHA. Tex., Mirabilis jalapa, L. In Sanskrit the moonstone.

CHANDRA OTATA, an ancient town at the foot of the Aravalli mountains. It was anciently the capital of the Pramara rajas, vassals of the Hindu rulers of Gujarat. Its ruins are situated about 12 miles from the foot of the Abu mountain, on the banks of the Bunas, and in a fine, well-wooded country. When Ahmad, grandson of Jaka, styled Wajah-ul-Mulk, resolved to found Ahmadabad, he chose a site occupied by a community of the Bhil race, whose predatory habits were the terror of the neighbourhood, and resolved to create his new capital by means of the city of Chandraota, the materials of which he used, and compelled all its people to follow the spoils of their temples and dwellings to the uninteresting, unhealthy, low flat on the banks of the Sabarmati. It is now only marked by mounds of ruined temples and palaces. Ahmadabad was taken by General Goddard 15th February 1790.—Tod s Travels, p. 134.

CHANDRA PALA, a prince mentioned on an inscription at Oomya, A.D. 1439.

CHANDRAPODA. Tex., Argyria speciosa. CHANDRASECHA, a mountain in the N.W. Himalaya. See Kali. Chandrasekharan, the moon-crest. One of Siva s many names.

CHANDRA SENA, a ruler at Ujjain about A.D. 50, who followed after Vikramaditya about 100 years. He restored the Hindu kingdom to its entirety.

CHANDRASENI KAYASTHA, a caste of clerks in Poona, who claim to be descended from a raja named Chandrasena, and therefore claim to be regarded in some degree as Khatriya, and to be entitled to perform the ceremonies of the Vedas,—a claim not recognised by the Brahmins. There are two divisions,—the Patani Prabhu and the Dawai Prabhu. The former are found at Bombay and other towns, the latter at Goa. It is this caste whom the British call Purvo.—Wilson.

CHANDRAVANSA or Indavansa, or Lunar race, a race that reigned in Antarkveda and Kasi, but afterwards in Magadh (Behar) and Indraprastha (Delhi). In this dynasty are included the kings of Kasi (Benares), the line of Pura, and the line of Yadu.

Atri—Muni.
Soma—Lunas, the moon.
Budh—Mereury; married Ila, daughter of the sun. Alias or Pururavas.
Ayu—kings of Kasi descended from him.
Nahusha—Devasahusaha, Dionysos, Bacchus (Wd.).
Yayati—father of Puru and Yadu.

According to Tod, the following are synchronisms of the Solar and Lunar races:—

Budha of the Lunar race married Ila, the sister of Kshwaka, s. l.

Harischandra, s. l., contemporary of Parasaruma of Lunar line.

Sagara, cot. of Taljanga, of Parasaruma.

Ambarisa, cot. of Gahdi; founded Kanouj.

In the line of Pura occurs Hastin, who built Hastinapur and Vichitravirya.

Indu, Som, Chandra, in Sanskrit mean the moon;
hence the lunar race is termed the Chandravansas, or Induvansas, or Somavansas. They are divided into two great branches, the Yadava, who are descendants from Yudh, to which Krishna belonged, and the Paurava, who claim from Puru, to whom belonged Dushyanta with the Kuru and Pandu princes.— *Tod; Thomas’ Prince’s Indian Antiquities; Dowson.* See Magna; Pandu; Rama; Surya.

CHANDRAWUT, descendants of Chandra, one of the most powerful vassal classes of Mewar. Rampura (Bhampura) was their residence, yielding a revenue of five lakhas (£110,000), held on the tenure of service from an original grant from Rana Jugjot Singh to his nephew Madhu Singh. Chandra obtained an appanage on the Chambal.

—*Tod’s Rajasthan,* i. p. 261.

CHANDRAYANA, a Hindu penance, which consists in the sinner or devotee ‘eating for a whole month no more than thrice eighty mouthfuls of wild grains, as he happens to meet with them, keeping his organs in subjection.’ The reward of this is attaining the same abode as Chandra, the regent of the moon; and it absolves a Brahman from the sin of slaughtering a thousand small animals which have bones, or of boneless animals enough to fill a cart; and it is also the common penance for killing a Sudra, a Hindu of the fourth or servile class.—*Coleman,* p. 92.

CHANDRIE. Hind. Calonectomy Roxburghii.

CHANDHIKJA, a name of Lakshmi.

CHANDHIKI-KHAR. H. Ophioxylen, sp.

CHANDUS. Hind. Cotton cloth, coloured border and ends.

CHANDWAR, of the 12th century, is the modern Firozabad. The fields around form the memorable battle-ground on which was decided the contest between the Hindu and Mussalman for the sovereignty of India. The heroes Alfa and Udal, two brothers, fell here; but their memory is preserved in the songs and traditions of the people, amongst the Mahoba and the Rahores and Chandals of the Doab. The last Hindu raja, Jye-Chand of Kanouj, here closed his career by leaping into the Ganges.—*Tr. of a Hindoo,* i. p. 378.

CHANG. A deity of the Assamese, replaced in 1665 by Hinduism.

CHANG. HIND. Salix alba.

CHANG, CHIN., is a measure of 10 che, or Chinese cubits of about 14 inches each.—*Staunton’s Narrative,* pp. 43, 73.

CHANG. BURM. A fortified city.

CHANG, a beer made by the Bhot race from malted barley; also the barley Hordeum hexastichum.

CHANGA DEVA, a Hindu devotee, whose equipage was a tiger, but other holy men have adopted the tiger as a vehicle. A pious personage of this description was reported to have visited Sri-ranga-patna (the city of Sri Ranga, or Mahadeva, commonly Seringapatam) about the year 1797, and although a Hindu, to have been hospitably invited by Tipu Sultan. He was attended by ten disciples, and declined the royal civilities, saying a tree was sufficient shelter for him. Chang Deva was of that class which pandits call Yug-saddan, or Yug-brashat, or Yug-Vyasa, who by extraordinarily pious pains obtain miraculous longevity; they prolong their existence, it is hyperbolically said, to some hundreds of years.—*Coleman,* p. 426.

CHANGA GADDA. Tel. Sanseviera Zeylanica.

CHANGAL or Champal. HIND. A moderate-sized tree of Akyah, not plentiful. Wood used for boats.—*Cal. Cat. Ez.* 1382.

CHANGALI GADDI. Tel. Panicum comutatum, Nees; P. ciliare, L. i. 290.

CHANGALI KOSHTU. Tel. Costus Arabicus, Heyne.

CHANGAR, a predatory tribe of the Punjab.

CHANG BHAKAR, a small native state of Chutia Nagpur, with a population of 5,919. Its hills are clothed with the sal trees. Its people are Kolarian aborigines (Musai Kurn), 3,195, and Dravidian aborigines, 2,655, viz. Gond, and are poor.—*Imp. Gaz.*

CHANG-CHEN-MO. This place gives its name to a route of about 16 marches between Luddah and Eastern Turkestan, said to be the easiest from India to Upper Asia, much easier than the more westerly Kara Korum route traversed by Schlagintweit and Mr. Jebson. The heights vary from 19,000 to 21,000 feet, but the mountains are generally rounded, and fuel and grass are abundant, save at one stage. Gumbah is equidistant between Ilchi and Yarkand, and the Kara Korum route meets this route at Shadala.

CHANGEZ KHAN or Jenghiz Khan, anameme from the Uigur chang, firm, and Kisser ghiz, powerful. Temuchin, afterwards known as Changhiz, was born of a Mongol tribe on the banks of the Onon in 1162. He conquered and expelled Mahomed the Kharasman, and defeated his son Jalaluddin, on the banks of the Indus. Aung Khan of the Kerait Mongols, celebrated in Europe under the name of Prester John, was a contemporary of Changhiz Khan, whom, at the instigation of jealous enemies, he attempted but failed to destroy.—*Elliot,* p. 498. As the result of Temuchin’s successes against the nations of Tartary, he was saluted in 1206 by the diet of his nation as Changiz Khan. According to Quatremère, Changez did not use the higher appellation of Kahn (or Qaan), which was adopted by his son Okkodai and his successors as their distinctive title, identical with Khaqan, the Xagans of the Byzantine historians. Properly a distinction should therefore be preserved between Khan, the ordinary title of Tartar chiefs, and which has since spread to Persian gentlemen, and in India became a common titular affix to the name of Mahomedans of all classes, and Qaan as the peculiar title of the supreme chief of the Mongols. The Mongol princes of the subordinate empires of Chaghtali, Fersia, and Kapehak were entitled only to the former affix, though the other is sometimes applied to them in adulation, and claimed by all Afghans. The conquest of China was commenced by Changez, although it was not completed for several generations. In 1206 he invaded Tangut, a kingdom occupying the extreme north-west of China, and extending beyond Chinese limits in the same direction, held by a dynasty of Tibetan race, which was or had been vassal to the Kin. This invasion was repeated in succeeding years; and in 1211 his attacks extended to the empire of the Kin itself. In 1214 he ravaged their provinces to the Yellow River, and in the following year took Chimgtu or Pekin. In 1219 he turned
his arms against Western Asia, and conquered all the countries between the Bolor and the Caspian, and southward to the Indus, whilst his generals penetrated to Russia, Armenia, and Georgia; and a lieutenant, whom he had left behind him in the east, continued to prosecute the subjection of Northern China. Changez himself, on his return from his western conquests, renewed his attack on Tungut, and died in that enterprise, 18th August 1227. Okkodai, his son and successor, followed up the subjugation of China, extinguished the Kin finally in 1234, and consolidated with his empire all the provinces north of the Great Kiang. After establishing his power over that part of China, Okkodai raised a vast army and set it in motion towards the west. One portion was directed against Armenia, Georgia, and Asia Minor; whilst another great host, under Batu, the nephew of the Great Khan, conquered the countries north of Caucasus, overran Russia, making it tributary, and still continued to carry fire and slaughter westward. One great detachment, under a lieutenant of Batu, entered Poland, burned Cracow, found Breslan in ashes and abandoned by its people, and defeated with great slaughter, at Wahlstadt, near Liegnitz (April 12, 1241), the troops of Poland, Moravia, and Silesia, who had gathered under Duke Henry of the latter province to make head against this astounding flood of heathen. Batu himself, with the main body of his army, was ravaging Hungary. The king had been very slack in his preparations, and when, eventually, he made a stand against the enemy, his army was defeated with great loss, and he escaped with difficulty. Pesth was now taken and burnt, and all its people put to the sword. The rumours of the Tartars and their frightful devastations had scattered fear of them throughout Europe, which did not end at Liegnitz raised to a climax. Indeed, weak and disunited Christendom seemed to lie at the feet of the barbarians. The Pope, to be sure, proclaimed a crusade, and wrote circular letters, but the enmity between him and the Emperor Frederick II. was allowed to prevent any co-operation, and neither of them responded by anything better than words to the earnest calls for help which came from the king of Hungary. No human aid merited thanks when Europe was relieved by hearing that the Tartar host had suddenly retreated eastward. The Great Khan, Okkodai, was dead in the depths of Asia, and a courier had come to recall the army from Europe. In 1255, however, a new wave of conquest rolled westward from Mongolia, this time directed against the Ismaili or Assassins on the south of the Caspian, and then successively against the Khilifs of Baghdad and the King of Persia. This expedition under Hulaku may be considered to mark the climax of the Mongol power. Mangu Khan, the emperor then reigning, and who died on a campaign in China in 1259, was the last who exercised a sovereignty so nearly universal. His successor Kablai extended, indeed, largely the frontiers of the Mongol power in China, which he brought entirely under the yoke, besides gaining conquests rather nominal than real on its southern and southeastern borders, but he ruled effectively only in the eastern regions of the great empire, which had now broken up into four, viz. (1) the immediate empire of the Great Khan, seated eventually at Kuanbalik or Pekin, embraced China, Corea, Mongolia, Manchuria, and Tibet, and claims at least over Tungking and countries on the Ava frontier; (2) the Chaghtai khanate, or middle empire of the Tartars, with its capital at Almalik, included the modern Dsungaria, part of Chinese Turkestan, Transoxiana, and Afghanistan; (3) the empire of Kapchak, or the northern Tartars, founded on the conquests of Batu, and with its chief seat at Sarai on the Wolga, covered a large part of Russia, the country north of Caucasus, Khwarizm, and a part of the modern Siberia; (4) Persia, with its capital eventually at Tabrez, embraced Georgia, Armenia, Azerbaijan, and part of Asia Minor, all Persia, Arabian Irak, and Khorasan.

The conquests of Changez Khan, and of his successor Okkodai Khan, in the first half of the century, brought China a vast influx of Ugoor and Toongzani immigrants. Atabeg, also Atabak, in ancient Persia, was an officer or prince, ruler of a province. Luristan seems to have been the latest territory so ruled, until Changez Khan, with his destructive hordes of Tartar and Moghul, overwhelmed the land. Changez Khan, with respect to religion, was the apostle of the most complete toleration. Mahomedans relate that he had the subject discussed in a mosque of Bokhara, and there laid down the principle that he required only faith in one all-powerful God, leaving all the rest to be supplied by man's free study and judgment. But the creed of Changez Khan was Buddhism.—Princely of Tibet, Tartary, and Mongolia, pp. 3 and 4; Yale's Cathay, *xxivii., 1522; Osborn's Islan; Vanbery, Bokhara, p. 120.

**CHANG-GARH. ASSAM.** A house raised on posts with a space open underneath,—the ordinary house of the Miri, Burmese, and Malay.

**CHANG-LIA-KHIOU, a pass from the great wall of China, in the province of Pe-che-kuin, about a hundred miles to the westward of that of Kou-pee-kuin, by which the embassy of Lord Macartney crossed the wall in 1793, and Sir George Staunton later. The words mean the gate of the Chang family.—Staunton's Narrative, p. 22.

**CHANGLA.** Tel. Aucklandia costus.

**CHANGO, a Tibetan race, a branch of the Lhapa of Butan. The Chango dialect has a considerable amount of glossarial peculiarity with Tibetan, but in other respects it is entirely Tibetan softened and slightly changed in phonology. It is spoken along that portion of the northern frontier of the valley which extends from the Binji Doar to the confines of the Kuriqnara Doar, or from about long 90° to 92° E. Neither its northern limit nor the numbers speaking it have been ascertained. The inhabitants of this tract occupy the lesser elevations of the southern Himalaya range, and are generally speaking, agricultural. Their physical appearance exhibits a few shades of distinction noticeable between them and the tribes of the Sub-Himalaya. They are smaller, less muscular, and the hue of their skin possesses a deep isabelline tint. From the latter circumstance, probably, they derive their appellation, the term Chango meaning black.—*Journ. Ind. Arch.*, April—May 1853, p. 192. See India.

**CHANGMA.** HIND. Populus balsamifera, P. nigra, also Salix alba.

**CHANG-MAI, a mode of spelling Zunmauy of**
CHANGRA. HIND. Capra hircus, L.

CHANG-THANI. TIR. On the northern plains to the north of Ladakh, supposed to be the Chatae Systhe of Ptolemy.—A. Cunn.

CHANG TIEN-SZ, the chief of the Taoist priests, living at Kiang-si.—Smith, p. 5.

CHANGU. TIR. Canis laniger, Holgs.

CHANI. TEL. Aderanterha aculeata.

CHANJAN WALE. HIND. Asparagus Paujabensis.

CHANK. HIND. A harvest ceremony in several parts of Northern India, differing in each province. After the heap of grain on the threshing ground has been raised a foot high, a man, in silence, standing with his face to the north, a winnowing basket in his right hand, his left hand being full of grain, commencing from the south, goes round from east to west, and again to the south, pressing his basket against the bottom of the heap. This is repeated, changing hands, and when complete, he joins his hands, bow to the heap, and supplicates in a few words, either Farmeshwar or Anna Deota, as,

'Anna Deota ji, Sahas goona hajiy.'

In the Lower and Central Doab and Sauagor, a circle is made with cow-dung or ashes round the Ras and Thapa at the same time, commencing from the east, and going from south to west till the east point is again reached, the operator taking care all the while to hold his breath. A superstitious observance in the highlands of Scotland bears a remote resemblance to this.—Elliot.

CHANK. HIND. Also Chanka, and Chhapra. A stamp cut in wood, with the words Akibat ba 'kharibad.—May the end be prosperous; or Iman ki salamati,—Safety in your honour; and impressed on a cake of moist earth (barkat ki matti) on stacks or heaps of grain which are left in the care of one of the parties between whom it is to be divided. The words on the stamp mean, 'May the end be happy,' and 'Safety on honour,' implying that the grain is left to the honour of the person keeping it. The seal is then placed on the sides of the heap, never on the top, lest the increase of corn be thereby prevented. It is the system of making an article over to the Supreme Being, common in Africa and the Archipelago, under the term Taboo, and it is similar to the Ch'hu-toor of the Hindu.

CHANKEE. MALAY. Cloves. Caryophyllus aromaticus.

CHANK SHELLS, Konk, Conch.

Sukk, . . . . . . DUKH. Sanka, . . . . . . TAM. Senkham, . . . . . . SANSK. Sangu, . . . . . . TAM. Shenkum, . . . . . . " " " " " " Tel.

These shells are species of the genus Turbinella, fished up by divers in the Gulf of Mannar, on the coast opposite Jaffnapastam in Ceylon, in about the fathom of water, and in Travancore, Tuticoric, Kila-Karei, and other places. Large beds of fossil chanks have also been found. They form a considerable article of trade in India, as they are in extensive demand all over the country. The fishery is chiefly worked at Kila-Karei in the Rammed territory, and Tuticoric in the Tinnevelly district. They lie at the bottom in from 2 to 5 fathoms of water. The divers carry a bag round their necks, and dive and grope over the bottom; 20 chanks are a very good haul for one plunge. The rents paid to the zamindar of Rammed are £500, and to the British Government £1000. The fishing season is from October to March.

Chank shell was one of the insignia of royalty of the Chalukya dynasty when ruling at Kalian. The Chank and the Voluta species are used for making the shell ornaments of Daeca.

They are sawn into narrow rings or bracelets, armlets, heads, and are worn as ornaments for the arms, legs, fingers, etc., by Hindu women. Many of them are also buried with the bodies of opulent and distinguished persons. Those which, from being taken with the living mollusce, are called green chanks, are most in demand. The white chank, which is the dead shell thrown upon the beach by strong tides, having lost its gloss and consistency, is not worth the freight up to Calcutta. The value of the green chank depends upon its size. A chank opening to the right, called in Calcutta the right-handed chank, is so highly prized as sometimes to sell for 400 or 500 or even 1000 rupees. Even 20,000 rupees have been named. The Jangam religious mendicants and those of the Vemunatty sect blow them as horns. The commercial returns show an exportation from Madras of ten to twenty-four lakhs of these shells in one year.

1852-53. . . 15,15,495 Rs. 54,780
1853-54. . . 24,60,727 1,04,481
1854-55. . . 10,84,575 56,165
1855-56. . . Not given 26,171

They are classed as Patty and Pajel, or short and pointed headed, and Wallampory, or right-hand chanks. Bertolacci mentions, as a peculiarity observed by the Ceylon fishermen, that all shells found to the northward of a line drawn from a point about midway from Mannar to the opposite coast at India are of the kind called Patty, and are distinguished by a short flat head; and all those found to the southward of that line are of the kind called Pajel, and are known from having a longer and more pointed head than the former. The former is distinguished by a deviation from this singular law of nature. The Wallampory or right-hand chanks are found of both kinds. Chanks are alluded to in Cosmic Indicopleustes, and by Abu Zaid in Voyages Arabes, showing that so early as the 6th century this shell was fished for. 'The fishery until a few years ago continued a government royalty. The Sankasari of Daeca are famed for their skill in working with the chank or sank. Turbinella rapa is used as a trumpet, a hole being bored through its base. When blown into it gives a loud, sharp, and piercing sound. It is used in Hindu worship to call the attention of the gods to their worshippers. The conch shell, used for pouring water
on the gods, is a smaller one, the Mazza raga of naturalists. The pictures and figures of the Hindu god Vishnu always represent him with a chank shell in one hand, and a discus or chakra in the other. In ancient times, the Indian warriors used the chank as a trumpet. Chankangan of Shahpur is a silver armlet worn with churis or bracelets.—Rohde, M.S.; Ainslie, Mat. Med. p. 143: Tennant’s Ceylon; Hooker, ii. 254.

CHANNA. HIND. The pulse Cicur ariciatum, called Bengal gram, gram, and chick-pea. Channa siya is black gram, and Channa Kabuli, Kabul or white gram. Its principal use is to feed horses and cattle, but the people of N. India often eat it. An acid forms on the leaf of the channa, a mixture of oxalic and acetic acids, which is used in chemical processes, and in the preparation of nitric and nitric acids. Cloths spread on the plant become moistened by the dew, and absorb the acid.—Elliot.

CHANNA, also Channu, on the Chenab, etc. Populus alba, the white poplar.

CHANNI. HIND. Daphne oleanoides.

CHANOO. BENG. Aipium involucratum.

CHANS ARGENTEUS. Bloch. The milk fish. C. salmonesus, introduced from the sea into a tank in Canara.

CHAN-PA, the Tibetan name of Great Tibet. It means snow-land. See Lhasa.

CHANTABURI, CHANTABURI, or Hopapda. SUMATRAN. Fruit of Arctocarpus integrifolia.

CHAORI. Population; the village forum.—Elliot.

CHAO. HIND. A police station; the village forum.—Elliot.

CHAOI. HIND. This is made of ivory, bone, or shell, and is the most ancient ornament of the Indo-Scticcian dames. It appears in old sculptures and paintings. In a very old Gothic church at Moissac in Languedoc, the porch, attributed to the age of Dagobert, is the only part left. Sculptures on it represent the conversion of Clovis. Some sculptured figures below are of a distinct age, of an Asiatic character, showing the scarfs, the champa-kuli or necklace representing the buds of the jessamine (champa), and chauri.—Tod’s Rajastan, ii. p. 284.

CHAOUS. TURK. A herald, a running footman, an interpreter. The word is supposed to have originated the English phrase, to chase, or cheat, as the Turkish interpreters so frequently misinterpret.

CHAOU SEEN, the native name of Corea.

CHAP. HIND. An impression from a stamp or seal, from the verb chapa, to stamp or seal. The Chineso ‘chop’ is a stamped permit; hence also the Hindi term Chapa-khana, a printing press. properly Chap. Chap-ka-lac, scaling-wax.

CHAP. HIND. The refuse of the jhurbuce, after the pala is beaten from it.—Elliot.

CHAP. BRAHUI. Stone circles of different kinds, commemorative of weddings amongst the nomad Brahni.

CHAPADA, or Choparda. Fruit of Artocarpus integrifolia.

CHAPA JANNA. TEL. Fish roe.

CHAPAO, a raid, an inroad. The Turkoman inhabitants of the deserts have ever been famous for their terrible inroads into the Persian provinces. They are of the Sunni creed, a cruel and rapacious race, and always prefer flight to facing a superior force. The arms of the Turkoman are a spear 10 feet long, and a sword. They are excellent horsemen, and pass their lives in pillage and rapine. When a chief determines upon making a chapao, a month is given to his followers to get their horses into proper condition. Spies are sent out, and news being brought, the whole party gallops swiftly on the prey, whether caravan or village. In a few minutes all is over, the people carried off into slavery, and the village burnt. The prisoners are tied to the saddle-bows of the captors, and are treated with horrible cruelty, until they are finally sold in the slave markets of Khiva. The horses of the Turkomans have been known to go over 600 miles in six days.

CHAPAR. HIND. A thatch of straw, also roofing slate.—Elliot.

CHAPATTI. HIND. An unleavened cake baked on a girdle, eaten by the people of Hindustan. Prior to the mutiny of 1857, wheaten cakes were circulated amongst the people. The meaning of that act remains unknown.

CHAPKAN. HIND. A jacket fitting close to the body, opening at one side of the front, and prefixing.

CHAPLASHA. HIND. Artocarpus chaplasha.

CHAPLET, or immortelle, made of the flowers of an ‘everlasting’ (Helichrysum, sp.), commonly hung about tombs.

CHAPLI. HIND. Leather or leaf sandals.

CHAP'TALIA GOSSYPIA. —?

Orsosia lamina.

Shepherd’s tinder, Enc. Kuff, Kufic, Sookta, Pn. This is found in the Sutlej valley between Rampur and Sungnam, at an elevation of 7000 to 9000 feet. The tumentum or downy filament on the under surface of the leaves is employed by the hill people as tinder.—Cleyborn.

CHAPT-LAC. HIND. Shell-lac.

CHAPU. TEL. Fishers.

CHAR. HIND, PEBS. Four. Char-yar, lit. four friends, a Sunni Mahomedan, who maintains that Abubakr, Omar, Osman, and Ali were the rightful succeeding khilifs. Char in composition is softened into chau. Char-Abru, the beard, the moustaches, eyebrows, and hair on other parts of the body.—W.
CHAR, also Char-Charoli. MAHR., Buchanan latifolia. Valeriana Wallachiana, Valeriana Hardwickii, Quercus semecarpifolia.

CHAR or Char. HIND. A shoal, a sandbank. Baluchur, land covered by a deposit of sand.

CHARA. HIND. Fodder, forage, green grain; wheat or other crop cut for forage or fodder; also a trunk, a sheaf, grass, food for animals.

CHARA CHETTU. Tel. Buchanania latifolia. Fruit called Chara pappu, Charu mammidi.

CHARADRIUS, the plover genus of birds, species of which are common to India and Europe. Ch. hiaticula, the ringed plover of Europe, N. Asia.

CHARAI. J. Arboresce. J. arborea; pencil cedar.

CHAR AIMAK. Aimak is a Mongolian, Manchu, and Turki word, meaning a tribe. Of these, there are in Kâbul and Persia four, the Char Aimak.

CHARAN. HIND. A lamp. Charaghan-i-Zandah Shah Madar, a Mahomedan festival held on the 17th Jamadi ul Awal, in honour of Badi-ul-Din.

CHARA. Tel. Latham’s Ethnology; Ferrier’s Hist. of Afghan, p. 3; Vambery, Sketches of Central Asia. See Aimak; Mongols.

CHARA-INA. HIND. Armour-plates worn by the Sikhs.

CHARAITA. DUKH. Agathochis chitrata, G. Don. This valuable bitter is largely employed in medicine, being a perfect substitute for the gentian of Europe. Several plants are, however, used under this general name. The Andrographis (Justicia) paniculata is one of the best of these, and the Ophelia elegans is another.

CHARAKA, a medical writer who lived in Vedic times. He states that he received the materials of his work from Agniwesa, to whom they were delivered by Atreya. Professor Wilson gives the 9th or 10th century A.D., as his era. His book was translated from the Sanskrit into Arabic before the end of the 8th century A.D.—Dowson.

CHARA KANDA. Tel. Colocasia nymphaefolia, Roiye.

CHARAN, a sacred race in the west of India, whose character and pursuits almost resemble those of the Bhat, or Bards, and the origin of both is involved in fable. In Hindu mythology, the Bhat are said to have been produced to amuse Parvati, from the drops of sweat on Siva’s brow, but they sang the praises of Siva only, which so offended Parvati, that she turned them out of heaven, and condemned them to lead a wandering life upon earth, to sing there the martial deeds of heroes and the praises of the gods.

According to another legend, Mahadeva created a bard to attend to his lion and his bull, but the bull was daily killed by the lion, on which Mahadeva, tired with daily creating a bull, formed the Charan to be their attendant. The Charan was equally devout with the Bard, but of bolder spirit, and from that date the bull was never destroyed by the lion. It is an allegory of brute violence and justice.

The Charans of the Murr or desert in the sandy tract of the Indus, are mendicants who attend at marriages and festivals, and threaten to injure themselves if not relieved. The Charan is generally revered, and follows the profession of a bard, herald, and genealogist, and as such is often taken as personal security, the breach of which was followed by the death of the Charan, or of some member of his family. On this account it was usual for travellers in Mawra and Gujerat to hire a Charan to protect them, and the sanctity of his name was generally sufficient. If robbers appeared, he stepped forward, waving his long white garments, and denouncing in verse, infancy and disgrace on all who should injure travellers under the protection of the holy members of Siva. If this failed, he stabbed himself with a dagger in the arm, declaring that his blood was on their heads; and if all failed, he was bound in honour to stab himself to the heart. It is these Charans that are termed Charali. The Charan, young and old, are not merely taught to desire to die when the honour of the family or clan require it, but one and all are eager to be the first to die. Charan are divided into two tribes, the Kachilli, who are merchants, and the Maru, who are Bards. These, again, branch out into 120 clans. The Kachilli and Maru do not intermarry, but the latter intermarry with Rajputs. The Charan are taught to read and write. The mercantile tribe, who traffic in camels and horses largely, are shrewd men of business. The Maru tribe are genealogists and Bards, celebrate the praises of heroes in legends and songs. The warlike tribes esteem the heroic lays of the Bard more than the homily of the Brahan. The Charans are throughout revered by the Râtor, and hold lands literally
on the tenure of 'an old song.' A colony of Charanars from the frontiers of Cutch Bluj was founded at Murah, near Chitore, by rana Hamir, who is celebrated in the history of Newar; he had a leprous spot on his hand, to remove which he made a pilgrimage to the shrine of Hinglo, upon the coast of Makran, the division of Arran's geography. The Murah Charans are of the tribe Kaucholeah, and are grain-carriers. The sanctity of their office made their persons sacred, and the immunity extended likewise to their goods, and saved them from all imposts; so that in process of time they became the free-traders of Rajputana. This community collectively advanced to receive Colonel Tod at some distance from the town. The procession was headed by the village land and all the fair Charani, who, as they approached, gracefully waved their scarfs over him. It was a novel and interesting scene: the mainly persons of the Charan, clad in the flowing white robe, with the high loose folded turban inclined on one side, from which the mala, or chaplet, was gracefully suspended; the naiks or leaders, with their massive necklaces of gold, with the image of the pitriswam (manes) depending therefrom, gave the whole an air of opulence and dignity. The women were unarm'd and attired in dark brown cambric, having a bodice of light-colored stuff, with gold ornaments worked into their fine black hair; and all had the favourite churi, or rings of lati-dant (elephant's tooth), covering the arm from the wrist to the elbow, and even above it. The founders of this little colony accompanied rana Hamir from Gujarat in the early part of his reign, and although five centuries have elapsed, they had not parted with one iota of their nationality or their privileges since that period; neither in person, manners, nor dress had they anything analogous to those amidst whom they dwell. Indeed, their air is altogether foreign to India; and although they have attained a high place amongst the tribes of India, their affinity to the ancient Persian is striking—the loose robe, high turban, and flowing beard being more akin to the figures on the temples of the Guebres than to anything appertaining to the Char-bourun or four classes of the Hindus.—Rejksudan, ii. p. 622.

CHARANA. Hind. Footprints of the Jaina thirhankara, Reshabhanata. See Rayana.

CHARAN-AMRIT, Hind.; also Charanodaka, water in which the feet of a Brahman has been washed.—W.

CHARANDAIN, disciples of Charan who lived in the days of Ramana. Their ceremonies and habits are similar to those of Vaishnava, Bairagi, and Kabirpanthi.—Sherring's Tribes, p. 267.

CHARAN DAS, founder of the Charan Das sect, was born at Dehra, near Ulwar, in s.1760 (A.D. 1703). When very young, he was taken to Dehl. He was a good musician. He died s. 1839 (A.D. 1782). The sect keep images in their temples, and respect Brahmanas. He lived in the time of Alam-gir ii., and Sahaini Bai, his sister, was his first disciple. Charan Dasi are Vaishnava Hindus, who worship Krishna and Radha. Charan Das were also known as Auras, gowda, and Murlinh. All are residents of Dehl. His followers are both clerical and secular. At Dehl is the samadhi or monument of their founder.—Wilson. See Hindu.

CHAR-ANGLI. Hind. of Salt Range. Bouclesis edulis.

CHAR-ANKH. Hind. A meeting; literally, four eyes.

CHARAN-PAD, also called Padka, two feet engraved on the top of the tombstone of a Gosain, to mark his tomb or samadhi.

CHARA-PUPPU. Hind. Buchanania latifolia.

CHARAS, in Kachar, seedling rice for transplantation.

CHARATI. Sansk. Iodinium sufrutescens.

CHARAY, also Charay. Hind. A knife, any knife; also the knife of the Afghan, a long single-edged dagger, used with much effect by them. It is about the size of the old Roman sword, and speaks volumes for the courage of the wielders.—Burton's Seinde, i. p. 267; Pilgrimage, i. p. 329.

CHARAYUM. Tam. Arrack. Charaya karan, Malex., is a distiller or vendor of spirituous liquor.

CHARAZ, also Chars. Hind. of S. India. Syphoeotes auritus, Latham.; the florikin.

CHARBAR, Charia, or Chewabad Bay, the best in Makran, is formed by Ras Maleedkum or Koolkpb point on the west, and Ras Charhar on the Cher poleh, is a town of 1500 inhabitants; it is surrounded by a mud wall. The inhabitants and the cattle live entirely on fish, oysters, crabs, and shell-fish, those for the cattle being mixed with dates. All on that coast, which is the country of the ancient Ichthyophagi, have similar food.

CHARCHARILA. Hind. Pernelia Kamtchadalis, and other species of Pernelia.

CHARCOAL.

In the south and south-east of Asia, coal being found only in distant localities, and the cost of carriage great, charcoal are in great request. In the Peninsula of India, the common native mode of preparing them is to set on fire a heap of small wood, and, after allowing it to burn for some time, to quench it either by water or by heaping earth upon it; but charcoal so prepared is of little value in reducing iron ore, and the process is wasteful. The destruction of firewood in the neighbourhood of ironworks is grossly extravagant. Native iron-smelters only employ fuel from one to three inches in diameter; and to procure this they take saplings, or the tops and branches of the largest hardwood trees, allowing the trunks to decay. They do this because large trees are not adapted for fuel for native smelting, as the cost of splitting them adds greatly to the expense; and unless the logs be split, the inner wood is not carbonized. Charcoal, to be good, should be of wood burned with as little exposure to the action of the air as possible, and be black, brittle, easily pulverized, perfectly insipid, solid, and inodorous. Charcoal is mostly used as a fuel, but also in the manufacture of gunpowder. For the forge, the best is that prepared from bamboo and from stems of the bamboo Charhar (Tati kom aloco, Tel.). The tama-rind yields a good charcoal for the same purpose, as do most hard woods, but the charcoal of the Acacia sandra is said to be amongst the best.
CHARCOAL.

for this purpose. Other woods used in the S. of India are the vella-marda, karra-marda, erool, Indian gooseberry, the poohum, the nux vomica, and the eassau. In Northern India, Acacia catechu, A. modesta, Cassia fistula, Butea frondosa, Capparis, sp., Pinus longifolia, Prosopis spicigera, Salvadoria. For gunpowder, the roots of the milk hedge, Emphorbia neriifolia, and of the Calotropis gigantea are preferred. At the Madras Government Powder Mills, that of the gram bush, Dolichos uniflorus, and in those of Bengal and Bombay, the Cajanus indicus, or pigeon-pea stalks, are used. Charcoal used for gunpowder manufacture is generally made from small shrubs or herbs, as Vitex, Cajanus, Calotropis, and Parkinsonia aculeata, the Parkinsonia being said to yield a very good charcoal for gunpowder, though the gunpowder considered the best is manufactured from the Sesbania-egyptiaca. The gunpowder charcoal used at the Dumout coal-works is made from an acacia. The Sikhs employed Justicia adhatoda, which is said to be an A-Aden, and Arabs prefer the Calotropis, probably because it is most easily procured. The grain of all these plants is open, whereas in England closer-grained and more woody trees, especially willows, are preferred. In India, gunpowder charcoal is also made from the Adhatoda vasica, Alnus, Butea frondosa, Ccebrookia oppositifolia, Cornus macrophylla, Daphne oleoides, and Hamiltonia suaveolens. In China the gunpowder charcoal is made from the Cunn-ninghamia Sinensis. Charcoal is burned as a disinfectant on the last days of the year, in all Chinese houses. Charcoal powder, Pan-moh, Chin., is used internally in China, mixed with water, in metallic poisoning, in acute diseases of the throat, and in dysentery.

In Ceylon the cashew nut tree is considered the best sort of wood for charcoal for ironsmiths, and is sold for this purpose only. At Darjiling that of the chestnut wood is used by blacksmiths. In Nepal the best is made of the wood of the bahang, or holly-leaved oak. In Kulu and Kangra the wood chiefly used for charcoal is Chil, Pinus excelsa; but the alder (kaunch) and Alnus Nepalensis, which fringes the tributary streams, is also employed for this purpose, as no hard woods are available. The lighter woods generally yield lighter and more combustible charcoals. Nevertheless the dogwood of Britain, the wild cornel tree, which makes the strongest of the British gunpowders, and is exclusively used for the powder of the breechloading firearms, is a dense, comparatively heavy, slow-growing wood. In Brittain, the alder, the willow, and dogwood are the only woods used for charcoal in the Government establish-ments,—the two former for cannon powder, the last for small arms. Private makers use the same woods, and they use the last for the forest sporting powder. The three woods grow well in England, but they are chiefly obtained from Belgium, Holland, and Sussex, the dogwood selling at £12 to £15 the ton. Coarser woods are used for common blasting powder. There are many circumstances connected with this ingredient of gunpowder not yet understood, but it seems to be the variations in charcoal which cause the differences in the powder. Charcoal is little liable to decay. The best charcoal for a dentifrice is that of the betel-nut. Charcoal possesses remarkable antiseptic properties, as it resists the putrefaction of animal

CHARIZM.

matter, and destroys the smell and colour of many substances.—Mr. Faulkner; Mr. Roade; Dr. Cleghorn; McCulloch's Dict. p. 286; Mr. Wall's Report in G. O. 17th July, No. 1940 of 1857; Hooker's Jour. 1. p. 9; Edge, Mal and Can.; Dr. J. L. Stewart; Quarterly Review, July 1865.

CHAR-DEH, in Persia, a mode of dividing fields. See Dangah.

Char deh, the town of Kabul is built at the foot of a hill of gniss that rises 1000 feet above it. The town bends round it from the south-east to the south-west, where, with the dip of another hill opposite, is formed the pass, 150 yards broad, that leads into Char-Deh. Kabul may be described as lying at the foot of a range of hills whose direction is from north-east to south-west. The country is thus divided into the plain of Kabul, and the Char-Deh, or four villages. See Kabul.

CHARDIN, Sin John, travelled in Persia and the East Indies from 1664 to 1670. The first part of his Journal du Voyage was published in London 1686, and the second and third at Amsterdam in 1711. In 1811 his travels were republished in Paris.

CHARGUL. Hind. An ornament worn by women in Hazara.

CHARI, the doe of the Antilope Arabiea.

CHARI. Hind. Stalks of millet, etc., sown close for fodder; also Sorghum vulgare; Carex Indica? Rang-Chari is Elsholtzia polyctchaeta.

CHARIKAR, a town in long. 68° 59' E. and lat. 34° 28' N. It is near Beghurn, and 30 miles north of Kabul. From Charikar to Jellalabad the road is open, and it is supposed that Alexander, whether he recrossed the mountains at Bamiyan or at Beghurn, marched by this route on India. It is on the high road between Kabul and Turkestan, and the valley offers supplies of all kinds.—MacGregor, p. 211.

CHARIKONA SHIM. Beng. Goa beau; Psophocarpus tetragonolobus.

CHARI-MARAM. Tam. Ebony.

CHARIOT. In Judges iv. we are told that Sisera had 900 chariots of iron. From the Sanskrit word called the Dhamurveda, it appears that the Hindus had war chariots similar to those of the Persians. They are described as having had many wheels, and to have contained a number of rooms. The war chariot was peculiar to the Indo-Scythian nations, and was in use in India from the days of Dasaratha and the heroes of the Mahabharata, to the conquest of the Hindus by the Mahomedans, when it was laid aside. On the plains of Kurukhet, Krishna became charioteer to his friend Arjuna; indeed, the title Dasaratha means a charioteer. The Gotic hordes of the Jaxartes, when they invaded Europe in the 3rd century, followed the plains of Arbela, had their chief strength in the war chariot. The war chariot continued to be used later in the south-west of India than elsewhere; and the Caddhi, Comani, Comari of Saurashtra have, to recent times, retained their Scythian habits, as their monumental stones testify, expressing their being slain from their cars.—Toel's Rajasthan. See Hindu.

CHARITA, the first degree in the Saiva system.

CHARIZM, in the 6th century of the Hijira, a Charizmian empire rose on the ruins of the Seljukids, which extended itself over Tartary and the greatest part of the Persian provinces. During the reign of Mahomed, Chengiz Khan overr
CHARJ.  

the Chazirian empire.—Dow's Hindostan.  See Kharasun.

CHARJ. Beng.  Otis Bengalensis.

CHAR-JAMA. Hind.  A sort of horse housing in two pieces, one for each side under the saddle.

CHAR-JATI. Hind.  The four classes of the first class of the Khatri, viz. Seth, Marbota, Khanna, and Kuppor.

CHARJU, in lat. 39° 5' N., and long. 63° 40' E., a town in the district of the same name, 6 miles inland from the left bank of the Amu. It has about 4500 inhabitants. The Saugan (Cyprius calbayetus) and the lakka (Siluris glansis) attain a large size at this part of the Amu.

CHARKA. Hind.  Letsea, sp.

CHARKARI MAHAL, in the Panjab, the portion of a doab requiring well irrigation.

CHARKH. Hind.  A pulley over which a water-ropes run; a wheel; the sheave of a block; a needlemaker's grinding wheel; a cotton-cleaning wheel; also the rope-twister's apparatus; a spinning-wheel.

CHARKHAHEII. Hind.  Chequered muslin; also called Zilnail.  Charkhi, a kind of silk of Kabul.

CHARKH PUJA. Hind.  Cheeldul, Tam.  A bangle used among the lower classes and low castes of Hindustan of India.  By self-inflicted wounds, or being suspended in the air by hooks passed through the back, individuals hope to expiate their sins.  It is commonly called the Swinging Festival, because the more prominent form of expiration amongst Hindus is that of swinging, suspended by hooks through the skin over each shoulder-blade, and connected by ropes with one end of a lever, traversing an upright post, to which a circular motion is given.  It is held when the sun enters Aries.  But children of tender years, aged five or six, were to be seen with bamboo sticks through both checks.  Hooks from a lever are passed through the skin over each shoulder-blade, and the lever is made to rise high in the air and revolve with the hooked person.  Wood and iron and snakes are passed through the tongues, the cheeks, and the skin of devotees and of young children.  The devotees were hailed Gajan, and had a charm of Siva that they inflict tortures on themselves.  The British Government about the middle of the 19th century prohibited its practice in British India.  See Siva.

CHARKHI. Hind.  Carpinus viminalis.

CHAR-KUCHOO, Beng.  Colocasia antiquorum.

CHARLANG, a section of the Bakhhtiar tribes.

CHAR-MAGHIZ. Hind.  Juglans regia; the walnut, lit. 'the four-kernelled fruit.'

CHARMS.

- Charms are in general use amongst all races; and amulets are worn and used both to work for good and to work for evil.  The custom of inscribing mystic characters upon the person as a safeguard, or having them engraved in the form of an amulet or charm, is of the most remote antiquity.  Cairs have a mark set upon him, which denoted the bearer to be placed under the immediate protection of Heaven, so that no man might slay him.  The blood sprinkled on the door-posts of Israel in Egypt was a sign that the destroying angel was not to enter, the inmates being under the divine protection.  A similar preserving token is referred to in Ezekiel ix. 2, where the man 'clothed in linen,' having a writing inkhorn by his side, was commanded by God to set a mark upon the foreheads of those who were privy for the determinations of Jerusalem.  ' Behold my sign,' says Job xxxvi. 35, according to the marginal reading; or, ' Behold, here is my Thun' (a mystic mark), as Calmet renders it.  Paul, probably alluding to some acknowledged sacred sign, observes, ' Henceforth let no man trouble me, for I bear in my body the marks of the Lord Jesus.'  Portions of St. John's Gospel were worn by the early Christians, and verses of Scripture were even placed upon horses.  Among the Anglo-Saxons, amulet gems were much esteemed.  King John had a large collection; and, in the 16th century, amulets were warehoused in England in large quantities, and usually worn round the neck, as a protection from pestilence (Gage's Haarvgre, p. 155).  A ms. poem on the virtues of gems, written by Pierre de Boniface in the 14th century, says: 'The diamond renders a man invincible; the agate of India or Crete, eloquent and prudent; the amethyst appeases anger; the hyacinth provokes sleep' (Milner's Seven Churches of Asia, p. 127).  The six descriptions of charms or mantra known in Gujarat, are described in the Mantra Shatra.  Marun Mantra has the power of taking away life; Mobun Mantra produces ocular or auricular illusions; Shambhun Mantra stops what is in motion; Akurshun Mantra calls or makes present anything; Wesheekurun Mantra has the power of enthraling; and Oochhatun Mantra of causing bodily injury short of death (Rasamala, Hindu Annals, ii. p. 406).  Charms, amulets, talismans, and phylacteries all belong to the list of articles which produce imaginative cures, seeing that the persons who trust to them believe in some good obtainable from them, in pursu or in person, in health or in welfare.  The amulets, hung in a little bag around the neck, are very widely credited with the power of the charm of disease.  One especial kind of amulet is the phylactery, a bit of parchment on which a few sacred words have been written; if worn on the person, it is a safeguard against disease and calamity.  The Jews in the East used to carry such an amulet written with a Hebrew verse from the Bible; and some of the Mahomedans with an Arabic sentence from the Koran.  The Burmese insert lumps of gold beneath the skin, to procure invulnerability, and Burmese are said to conceal gold in that manner.  Many of the charms worn by Hindus and Mahomedans are merely to distract or avert the evil eye.  A not unfruitful one, in sickness, is a string formed of hair of the head, to which is attached a piece of the Acorus calamus root, a cowrie shell, a marking nut, and the eye of a peacock's feather.  In the Ushai Namah (section 12), it is mentioned that women, during parturition, derive considerable benefit from wearing a charm composed of certain ingredients made into a little ball, which must be perforated with a hog's bristle (Ouseley's Travels, i. p. 227).  Most of the Mahomedan pilgrims, when moving towards Mecca, have a charm or tawiz suspended around their necks; and almost all Mahomedans,
when setting out on a journey, bind a piece of money on their arm, as a votive offering to the Imam Zamin. In Arabia, the instant a foal is born, a charm is tied round its neck in a bag of black cloth, and sometimes in this the pedigree is placed. Many of the Mahomedans of Turkey and Asia carry talismans about with them, especially in war, consisting of verses of the Koran, to which they attach extraordinary influence; and with one Mahomedan soldier, who had fallen in battle, a whole Koran was found wrapped in the rolls of his turban. The Mahomedans put up charms over the lintels of the doors, on the walls of their houses, and almost constantly use them on their arms as amulets, for the cure of aliments, to cast out devils, to ward off demons, fairies, enchanters, and to cleanse a haunted house. In exorcism, certain names (Ism, sing.; Isma, pl.) are used by Mahomedans. The ism-jallali, or fiery or terrible attribute, is used; also the ism-jamali, the watery or air attribute; and with these they cast out devils, and command the presence of genii and demons. Amongst Mahomedan women love-philters are in frequent use; and engraved amulets, and leaves and roots of plants, are worn by them to retain or win affection. The Rev. Mr. Ward saw a Mahomedan woman dropping slips of paper into the river, and upon inquiry found that they contained some sacred words, and that the woman was presenting those papers to the river-saint, Khaja Khizr, in hopes of obtaining relief. Persians consider the number thirteen so unlucky, that, in general, they will not even name it. When they have occasion to allude to this number, instead of mentioning sechleh (thirteen), they say ziyad (much more) or hoch (nothing). In ancient Rome, the ladies wore the phallic emblem to overcome their sterility. It was a mango-fruit, given by a rishi to Jamisinha's father, and eaten by his mother, which begot that famous Maghada prince of old. To this day, very often do barren Hindu women, and those who lose their children in the cradle, repair to the most reputed shrine of Siva in their neighbourhood, and by fasts and vigils ensure his blessings for progeny.

Lane says in Egypt the most esteemed of all hegab or charms is a mushaf (or copy of the Koran). This and others are worn by many women, generally enclosed in cases of gold, or of gilt, and plain silver. Next in estimation to the mushaf is a book or wallet containing certain chapters of the Koran, as the 6th, 18th, 36th, 44th, 55th, 67th, and 78th, or some others, generally seven. The ninety-nine attributes of God, written on a paper, and worn on the person, are supposed to make the wearer a particular object for the exercise of all the benevolent divine attributes. The names of Mahomed's relics are also charms. These relics, called Mukhallatun Nabi, were two sabbahs (or rosaries), his mufshaf (in unarranged fragments), his mukhul'uh (or the vessel in which he kept the black powder with which he painted the edges of his eyelids), a furdah or kind of woolen covering. Sometimes, for the cure of diseases, and to counteract poisons, etc., a draught of water from a metal cup having certain passages from the Koran, and talismanic characters and figures engraved in the interior of the vessel, is given to the patient. Water from the sacred well of Zem-zen in the temple of Mecca, and pieces of the black brocade covering of the Ka'ba, small oblong flat cakes of a kind of greyish earth, mixed with salvia, supposed to be composed of earth from over Mahomed's grave, are believed to be a cure for every disease. They are sold at the prophet's tomb, and are occasionally eaten. The Chinese have a written charm, praying for the three manyus, happiness, long life, and sons; and nine lies, prosperity, dignity, longevity, etc.; koo-tung-king, the old brass mirror, to cure the looker of insanity. The Singhalese believe that certain charms are efficacious in protecting them from the violence of bears.—Skinner's Overland Journ. ii. p. 70; Ward's View of the Hindoos, t. p. 71; Milher's Seven Churches of Israel; Herklots Kanou-i-Islam; Tr. Hind. ii. p. 3.

CHAR-MUGHZ, Pers.; also Girdghian; Jouz-i-roomi. Juglans regia; walnuts.

CHARNOCK, JOB, the founder of Calcutta. In the end of the 17th century he dwelt at Barrackpur, which the natives have named Acharak, after him. He resided there so as to be near the grave of his wife,—a Hindu woman, whom he had espoused after rescuing her from burning on the funeral pile of her deceased husband. The mausoleum over her remains is the oldest piece of masonry in Calcutta. His sorrow for the loss of his wife was unbounded. So long as life lasted, he on the anniversary of her death sacrificed a cock in her mausoleum in the cemetery of St. John's Church. His epitaph—

CHAR-PAI. HIND. A sleeping cot or bedstead; literally, four legs.

CHARRAH. ARAB. Lagernaria vulgaris, Sen.
CHARRAS, the gum-resin of the hemp plant, Cannabis sativa. It exudes from the flower heads, and also from the seed when ripe. In the Punjab, when the seed is gathered, the heads are rubbed with the hands, and the charras collected. The finest charras is produced in Yarkand and Kashgar. A kind called garda is much in use, and of this again there are three sorts, surkha, bhanga, and khuk. It is brought into the Punjab from Ladakh via Kulu, Kangra, and Kashmir; also from Yarkand and Persia via Peshawur and Dhera Ismail Khan on the western frontier of the Punjab. A small quantity placed in the hookah and smoked, produces almost immediately an intoxicating effect. It seems to have been employed as an intoxicating substance in Asia and Egypt from very early times, and even in medicine in Europe in former times, as Dr. Royle mentions in the Pharmacognosy (p. 138) and Murray (Appar. Medicaeinin, iv. pp. 608—620). In Central India, the Sangor territory, and Nepal, charras is collected during the hot season.
Men clad in leathern dresses run through the hemp fields, brushing against the plant with all possible violence; the soft resin adheres to the leather, and is subsequently scraped off and kneaded into balls, which sell at from five to six rupees the seer. A still finer kind, the Monia, or waxen churra, is collected by the hand in Nepal, and sells for nearly double the price of the ordinary kind. In Nepal the leathern attire is dispensed with, and the resin is gathered on the skins of naked coolies. In Persia, it is stated by Mirza Abdul Nassar that the churra is prepared by pressing the resinous plant on coarse cloths, and then scraping it from these and melting it in a pot with a little warm water. The charms of Herat is considered to be the best and most powerful of all the varieties of the drug. It is said also that when the bang leaves are picked off and the stalks remain, the little knots which occur wherever a leaf issues from the stem, are picked and collected as ganja, and these contain much resin. Indian hemp secretes a much larger proportion of resin than is observable in the European plant, but a difference is observed in this point in India; between plants grown in the plains and those of the mountains, and also when grown thickly together. The natives plant them wide apart, to enable them to secrete their full power. In Europe, the thick sowing, and moisten, often dull, climate will prevent the due secretion of the peculiar principles of a plant of the Persian region.—Powell; O'Shaugh.

CHARRI. HIND. The royal or imperial rod, a long staff or javelin, and often placed by Hindu princes on the royal crown or throne. It is an emblem of authority, and Charri men zor hai—His rod is strong—is meant to indicate that the authority is obeyed.

CHARSA of Ptolemy, the modern Kas.

CHARSA. HIND. A huge bucket made of hide, for a well.

CHARSUDDA, a town in the Peshawur valley, near which the Swat river joins the Kabul river.

CHART.

marine charts of coasts, seas, and oceans.

CHAR-TARA, a musical instrument, literally four-stringed, as the sāl-tarn is three-stringed.

CHARŪ. MAEAL. A jungle tree which grows to about 40 feet high, and 2 feet in diameter. It is used in building native villages, particularly for planks, but is not very durable.—Edge, M. and C.

CHARU, in Hinduism, one of the five Jagna, who consist of the Bali, Charu, Baswadeva, and Agnihotra.

CHARUKAR, a town in Afghanistan. It was burned 3d October 1842.

CHARU, the predial slaves in Malabar, whose name Wilson derives from Chera, in Malale, the soil. They follow the rule of Maruma-katayam. They are very diminutive, with a very black complexion, and not unfrequently woolly hair.

CHARUNG, a difficult pass in the Himalaya, in lat. 31° 24' N., and long. 78° 35' E. The crest is 17,348 feet. See Kunawar.

CHARVADAR, in Persia, the chief muleter of a caravan, and generally owner of the animals. He employs a certain number of the Ratichi or mule-drivers as his servants or assistants.

CHARVAKA, a Hindu philosopher who lived about the third century of the Christian era, and founded a school of materialism. The atheistical philosophy which he put forward is called Loka-yata, and its followers Loka-yati. It forms one of the six atheistical systems of philosophy current amongst the eastern Aryan race in India. The other five are the Yogachara, Sihlanta, Wai-bashika, Madhyamika, and Digambara, all full of indeterminate phrases, and containing a jumble of atheism and ethics. The derivation of Charvaka is from Charso, insinuating, and Vaka, a word. Charvaka, as the founder of the materialistic school of the Hindus, was the Pyrrho and Epicurus of India. The Charvaka system does not recognise the authority of the Vedas. The sect maintain that in this world of continual changes, which is developed out of four principal elements, prosperity is heaven and adversity is hell, and that there is neither heaven or hell besides these conditions. The Hindu philosophy is based on the nature of the soul and its relation to the Supreme, called the Adwika, the Dwaita, and the Visishtha adwika, are derived mostly from the views of the three great apostles of the Vedantist school, who flourished in Southern India, viz. Sankaracharya in the ninth century, Ramannja in the twelfth century, and Madhavacharya a little later.

Dwaita, the doctrine of duality held by many Hindus, distinguishes two principles in creation, spirit and matter, as opposed to the Adwika or Monad doctrine, which acknowledges the reality of spiritual existence only. Ananda Tirthachari was the founder of the Dwaita school. Sankara-charya was the propagator of the Adwika doctrines. The Vivishadwika school, non-duality with a difference, was founded by Ramannja-charya. It maintains an intermediate doctrine that the universe is a reality depending upon and supported by the body. The universe is the soul; that the divine and human soul are in some respects identical; yet that for all human purposes they are regarded as distinct, and that, in life, the human soul is subordinate and responsible to the divine soul.

CHAR VALAYAT, four territories under Afghanistan, comprising Maemana, Anikhi, Shibbongaun, and Siri pul, with a population of above 250,000.

CHARWAHA, a herdman, a grazer, of North India.

CHAR-YARI. HIND. Char, four, and Yar, a friend. A Sunni Mahomedan who acknowledges Abubakr, Omar, Osman, and Ali as the four legitimate khulifs.

CHAR-ZANOO. HIND. Lit., on four knees, i.e. sitting cross-legged.

CHAS, also Apayumm. Sansk. Opium. Chas is said to be derived from Khas khas, poppy seed.

CHAS, a Bengal cultivator. Chasa signifies a cultivator of the ground.

CHASARFO, a yellow earth of Spiti.

CHASHM. HIND. Pers. The eye. It is deemed amongst Eastern Mahomedans an organ of the body by which they can swear, possibly originating in the old practice of blinding persons. The Persian expressions 'Ba-chashm' and 'Ba
CHATSUKU.

CHATURTHI.

CHATRIYA, a warrior branch of the Aryan Hindus, taking social rank after the Brahmans. Menu says, 'To defend the people, to give alms, to sacrifice, to read the Vedas, to shun the allurements of sexual gratification; such are in a few words the duties of a Chatriya.' How this martial race broke up is extremely obscure. They were a brave race, and all Rajputs claim a Chatriya descent.

CHATTA-PAT. HIND. Leaf of Licuala peltata.

CHATTO. HIND. A canopy of royalty.

CHATUKHAM. TAM. Chatkar, HIND. A caravansary, temple, or choulter.—Wilson.

CHATTHRI. HIND. Agaricus campestris.

CHATURANGA-BALAM. TEL. An army of the four arms, horse, foot, elephants, and chariots.

CHATUR-BHUJ, a name of Vishnu with four arms. In a deed of conveyance by Maharao Sri Joy Singh, this deity is invoked. The deed runs thus: 'At this time, Brother Mann Singh, I bestow upon thee, of my own free will, the village and lands of Jaetoora. This donation shall not look to rankroos (physical infirmity), su-poot (worthiness), ca-poot (unworthiness); your issue shall enjoy them. Of this intention I call the four-armed divinity (Chatu-bhuj) as witness. You are my own child (chooroor); wherever and whenever I order, you will do my service; if you fail, the fault be on your head.'—Ted's Rajasth. i. 610.

CHATUR-BHUJA DEVY, a form of Durge, represented sitting on a padmaasana or lotus seat.

CHATUR-DASI, in Hindu astronomy, the 14th day of the lunar Paacha.

CHATUR-DASI, in the Hindu religion, festivals held on the 13th and 14th of the month Chet, in honour of Kama, the god of love. Madana, he who intoxicates with desire, or Kama, is both epithet and the god of love. The festivals on the 13th and 14th are called Madana triodas (thirteenth) and Chaturdasi (fourteenth). On these days the Rajputs of Udaipur sing hymns handed down by the Bards: 'Hail, god of the flowery bow! hail, warrior with a fish on thy banner! hail, powerful divinity, who causeth the firmness of the sage to forsake him! Glory to Madana, to Kama, the god of gods; to him by whom Brahma, Vishnu, Siva, and Indra are filled with emotions of rapture!' There is no city in the East where the adorations of the sex to Kama-deva are more fervent than in Udaipur, the city of the rising sun.—Ted's Rajasth., i, p. 577.

CHATUR-JEE, properly Chaturu paddhayya, the name of a family of Brahmans in Bengal learned in the four Vedas.—W.

CHATUR-MASYA, SANS. Four kinds of sacrifices—Vaisvadeva, Varuna Praghasa, Sakamedha, and Smasiriya, to be offered in four consecutive months, or every four months, consisting of roasted cakes of rice-flour, offered in the first to the Visvadevas, in the second to Varuna, with two figures of sheep made of flour, in the third with vegetables to Agni? and in the fourth to Indra.—W.

CHATURTHI, the fourth day after the new and full moon, sacred to Vighnesvara. On the Ganesh Chaturthi, or Chautthi, was born Ganesh, called also Ganapati, made from the turmeric and oil off the head of Parvati. He is the god of wisdom, who removes obstacles, and is invoked at the commencement of all undertakings. Ganapati has a man's body with the head of an elephant.

CHATTU, also the Hindi words, 'Mere sar aor ankh par,' meaning 'Your order be on my eyes,' are usual responses on receipt of an order, and acknowledging that it will be obeyed, on the penalty of the broken eyes. The evil eye is the Chattri-bad or Bad chashm of the Mahomedans of Persia and India. Chashm-i-khoras, Abrus precatorius, Linn. Chashm-i-maidah, cat's eye; the gem so called. See Evil Eye.

CHASKU. HIND. A cloth dyed with kusum-bhâ and printed.

CHASMAH-I-BAD, a spring in Khorasan on the road from Astarabad to Danjan. The people believe that if its waters be defiled, a furious wind rages till a tribe of the neighbourhood restore its purity.—Eastwicth; Morier; Fraser; MacGregor.

CHASNÎ, a sugar-boiler; syrup of sugar; a vessel for taking out boiled cane juice.

CHASTE. HIND. Vitex negundo, Linn.

CHATAI. HIND. Cicendia hy-sopifolia, Adana.

CHATAM. HIND. A mat.

CHATANULU. HIND. The Chaitanya.

CHATERA, CHATISGHAR, CHASNI, CHASKU. 

CHATE. HIND. Chaitanya.

CHATERA. HIND. Chaitanya.

CHATERA. HIND. Chaitanya.

CHATAI. HIND. Cicendia hy-sopifolia, Adana.

CHATARI. HIND. A mat.

CHATANULU. HIND. A mat.

CHATNEE, CHATNEY, CHATNEY. HIND. Whitewash.

CHATRA. HIND. Lecuas cephalotes.

CHATRANGA. TEL. The Chaturanga, the game of chess, so called from imitating the formation of an army, the four (chatur) bodied (anga) array, of elephants, chariots, horse, and foot, in Indian armies. See Chess: Shatranj.

CHATRANGA. HIND. The Kayastha or Kaet race, in the Peninsula of India, claim this mythological person as their ancestor. They say he was the secretary to Yama, the god of the infernal regions.

CHATRIYAL. HIND. Euphorbia helioscopia.
His head is said to have been cut off or destroyed by Siva, when Ganesh tried to prevent Siva entering the chamber of Parwat when bathing. Clay images are made and worshipped for from one to nine days, and then thrown into water. The Chinchor or Chinchwad, who resides at a village of that name near Poona, is believed to be an incarnation of Ganesh, who promised an ascetic named Moroba, who lived in Sivaji's time, that he would be incarnate for seven generations in his family. The earth image of Ganesh is one of three forms, in which the earth deity Mrittika is worshipped by Hindus. The first is the Nág-pancham, in which a feast a snail of clay is worshipped; the second is Gokul Ashtami, when a clay image of the infant Krishna is worshipped; and the third occasion is that on which Ganesh is worshipped, and this last day of the worship of Mrittika is observed with great pomp. The vañan or carriage of Ganesh is a rat. The feast in honour of his birth is held on the 4th of the month Bhadrapad, and falls on the first day of Scorpio, and has some planetary or seasonal connection. Ganesh is brought to the house with much pomp.

CHATURUPADHYAYA. Sansk. The name of a family of Brahmans in Bengal, commonly pronounced Chaturjia or Chaturjee.

CHATURVEDI, Sansk. Meaning a Brahman who has studied the four Vedas. It is usually pronounced Chauti. The term is now applied to a class of Brahmans who are not always of a literary character; and in the Upper Provinces they are usually boxers, wrestlers, and the like. — Wilson.

CHA. Hind. Four. Chau-bach'ha, in former times, in the Delhi territory, a levy of revenue on four things, the poll-tax, hearth-money, and hornegeld.

Chaubasi (24), any tract containing 24 villages in the occupation of a particular tribe.

Chaurai (84), a subdivision of a pargana embracing 84 villages.

CHAUDRAYATNI, also Chaturdasa-ratna, in Hindu mythology fourteen precious articles, called gems, obtained by churning the ocean. The second incarnation of Vishnu was in the form of a tortoise, hence known as the Kurma avatar. The principal incident in it was the churning of the ocean with the huge mountain Mandara as a churn-rod, using the great serpent Sesha as a churning rope; while Vishnu, in the form of a tortoise, sustained the vast load. The produce was the fourteen precious articles (or gems), the chao-da-mtni, or more classically the chatur dsa ratna, one of which was medicine, another poison. See Vishnu.

CHAUDHARI, the headman of a town in tribes; the headman of a village; also, in Hindu temples in the Peninsula, the figures at the corners of the temple supporting each succession of platforms. See Dhara.

CHAUGHAN, a game of Tibet resembling hockey. It is played on horseback, on a plain about 60 yards broad and 350 long, with a stone pillar at each end as the goal. The ball is somewhat larger than a cricket ball, and is called in Tibetan, Pulu, and now known to the British as Polo. The stick or Byntu is of the strong and straight bough of the almond-tree, about 4 feet long, and let in at the top and passed quite through to the other end of a curved piece of solid birch-wood, about the size and shape of a drenching horn. The game is mentioned by Baker. It is played in every valley in Little Tibet, Ladakh, Yessen, Chitral. See Chieane; Chotugha.

CHAUHAN, one of the principal Rajput races, descended from Prithi Raj, the last Hindu ruler of Iundra-prostha, or Delhi, and spread through Malwa and Rajasthan. The principal families are the Khich, Hara, Bhadauria, Rajkumar, Rajor, Pratapnir, Chaknagar, and Manchana. The head of the Manchana is the raja of Manipuri. This was the most valiant of the Agniwala Rajputs, and of the whole Rajput race. Its branches (saca) long maintained all the vigour of the original stem; and the Hara, the Khibi, the Pecora, the Sonigurra, and others of the twenty-four, have their names immortalized in the songs of the Bards. The derivation of Chauhan is.cecal with his fabulous birth,—the four-handed warrior Chatooor-bhooja, Chatoore-baha, Vira. Their name is often written Chaloun, also Chaluman. They are in every part of the N.W. Provinces, as well as in Malwa and Rajasthan; the chief of this tribe now in the Raat district of Ulwar claims to be the living representative of Prithi va Raj.— Tod.

CHAU, Hind. A market-place.

CHAUWA. Hind. A cleared space in which a Hindu cooks his food or performs any religious ceremony.

CHAU-KALASA. Mah. A section of the Sudra, so named from their having four (chau) ornaments (kalasa) to the bridegroom’s litter in a marriage procession.

CHUKAT. Hind. A window frame or a door frame.—Elliot.

CHUKI. Hind. A police station. Chaukidar, a watchman, policeman. Chaukidari, a tax levied to defray the cost of the village watch.

CHUULMOOGRA. Hind. Gynnoecrida odorata.

CHAU-MUKHA. Sansk. A quadruple image, or four images of a Jaina thirthankara placed back to back.

CHUJNI. Hind. Cleome pentaphylla.

CHUNSHI. Hind. Berchemia, sp.

CHUPAN PAL, or Pahal of Kashmir; shepherds who tend the flocks of other people.

CHUPAT or Chusara. Hind. A game played with dice.

CHU-PHIRA of the Shan race, means lord, ruler. It is the Taan-bwa of the Burmese.

CHURARAJ SCYTHE. Ptolemy, supposed to be the people of Khor, a territory S.E. of Ladakh, and eastward of the Bylta.

CHUR-ANGA. Sansk. Lit. a square altar or pedestal for the linga.

CHURAPUPPOO, Charul, also Chironji, of Hindustan, is the seed of the Buchanania latifolia, removed from the small stone or kernel of the achar or fruit; it is very palatable and nutritious, especially when roasted; is used also in medicine, and considered heating; one-seer and a half costs a rupee. The fresh fruit is very agreeable.—Gen. Med. Top. p. 131.

CHURASSA, Hind., from Char, four, is often applied to square tools. Churassa, a spiter for making holes in a wire-drawer’s plate. Churas bira, a narrow chisel. Churas mehli, a small square awl; Churas reti, a square or two-faced file.
CHAVICA BETLE. Miq. Betel vine.

This trailing plant is cultivated in many parts of India and through the Archipelago for its leaf (pan), which is used to enwrap ingredients—betel-nut, quicklime, aromatics, astrigents—presented to guests on ceremonial visits. The plant thrives best in a stiff soil. This is well Ploughed or dug, thoroughly cleaned and levelled, then enclosed with stakes and brushwood, and covered with a roof of south grass, Sescharum procurrens. Shallow trenches 2 feet wide and 5 or 6 inches deep, and about 5 feet apart, are next scooped out and filled with water, and when the ground is thoroughly saturated the planting begins. A full-grown plant is cut down to the roots, which are separated and laid horizontally, and the sprouts, which in three or four days arise from the joints, each forms a separate plant. Planting goes on from February to April, and each row receives two or three waterings daily. The stripping of the leaves commences about the middle of June, and continues regularly for about a year, when the site is abandoned. The leaves are packed in bundles of 200, called dholi, and the dholi are sold at from 15 pice to 14 annas per dholi, according to the quality and age of the leaf. Pan plants are grown to protect fences, calliadiums, and other foliage plants from sun and frost. See Betel.

CHAVICA ROXBURGII. Miq.

Piper longum, Linn., long pepper.

Dar-filil, ARAB., Chabai jawn, MALAY.

Fili-dur-dara, AR., Pers., Tabee, Tabe.

Pipul, Pippol, BENG., Katta terpal, MALEAL.

Pai-khoven, BURM., Pippaul, SANSK.

Pipal, Pipali, ALMAS., Krishna pipuli, SANSK.

Pipali, DEK., Tipil, TAM., SINGH.

Pipla mul, HIND., Pipal, Pipul, TEL.

This plant is extensively cultivated, but it grows wild on the banks of streams in the Circar mountains, S. Konkan, Bengal, Sylhet, and on the banks of the Irawadi. The dried catkins of the female plant form the long pepper of commerce.—Rozk.; Voyt; Useful Plants.

CHAWUL. Hind. Husked rice.

CHAWURA or Chaur, tribe once renowned in the history of India, though its name is now scarcely known, or only retained in the chronicles of the Bards. Of its origin, says Col. Tod, we are in ignorance. It belongs neither to the Solar nor Lunar races. The capital of the Chawura was the insular Deobunder, on the coast of Saurashtra; and the celebrated temple of Somnath, with many others on that coast, dedicated to Balnath, or the sun, is attributed to the tribe of the Saura, or worshippers of the sun. The Balabhi princes were succeeded in the rule of Gujerat by the Chaura, who finally established their capital, in A.D. 746, at Anhalwara, now Patan, and became one of the greatest dynasties of India. The last raja dying in A.D. 981 without male issue, was succeeded by his son-in-law, a prince of the Rajput tribe of Salonka or Chalukya, whose family were chiefs of Kalian in the Dekhan, above the Ghats.—Elphinstone's History of India, l. p. 411; Tod's Rajasthan, l. p. 101.

CHAWUT. MALAY. Back cloth from Artocarpus elastica.

CHAYAU. By. Chenopodium viride, Rosz.

CHAYA. JAP. A tea-house.

CHAYA. SANSK. A shadow, from Cha, a covering, or disappearance. See Surya.

CHAYA. BENG. Ærta janata, Juss.

CHAYAU-KA-YOE. BURM. Aroma rohutaka.

CHAYNPFOLLA. Tr. Trichosanthes cucumerina.

CHAYROOKA. MALEAL. Capparis Hecanea.

CHAY ROOT. ANGO-TEL.

Emboorel, TAM. Teberi velleo, TEL.

Rammissorem vayr, Chaya veyr.

This is the root of a small biennial plant, the Oldenlandia umbellata, which is largely used as a scarlet dye. It is extensively cultivated in Ceylon and the Peninsula of India, but also grows wild, and the Singhalese prefer the wild plant. The plant grows in light sandy ground near the sea, where its roots strike very deep. The colouring matter resides entirely in the bark of the root, the inner portion being white and useless. This root is of great importance to the S. Indian dyer, yielding a red dye similar to munjee, Rubia cordifolia. The celebrated red turbins of Madura are dyed with it. That of Madura is considered superior of its kind, but this superiority is probably owing to some chemical effect which the water of the Vigay river has upon it, and not to any particular excellence of the dye itself. Wild chay roots are shorter, and are considered to yield one-third or one-fourth more colouring matter than the cultivated root; this probably arises from too much watering, as much rain injures the quality of the root. Roots of two years' growth are preferred when procurable. It is said that chay root rapidly deteriorates by being kept in the hold of a ship, or, indeed, in any dark place. When cultivated, the minute seeds are gathered, together with the surface sand, and sown in land previously prepared. It is watered for a year, and then dug, and sells at Rs. 20 the candy of 500 lbs.
CHAY ROOT.

If left longer in the ground it increases in value, and does not require further watching.

When first sown, it is immediately watered with water in which cow-dung has been dissolved. This binds the surface, and prevents the seeds being blown about by the winds. The dyers in the Peninsula of India test the value of the root by mixing some of the pounded root and quicklime. If good, the mixture soon assumes a fine red colour, if the mixture become pale or brown, or if no change of colour take place, it is considered of little or of no value. If a white colour prevail in the inside of the bark and on the wood, it may be pretty certain that the root is spoiled; a green colour is a sure indication of its goodness (Rhode, MSS.). It furnishes the colouring matter for the durable red for which the chintzes of S. India are famous. Chay root forms a considerable article of export from Ceylon. It grows there spontaneously on light, dry, sandy ground on the sea-coast. The cultivated roots are slender, with a few lateral fibres, and from one to two feet long. Attention was drawn to it as a dye-stuff in 1796 by a special minute of the Board of Trade recommending its importation; but Dr. Bancroft's report discouraged its further importation.

Dr. Heyne's description of dyeing cotton yarn with chay root is as follows:

The yarn, being washed and untwisted, that it may not become entangled, and being so separated that every part may be equally penetrated by the colouring matter, is divided into bundles of thirty or forty threads, through each of which at the middle and extremities a cotton thread is loosely sewed, but so as to allow of every thread being exposed to the sun's rays when hung up, and the threads spread out on a bamboo.

The yarn is washed and cleansed in cold water, aided by half an hour's manipulation; it is then kept in water in covered vessels till it acquires a putrid smell, which takes place in from twenty-four to thirty-six hours, during which it is occasionally pressed and worked for a quarter of an hour together; it is then to be washed as clean as possible, beaten on a stone or earthen pot, and then hung up to dry.

While this process is going on, a lye is prepared of the ashes of the plantain or other tree in cold water. It is an object to have this lye of sufficient strength, which is determined by adding to a small quantity about half as much gingelly oil and giving it to a gentle motion. Should it turn immediately white, having no visible globules of oil swimming on the surface, it is good.

The quantity required of clean lye being poured off and strained, sheep dung, in the proportion of three ounces to a pint of lye, is dissolved in one-half of it, and this solution is again strained. The other half of the lye is mixed with half its bulk of gingelly oil and half as much tsiky (the saponaceous water procured during and retained from former process, being, in fact, a solution of soap in water); the two liquors are then mixed together, and if things are favourable a milky scum arises.

The proportions required for say half a pound of yarn would be,—gingelly oil, half a pint by two pints; tsiky (soapy liquor from former process), a quarter of a pint; sheep dung, two or three ounces.

The yarn having been thoroughly imbued with this mordant, is dried in the sun for some hours; it is then again soaked and dried as before. The same night it is treated with an additional portion of mordant, is put into covered vessels, and allowed to remain till morning. If any mordant remain, the same process is again repeated.

The yarn is at night moistened with the lye first prepared, diluted with one-third of its bulk of water, and put into covered vessels. The yarn in drying, it should be remarked, should have the position constantly changed, to prevent the mordants or lye from accumulating in the lower part.

Next day the yarn is spread out to dry on the bamboo. It is taken in at night, and treated with lye. This alternate soaking or thorough moistening with lye at night and exposure during the day are continued without intermission till the yarn appears saturated with lye, or, in fact, till the oil is converted into soap. This, if the lye is sufficiently strong, may occupy five days. This is ascertained by washing a few inches from off the bundle in water holding some astringent in solution; a whitish scum will arise, and it is from the feeling of this scum when worked between the hands, and the appearance of it afterwards, that they determine the state. The workman being satisfied of the completion of this process, the yarn is again moistened for one day, morning and evening, with much diluted lye or plain water. The yarn may be immediately washed, but the process is much improved by retaining it for some weeks, probably to allow the amalitzing matter to get fixed.

Before washing it thoroughly, the yarn is washed in a small quantity of water, which, receiving the soapy particles in solution, is retained by the dyer under the denomination of tsiky. It gradually acquires some consistency and a disagreeable smell. The yarn is then washed in a tank till nothing of the mordant seemingly remains, but the smell and a certain softness to the touch. Occasionally the whole process is again repeated.

The yarn being thus thoroughly impregnated with the mordant, a cold infusion of cassa leaves in water is made, and after some hours the yarn is put into the vessel immersed in such an infusion. The manner as to expose every thread to its action. It is allowed to remain therein all night. The quantity of leaf used in the infusion is so great that it resembles a paste.

Next morning the water is wrung out from the yarn, the adhering leaves are shaken off, and fresh ones with an equal quantity of chay root substituted; for half a pound of yarn a handful of each is sufficient. After two hours the yarn is laid in the liquor.

The same process is repeated on the third day; by this time the yarn usually changes to a reddish-yellow colour, with occasional red spots. A liquor in which to soak the yarn is now prepared of a handful of chay root in water.

On the fourth day the yarn will appear in the evening of a light red colour. It is to be treated in the same manner as on preceding days, and a Tullar liquor to the last-named is prepared for soaking it in at night.

On the fifth day the yarn is washed in a tank, and afterwards dried in the sun. As usual, for soaking it in at night, a liquor is prepared of
pounded cessa leaves, mixed with gingelly oil sufficient to form a dry paste, of which about half an ounce is mixed in the usual portion of water; after standing two hours, a handful of clay root is added, and the yarn immediately immersed for the night.

The mode of proceeding on the sixth day is precisely similar, but the liquor for the night is prepared wholly of clay root.

On the seventh day the yarn is again washed, dried, etc. On this and the next day it is immersed in a liquor composed of equal parts of cessa leaves and clay root in water.

The yarn is now boiled in a liquor composed of that strained from it at the last night's process, with the addition of clay root, a handful for half a pound of yarn, and sufficient water to give room to agitate the yarn freely. The pot containing the liquor is placed on the fire, which is kept up briskly till it begins to boil; it is then kept simmering till a rose-coloured froth rises and covers the surface, when the fire is withdrawn, and the pot with its contents allowed to cool gradually. During the boiling the contents of the pot are stirred quickly, so as to expose the yarn as little as possible to the action of the air. When cold, the yarn is taken out and washed in a tank, beaten as usual, and dried in the sun; its colour should be a bright and lively red. If it fail, it is occasionally brightened by steeping once more in a liquor composed with cessa leaves and clay root, the former being mixed first with a little gingelly oil. A temporary brilliancy is further given by putting it in a cold infusion of safer wood.—Rehbe; M. E. J. R.; Simmonds, See Dyes.

CHARYUKA. Maleal. Caparris Heynemana. CHE-ANX, literally six annas, a clan of the Garo, who are rated at six annas.

CHEAYTI. Beng. Agathotes cherayta. CHEBULIC MYROBALAN. Six kinds of chebulic myrobalsan are used in India, all known as Haliloh:—

H.-i-Zira, is the fruit dried when just formed, and the size of a cumin seed or Zira.
H.-i-Javi, the fruit dried when the size of a Jao or barley-corn.
H.-i-Zingi, the fruit dried when of a larger size, and black like a Negro.
H.-i-Chini, larger than H.-i-Zingi, and greenish.
H.-i-Asfar, the fruit near maturity, and yellow.
H.-i-Kabuli, the fruit at full maturity. Mature Kabul myrobolans sell for a rupee a piece in the Bombay market, under the name of Sarwar-i-Hindi.

CHECHAR. HIND. Rhins buckianela. CHECHER, under the Mahomedan system of land-tax, lands which had suffered from inundation or excessive rains, the rent of which was remitted for five or six years. See Khiraj.

CHEDA. Pers. A funeral pillar erected by the Brahui nomades, modern representations of the ancient Buddhist chodten or chaitya. They are, like the cairns or tsulai of the Afghans, piled over the graves of their holy men and martyrs.—Bullen.

CHEDARASI. Tel. Mollago spargula, L. CHEDDI or Cheri, T.M. A tree, a plant.

CHEDUL. TAM. The charcoal piano.

CHEDULU. Tel. White ants.

CHEDI, a kingdom in Samadhra to which Krishna resorted, once as a fugitive, and again as a conqueror. See Krishna.

CHEDUBA, a moderately high island, extending from lat. 18° 40' to 15° 50' N., its greatest breadth being almost 15 miles. Its N. peak is in long. 95° 31' E. Area, 120 square miles. It is a volcano island, lies off Arakan, and is about 1760 feet high; it was lifted 10 feet up about the year A.D. 1750. Population in 1872, 22,078. Petroleum is found in several parts of the island; and at the N.W. corner is a site, known as the volcano, from which issues an inflammable gas. The neighbouring seas of Cheduba and Ramree need careful navigation. Hallstead gives an account of it in Bl. As. Trans., 1841, x. p. 350. It was taken from the Burmese on the 27th May 1854.—Horsburgh; "Dr. Budj; "Imp. Gaz."

CHEDU RADDU DUMPA. Tel. Dioscorea pulechella, R. iii. 801. The name signifies 'bitter climbing tuber.' Not uncommon in the forests of the Manyam lands, in the hill country of Vizagapatam and Ganjam. Chedub bira, Buda amara, R. iii. Chedu potla, Trichosanthes cucumerina, L. CHEEEHEE, a Gujar tribe.

CHEEEL, also Cheer. HIND. Pinus longifolia. Plentiful on the lower hills of the Himalaya; its upper limit is 6000 feet.—Captain Gerard.

CHEEEL. HIND. A kite. The word is applied to the Hillasturr Indus, which is called the Sankaar cheel, or Siva's kite, and is known to Europeans as the Brahmany kite; also name of the Milvus ater or common kite of India, Malayana, and E. of Europe.

CHEENA. BENG. HIND. Panicum miliecum. CHEENAPU. TAM. Lagerstratiana Indica, Linn. CHEE-NEB. BURN. This tree, of maximum girth 4 cubits, and maximum length 24½ feet, is abundant in Tavoy and Mergui. When seasoned it sinks in water. The flowers have an intolerably fetid, sickening smell, hence its name. It is used by the Burmese for boxes, tables, etc., and is a long-fibred, tough wood when new, but rots readily.—Captain Dance.

CHEENEI, a subdivision of the Jat race in the Punjab. See Jat.

CHEEP. GUI. Mother-of-pearl shell; a corruption of the Persian sphi, any shell or mollusc. CHEER, a peasan of the Himalaya, also called Charr; Phasianus Wallachi. CHEERA MELLA. HIND. Phylanthus longifolius.

CHEERI. SANSK. Mimosa hexandra; also Wrightia antidysenterica.

CHEERONJI. HIND. Buchanania latifolia. Its Oil.

Charuli ka tel, HIND. Sare pappu nuna, TEL. Sar-e pappu yennai, TAM.

The kernels of the fruit are eaten by the natives of India to promote fatness; they abound in a straw-coloured, sweet-tasted, and limpid oil, which is seldom extracted. The tree grows plentifully.—Mad. Ex. Jur. Rep.

CHEESE.

Cheese is made by the natives of India, but that used by Europeans is imported, and is known in

768
the market by names derived from the places of manufacture, such as single and double Gloucester, Stilton, Cheedar, Dunlop, Dutch, Cheshire, etc. Cheese is made from milk in China, also from a mixture of cream and butter, and called tsing- shwut. In Britain the chief season for cheese-making is from May to September, and it is carried on in nearly every county; but particular districts have acquired great repute. In Cheshire cheese, the salt is well mixed with the curd, and not merely rubbed on the outside. This, which is the most celebrated English cheese, is made in quantities amounting to nearly 14,000 tons annually. The average annual produce of cheese in Great Britain and Ireland is 80,000 tons, most of which is made in Cheshire, Gloucestershire, Shropshire, and Derbyshire. The rich cheese called Stilton is made in Leicestershire; it is not sufficiently mellow for use under two years old. Double and single Gloucester cheese is also well known. The former is made of the milk and cream, the latter of the milk and half the cream. Bath and York are famous for cream cheeses. Good cheeses are produced in large quantities in Holland. In Gouda cheese, which is considered the best in that country, matric acid is used instead of rennet. However, this cheese from Parma, in Italy, is skim-milk cheese, owing its rich flavour simply to the fine herbage on the banks of the river Po. Swiss cheese, especially that of Gruyère, is pleasing to some tastes. It is flavoured with herbs. — Toulminson, p. 359; Faulkner; M'Culloch's Commercial Dictionary, p. 271; Statist. of Commerce.

CHEESE-MACARONI, Ju-sien, Chinese, is made by the Chinese.

CHEETA. HIND. The several leopards and panthers of India are so named. The word, meaning spotted, is so used by the natives of India, but they prefix another word to indicate the particular animal intended. Generally, by the word cheeta is meant the Felis pardus, Sechb. The F. pardus is called the tewwa, also chita and chita-bag; it is the larger cheeta or pard or panther, and the hunting leopard the shikari cheeta. The black or kala cheeta is supposed to be kept to hunt the Tiger. The smaller variety, the leopard, is the gor-bacha or bor-bacha, or bibia-bag. The hunting leopard, the Felis jubata, is carried to the field on a flat-topped cart without sides, drawn by two bullocks. Each animal has two attendants, and is loosely bound by a collar and rope to the back of the vehicle, but is also held by the keepers by a strap round the loins. A leather hood covers their eyes. By skilful management the cart approaches within two hundred yards of the game. The cheeta is then unhooded and loosed from its bonds, and it drops quietly off the cart. It approaches them at a slow, crouching canter, masking itself by every bush and inequality of ground. As soon, however, as they begin to show alarm, he quickens his pace, and is in the midst of the herd in a few bounds, rolls over the one he fixes on, and in an instant is sucking the life-blood from its throat. The moment that the deer is pulled down, a keeper runs up, hoods the cheeta, cuts the victim's throat, and, receiving some of the blood in a wooden ladle, thrusts it under the leopard's nose. The antelope is then dragged away and placed in a receptacle under the cart, while the cheeta is rewarded with a leg for his success. Jerdon regards as one species the three cheetas of India, viz. the two varieties of Felis pardus, the panther and the leopard; also the black cheeta or black leopard, Felis melas, Debr. The hunting leopard or shikari cheeta is the maned leopard, Felis jubata, the parent of the ancients.—Schreber; Mundy's Sketches in India.

CHEETA-MEENA, a branch of the Meena race, from whom spring the Mair or Meera clan, the mountaineers of Rajputana, one of the aboriginal races of India, whose country is styled Mairawar or 'the region of hills.' The Mair branch of the Meena is also called Mairote and Mairoi. Mairwara is that portion of the Aravalli chain between Komulmir and Ajmir, a space of about 90 miles in length, and varying in breadth from 6 to 20. Rajputana rises from 3000 to 4000 feet above the level of the sea. Meera is 'a mountain' in Sanskrit; Mairwara and Mairote, 'of or belonging to the mountain'; the name of the Albanian mountaineer, Maimote, has the same signification. The Meena race consists of as many branches as their conquerors, the Rajputs. All these wild races have the vanity to mingle their pedigree with that of their conquerors, though in doing so they stigmatise themselves. The Cheeta-Meena accordingly claim descent from a grandson of the last Chaulan emperor of Delhi. Unail and Anoop were the sons of Lakha, the nephew of the Chaulan king. The cocoonat was sent from Jeymosulm, offering princesses of that house in marriage, but an investigation into their maternal ancestry disclosed that they were the issue of a Meena concubine, and their birth being thus revealed, they became exiles from Ajmir, and associates with their maternal relatives. Unail espoused the daughter of a Meena chieftain, by whom he had Cheeta, whose descendants enjoy almost a monopoly of power in Mairwara. The sons of Cheeta, who occupied the northern frontier near Ajmir, became Mahomedans about the 15th century, when Dudoth, the sixteenth from the founder of the race, was created Dawad Khan by the hakim of Ajmir; and as Aithoon has his residence in the Meena region, he is considered the chief of the Mairotes. Aithoon is still the chief town of the Mair race. Chang, Jhak, and Rajasi are the principal towns adjoining Aithoon. Anoop also took a Meena wife, by whom he had Burrar, whose descendants have continued true to their original tenets. Their chief places are Burrar, Bairawara, Mundilla, etc. The Meena were always notorious for their lawless habits; and importance has been attached to them so far back as the period of Biscidico, the celebrated prince of Ajmir, whom the Bard Chand states to have reduced them to submission, making them carry water in the streets of Ajmir. Like all mountaineers, they break out whenever the hands of power are feeble. In the autumn of 1882 the Meena committed a cruel outrage in the Jeypore territory.—Tole's Rajistan, i. p. 681.

CHEETO, a famous Pindari chief of the early part of the 19th century, who would not yield to the British, but sought refuge in forests, where he was deserted by all his followers. His mangled body was at length found in a tiger's lair, with his sword, and a letter-case holding some important papers.—Heber, ii. 551.
CHEITUL. Hind. The spotted deer. Axial maculatus.
CHEITZ. Mahr. Tamarindus Indica, Linn.
CHEGA. Tel. Sanseveria Roxburghiana.
CHEGA GADDA. Tel. Vanzueria spinosa.

CHEGO, a race in Malabar, who seem to be noticed by Wilson as the Chegavan or Chekvavan, and whom he describes as a man of low caste, commonly a Tair, one whose occupation is drawing toddy. The tradition is that the Chego came originally from Ceylon, where they belonged to the military caste. The Chego say that in the time of Cheram Perumal, a washerwoman, whose house adjoined that of an Ajari (carpenter), being occupied as usual in washing a cloth in water mixed with ashes, and having no one at hand to hold the other end of it, called to a young daughter of the Ajari, who was alone in the house, to assist her. The child, not knowing that this was an infringement of the laws of her caste, did as she was requested, and then went home. The washerwoman was emboldened by this affair to enter the Ajari’s house a few days afterwards, and upon the latter demanding angrily how she dared to cross his threshold, the woman answered scornfully that he belonged now to the same caste as she did, since her daughter had helped to hold her cloth. The Ajari, learning the disgrace that had befallen him, killed the washerwoman. Upon this her friends complained to Cheram Perumal, who espoused their cause, and threatened the carpenters, whereupon the latter combined together to take refuge in Ceylon, where they were favourably received by the king of Kandy. Cheram Perumal begged the king of Kandy to save the back, promising to do them no injury. The Ajari did not place entire confidence in these promises, but asked the king to send with them two Chego and their wives, to witness Cheram Perumal’s conduct towards them, and to protect them. The king granted their request, with the stipulation that on all occasions, such as weddings and deaths and other ceremonies, the Ajari should bestow three measures of rice on each of these Chego and their descendants, as a tribute for this protection,—a custom which still exists. If the Ajari is too poor to afford the outlay, he is still obliged to present the requisite quantity of rice, which is then given back to him again,—the rights of the Chego being thus maintained. From these two couples all the Chego of Malabar are said to be descended. This caste comes next below that of the Sudras, but is considered much less honourable. In times of civil war and rebellion, the Chego are bound to take up arms for the lawful sovereign; and some princes employed them as soldiers on other occasions, if they had not a sufficient force of Nairs. Their principal occupation is that of drawing coconuts toddy, which is compulsory on their caste. The Chego are subdivided into two castes, the Chego and the Tewn Chego.

CHEHAL TAN, properly Chahal Tan. Near the Jahan Nuna, in Shiraz, is a building called Chahal Tan, ‘the forty bodies or persons;’ another the Haff Tan, or ‘seven persons,’ from the number of holy men there buried.—Onslow’s Travels.

CHEHIL-WASTI, or captain of forty, amongst the Cherihi, a nomade race who occupy the Tothi and Hotuki countries in summer, and the Daman or skirts of the Sullman range in winter. In their migrations, they appoint a cheli wasti, or captain of forty, and a director-general.

CHEHOORO. Sing. A pale brownish-coloured cordage of Birbhum, coarse, and of moderate strength.—Royle.

CHEIRANTHUS ANNUUS. Linn. Na-farmani, ... Hind. [Tood sadaf, ... Hind.]

The natives of India recognise five kinds of seed, which they distinguish by their flowers. Lab or surkh, red, and zard, yellow, appear to be wallflower seeds. Safaid (white), nafarmani, and nila (blue), are stock seeds.—Powell’s Handbook.

CHEIRANTHUS CHEIRI, wallflower, from Cheir, the hand, and Anthos, a flower, derives its English name from growing wild on old walls and ruins in England. It is of a light yellow colour, but, when cultivated in gardens, assumes a rich dark tint, mixed with brown; the double variety of a yellow colour, and striped with deep orange. In the Punjab it is called Lahori subi. It has small linear, acute, reddish seeds (todi surkh, tal toodi), and the flowers said to be cordic and emenagoge, are used in paralysis.—Powell.

CHEIRONECTES, the frog-fish of the British, in India, belong to the family of Lophidae or anglers, and are met with in many seas. In this group the bones of the carpus form arms that support the pectoral fins, and enable these fishes to walk along the moist ground, almost like quadrupeds. Cheironecites immaculatus, Ruppell, has feet or claws rather than fins. Hartwig mentions a frog-fish of the Asiatic islands and the southern hemisphere, remarkable for its hideous appearance and its capability of surviving for several days on land.—Tennent’s Ceylon, p. 550. See Fishes.

CHEIROPTERA, the bats.

Chauve souris ... Fr. Nottoli, ... It. Fleder mauser, ... Gen. Vespertiliones, ... Iat. Gadihil, ... Hind. Shub para, ... Pers. Pipistrelli, ... It. Trinjan, ... Tam.

A sub-order of mammals of the order Primates.

The bats, or fitter name, derive their scientific name from the two Greek words, Cheir, a hand, and Pteron, a wing, from the circumstance that a membranous fold of their skin, commencing from their neck, spreads out between their fore feet and their fingers. They include four families, viz.,

3 Gen,—Pteropus, 4 species; Cynopterus, 2 species; MacroGLOSSUS, 1 species.

Fam. Vampyridae, Vampire bats, Sub-Fam. Megadermatinae.

1 Gen,—Megaderma, 4 species. ... Sub-Fam. Rhinolophidae.

5 Gen.—Rhinolophus, 11 species; Hipposideros, 10 species; Cynopterus, 1 species; Rhinopoma, 1 species; Nyeretia, 1 species.

1 Gen.—Taphozous, 5 species. ... Sub-Fam. Noctilionidae.

2 Gen.—Nyctinomus, 1 species; Cheirodomes, 1 species. ... Fam. Vespertilionidae. Sub-Fam. Scotophilinae.

3 Gen.—Scotophilus, 11 species; Noctulinia, 1 species; Nycticeius, 8 species. ... Sub-Fam. Vespertilionidae.

8 Gen.—Lamprologus, 1 species; Murina, 2 species; Kerivoula, 5 species; Vespolina, 7 species; Myotis, 6 species; Plecotus, 3 species; Barbastelus, 3 species; Nyctophilus, 1 species.

Some of the frugivorous bats are eaten in the East. The Indian fruit-bats are Pteropus Edwardsi and Pt. Leschenaultii; that of Australia, Pt. poliocephalus; and Cynonotus collaris is the collared fruit-bat.

CHEITUN, a Brahman of Nadia, who in the
beginning of the 16th century introduced the reforma of Rama-nand into Bengal.

CHEKAVAN or Chekavan, Mal. A toddy-drawer in Malabar.—Wilson, See Chego.

CHE-KIANG, a province on the east of China, of 57,000 square miles. It is washed by the China Sea. Its chief towns are Hang-chau, Niumg-chot, and Wau-chao.

CHE-KIANG RIVER, or Pearl river, disem- bogue after a course of 500 miles. As it passes Canton, it divides into two branches, which, embracing the island of Honan and the Flat islands, re- unite below the Flat islands to form the true Pearl river, which flows on in a broad stream, receives many tributaries, and finally empties itself by many mouths into the sea below the Bogue Forts. It drains 150,000 square miles. The channels are narrow, but most of them are navigable by boats to all the large towns in the province. One, the Lung-tung and Kwang-ai.

CHEKONADI, Tel. Cuddapah India, Lam.

CHEKURI TIVVA. Tel. Pentatropis microphyla, R. ii. 35.

CHEL. HIND. Cannabis sativa.

CHELA. HIND. Alangium decapetalum.

CHELAH means literally an adopted depend- ant. It neither applies to a slave nor an adopted child, but to a person who is admitted to the claims of a dependent relation. In use, it means a disciple, a pupil, a slave. Tod (ii. 608) says it includes servitude or domestic slavery, but implies at the same time treatment as a child of the family, or disciple. Tod mentions that at Bhynsor the head of the establishment came forth to bestow his blessing on him and to beg something for his order. He, however, in the first place elected Colonel Tod one of his chela, or disciples, by marking his forehead with a tika of bhaaboot, which he took from a platter made of dhak leaves. Tod gives the name: Arctocol, Central India.

CHEL-PIPU. Beng. Calingia scibifera.

CHELIDONIUM MAJUS. Smith. Chi-mu, ... Chin. | Celandine, ... Eng.

Its use is as an expectorant.

CHELIFER. Amongst the insects which infest books in India are two genera, which are usually regarded as accomplices in the work of destruction, but which, on the contrary, pursue and greedily feed on the larvae of the death-watch and the numerous acari which are believed to be the chief depredators that prey upon books. One of these maligned genera is a tiny tailless scorpion (Chelicer), of which three species have been noticed in Ceylon, the Ch. librorum, Temps., Ch. oblongum, Temps., and Ch. acaroides, HerriauII, the last of which is believed to have been introduced from Europe in Dutch and Portuguese books. Another genus of book insects is the Lepisma, the fish insect genus, and called so by Fabricius from its fish-like scales, which are the chief oreatures which feed on the acari and soft-bodied insects that infest books. There have only been two species described, viz., the L. nivo- fasciatus and L. niger, Temp. It has six legs.

CHE-LING-TCHA-POO, a division of the country of the Kalkas, in the district of Pola, adjoining the Russian district Selingsky.

CHELDA DUDUGA. Tel. Unona disolor.

CHELLAWN, HIND., properly Chilian. An invoice, a passport, from Chilans, to forward.

CHELLU. Tam. Termites, white ants.

CHELLUMBRRUM, a town in S. Arcot district, famous amongst Saiva Hindus for its shrine, called Sabanaike Koll, to which pilgrims repair. It was built by one of the kings of Chola Mundaum. The Hindus of Ceylon and the Natta Kotta mer- chants of Madura contribute largely to its support. The single blocks of granite in the gateway and roof are each 30 feet long and 5 feet square. In one part there is a roof supported by 1000 solid granite columns; and the lights from the Gopuram, 122 feet high, can be seen at sea 10 miles distant.

CHEL-MAR-ZAI, one of the four divisions of the Med, a seafaring and fishing population on the seaports of the Makran coast; the other three divisions are Guzbar, Hormari, and Jellar-zaL.

CHELMERI. HIND. Cica disticha.

CHEL-MON ROSTRATUS. Lin. One of the archer fishes. Chetolozon rostratus, Shaw, according to Sir J. E. Tennent, is the archer fish of the fresh waters of India. On seeing a fly settle overhead on a leaf, it propels a drop of water and brings it down. See Chelotol oxotoxes.

CHELONIA, an order of reptiles, known as tortoises and turtles, generally considered the first by zoologists. They are also termed Testudinata, from testudo, the Latin for a tortoise. They belong to the section Cataphracta or shielded reptiles; and the families, genera, and species in S.E. Asia are as under:—

SUB-CLASS, REPTILIA PROPER.

The Order of Tortoises—Chelonia.

1. Land Tortoises, Testudinidae.

Testudo elegans, Schöpf., Peninsula of India, Ceylon.
T. Horsfieldii, Gray, Afghanistan.
T. elongata, Blyth, Gamboja, Arakan, Mergui.
T. indica, Gmel., Ceylon.
T. radiata, Shaw, Madagascar.
T. stellata, Vizagapatam.
T. platynotus, Blyth, Burma.

2. Freshwater Tortoises, Emydidae.

Cuora amboinensis, Daud, Eastern India.
C. flavomarginata, Gray, China, Formosa.
C. trifasciata, ... China.
Cyclemys Oldhami, Mergui, Gamboja.
Syndactyla Monnieta, Ceylon-China.
Notobrachys platynota, Singapore.
Geocemydia spinosa, Tenasserim, Pegu.
G. grandis, Gamboja.
G. tricarinata, Blyth, Ceyhassa.
Emys ocellata, D. E., Tenasserim, Pegu.
E. Bolet, Gray, Southern China.
E. Thurgii, ... Bengal, Penang.
E. mutica, Canton, Chusan.
E. nigricans, Gray, Southern China.
E. muelhah, Blyth, Java.
E. nigra, Blyth, Tenasserim.
E. sebae.
E. Sinensia, Gray, Canton, Formosa.
E. crassieoliis, ... Mergui, Malay Peninsula, Gamboja.
G. Reevei, Ceylon-China, S. China.
E. trijuga, Schweigg., Peninsula of India, Ceylon.
E. macrocephala, Gray, Siam, Gamboja.
E. Hamiltonii, ... Lower Ganges.
Pangshura teeta, ... Dekhan, Indus.
E. tentoria, Schleg., ... S. China.
E. flaviventer, Glhr., Bengal?
E. Smithii, Gray, Panjab?
Batagur faska, Gray, Gamboja, Irawadi, Penang.
E. Thurgii, ... Central India.
E. Berdmorei, Blyth, Pegu.
E. ocellata, Dunn, Calcutta.
E. trivittata, ... Moulineim.
E. bicarinatus, Gray, Nepal, Moulinein.
E. Elliott'i, ... Kistna River.
E. allinii, (Bantor, Malay Peninsula.
E. bhongoka, Gray, Nepal, Assam.

Platysternum megacephalum, Gray, China, Pegu.
CHEM MUNDO.

CHEM PURI.

CHEM VON. Tel. Euphorbia tirucalli, L. cuttanamu. See Cuttanamu.

CHEMULA or Chemula, the Semylla of Greek writers.

CHENA. Hind. Panicum milliaceum. It is sown and reaped in the hot season after all the rabi crops have been cut. It needs much water, hence the saying—

‘Chena j ka lena, Chondhal pani dena, Byar chalo te, na lena na dena.’

To get the chena crop, water it fourteen times. If a blast strike it, then neither harvesting nor selling. It is a very precarious crop.—Elliott.

CHENAB, next to the Sutlej, is the largest of the five great rivers of the Panjab. It is also called the Trimab. Ptolemy called it Sindabal or Sandablis, but the Greek historians of Alexander called it Akesines. Its source is in the high land of Tibet, about lat. 32° 50’ N., and long. 77° 40’ E., near the Bara Lacha pass. The Chandra and Bhaga rise on opposite sides of the Bara Lacha pass, which is in lat. 32° 45’ N., and long. 77° 22’ E.; and as their junction form the Chenab, they give also its Sanskrit name, Chandrabhaga, or moon garden. It runs north-west to Murumurdwam; south-west to its confluence with the Jhelum, thence south-east to the Sutlej, or continuation of the Sutlej. Its length to the Ghanta is 765 miles. It descends at the average rate of 40 feet per mile. Its estimated elevation for the first 200 miles is 5000 feet. It receives the Suruj Bhung, Murumurdwam, and the Dharl, all short streams. It becomes navigable for timber rafts at Aknur. Above Darwas it is a rapid river, running through a deep rocky channel.

The portion of it which passes through the territories of the maharaja of Kashmir is about 200 miles long. From the junction of the Chandra and Bhaga at Tanki, in British Lahul, to Aknur, where the river debouches upon the plains, its length is about 300 miles. The fall, according to General A. Cunningham, is 34 feet per mile from Tanki to Kishtawar, and 26 feet per mile from Kishtawar to Aknur. The flora of the upper valley agrees in most respects with that of Kumawar; lower down there is an approach to the vegetation of the Upper Himalaya. In the basins of the Chenab and Jhelum are four distinct races, but all of Aryun origin, viz. the Dogra, Pahari, Kashmiri, and Chaibati. The races on its valley call it Sanda Bhung, Jenab, Ghenh, Jenal, and Ghenal.—Powell, 532; Thomson’s Tr. 348; Cleghorn, Rep. 134, 153; Panjab, i. 10, 11.

CHENA CULTIVATION. ANGLO-SINGH. In Ceylon, Chenab means scrub land, patches of forest, burned, cleared, and cultivated for two or three years, and then abandoned and allowed to become forest lands again. This destructive form of cultivation is known as Kumari on the western coast of India.—Tenent; Dr. Cleghorn. See Kumari.

CHENA-GHANRI. Beng. Xyris indica. This is one of the large species of xyris used in house-building; plentiful in the Ramce and Sandoway districts.—Cal. Cat. Ex. 1862.

CHENK PURI, also Thungon-Puri. BURM. The elytra or wing-cases of the genus Buprestis, order Coleoptera. See Beetles. They are used for ornamenting the dress and person; 5000 maunds procurable during the rains. Price in Akyab, from 6 to 7 rupees per maund.
CHENNA.

CHENNA, also Chinna. TAM. Small. Many towns seem to be called from this word.

CHENNA. HIND. Cicer arietinum, Linn. This is called Bengal gram, in contradistinction to Koolti or Madras gram, Dolichos uniflorus, Properly Chann.

CHENNAI. Tel. Lagerstromia macrogyna, R, and L. parviflora, R. ii. 505.

CHENAPPAPA NAYAKKAR, father-in-law of the Nayakkar of Chingleput, a petty local chieftain; a feudatory of the Chandrangi raja, from whom the English obtained possession of a little fort on the coast, which they converted into a fortified factory, and it became the fortress and town of Madras, which is known to the native inhabitants as Chenapatam.

CHENNAT NAIR, a forest near Palghat, with well-grown Terminalia glabra, Pterocarpus marsupium, and Inga xylocarpa trees.

CHENPODIACEÂ, the goosefoot tribe of plants, many species of which grow in the S. and S.E. of Asia, of the genera chenopodium, beta, bitumin, salticaria, spinacia, basella, saolosa, and atriplex. Several species are used for culinary purposes. Garden orach (atriplex), chard-bet, beet, mangold wzel, belong to this order, and soda is obtained from species of salticora and salticaria. Ch. album (beta sag), common in Bengal, is used as a pot herb; Ch. laciniatum, an erect annual, and Ch. virede, of which there are two varieties. Ch. ollicos, stinking goosefoot, smells like putrid salt fish, and exhales ammonia gas. It is employed as an emenagogue and astringent.—D'Ohne, p. 523; Voigt.

Chenopodium album, Linn. Kulf, . . . . ARAB. Ructanala, . . . SANKE. Kuhlje baji, . . . . DUKH. Parupu kire, . . . TAM. Bhata, Bathu, . . . . HIND. Pappu kura, . . . . Tel. Bathu, . . . . PANJ. Chakra varli kura, . . . .

Grows all over India, coming up with the spring crops in N. India and the Punjab hills. The poorer people use it largely as a pot herb. Chenopodium auricomum, Lindley, a tall perennial herb of the Darling river to Aramuri's land, furnishing a nutritious and palatable spinach. It can live in arid desert regions.—V. Mueller.

Chenopodium bitumin, R. Mueller, Bitumin virgata, Linn. An annual herb found from S. of Europe to India, cultivated as a spinach plant; fruits furnish a red dye.—V. Mueller.

Chenopodium rubrum, Chih-hien and Hentsai of the Chinese. Much cultivated in Hu-peh, in China, as a vegetable.

Chenopodium viride, Roxb. ii. 58. Rockeb el jammel, ARAB. Betoya, . . . . BENG. Beto sag, . . . . BENG. Chawut, . . . . BY.

Chenopodium vulgare, Bhatwa of Panjib. Goosefoot is found in the Sutlej valley between Rampur and Sungnang, at an elevation of 7000 feet. Entirely a rain-crop; grows to six feet high; seeds considered nourishing.—Clephorn, Report.

CHEN-PO. CHIN. Michelia champaca, Linn. CHEN-SUAR, a wild, half-savage forest tribe inhabiting the Eastern Ghats of the Peninsula of India. They are known to their settled neighbours as the Chenchu kulam, Chenchwar, and Chensuar. They seem to be the people whom Wilson names Chenchi-yadu (vadu, Tel., a man). They are about 1200 in number, and dwell in the tract of jungle covering the westernmost range of the Eastern Ghat line, between the Penmar river and the Kistna, and known locally as the Nulla-Mulla and the Lankamulla; occupy the Palencondah hills to the west of the Nellore district, but chiefly in the Nandikandah pass, on the road between Cumbum and Ghooty, where they serve as watchmen and guides. They inhabit clearings in the forest, live in beehive-shaped huts like the African, Nicobarians, and other of the ruder Asinian tribes. These are of wicker work, with walls about three feet high, and a conical straw roof, with a screen for a door. The women dress like the wandering female basketmakers, whom they resemble in features. They speak Telugu with a harsh and peculiar pronunciation. They look on weaving and other manufacturing arts with contempt. Some of them occasionally visit Nellore, living in patchwork tents, from which they are named Bonta Chenu. They bring for sale bamboo seed and bamboo flutes. They never engage in cultivation, but live by hunting deer, wild hog, hares, using darts which they throw by hand. They also collect forest products, wax and honey; and a few rear sheep, goats, and cattle. Their food consists of all kinds of flesh, with bamboo seed, wild roots, and ragi, when obtainable. A few firearms are in their possession. They build small round huts of stone and grass, in clusters of ten or so. The men are almost nude; they wear piece of cloth about their loins, sometimes a cloth round the waist. The more savage members of this race are said to wear leaf-/prongs, and never to leave the forests. Their colour varies from dark brown to black. The men are shorter than the neighbouring Hindus, slightly but well made, except above the knee, which is large, and the leg. The features of the men are small and animated; cheek-bones higher and more prominent than in the Hindu in general; nose flatter, and nostrils more expanded; eyes black and piercing. Their hair is more shaggy and less straight than that of the Hindu, and they wear it very long, and rolled up at the back or near the crown like that of a woman. They bury their dead, but sometimes burn; and the Nandial Chenchwar, like the Tartar, carry the deceased's weapons to the grave. They use the spear, axe, or matchlock, or bamboo bow and reed arrow tipped with iron. They are patient hunters. In the lower Ghats, like the Chensuar, are a continuation of the wild forest Surah of the mountainous tracts further north in the line of the Eastern Ghats. They have large dogs; and a few are employed as hill police in the pass from the Kuman to Badwail. Vocabulary of six of the non-Aryan tongues—the Kond, Savara, Gadaba, Yerukala, and Chentsu—are given in Beng. As. Soc. Journal for 1856.—Newbold in R. As. Soc. Journ. 1845; Logan in Journ. Ind. Arch.

CHENSU KARRIR, a wandering race mentioned by Buchanan as residing in the hilly tracts near Coimatore. They are described as without houses or cultivation; but by shares, or with the bow, catch birds or large game, which they dispose of for rice. The white ant is said to be used by them for food. They approach their game under the shelter of a cow or buffalo, which they have taught to stalk. Their language is a dialect of the Tamil, with a few Canarese words intermixed. Those near towns learn the use of Telugu words. A Tamil man is unable to understand their language. A few reside in little huts out-
side on the outskirts of villages, and have a little blanket, but their ordinary clothing is a loin-cloth. In the denser forests they dwell in caves or hollows of trees, or under the shelter of a hut made of branches of trees, and use only a few leaves for covering. They describe the Animalley as their original country. They seem to have disappeared from that locality.

CHERPANG. Haiyu, and Kusunda, three uncivilised Bhot tribes who reside amid the dense forests of the central region of Nepal, to the westward of the great valley; they dwell in scanty numbers, and nearly in a state of nature. They live in huts made of the branches of trees, on wild fruits and the produce of the chase. The Chepang are slight, with large bellies. Mr. Hodgson says they are of Mongol descent. Their language is akin to the Lhopa. The Chepang, Haiyu, and Kusunda seem to belong to the Rawat group of frontier populations. They are named by Mr. Hodgson, the Durre, Denwar, and Brahmo. They occupy the districts where the soil is moist, the air hot, and the effluvia miasmatic.—*Tatham.*

CHEPATI. HIND. Cakes made of wheaten flour and water or milk, baked on the griddle. They form the principal article of diet of the Hindus of N.W. India and of the Rajput races.

CHEPU-NARINGI. TAM. *Indigofera eunamphylla, Linu.*

CHEPURU VAELLU. Tel. A grass grown in Kinnedy, from the roots of which neat table mats and teazing-brushes are made.

CHEPU TATTA. Tel. This term is applied to several plants. *Desmodium polycarpum, D. C. Hedysarum purpureum, R. iii. 358.* Coldenia procumbens, *Asarum Europoeum,* and *Elytraria crenata.*

CHER, in the Panjab, statute labour.

CHERA or Kerala, an ancient dynasty in the south of the Indian Peninsula. They seem to have risen on the fall of the Pandiya sovereignty, and to have ruled over a small state between the territory of the Pandiya and the western sea. It comprehended Travancore and parts of Malabar, Coimbatore, and Salem. It is mentioned in Ptolemy, and may have existed at the commencement of the Christian era. It spread at one time over the greater part of Karnataka, but was subverted in the 10th century, and its lands partitioned among the surrounding states. The Chera princes appear to have been established first at Scandapura in the Malabar coast, and subsequently at Talad or Dalavanpura on the Caunery and Mudi-gondapattam, perhaps the same as the modern village of Mujugonoor, on the road from Seringapatam to Koonghul. The Carura regio Cechoborthi has been supposed to indicate that Carour in the Coimbatore country was one of their earliest seats. They were powerful in the 4th and 5th centuries. Their 16th king boasts of having conquered Andhura and Kalinga; and their 20th king, Kong-nut Raya i, boasts of having conquered Chola, Pandiya, Dravida, Andhura, Kalinga, Varada, and Maharstra desas, as far north as the Nerbadda river. *Vira Chola* (A.D. 927-977) seems to have checked their victorious career; and Ari Vera Deva, another Chola king (A.D. 1004), to have completed their destruction. He also boasts of having carried his victorious standard over the Nerbadda, and to have been a benefactor to Chillumaram. After this, the Bollala of Mysore, and the Chalukey in Central India, seem to have become dominant.

The Kongu Desa Rajakal is a book describing the series of the Kongu or Chera princes, from Vira Raya Chakravarti to raja Malla-deva.—*Elphinstone's History of India,* p. 414; *As. Res. xv.* p. 40; *Ferguson,* p. 321; *J. R. As. Soc. viii.* p. 5. See Kerala; Narapat; Pandiya.

CHERRAITA. HIND. Valuable bitters, equivalents of gentian, obtained from the genus *Ophiopogon,* *Excama,* *Agathotes,* *Adenema,* and *Andrographis* (Justinia).—*Dr. Coghorn, Ed. New Phil. Mag.* No. 6 of 1856. See Chirretta.

CHERRAKEN. JAV. Croton seed.

CHERAN, a name of the Chera race, who ruled at Kerela on the Malabar coast.

CHERAT, a hill cantonment and sanatorium, near the Markultan pass in the Peshawur district, 84 miles from Peshawur in the Panjab, in lat. 33° 50' N., and long. 72° 1' E., on the west of the Khatak range. It is 4500 feet above the sea. —*Imp. Gaz.*

CHERI. TAM. A town, a village, a hamlet. Paraicheri or Parcherry, the Pariah district of a town, Tellicherry, Pondicherry.

CHERIBON or Cherimal, a mountain in lat. 6° 54.5' S., and long. 108° 26.4' E., in the north of Java, 10,538 feet high.—*Horsburgh.*

CHERIMELLE, Cheramella, or Harrippal. BENG. Cheremin, MALAY. *Cherambola,* PORT. In Japan this fruit is pricked all over with a needle, and laid in water. For use it is boiled up with sugar, and kept with syrup in glass bottles. These fruits are often eaten with tea. They are sometimes eaten unmarried with a little salt, and may likewise, when in that state, be preserved in salt. Sometimes they are eaten ripe, and have then a subacid taste.—*Thunberg's Travels,* ii. p. 292.

CHERIMOYA. Anona cherimola.

CHERIN. — a form of divination.

CHERKH.Pers. A breed of hawks used in Persia in hunting antelope. They are trained to fly at and pounce on the deer's head, so as to enable the dogs to come up with the antelope.

CHERROOTS, the dried leaves of the tobacco plant, wrapped in small rolls for the purpose of smoking. In Europe, Havana cigars are usually reckoned the best. In India, Manilla cigars are most esteemed. Imitation Manillas, Chinsurah cheroots, Lunka, Dindigul, and Trichinopoly cheroots are the chief kinds manufactured in India.

CHERRAPOONJEE or Charapunjee is a hill station in the Khassya hill district of Assam, 4588 feet above sea-level, in lat. 25° 15' 58" N., and long. 91° 46' 42" E. Its average rainfall during 1874, 1875, and 1876 was 868.41 inches, and in 1861 the fall was stated to be 805 inches. The station stands on the first of a series of hills that rise abruptly from the plain of Bengal, and catch the vapour of all the clouds that roll up from the sea. The principal race in the neighbourhood are the Khassya, an able-bodied people, who differ little from the Garo. They are arranged in petty relations in the Khassya hills. They build their houses on piles; they trap fish like the people of Borneo, Java, and Sumatra. A bed of coal is raised on an insulated summit; sandstone, composing here as elsewhere the base of the coal-measures, forms the lofty front of the mountains facing the plains. The lower beds consist of a
CHERU-PUNA.

Coarse conglomerate, resting on greenstone, after the manner of similar conglomerates in nearly all countries in which their fundamental rocks have been observed. Between Rinhut and Cherra-poonje, and at other places in the hills, are bridges made of the fibre of the India rubber tree. The Khasya race inter their dead in places where they erect oblong pillars, hewn or unhewn, three to thirteen in number.—*B. As. Trans.* iii. p. 25, xii. p. 614; *Dr. Buiss's Catalogue; Latham.*

**CHERU NALMAPPELLA.**

**CHERO-POONA.**

A light brown-coloured wood of Travancore, sp. gr. 0.483, used for making canoes.—*Col. Frith.*

**CHERO-PUNA.**

A dark-coloured wood of Travancore, used for building houses.—*Col. Frith.*

**CHERO-TIMBA.**

A dark-coloured wood of Travancore, sp. gr. 0.843, about 3 feet in circumference, used for house-building, tools, etc. —*Col. Frith.*

**CHERRU.**

Tel. A tank.

**CHERRU-PINAKOTTE.** Can., Maleal. Calophyllum calaba.

**CHERRY.**

The fruit of the Prunus cerasus. The bird cherry, *P. padus*, occurs in the Panjab, the N.W. Himalaya, and Afghanistan. It has a mawkish taste.

**CHERRY LAUREL.** Cinnamomum cerasus.

**CHERRY-STONE OIL.** Oil of Prunus cerasus.

**CHERRY TREE OF Norfolk Island.** The bark is used for tanning; and it furnishes one of the most useful woods.

**CHERSYDRUS.** A genus of sea-snakes. *C. annulata* and *C. granulata* occur in the sea at Madras. See Hydrida; Reptiles.

**CHERU.** Aborigines in Ghazipur, part of Gorakhpur, the southern part of Benares, Mirzapur, and Behar. They are sometimes said to be a branch of the Bhur. They seem to be the same as the Sivira or Scoree, but Buchanan considered them distinct. Cheru declare themselves to be descended from the great serpent, from which they may be supposed to be the Nagbans of Magadha. Remains of buildings attributed to them are found near Buddha Gya, Saaram, and Ramghur, and the images of Siva and Hanuman found in them indicate that they belonged to the Hindu religion. They appear to have been expelled from their ancient abodes by the Pramara of Bhobjur, the Hyobum of Hurli, and the Bhoonar, a little before the first Mahomedan invasion, about which time there seems to have been a general commotion in N. India, during which several tribes of this class possessed themselves. The features of the Cheru are said to resemble the occupants of the Vindhyas mountains. They live by cutting timber, collecting drugs, and killing game; and though their numbers are very low, they continue to create a raja for every five or six houses, and invest him with the tilak in due form. The emperor Sher Shah subdued Multara, a Cheru zamindar of Behar, which seems to have been a last but strong effort of the Cheru race. The chief of Singrowlee in Mirzapur is a Cheru, though he calls himself a Benbas. Sir H. Elliot suggests that the Sivira, Scori, and Cheru may perhaps be the Sauraseni. In the Harivansa is the following passage: 'From this race came the Sauravira and Saurasaeni. The great king Saurasaeni has given his name to the country over which he reigned' (Elliot, *Glos.*). They have almost disappeared from the seat of their ancient splendour. Once rulers of Behar, a petty population (2377) now represents the nation there. Not above 400 remain in their old home on the plateau of Shahabad, and about 3000 live in the land bordering on Nepal. They were driven into the Nepal Terai, and into the highlands of Chutia Nagpur, where they number 17,852, but are a very humble class of cultivators and day-labourers. They are usually of a light-brown colour, with high cheek-bones, small eyes obliquely set, low, broad noses, and large mouths with protuberant lips, but considerably softened by the alliances with pure Hindu families, which their ancient power and large possessions enabled them to secure. The village of Munka in Palanam belongs to a Cheru. The Cheru and Kharwar and Kol observe triennial sacrifices. Every three years a buffalo and other animals are offered in the sacred grove 'Sarna,' or on a rock near the village. They also have, like some of the Kol, a priest for each village, called Pahn. He is always one of the impure tribes, a Bhutia, or Kharwar, or a Parbeya, and is also called Byga, and he only can offer this great sacrifice. No Brahmanical priests are allowed on these occasions to interfere. The deity honoured is the tutelary god of the village, sometimes called Daur Pahar, sometimes Dharti, sometimes Purghahul or Daknai, a female, or Durn, a sylvan god, the same, perhaps, as the Darka of the Kohls.—*Elliot; Wilson; Dalton, Ethnol.*

**CHERUMAN,** a class of predial slaves in Malabar, whose name Wilson derives from Chera, Maleal, the soil. General Briggs names a non-Aryan race Cherumar. They follow the custom of Maruma Katayam.—*Wilson; Briggs.*

**CHERUMA PERUMAL, a viceroy of the 9th century, who governed the whole Malealim country of Chera or Kerala, including Malabar and Travancore, but afterwards established himself as an independent ruler. He is supposed to have founded the town of Calicut, and all the royal races of Malabar claim descent from him.**

**CHERU PINAY.** Tam. Calophyllum squamum, also C. calaba, Linn.

**CHERU-PUNA, Tamil,** is the small leaf or real mast poon, which is preferred for the masts of ships or vessels. The peon or puan woods are similar in shape and growth; the large sort is of right, bright yellow, and in the forests of Coromandel and Canara, it grows to a length of 150 feet. At Mangalore, Mr. Edye procured a tree of this sort that would have made a foremast for the Leander sixty-gun ship in one piece, for the sum of 1300 rupees, or £149 sterling. Poon of the forests of Cochin and Travancore is of a very inferior quality to that before stated; one sort is named the Karapa pusa, which is dark poon; and Malai pusa, meaning the hill poon; and another sort, the Vellai puna, or the white poon, is small, not more than 12 or 18 inches in diameter, and 18 or 20 feet long. In Canara, another sort, named Merchie pusa, grows to 28 inches or three feet in diameter, and from 30 to 50 feet long, and is very much like American birch. It is generally
defective and not durable; when filled, it opens and splits at the top and butt for many feet in length. The weight of the poun may be said to be from 40 to 48 pounds the cubic foot; but the lightest Edey met with was 343 and the heaviest 50 pounds the cubic foot when dry. The leaf of this tree is small and oval, about two by one and a half inches broad, and the fruit grows in bunches; it is about the size of coffee-berries. From this the natives extract oil, which is used for various native purposes.—Edge, M. and C.

CHETVIL, Chaerophyllum sativum. The leaves are used in soups and salads.

CHES, the Shatranj of the Persians, is supposed to have been invented by a Brahman who succeeded the dynasty in Sind. In Hindu legend, the wife of Ravana invented chess to wile him from his martial propensities.

CHEST, the commercial form in which opium is sold. A chest of Behar opium, consistence 75, made at Patna, contains 105-107 lbs. avoirdupois.

A chest of Benares opium, consistence 70, made at Ghazipur, contains 98 1 lbs. avoirdupois. The 'consistence' is the percentage of fine opium, excluding all water.

A chest of Malwa opium is usually assumed to range a little above 126-128 lbs., of 90 to 95 per cent. of fine opium.

A chest of Behar opium contains 83, and a chest of Benares opium at most 78, of the contents of a chest of Malwa opium.

The actual cost of a chest of Benares opium is Rs. 373, and of a chest of Behar opium, Rs. 436. The amount paid to the cultivator is Rs. 43 to Rs. 6 a seer, at 70 per cent. consistence.

CHESNEY, General F. R., an officer of the Royal Engineers, who in the years 1825, 1836, and 1897 conducted an expedition for the survey of the rivers Euphrates and Tigris, and wrote the reports.

CHESTNUTS.

The fruit of the Castanea vesca of Europe. The chestnut tree grows to a large size in China, and one, two, or three nuts are found within the large, dehiscent-spiny fruits. They are constantly spread for sale in Chinese streets in both the raw and roasted forms. Chestnut of China is Southwellia balanghas.

Horse chestnuts are the fruit of the Aesculus hippocastanum, Linn., an Asiatic tree, planted in Europe for shade and ornament; they are used for feeding sheep, horses, etc.

Water chestnuts are the horned fruits of species of Trapa, T. bicornis, T. biapinosa, and T. natans, Linn., growing in ponds, lakes, etc., in the temperate climates of Europe and Asia. In China and Kashmir they are largely used for food.

CHETAN. Mal. On the Malabar coast, a man-servant, a slave, a weaver of a particular caste.—Wilson.

CHETANA SWAMI, a Hindu religious reformer, the preceptor of Baba Lal, who founded the Baba Lal sect.

CHETCHEN, a tribe of the Eastern Caucasus, a branch of the Mitchehdegen or Kists, of one of the seven clans of that range. They dwell along the banks of the Terek. They are Mahomedans and fanatical, and plunder and enslave their pagan neighbours, receiving assistance from the Lesghi and all Mahomedans. They headed the opposition to the Russians on the eastern, as did the Circassians on the western, side of the Caucasus, whilst there rallied round them the smaller tribes, Abechas, Ubiche, Tschegitian, Tartar (Karatschais), and Kabardan, related with the Adighe by blood and tongue. They inhabit the beautiful mountain chain between the high Caucasian chain and the Terek. Shamyl was their leader in opposing the Russians.

The Chetchenzi tribes were considered the most formidable of all those which inhabit the innumerable rocky valleys of the eastern line of the Caucasus. Their predatory excursions, whether in large or small bodies, were not only a dread to their own immediate neighbours, tribes like themselves, though of less extent and power, but their sudden descents, ambuscades, and continued warfare, kept the disciplined Russians constantly on the alert. These lords of the mountains seemed never to rest, day or night. Unwaryed in their watch for prey, and like lightning in attack, for they struck or were lost to sight as quickly. The bride always brings a dower, consisting of cattle, etc. She is brought home to the house of her betrothed husband, and then the ceremony is completed by dancing, drinking, and carolling.—MacGregor; Porter's Travels, p. 62.

CHETEK, a climbing vine of Java; its sap is poisonous.—Bikmore, p. 53.

CHETTI POTILA. Tel. Trichosanthes cucumis. See Castanea.

CHETTIPA. Tel. Hymenodictyon excisum. CHETTKA. From this town to Neilung, on the Jankee or Jannubee branch of the Ganges, is the lofty pass of Chungsakhago, not under 18,000 feet. See Kanawar.

CHETKOOL. From this place to Burasoo in Garhwal the road leads over the Sungsia pass, about 16,000 feet high. See Kanawar.

CHETRIYA, commonly pronounced k'hetri, in the Hindu castes; also written Chatriya, Ch'hatri, Khetri, and properly Kshatriya. All Rajputs claim to be of this caste, but none of the ancient race are supposed to have survived their incessant wars. Menu says (Art. 43, 44, ch. x. p. 346) that several of the Chetriya tribes—Paudrakra, Odra, Dravira, Camboja, Yavana, Saca, Parada, Pahlava, China, Cirata, Derada, Ch'asa, Cirata, and Derada—had gradually sunk from the second to the Sudra class, owing to their omission of holy rites and to their seeing no Brahmas. See Chattri; Khetri; Kshatriya.

CHETTU. Tel. A tree.

CHETTU-KARAN. Maleal. A toddy-drawer; a grass-cutter.

CHETTY, pl. Chettiar, a titular distinction for the traders and financiers of the Peninsula of India, under the forms of Seth, Seth, Sethi, Chettiar. It is applied without any reference to caste or race, to the Zoroastrian Parsee engaged in trade, to the Mahomedan Borah, the Telign Komati, the Tamil Velleler, the silk-weaver, the Kavvay; and amongst the Telugu races the title is conceded to the Gajoolla baliya bangle-makers, the Vaniar oil-pressers, the Elavianar cloth merchants, and the Komati (Comati) grocers and general dealers. In the Tamil country to the south it is allowed to the Nattoo kottiyar, keen, enterprising

676
CHEUNAKA.  SANSK.  Cicer arietinum.

CHEYA CHETTU or Mrunu.  Tel.  Red-wood timber.

CHEYANESSIA ESCULENTA, a creeper cultivated in British Burma.  See Caoutchouc.

CHEVIKAM.  MALEAL.  Piper nigrum.

CHEVUKURTI CHETTU.  Tel.  Slevogtia verticillata.  D. Don.;  Adenema hyssopifolium.

CHEVALILLI TIGE.  Tel.  Ipomoea pes-caprae.  Siwet.

CHEWA.  HIND.  Ephedra Gerardiana.

CHEWAGIR-CHHATRA.  HIND.  Morechella semilibera.

CHEWANG, a chief of one of the vassal states into which feudally governed China had been divided.  He made himself sovereign of the empire, under the title of Chheng.  He was a great conqueror, and was successful in opposing the invasions of the northern barbarians, the Heung noo or Huns, one of his measures to withstand whom was the erection of the celebrated Great Wall.

CHEWKA.  Tel.  Tamarindus Indica.

CHEYAIH, a tributary of the Penner river; also a tributary of the Palar river.—Imp. Gaz.

CH'HACH'H.  HIND.  Butter-milk.

CH'HAAE or Chhai.  HIND.  A pad to prevent laden bullock from being galloped.

CH'HAIH.  HIND.  A basket used in winnowing.

CH'HAKRA.  HIND.  A cart or carriage without sides, used for conveying cotton.  The garri has sides.—Elit.

CH'HANTI.  HIND.  A coarse cloth.

CH'HAP.  HIND.  A stamp, a seal; in North India, the Pottadar's stamp.  The Chinese chop.  In Delhi and the Upper Doab it is the name applied to a small bundle or heap of thorns about a foot high.  When large, it is called Khewa, q.v.

Ch'hapa-Kaghaz, a newspaper, a printed paper.

CH'HAPPAR.  HIND.  Thatch, or a thatched roof.  Chhappar-band, a thatcher.

CH'HATAPUR, the chief town of a feudatory state in Bundelkhand of 1240 square miles, and a population in 1875 of 170,000; revenue, 225,000.  Its chief is a Puar Rajput.  Its troops, 62 horse and 1178 infantry and police, with 32 guns.—Imp. Gaz.

CH'HATIN.  Beng.  Alstonia scholaris.

CH'HATISGARH, the S.E. division of the Central Provinces, lying between lat. 20° 1' and 22° 30' 30" N., and long. 80° 28' and 84° 26' E.  The area of the plains of Chhattisgarh is computed at about 10,000 square miles, including most of the zamindari estates, but excluding tracts of hill and forest.  The population in 1866 was 2,103,165.  The ChhantAR castle maintain here a numerical preponderance.  They are not, however, leather-workers, but are enterprising and industrious agriculturists; and nearly a fourth of the cultivation of the land must be in their hands.  About the middle of the 19th century, under the teaching of Ghazi Das, they became monotheists; every evening they fall prostrate before the sun, exclaiming Sat Nam! Sat Nam! from which they have been styled the Sat Nami, meaning worshippers of the Pure God.  But serpent-worship seems to have largely prevailed in former times in many parts of the Central Provinces; and other races are spirit-worshippers, believe in sorcery and witchcraft, and have recourse to the ordeals.  See Central Provinces; Chamar; Gond; Rai Dasi; Rajpur; Satnami.

CH'HATRI.  HIND.  An umbrella; a small ornamented pavilion built over a place of interment, the cenotaph of a Hindu chief.

CH'HATTOOR, also Ch'hattar.  HIND.  The name given in Northern India to a covering placed over the globe winnowed on the Ghagh.  It is from the Hindi Chhatar, an umbrella, but is known also by the names of Bhurhawn and Chank, q.v.  In Benares it is generally a mere cake of cow-dung; elsewhere it is a shoot of grass or a dry stick of the arhar, Cajanuss Indicus, with several (generally five) projecting twigs, on each of which a small piece of cow-dung is placed, or a flower of the ak or meddar (Calotropis gigantea).  Sometimes a spear is stuck in the ground at the side of the heap; and sometimes an artificial flower is placed at a short distance from the bottom of the heap.  The object in view is to prevent the effect of an evil eye, or the injury which is sure to be sustained from the praises of any casual visitor, or any eye-biter, as an Irishman would say.  That this strange opinion was entertained among the ancients, is known to every reader of Virgil and Theocritus.  It is a prevalent opinion not only among the Scotch and Irish, but with almost every other nation on the globe.  The Ceylonese and many other Indians also are devoutly believed to offer a sure safeguard against the disastrous effects of fascination.  If his rasc or heap be but provided with this protection, the husbandman may sleep secure; but as sure as he neglects it, should an evil eye fall upon the grain, he will have to weep over the lost hopes of a year's labours.

Nam quoqueque sciem horribilem intensioni iibi omnes Cernere erat subito afflatus languescere flores.

Semp que anni agricole meest i lever caudum.'—Elliot.

CH'HAIH.  HIND.  A custom in the N.W. Provinces of India, of walking a boundary with a raw cow-skin on the head, under a solemn oath to decide correctly; five sticks are held in the hand, to imply that the arbiter is the representative of the people.

CH'HAYA.  Beng.  Erua lanata.

CH'HAYA means a shadow.  In Hindu astronomy, Vishvaha ch'haya, the shadow of a gnomon, when the sun is in the equinoctial points.  Madlyana ch'haya, the mid-day shadow of the same at any other time of the year.  Sama mandala ch'haya, the mid-day shadow of the same when the
sun is east or west of the gnomon. Ch'haya suta, one of the names of Saturn, meaning born from darkness.—Warren.

CH'HAYA. Hind. A shade, a spirit, the shade of a goddess or deity. In the hysterical or cataleptic seizures which happen to Hindu devotees, where a deity is supposed to take possession, the expression used to denote it is Ch'haya aya or Sayya aya; and the body of the possessed is said to be filled, ang-hbara. In Hindu mythology, Ch'haya is the wife of the sun.

CHIPEDA. Hind. A destructive little animal similar to the weevil (Calandra granaria), from Ch'hed, Hind, a hole, the verbal root of Chhedana, to pierce. It is also the name of the disease which grain sustains when affected by the ravages of this insect.—Elliot.

CHIPENKA. Hind. A network made of strings or cords; to place anything on the cords of a bhangi.

CHIPENTA, also Ch'hinti. Hind. From Ch'heente, to sprinkle. A field in which peas and linseed have been sown by broadcasting while the rice crops are standing on the ground. When the rice is cut, these crops are left to grow, and are harvested in the beginning of the month Chait. In Delhi the Ch'heente is applied to throwing more seed among a growing rice-crop. The same word is employed in Gorakhpur to signify lands in which seed has been scattered after a single ploughing; more particularly at the extremities of villages, with a view to secure possession.

Ch'heente is also a drop of water. Ch'heentecheute paran, spitting of rain. Dud'h ki handi men, pani ki ch'hinti dalna, to sprinkle water into a jar of milk, meaning to cause unnecessary annoyance. From this word is the English chintz. —Elliot.

CH'HIL-TAMBA. Hind. Oxidized copper filings.

CH'HINDWARA, a town which gives its name to a British district of the Central Provinces, with an area of 3852 square miles, and a population in 1872 of 316,095. The midland Gond Kingdom of Deogarh had its capital in this district; the hill parts have long been held by Gond or Kurku chiefs, and the British have allowed the petty rajas to retain their lands and rights as tributaries. The Gonds in 1872 numbered 109,469, besides Bhard and Kurku; Ahar or Gaoli, 23,814; Bhoyar, 10,606; Dher or Mhar, 27,390. The others are Hindus, Brahman, Kumbi, Tel. Ch'hindwara is 2200 feet above the sea. Coal of the same quality as that of Ramganj occurs. The Ch'hindwara forests are very extensive, and lie principally on the southern slopes of the Satpura mountains.—Imp. Gaz.

CH'HIPA or Ch'hipi, a printer of cottons, a stapmer of chintz.

CH'HIPA, or village in the Gonda district in Oudh, in lat. 22° 3' 30" N., long. 78° 59' E. It has a handsome Vaishnava temple of stone and marble, erected by Sahijanand, a religious reformer in Western India, who is regarded by his followers as an incarnation of Krishna, and is worshipped as Swami Namayan. His descendants are at the head of the sect at Junagarh. Many Hindu pilgrims visit the birthplace of their deified leader.—Imp. Gazetteer.

CH'HITUA. Hind. Broadcast sowing.—Elliot.

CH'HOD-TEN, an offering to a Buddhist deity; a Buddhist temple. These are numerous in Tibet, consecrated to the celestial Buddha, in contradistinction to the dungen, which are built in honour of the mortal Buddhhas, and which ought to contain some portion of relics, either real or supposed. See Buddha; Chaitya; Dungten; Tope.

CH'HOLA. Beng. Cicer arietinum.

CH'HONCHOO MOORMORI. Beng. Isopis squarrosa.

CH'HOTA, Ch'hoti. Hind. Ch'hoto, Beng., small.

Ch'hota-kela, Asparagus racemosus.

Ch'hota-lewar, Andromeda fastigiata.

Ch'hotl-land, Sueda fruticosa.

Ch'hotl-mahani, Solanum xanthocarpum.

Ch'hoti, van, Salvadorica Persica.

Ch'hoti-mai, Tamarix orientalis.

Ch'hoto, Akundo, Calotropis herbacea.

Ch'hoto-bich tarnika, Argyreia argentea.

Ch'hoto-doodhe, Ophiorrhiza argyrophylla.

Ch'hoto-doodhe-luto, Gymnema sylvestre.

Ch'hoto-genda, French marigold, Tagetes patula.

Ch'hoto-gotheoobee, Cyperus dubius.

Ch'hoto-jaluknas, Leucas aspera.

Ch'hoto-jalgantree, Panicea pennina.

Ch'hoto-ka, Elatostema hirtum.

Ch'hoto-jam, Eugenya caryophyllifolia.

Ch'hoto-juan, Utricularia lancifolia.

Ch'hoto-kechu, Crotalaria prostrata.

Ch'hoto-kentze, Euphorbia chamisseea.

Ch'hoto-ki, Sicyonia verticillata.

Ch'hoto-kokshim, Vernonhia cineria.

Ch'hoto-kulp, Trichodesma indicum.

Ch'hoto-kut, Sagitariar sagittifolia.

Ch'hoto-looniya, Portulaca meridiana.

Ch'hoto-ma, Hemialaeha polysperma.

Ch'hoto-musoor, garden tare, Ermum hisatum.

Ch'hoto-mutur, grey pea, Pismum sativum, P. quadratum.

Ch'hoto-neelapudmo, Nymphaea stellata.

Ch'hoto-okra, Zapania noeliana.

Ch'hoto-pan-chooele, Villarisa cristata.

Ch'hoto-phocticia, Osbeckia aspera.

Ch'hoto-pine-nutee, Cynodon hififormis.

Ch'hoto-kra, Sicyonia verticillata.

Ch'hoto-sada-malkhum-slim, Canavalia corytho-sperma, flore albo.

Ch'hoto-shundhi, Nymphaea edulis.

CH'HOTA UDAIPUR, also called Mohan, the chief town of a tributary estate in the province of Gjerat; area, 873 square miles, and population 62,913, 86 per cent. being the Bih and Koli. The chief is of the Chauhan Rajput. During the rebellion in 1858, the chief refused to admit Tantia Topi into his capital, and Tantia was defeated there by General Parke. Revenue, £50,000; and tribute, 15050.—Imp. Gaz.

CH'HURA. Hind. A big knife used by Afghans as a weapon. Ch'huri, a small knife.

CH'HURI-KA-BANDHA. Hind. A ceremony, formerly in use in the Maharatta country, of formally investing a Soudar with a bill-hook, in imitation of the investiture of the Brahman with the cord.

CH'HUTTEE. Hind. A Mahomedan rite on the sixth day of a woman's confinement.—Herk.

CH'HUTTHIE, a subdivision of the Jat race in the Panjab. See Jat.

CHIA KAI. MALEAL. Pods of Acacia concinna.

CHIAN and Cyprus turpentine, gum-resins, products of a pistacia. See Guns.—

CHIBBUR. Sind. Cynemis pubescens.

CHIBBH, a tribe south of Kashmir, but little reconciled from barbarism either by Hindu or Mahomedan conquerors.
CHICACOLE. CHICHAR

CHICACOLE, in lat. 18° 17' 25" N., and long. 89° 56' 25" E.; a town in the Ganjam district of the Madras Presidency. It is four miles from the sea on the Languliga river. It was at one time the Kalinga capital. It gives its name to a district with a population of 169,094 souls, mostly Vaishnava Hindus, and speaking Telugu and some Urya. It forms part of the Northern Circars, which have been under the Reddi or Gajapati; during the 16th century under the Kutub Shashi, in the 18th century under the Nawabs of Hyderabad and Aroet. In November 1753, M. Bussy obtained it for the French E. I. Company, but it was afterwards ceded to the British. In 1791, and again in 1866, Chicacole suffered greatly from famine. — Imp. Gaz.

CHICANE of Languedoc is the game of Choughan, once universally practised throughout Persia, and formerly often played on a level piece of ground near Shiraz. As a game on foot, we have it in the cricket of England, the golf and shinty and hockey of Scotland, and the hurling matches of Ireland. Pietro della Valle (Viaggio, Lettera de Casvin 25 Iuglio 1618) discovered it in the Florentine Calcio. Ci' e solo questa differenza tra il giuoco di Persiani e 'l calcio de Fiorenti, che i Fiorentini guciano con molta gente a piedi, etc.; Ma i Persiani, piu nobilmente guciano a cavallo. The chicisme of Languedoc is played as in Persia, with a wooden ball and a club headed like a mallet or hammer. — Ouseley's Travels, i. p. 346. See Choughan.

CHICHA. In a battle fought here A.D. 1772 by the British, the forces of the Bhu-tar raja were defeated.

CHI-CHAY, CHI-CHOU, CHI-CHUNA. In the Himalayan range, the hill villages are covered with woods, where, in the whole village lands were parcelled out in lots of equal value. — W.

CHICHI. A division of the Gujar tribe.

CHICHRI. Chand. Acer palmeri. A climbing shrub abundant in the Dry Zone of Ceylon.

CHICHUNDA. A small tree close-grained, and rather light in weight, used for cabinet making. It is known as the 'chiknur' of the Madras Presidency.

CHICHUNDA. A tree of India, belonging to the family of Leguminosae. The wood is hard, and is used for cabinet making.

CHICHUNDA. A small tree close-grained, and rather light in weight, used for cabinet making. It is known as the 'chiknur' of the Madras Presidency.

CHICHUNDA. A tree of India, belonging to the family of Leguminosae. The wood is hard, and is used for cabinet making.

CHICHUNDA. A small tree close-grained, and rather light in weight, used for cabinet making. It is known as the 'chiknur' of the Madras Presidency.

CHICHUNDA. A tree of India, belonging to the family of Leguminosae. The wood is hard, and is used for cabinet making.

CHICHUNDA. A small tree close-grained, and rather light in weight, used for cabinet making. It is known as the 'chiknur' of the Madras Presidency.

CHICHUNDA. A tree of India, belonging to the family of Leguminosae. The wood is hard, and is used for cabinet making.

CHICHUNDA. A small tree close-grained, and rather light in weight, used for cabinet making. It is known as the 'chiknur' of the Madras Presidency.

CHICHUNDA. A tree of India, belonging to the family of Leguminosae. The wood is hard, and is used for cabinet making.

CHICHUNDA. A small tree close-grained, and rather light in weight, used for cabinet making. It is known as the 'chiknur' of the Madras Presidency.

CHICHUNDA. A tree of India, belonging to the family of Leguminosae. The wood is hard, and is used for cabinet making.

CHICHUNDA. A small tree close-grained, and rather light in weight, used for cabinet making. It is known as the 'chiknur' of the Madras Presidency.

CHICHUNDA. A tree of India, belonging to the family of Leguminosae. The wood is hard, and is used for cabinet making.

CHICHUNDA. A small tree close-grained, and rather light in weight, used for cabinet making. It is known as the 'chiknur' of the Madras Presidency.

CHICHUNDA. A tree of India, belonging to the family of Leguminosae. The wood is hard, and is used for cabinet making.

CHICHUNDA. A small tree close-grained, and rather light in weight, used for cabinet making. It is known as the 'chiknur' of the Madras Presidency.

CHICHUNDA. A tree of India, belonging to the family of Leguminosae. The wood is hard, and is used for cabinet making.

CHICHUNDA. A small tree close-grained, and rather light in weight, used for cabinet making. It is known as the 'chiknur' of the Madras Presidency.

CHICHUNDA. A tree of India, belonging to the family of Leguminosae. The wood is hard, and is used for cabinet making.

CHICHUNDA. A small tree close-grained, and rather light in weight, used for cabinet making. It is known as the 'chiknur' of the Madras Presidency.

CHICHUNDA. A tree of India, belonging to the family of Leguminosae. The wood is hard, and is used for cabinet making.

CHICHUNDA. A small tree close-grained, and rather light in weight, used for cabinet making. It is known as the 'chiknur' of the Madras Presidency.

CHICHUNDA. A tree of India, belonging to the family of Leguminosae. The wood is hard, and is used for cabinet making.

CHICHUNDA. A small tree close-grained, and rather light in weight, used for cabinet making. It is known as the 'chiknur' of the Madras Presidency.

CHICHUNDA. A tree of India, belonging to the family of Leguminosae. The wood is hard, and is used for cabinet making.

CHICHUNDA. A small tree close-grained, and rather light in weight, used for cabinet making. It is known as the 'chiknur' of the Madras Presidency.

CHICHUNDA. A tree of India, belonging to the family of Leguminosae. The wood is hard, and is used for cabinet making.

CHICHUNDA. A small tree close-grained, and rather light in weight, used for cabinet making. It is known as the 'chiknur' of the Madras Presidency.

CHICHUNDA. A tree of India, belonging to the family of Leguminosae. The wood is hard, and is used for cabinet making.

CHICHUNDA. A small tree close-grained, and rather light in weight, used for cabinet making. It is known as the 'chiknur' of the Madras Presidency.

CHICHUNDA. A tree of India, belonging to the family of Leguminosae. The wood is hard, and is used for cabinet making.

CHICHUNDA. A small tree close-grained, and rather light in weight, used for cabinet making. It is known as the 'chiknur' of the Madras Presidency.

CHICHUNDA. A tree of India, belonging to the family of Leguminosae. The wood is hard, and is used for cabinet making.

CHICHUNDA. A small tree close-grained, and rather light in weight, used for cabinet making. It is known as the 'chiknur' of the Madras Presidency.

CHICHUNDA. A tree of India, belonging to the family of Leguminosae. The wood is hard, and is used for cabinet making.

CHILAS. This country is bounded on the north by the Indus river, on the south by the watershed of the ridge over Loolooosur lake, on the east by the watershed of the same ridge as above Loolooosur lake, culminating in the lofty peak of Munga Farbuth; the Astor boundary marches with Chilas here on the west to a point beyond the village of Sazeen, where the Indus takes a turn to the south-west. It is affected by good pasturage, but rice is under snow for a considerable portion of the year. The Sheem, claiming an Arab descent, are the proprietary and governing class. Crime is rare; women have more liberty and power than among Mahomedan tribes, and breaches of chastity are punished by death. They were visited in 1866 by Dr. Leitner, at the request of the Bengal Asiatic Society. Their language seems distinct from Pushtu, Persian, and Hindi, and is not understood by their neighbours the Syud race, who inhabit Durrell and Tankeeer to the west of Gilhght. According to their own traditions, the inhabitants of Chilas were conquered about the middle of the 16th century, and converted to the Mahomedan faith. Up to about 1840, the Kahgan Syuda received quantities of gold-dust as religious dues from the people of Chilas; but when the Syuds, aided by the Sikhs, failed in an attack on Chilas, the dues were discontinued. A second attack by the Sikh nation was successful, and a small annual tribute of 3 tolas of gold-dust and 100 goats is paid to the Kashmir durbar.

CHIL. BINJ. HIND. Strophanthus potatorum, clearing nut.

CHILCHIL. HIND. Celosia argentea.

CHILDREN.

Aulad, . . . . ARAB. Bateh-Katch. HIND. Batehe, . . . . HIND. | Pulli, . . . . TAM. |

Male children are greatly longed for by all the races inhabiting the south and east of Asia. One prevailing feeling regarding them is such as is expressed in Psalm xxvii. 4, 5: "As arrows are in the hand of a mighty man, so are children of the youth. Happy is the man that hath his quiver full of them: they shall not be ashamed, but they shall speak with the enemies in the gate. Most persons will hesitate to attack a large united family. Amongst Hindus and Chinese, with all of whom spirit-worship prevails, sons are particularly longed for, in order to obtain from them duties to the manes of their parents. The eastern custom of nursing a child from the hip or side, as in Isaiah lx. 4, lxvi. 12, is still continued; and a child born after vows is still, as in Proverbs xxi. 2, called the son of a vow; and many Hindu children of both sexes, but principally girls, are devoted to the gods. As in Genesis xxv. 6, the children of Mahomedans, born of a wife of humble birth, or of a harman woman, are not deemed equal in social rank to the children of a high-born woman. Infanticide is still continued amongst certain Rajput races, but the causes are not for fulfillment of any vow, or from any religious duty, but pride or poverty induces them to destroy their female children, and many Rajput tribes have the utmost difficulty in obtaining wives. The British Indian Government, in the early
part of the 19th century, declared the throwing of children into the Ganges to be criminal, and has made continuous efforts to prevent the destruction of children. The Chinese have complete power over their offspring, even to life, but in no country of the south-east of Asia is the sacrificing of children, on religious grounds, continued; though, down to comparatively recent historic times, the Phoenicians, Carthaginians, Arameans, Syrians, Babylonians, and even Israelites, and their neighbours on both sides of the Jordan, sacrificed their children with the hoped-for object of averting any great and serious misfortune. A Phoenician legend is of El, the strong, offering up his son Yedut or Yedut, that beloved,—El being the Kronos (Bunsen, iii. 286). Malek Bel was the same as the Tyrian Hercules, or Moloch or Bal-Moloch, to whom, as also to Hecate and Meleket Artemis, dogs were sacrificed. In Exodus xiii. 18, xxxiv. 20, the animal's neck or backbone had to be broken unless redeemed. The principal sacrifices offered to Hercules Usoo, as well as to his mythical companion, were human beings, who in Luocica of Phoenicia might be ransomed by a doce. At Carthage, the practice of sacrificing their favourite children, and those of the highest rank, in honour of Hercules, continued down to their latest wars. The legend of the Grecian Hercules is that he became insane, burned his own children, as well as those of his twin brother Iphicles, and murdered his guest Iphitus.—Bunsen, iv. 212, 213. See China; Harm; Infanticide: Rajput.

CHI-LE-CHOU and Chi-le-tung-chi, prefects in the Chinese province of Kwang-Tung.

CHILGOZA. Hind.; corruptly Galgotha. The nuts or seeds from the cones of the edible pine, Pinus Gerardiana, in India, are the seeds of the Chil, P. excelsa and P. longifolia, are so called.

CHILLANWALAH. A drawn battle was fought here on the 13th January 1849, between the British and the Sikhs, where 14½ per cent. of the British soldiers fell in the action. It lies between the Chenab and the Jhelum rivers.

CHILI PINE, Araucaria imbricata. The harsh, rigid, scale-like and persistent foliage of dark green, and its singular mode of branching, render this tree very conspicuous. The seeds, borne in large round cones, are eaten in Chili, where it forms widespread forests between lat. 37° and 48° S. The cones are about the size of a child's head, each enclosing between 200 and 300 nuts; and not unfrequently twenty or thirty cones are borne on a single tree, so that eighteen Araucarias are reckoned to maintain a single person for a whole year. The nuts, in form like an almond but twice the size, are eaten by the Indians either fresh, or roasted, the latter mode of cooking giving them a flavour something like a chestnut. They might be introduced into India.—Dr. Poopiga.

CHILIVA. Hind. The Indian bleak of N.W. India, a lonely little fish, seldom reaching more than two or three ounces; he is active, playful, and ravenous; his appearance is like new silver (the scales being used in making false pearls), and he ranks among the most delicate at table. Lady anglers, with a long, graceful wand, whip for him with great success on fine clear evenings, near the cold season, with tiny midges of rainbow hue, begirt with gold tinsel. Five pounds' weight and more of these pearly playthings have been the reward of a lady party on one evening, caught without much exertion from a boat, and under the shade of contiguous tops and groves, along the river Rapti. Besides the artificial fly, the chilliva greedily seize everything from a mosquito to a butterfly; and a grub or flesh maggat, a bit of paste, or a large grain of tough rice, are equally good. He is essentially a surface fish, active and cleanly in his predilections; of a delicate constitution, he soon dies after handling, especially if he has been hooked. The casting net is the proper modus operandi to get stock fish for a water, and the supply should be kept very few together, or they will rapidly die; earthen pans carried on a pole across a man's shoulder by night are best. This fish is very prolific, but his enemies are abundant in proportion. From his surface habits, he falls an easy prey to the ducks, fish-hawks, kingfishers, snakes, turtle, etc. To feed them or cause them to congregate, burn a little ghi or fat in a pot over the fire, and when it begins to smoke, empty out the contents on the pool or lake, and the chilliva will soon be seen hunting this new food on the surface. Coarse flour slightly melted and thrown in will also attract a great number; the casting net thrown on the spot will gather quite a silvery load. The Indian angler prizes the little chilliva beyond all his confreres, for he is the shining bonne bouche which, when properly spun on a first-class rapid, tempts the majestic mahseer of discreet 50 to 120 lbs. from all his propriety, or seduces the golden-eyed bokhar of 20 to run amok.

CHILKA. DUDUGU. Tel. Guatteria concinna; Dnn.: Unona discolor, Vahl.

CHILKA LAKE, a marine lagoon in the Orissa and Ganjam districts on the north-western side of the Bay of Bengal. It bounds the Northern Circars on the north. It seems to be the result of a breach of the sea over a flat sandy shore, whose elevation is something above the level of the country within. Pulicat lake appears to have had the like origin. Each of them communicates with the sea by a very narrow but deep opening, and are shallow within. The Chilka lake, extending from lat. 9° 28' to 19° 56' 15" N., is about 44 miles in length from N.E. to S.W., and in most places 12 or 15 miles wide. It is at the extreme end of the Puri district, just where it touches the Presidency of Madras. It is separated from the Bay of Bengal by a long sandy ridge of a few hundred yards in breadth, against which the force of the south-west monsoon expends itself in vain. Its area varies from 344 to 400 sq. m., during the dry and rainy seasons respectively. It is dotted with half-formed islands, and hardly anywhere exceeds six feet in depth. Here and there there is a forest of reeds and high grasses, and in some places the lake is fringed by picturesque and wooded hills. It is annually frequented by numbers of waterfowl.—Renonu's Memoir, p. 242.

CHILKI. Hind. A rupee of Kashmir, value ten annas.

CHILLA. Hind. Casearia tomentosa.

CHILLA CHETTU or Indupu Chetti. Tel. Strychnos potatorum. I.

CHILLA GADA, also Grasuguda. Tel. Batatas edulis.

CHILLAH, the fortieth day after childbirth, on which a Mahomedan woman performs her
purifications. It is the forty days of Lev. xii. 4. —HERKL.

CHILLA-JAIDAR, a kind of silk of Bokhara. CHILLAMA COOR. A small village, 193 miles from Madras. Earth salt is abundant.

CHILLANKI. Tel. Inga umbellata, Wild. CHILLAR. HIND. The husk, skin, or kind of fruit grain, etc.

CHILLAR. HIND. Small money or change; it corresponds also to the English word ‘upwards,’ as a hundred rupees and upwards.—sao rupai challar.

CHILLHA. HIND. A holy place where a fakir sits, so called from the initiatory Chihla (40 days’ abstinence. It is also known as a fakir’s takia.—Elliot.

CHILLIES. Capsicum, . . . Eng. Lombok; Chabai, MALAY. Cayenne pepper, . . . HIND. Lada mera; Lada china. Mireh, . . . JAV. Mirapa-kaialu, . . . Tel. Chillies. Lombok, . . . Eng. Lombok; Chabai, MALAY.

Chilli is the Mexican name for all various of capsicum, though they are natives of the East and West Indies, and other hot climates. C. annuum is the species commonly noticed, but there are numerous varieties which, by many, are reckoned species. Thus C. frutescens is a shrubby plant, which grows to a large and more bushy size; C. minimum supplies the variety called bird pepper; C. baccatum has a globular fruit, and furnishes cherry or berry capsicum. They are all of the simplest culture; but culture appears to increase the size, and to diminish the pungency of the fruit. Their acidity is owing to an oleaginous substance called capsicin. When the fruit is fresh, it has a penetrating acrid smell; is extremely pungent to the taste, and produces a most painful burning in the mouth. When dried, they form a large article of local and foreign traffic, and form the basis of cayenne pepper, but in vinegar, when green or ripe, they are an acceptable pickle. In Bengal, the natives make an extract from chilies, which is about the consistence and colour of treacle. In all Southern and Eastern Asia both rich and poor daily use them, and they form the principal ingredient in all chatnis and curries; ground into a paste between two stones, with a little mustard, oil, ginger, and salt, they form the only seasoning which the millions of poor in those countries can obtain to eat with their rice. They are worth about 40a. the candy of 600 lbs. Cayenne pepper is used in medicine chiefly in the form of tincture, as a rubefacient and stimulant, especially in cases of ulcerated sore-throat. It acts on the stomach as an aromatic condiment; and when preserved in acetic acid it forms chilli vinegar. Red pepper may be considered one of the most useful vegetables in hygiene. As a stimulant and auxiliary in digestion, it has been considered invaluable, especially in warm countries. Immense quantities of the capsicum are used by the native population of the West Indies, Africa, and Mexico; the consumption there as a condiment being almost universal, and perhaps equal in quantity to salt. The ‘wort’ or cayenne potage may be termed the national dish of the Abyssinians, as that or its basis ‘dillock’ is invariably eaten with their ‘ordinary diet,’ the thin crumpet-like bread of teff or wheat flour. Equal parts of salt and the red cayenne pods are powdered and mixed together with a little pea or bean meal to make a paste. This is called dillock, and is made in quantities at a time, being preserved in a large gourd shell, generally suspended from the roof. The wort is merely a little water added to this paste, which is then boiled over the fire, with the addition of a little fat meat and more meal to make a kind of porridge, to which sometimes is also added several warm seeds, such as the common cress or black mustard, both of which are indigenous in Abyssinia. A kind called the Tobago red pepper is said to possess the most pungent properties of any of the species. It yields a small red pod, less than an inch in length, and longitudinal in shape, which is so exceedingly hot, that a small quantity of it is sufficient to season a large dish of any food. Owing to its oleginous character, it has been found impossible to preserve it by drying; but by pouring strong boiling vinegar on it, a sauce or decoction can be made, which possesses in a concentrated form all the essential qualities of the vegetable. A single drop of this sauce will flavour a whole plate of soup or other food. —Johnson’s Abyssinia; O’S’; Faulkner’s Simmonds, p. 429. See Capsicum.

CHILLOUNEA, a singular tree of Nepal. Its upper coat is entirely composed of innumerable needle-form fibres, partially united by a kind of gelatinous sap. The wood makes good beams and rafters, and is held in such estimation by the natives, that no house is considered secure in which more or less of the timber has not been employed.—Smith’s Nepal.

CHILLUM. HIND. A pipe bowl, a hookah bowl.

CHILON. HIND. Populus ciliata.

CHILRAI, also Khatroo, Picca (Abies) Webbiana, P. vindrow, the silver fir.

CHILITA-RITA. Tel. Phoenix farinifera.

CHILUCHI. HIND. Iris Napalesia.

CHILU NUTIYA. Beng. Amaranthus polygonoides.

CHIMA-PUNJI. Maleal. Cochlospermum gossypium.

CHIMBARI. HIND. Dactylotumum Egyptiacum, Eleusine flagelliformis.

CHIMKANI. HIND. Cathartocarpus fistula.

CHIMNANU, of Lahoul and the Chenab, Amyg- dalus Persica, the peach.

CHI MOEE. CHIN. A bacchanalian game played at Chinese parties.

CHIMONTHANS FRAGRANS. Fortune; the Lah-mei or Hwang-mei-hwa of the Chinese. This shrub is sometimes grafted. The flowers, mounted on brass wire, are the favourite winter ornament of Chinese women of all classes. The Chinese macerate the tree in water, and then polish it a beautifully black brilliant surface. It is a favourite in England, where it blooms in the open air at Christmas. It is quite common in China.—Fortune’s Tea Districts, p. 79.

CHIMPANZEE, one of the Simiades, which approach near to man. The term has been applied to the Simia satyrus of Linneus, the oriental orang, but it is now generally restricted to a West African genus, the Troglodytes niger of Geoffroy, the Homo troglodytes of Linneaus.—Engl. Cyc., p. 1016. See Simiade.

CHIMU, also Chinyaka. HIND. Syringa emodi, Morus serrata, Podophyllum emodi.

CHIMURUDU. Tel. Cadaba Indica, Lam.
CHINA.

CHINA. HND. Panicum miliecum.

CHINA, the empire in the centre and cast of continental Asia, known to Europe by this name, is called by the western Mongols, Cathay; by the Manchu Tatars it is called Nikan Koun; and by the Chinese Tchoung-kou, the last term meaning the Central Kingdom (Duhalde, Hist. of China, p. 1), also Tchoung-kuo, the Empire of the Centre. According to M. Huc (i. pp. 349–350), the Chinese also name it Tchoung-hoa, or Flower of the Centre; also Tien-hia, the Beneath the Heavens, or the world, as the Romans called their dominions Orbis. The name most in use is Tchoung-kou. It is also, however, called Tang-shan, the Hills of Tang (the name of one of their most celebrated dynasties). The present reigning family has given it the name of Tat-sing-kou, the Empire of Great Purity; and in government proclamations, especially in those addressed to Barbarians, it is often called Tien-chao, the Celestial Empire. Other figurative appellations are Tchoung-ang and Tien-chao, Heaven's Empire. The Chinese call themselves Chung-kou-teih-jin, men of the middle kingdom; also Han-jin and Tang-jin, men of Han or of Tang (from the dynasties of those names). China is supposed to be the country mentioned as the land of Sinim in Isaiah xlix. 12. Chinese annals extend back for three or four thousand years. Fo-hi is the first named sovereign of the Chinese, but the date of his reign is not ascertained. Yu the Great is the first monarch of whose reality there is no historic doubt. Their Babm-book contains the record of the ancient imperial dynasties from B.C. 1911 to A.D. 264:

1st. Hia, the first emperor Yu beginning B.C. 1911, reigned 432 years.
2d. Shang, began B.C. 1359, lasted 500 years; 28 reigns in 15 generations.
3d. Tsheu, began B.C. 1030, lasted 479 years. The 12th emperor Yen-yang began to reign B.C. 781. His sixth year was B.C. 776. Confucius lived under this dynasty, and he recorded the observations of the solar eclipses from B.C. 451 upwards to 750.
4th. Tang, began B.C. 255, and lasted to 207, 49 years.
5th. Han, began B.C. 206, and lasted to A.D. 264, a total of 469 years.

But systematic Chinese history hardly goes back so far as the reign of Yu, who was the founder of the dynasty of the kings or princes of Shen-si in S. China, as far as the great river. He diverted the course of the Yellow River to fertilize the lands between the two rivers.

Prior to Chi-hoang of the Tsin dynasty, about 255 years B.C., the country had been subdivided into numerous principalities and commonwealths, but that warrior emperor brought them all under subjection. He built the Great Wall to keep off the Tatars. Seres, which Horace and the ancients used, seems to have been strictly applicable to some nation in the west of China, and many authors have surmised that the term China (Cheena) was given to the country when the Tsin dynasty carried their arms to the west. China (Cheena) was early given by the people of the N.W. of India to the nation which Europe now calls China.

The Tsin dynasty was overthrown by Lin-pang of the Han province, who was the first of the Han dynasty. With the destruction of the Tsin dynasty great injury resulted to the Chinese annals; but most of the Han princes were munificent patrons of literature. During the reign of Ming-li, the 15th of the Han dynasty, considerable intercourse was carried on between the princes of India and China; but it was particularly during the dynasties of Sun, Leam, and Tain, from the fourth to the seventh centuries A.D., that princes from Bengal and Malabar northwards to the Panjáb sent embassies to the Chinese monarachs. Near our own times, the Ming and Tsing dynasties have ruled from A.D. 1368 to the close of the 19th century, viz.:

Origin and Early History.—All the ancient traditions of the Chinese refer to their migrations from the west. Chevalier Bunsen (Report, Brit. Assoc., 1847) says that, according to Chinese traditions, Tibet is the land of their earliest recollections. But the first settlers of this race in China were probably emigrants from the lands lying to the south of the Caspian. An early relationship existed between Chinese and Mesopotamian culture, among the most striking proofs of which are the facts that 'the primitive Chinese, like the Babylonians, recognised five planets besides the sun and moon, and, with one exception, knew them by the same names;' and 'a comparison between the ancient names of the months given in the Urh ya, the oldest Chinese dictionary, with the Accadian equivalents, shows, in some instances, an exact identity.' A number of ethnological and linguistic facts point to the Chinese having left a home in the south of the Caspian Sea, where they had been brought under the influence of Accadian culture. From this resting-place they moved eastward about the twenty-fifth century B.C., probably in consequence of the invasion of Sussiana by some possibly Turanian tribe, and finally struck to the northern bend of the Yellow River, the course of which they followed until they reached the fertile plains of Shen-si. The Chinese immigrants found the country in possession of a number of Taie tribes, such as the Kwei, Lung, Pung, and Li, all of whom possessed a certain amount of culture. With these tribes they contended for dominion, and by force of a superior civilization gained the mastery over them. The relations thus established produced effects
which have left their mark on the history of the nation through all time. In the language at the present day, as well as in the traditions and customs now existing, are reflected traces of this intermingling of races more than four thousand years ago. The admixture of Taie blood was also of paramount importance to the Chinese; and they owe much of their endurance as a nation, and of their superiority in mental and bodily physique, to the constant introduction of new blood into the national life. They have a tradition of a deluge, B.C. 2297, in the reign of Yaou. The first settlement of the immigrant Chinese was in the northern portion of Chili-le; and Chinese legendary history tells us that Yaou, who reigned 4300 years ago, had his capital at the city of Tsin-chou, situated about 100 miles only to the south of the present capital, Peckin. From this the people spread gradually westward and southward, colonizing the newer regions, and displacing the aboriginal inhabitants.

Extent of China.—The territorial distinctions of China proper and the Chinese Empire have existed from the earliest periods of Chinese history. China proper has meant, at all periods, that portion of the east of the Asiatic continent which has been possessed and permanently occupied by the Chinese people. The Chinese Empire has meant, besides China proper, those large portions of the whole Asiatic continent occupied by Tartar nomades or other non-Chinese peoples, but which have from time to time been under the sway of the Empire of China, and more or less directly ruled by Chinese officers and armies. China proper has at all periods been characterized by Chinese civilization; that is to say, its population generally, besides being physically of the same race, has always been governed in its domestic, its social, and (with the exception of some very short periods) its political life, by the principles and rules laid down in the Chinese old sacred books. The non-Chinese peoples of the Chinese Empire have, on the other hand, at all periods either been destitute of anything that could be called civilization, or have been slightly tinged with Chinese civilization, or have been marked by some different civilization, as for instance at present, in the inhabitants of Turkestan by a Mahomedan civilization, and the inhabitants of Tibet by one strictly Buddhist. At present China proper and the Chinese Empire are supposed to be 3,910,400 square miles in extent, and may be noticed under three territorial divisions:—

China proper, as the empire existed under the Ming dynasty, which ruled in China from A.D. 1368 until the Manchu conquest in A.D. 1644.

Manchu, or, as known in Europe, Manchuria, the country of the reigning dynasty.

Colonies of China, in Mongolia, Soungarra, Eastern Turkestan, Tibet, and the countries of the several tribes bordering on Kan-su and Szechuen.

China proper is the largest as well as the most compact country in any part of the globe, extending in length from about lat. 19° to about 42° N., and in breadth (taking one extremity, where it borders upon the peninsula of Corea) from about 122° to 124° W. (the other, which reigned, being, where the Great Wall extends to the west) to about long. 85° E., being 23° in lat. and 39° in long. The area given by Sir George Staunton is 1,292,000 miles. A recent estimate is 1,584,963 English square miles; and in 1844 its revenue, 191,803,159 taels = £63,834,713.

It is separated on the north by the Great Wall from the desert lands of the Mongol tribes, and from the scarcely less dreary Manchau country; on the east is the Gulf of Pe-che-li, the Eastern Ocean, and the Formosa channel; on the west barbarous tribes; and S.W. are the kingdoms of Tonquin, Cochinh-China, Burma, and Laos.

In the course of ages the Chinese Empire has varied greatly in extent. It has been more than once larger than it is even now. It was so, for example, about 2000 years ago, under the five emperors, and that empire then included the greater portion of inhabited Asia east of the Caspian Sea, and inclusive of Siam, Pegu, Cambodia, and Bengal. In the intervals between these great extensions, it has shrunk up to the size of China proper, and even this latter has been occasionally subdivided for considerable periods under two or more ruling families or dynasties, each acknowledging no superior. But the Chinese people has continued the same, even when under several rulers, and has been steadily increasing its territorial possessions. They have annexed all the parts neighbouring on China proper from Manchau and Mongol races. The dynasty now is Mongol, and the army Manchu, and furnishes Manchu soldiers in Mongolia and Tibet.

Government.—The idea of the family is the grand principle that serves as the basis of society in China. Filial piety, the constant subject of instruction to moralists and philosophers, and continually recommended in the proclamations of emperors and the speeches of mandarins, has become, in the views of the Chinese, the fundamental root of all other virtues. All means are made use of to exalt this sentiment, so as to make of it an absolute passion. It assumes all forms, mingles in all actions, and serves as the moral pivot of public life. Every crime, every attempt against the authority, property, or life of individuals, is treated as filial disobedience; whilst, on the other hand, all acts of virtue, devotion, compassion toward the unfortunate, commercial probity, or even valour in battle, are referred to filial piety. To be a good or a bad citizen, is to be a good or bad son. This grand principle dominates and penetrates more or less deeply all the strata of society. The emperor, as the head of the family system on which Chinese political life is based, is responsible only to the gods. In civil cases the last appeal is to the emperor, and the registers of capital offenders are submitted to him. The names of the officials who merit promotion or disgrace are likewise submitted to him. He is called Hoang-te, August Sovereign, or Hoang-chou, August Election; but his name par excellence is Tien-dza, or Tien-tsze, Son of Heaven.

The empire of China, on the other hand, is the representative of mother earth. She is supposed to be ignorant of politics, and occupies herself in feeding silkworms, winding silk at the cocoan festival, and inspecting the silk stuffs woven by the women of the imperial household.

China has 18 political divisions,—Shang-tung, Pe-che-li, Shan-si, Shen-si, in the north; Kwang-tung and Kwang-si in the south; Chih-lung, Foh-kien, and Kiang-si, in the east; Kan-su, Sze-chuen, and Yun-nan, in the west; and Nang,
CHINA.

hui, Kiang-si, Hoo-nan, Hu-peh, Ho-nan, and Kwei-chu, as midland provinces.

Executive Civil Government.—The entire administration is under the direction of two councils, attached to the person of the emperor, the Nei-ko and Kiu-ke-tekho. The first is charged with the preparation of plans, and the despatch of current business. Its duty is, according to the official book, 'to put in order, and to make manifest the thoughts and designs of the imperial will, and to regulate the forms of administrative decrees.' It may be regarded in some measure as the secretariat of the empire. The second council, named 'Kiu-ke-kekho,' deliberates with the emperor concerning political affairs. In the Nei-ko, or Interior Council Chamber, are four chief councillors, two of them Tartars and two Chinese, who bear the titles of Chung-thang and Ko-lou. The Tartar minister presides.

Loo-Poo is the general appellation for the six civil and criminal tribunals of China. The first of these, properly termed Loo-Poo, has four departments for the administration of the provinces; the second, named Hoo-Poo, takes charge of the imperial revenues; the third board is named Lepoo; Ping-foo-war is the fourth; King-Poo, the criminal department; Kung-Poo, or public works, being the fifth and sixth.
